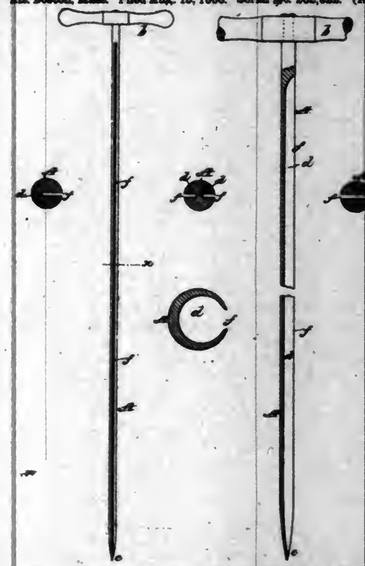
404,481. **DEVICE FOR OILING WHEELS.** FRANK W. HARRIS, Napa, Cal. Filed Nov. 1, 1888. Serial No. 289,780. (No model.)



Claim.—1. A device for treating the follies of wooden wheels, consisting of a segmental tank and supporting-standards, said standards being movable toward and from each other, whereby the tank is vertically adjusted, in combination with a lamp or heater beneath said tank, and other standards upon which a shaft or pin passing through the wheel-hub is supported, substantially as herein described.

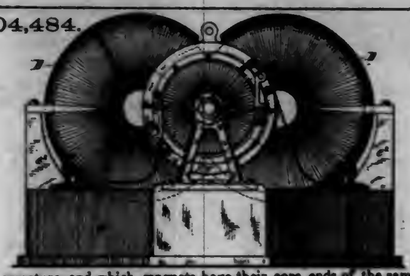
2. The segmental removable tank, with movable standards for adjusting its height, a lamp or heater beneath the tank, and standards upon each side having the holes H, and with a shaft the height of which is adjustable in said holes to support wheels of different sizes with their rims dipping into the tank, substantially as herein described

404,481.

404,482. **IMPLEMENT FOR MARKING CLOTH.** NATHAN HARRIS, Boston, Mass. Filed Aug. 15, 1888. Serial No. 282,822. (No model.)

Claim.—A cloth-marking implement consisting of a spindle A, provided at one end with a handle *b* and at the opposite end with a sharp point *c*, and having a longitudinal chamber or recess for containing powdered chalk or other suitable marking substance, and a continuous longitudinal slot or groove *f* for the passage of the marking substance to the cloth as the spindle is forced through the same, substantially as and for the purpose described.

404,483. **POLISHING COMPOUND.** GEORGE W. HASTINGS, Grafton, assignor to Edmund M. Wood, Natick, Mass. Filed July 2, 1888. Serial No. 278,849. (Specimens.)



Claim.—As an improved article of manufacture, a polishing compound composed of carnauba-wax, ozocerite, crude or refined, spirits turpentine, French chalk, and oil of citronella, substantially as herein set forth and described.

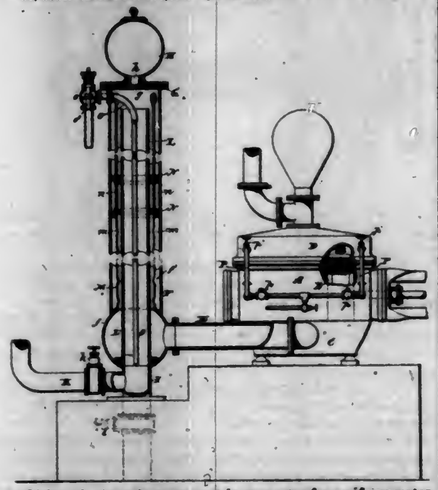
404,484. **DYNAMO-ELECTRIC MACHINE.** WILLIAM HOCHHAUSEN, Brooklyn, N.Y. Filed Feb. 1, 1886. Serial No. 190,517. (No model.)

Claim.—1. In a dynamo-electric machine or motor, an armature core or carrier provided with shallow grooves or flutings, in which the armature-conductors are partially embedded, as and for the purpose described.

2. In a dynamo-electric machine or motor, a field-of-force magnet consisting of two electro-magnets whose cores are curved in the arc of a circle which, prolonged, would pass through the center of

404,484.

the armature, and which magnets have their core ends of the same name magnetically distinct, so far as concerns union, by a mass of magnetic material, but held in proper proximity and properly formed to constitute together a field-of-force pole-piece.



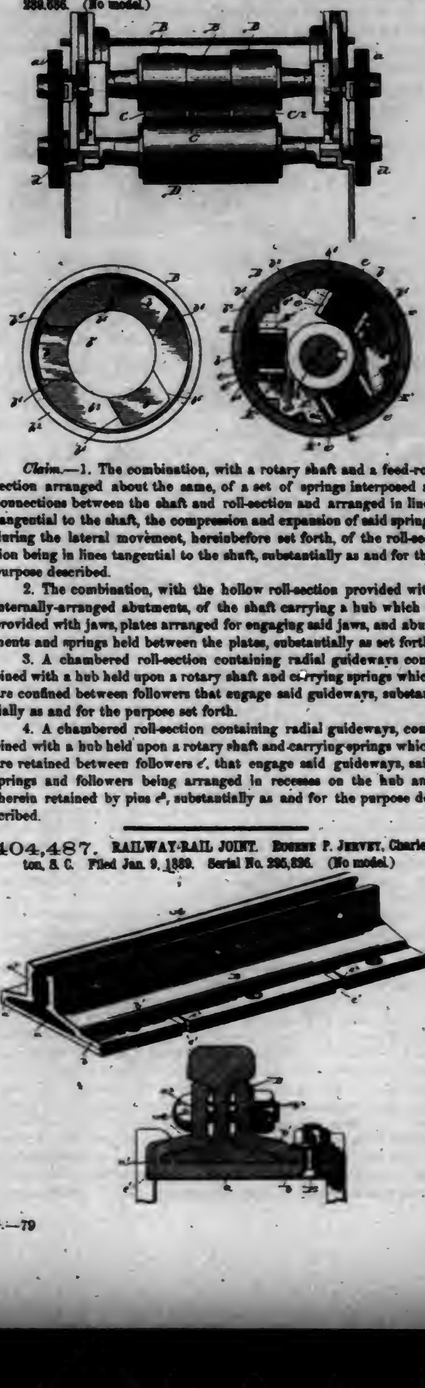
3. In a dynamo-electric machine or motor, a field-of-force pole-piece consisting of two magnet-core ends of the same polarity, arranged in proximity, with the axes of the magnet-cores at the end presented to the armature forming substantially a perpendicular to the circle of the armature periphery, in combination with uniting-pieces of non-magnetic material, as and for the purpose described.

4. In a dynamo-electric machine or motor, a field-of-force magnet consisting of two electro-magnets having like poles arranged on the same side of the armature, the cores of said magnets being formed of iron masses continuous in the direction of the magnetic axes, of the same or less area in cross-section than the body of the cores, as and for the purpose described.

5. In a dynamo-electric machine or motor, a field-of-force magnet composed of two electro-magnets whose like poles are placed in proximity but are magnetically disunited, in combination with the uniting diamagnetic block, and whose magnetic axes continued from their pole ends would cut the circular periphery of the armature at a right angle.

6. In a dynamo-electric machine or motor, a field-of-force magnet composed of two separate electro-magnets having their like poles juxtaposed, and whose poles are composed of curved iron plates superposed as described, the planes of said plates being transverse to the plane of curvature.

404,485. **APPARATUS FOR PURIFYING WATER.** OTIS S. HOWES, Cairo, Ill., assignor of one-half to Halliday Bros., same place. Filed Jan. 16, 1888. Serial No. 260,897. (No model.)



Claim.—1. As an improvement in apparatus for purifying water, the aerating-column provided with the central chamber for the admission of water, the centrally-discharging pipe for the admission of air, and the surrounding annular chamber having the perforated diaphragms for the mingling of said fluids, in combination with means for drawing water through said column, substantially as and for the purpose shown and described.

2. As an improvement in apparatus for purifying water, the combination, with a water-supply pipe or pipes and a force-pump, of an intermediate stand-pipe or column provided with a pipe which discharges air near the bottom thereof, and with an annular diaphragmed chamber in which the air and water are thoroughly mingled, substantially as and for the purpose set forth.

3. As an improvement in apparatus for purifying water, the combination, with a water-supply pipe or pipes and a force-pump, of a stand-pipe or column between said water-supply pipe or pipes and pump, said stand-pipe being provided with an air-discharging pipe which opens into the lower portion thereof, and also with an annular diaphragmed chamber in which the water and air are thoroughly mingled, and pipes connecting the inlet and outlet chambers of the said pump, substantially as and for the purpose shown and described.

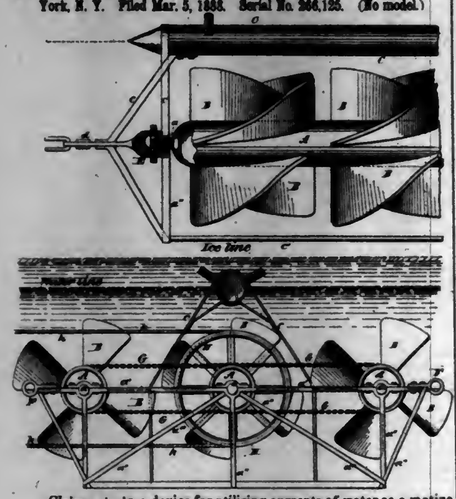
404,486. **FEED-ROLL FOR PLANING AND SURFACING MACHINES.** LUCIUS P. HOYT, Aurora, Ill. Filed Oct. 31, 1888. Serial No. 289,636. (No model.)

Claim.—1. The combination, with a rotary shaft and a feed-roll section arranged about the same, of a set of springs interposed as connections between the shaft and roll-section and arranged in lines tangential to the shaft, the compression and expansion of said springs during the lateral movement, hereinbefore set forth, of the roll-section being in lines tangential to the shaft, substantially as and for the purpose described.

2. The combination, with the hollow roll-section provided with internally-arranged abutments, of the shaft carrying a hub which is provided with jaws, plates arranged for engaging said jaws, and abutments and springs held between the plates, substantially as set forth.

3. A chambered roll-section containing radial guideways combined with a hub held upon a rotary shaft and carrying springs which are confined between followers that engage said guideways, substantially as and for the purpose set forth.

4. A chambered roll-section containing radial guideways, combined with a hub held upon a rotary shaft and carrying springs which are retained between followers *e*, that engage said guideways, said springs and followers being arranged in recesses on the hub and therein retained by pins *e*², substantially as and for the purpose described.



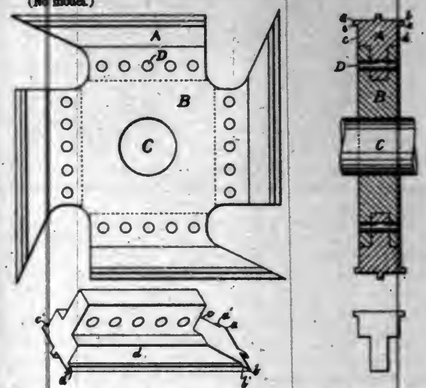
404,487. **RAILWAY-RAIL JOINT.** EUGENE P. JERVEY, Charleston, S. C. Filed Jan. 9, 1889. Serial No. 295,626. (No model.)

Claim.—1. In a rail-joint, the combination of the member A, provided with the base *a*, extending laterally beneath and beyond the rail, and the upwardly-extending portion to bear against the rail, the member B, provided with the flat portion *b*, to rest upon the exposed end of the base *a*, and the upwardly-extending portion to bear against the rail, and the vertical and horizontal fastening-bolts, the former extending through the base portions of the said members beyond the rail, and the latter passing through the upwardly-extending portions of the said members.

2. In a rail-joint, the member A, having the flat bed-plate *a*, the flange *a'*, the web a^2, and the grooves *c'*, in combination with the member D, having the flat bearing *b*, lip *b'*, web b^2, and grooves c^2, and the vertical and horizontal bolts uniting said parts in the manner described and shown.

3. In a rail-joint, the longitudinal members A B, adapted to embrace the rail and rest one upon the other, in combination with the vertical and the horizontal bolts, and the spikes passed through grooves in the two parts, as described and shown.

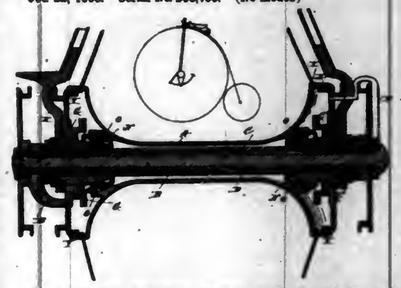
404,488. WATER-CURRENT MOTOR. FRANK G. JOHNSON, New York, N. Y. Filed Mar. 5, 1888. Serial No. 266,125. (No model.)



Claim.—1. In a device for utilizing currents of water as a motive power, the combination of the floating motors consisting of the hollow floating cylinders A A A, having the screw-blades B B B, the adjustable floating cylinder C, having suitable inlets and outlets for the ingress and egress of water and air, the connecting-bars *a' a' a'*, and ground-frame a^2 a^2 a^2, whereby the entire device, by introduction of water into the cylinder C, is lowered to the bed of the river, and by pumping the water out of the said cylinder C the entire device is again elevated to or near the surface of the river, and whereby when the device is lowered to the bed of the river the blades B B B are prevented by the ground-frame a^2 a^2 a^2 from striking the ground, substantially in the manner and for the purpose set forth.

2. In a device for utilizing currents of water as a motive power, the combination of the floating motors consisting of the hollow floating cylinders A A A, having the screw-blades B B B, the adjustable floating cylinder C, having suitable inlets and outlets for the ingress and egress of water and air, the connecting-bars *a' a' a'*, and ground-frame a^2 a^2 a^2, the connecting-chains G G, cable-wheel H, and cable *h h*, whereby the device can be lowered to the bed of the river by the introduction of water into the adjustable cylinder C and again raised to the surface of the river by the removal of the water from and the introduction of air into the said adjustable cylinder, substantially in the manner and for the purpose described.

3. In a device for utilizing currents of water as a motive power, the combination of the floating motors consisting of the hollow floating cylinders A A A, having the screw-blades B B B, the adjustable floating cylinder C, having suitable inlets and outlets for the ingress and egress of water and air, the connecting-bars *a' a' a'*, and ground-frame a^2 a^2 a^2, the connecting-chains G G, cable-wheel H, cable *h h*, the floating jetty consisting of the two converging hollow floating cylinders I I, having the jetty-blades J J, cross-bars *i i i i*, and suitable inlets and outlets for the ingress and egress of water and air, whereby the said jetty and the said floating cylinders A A A can be simultaneously lowered to the bed of the river by the introduction of water into the adjustable cylinder C and into the jetty-cylinders I I, and then again simultaneously raised to the surface of the river by the removal of the water from and the introduction of air into the said cylinders C and I I, substantially as and for the purpose set forth.



404,489. WOOD-WORKING TOOL. ISAAC R. JOSLIN and GILBERT T. LAWRENCE, New York, N. Y. Filed Nov. 20, 1888. Serial No. 291,367. (No model.)

Claim.—1. A cutter provided with a cutting-edge *a b*, similar in outline to the surface to be produced, in combination with a narrow supplemental side-cutting edge *a' c'*, formed by a substantially square jog extending to a cutter-body reduced in width immediately in rear of the said two cutting-edges, substantially as described.

2. In combination with a cutter-body, a surface-cutting edge *a b* thereon with lateral cutting-edges *a' c'* and *b' d'* on the sides thereof, said body being reduced in width immediately back of said cutting-edges with a square jog, substantially as set forth.

404,490. VELOCIPEDE. HOMER A. KING, Springfield, Mass. Filed Oct. 22, 1888. Serial No. 288,735. (No model.)

Claim.—1. The stationary tubular shaft B, with the fork-rests secured at each end by nuts, all inside of or between two outer retracing-drums.

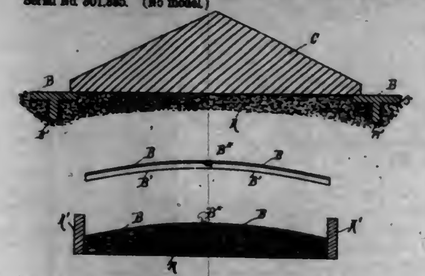
2. A stationary tubular shaft inclosing two shafts arranged to revolve in opposite directions and bearing or encircled by only one revolving drum at each end.

3. The connection E, with one or more side projections, as E', for the purpose set forth.

4. The connection F, with one or more side projections, as F', for the purpose set forth.

5. A roller-case with lips projecting to inclose elongations on the ends of roller-bearings, and with an opening on one or both lips through which to insert the rollers.

6. A roller-case with projecting lips to inclose the elongated ends of rollers with an elevation, as N", to hold in position and receive the end pressure of inclined rollers encircled by a central groove.



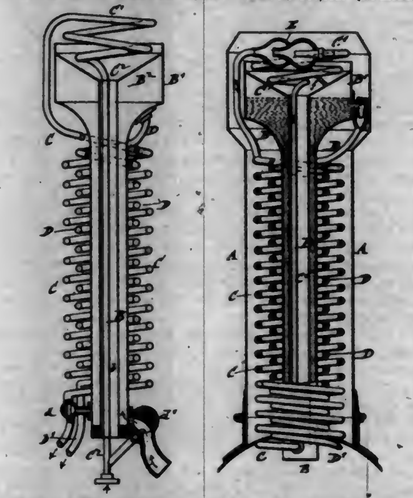
7. An inclined roller-bearing having two bearing-surfaces separated by a groove and with the bearing-surface on the smaller end broader than on the larger end, for the purpose set forth.

8. An inclined roller having two bearing-surfaces separated by a groove and an elongation at each end, for the purpose set forth.

9. The friction-spring K, doubled or thickened where wearing and bearing on a rotating part and with connection to J, for the purpose set forth.

10. The dogs H H, with connections I I to J and K, for the purposes set forth.

404,491. GUIDE-BAR FOR LINING UP THE CURVES OF STREET-SURFACES. JAMES M. MACK, Philadelphia, Pa. Filed Mar. 5, 1889. Serial No. 301,895. (No model.)



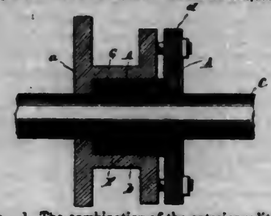
Claim.—1. A removable arched liner or gage for regulating the curve or arch of a road-bed formed upon a curve or shape to which the bed is to be conformed and having a flat top whose upper surface is adapted to coincide with the surface of the pavement, as set forth.

2. A removable arched liner or gage for regulating the curve or arch of a road-bed, consisting of a curved metallic piece T-shaped in cross-section, the head of the T resting upon and its top face being level with the upper surface of the filling, as set forth.

3. The combination of a pair of removable arched liners or gages extending from curb to curb and meeting in the center of the road-bed and having an offset-joint, as set forth.

404,492. CAR-HEATING APPARATUS. CHARLES A. MARRDEN, New York, N. Y. Filed Mar. 17, 1888. Serial No. 267,552. (No model.)

Claim.—1. The combination, with the smoke-stack of a locomotive, of a closed tubular reservoir located in the smoke-stack and provided with a central exhaust-channel and heating-coils located in the space between the smoke-stack and the reservoir and being connected with said reservoir, and having an outlet-pipe leading to the radiating-pipes in the cars to be heated, substantially as set forth.

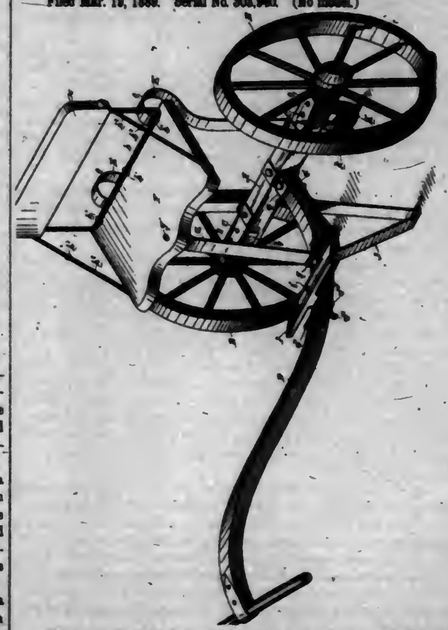


2. The combination, with the smoke-stack of a locomotive, of a closed tubular reservoir located in the smoke-stack and provided with an enlarged head and a central exhaust-channel, and heating-coils located in the space between the smoke-stack and the reservoir and being connected with said reservoir, and having an outlet-pipe leading to the radiating-pipes in the cars to be heated, substantially as set forth.

3. The combination, with the smoke-stack of a locomotive, of a closed tubular reservoir located in the smoke-stack, heating-coils in the smoke-stack connected with said reservoir, an inlet-pipe through the channel in the reservoir to one of said coils, and an outlet-pipe connected with the other coil, substantially as set forth.

4. The combination, with the smoke-stack of a locomotive, of a closed tubular reservoir in the smoke-stack provided with an enlarged head and funnel-shaped top, heating-coils connected to said reservoir, an intermediate heating-coil above said head, connected to one of said coils, an inlet-pipe connected with said intermediate coil, and an outlet-pipe connected to the other heating-coil, substantially as set forth.

5. The combination, with the smoke-stack of a locomotive, of a closed tubular reservoir in said smoke-stack, heating-coils connected to said reservoir, a supply-pipe passing through the inner channel of the reservoir, a coil connected with said supply-pipe at the upper part of the reservoir and with one of the heating-coils, an injector in said coil, and an outlet-pipe connected with the lower end of the other coil, substantially as set forth.



404,493. PACKING FOR PISTON-RODS. JOHN P. MURRAY, Jersey City, N. J., assignor of two-thirds to Robert Davis and Mark Curley, same place. Filed Feb. 27, 1889. Serial No. 301,360. (No model.)

Claim.—1. The combination of the exterior split packing-ring A, having the flared central opening C, the sheet metallic split expansion-ring E, flared in cross-section F to fit in said opening, and having the annular flange G, bearing on one side of said exterior packing-ring, and the split interior packing-ring I, having its exterior edge beveled to fit in the metallic expansion-ring, the said exterior ring being fitted in the packing-gland, and said interior ring being fitted on the piston-rod, substantially as described.

2. The combination of the exterior ring having the flared opening, the sheet metallic split expansion-ring, flared in cross section to fit in said opening and having the flange bearing on one side of the said ring, and the split interior packing-ring having its exterior edge beveled to fit in the flared expansion-ring, substantially as described.

404,494. FOLDING VEHICLE. JOSEPH MCBOYLE, Oakland, Cal. Filed Mar. 19, 1889. Serial No. 303,940. (No model.)

Claim.—1. In a folding vehicle, and in combination with its axle, wheels hinged to said axle, whereby they may be turned from their position when in use to a folded position when out of use, substantially as described.

2. In a folding vehicle, and in combination with its axle and wheels, journals on which the wheels are mounted, and a pivot or

hinge connection between said journals and the axle, whereby the wheels may be turned to a folded position, substantially as described.

3. In a folding vehicle, and in combination with its axle and wheels, journals on which the wheels are mounted, and vertical pivot-pins connecting the journals with the axle, whereby the wheels may be turned from a plane at right angles to said axle to a plane parallel therewith, substantially as described.

4. In a folding vehicle, and in combination with its axle and wheels, journals on which the wheels are mounted, fitted in slotted or grooved ends of the axle and adapted to be turned backwardly therein, and vertical pins pivoting the journals to the axle ends, whereby the wheels may be turned to the back of the axle in a plane parallel therewith, substantially as described.

5. In a folding vehicle, and in combination with its axle and wheels, the journals on which the wheels are mounted, fitting the axle ends, the vertical pivot-pins connecting the journals with the axles, whereby the wheels may be turned to a plane parallel with the axle, and the removable pins for holding the journals in line with the axle when the wheels are in use, substantially as described.

6. In a folding vehicle, and in combination with the axle, the tongue hinged or pivoted to said axle, adapted to be turned from a plane at right angles to the axle to a plane parallel therewith; substantially as described.

7. In a folding vehicle, and in combination with the axle, the tongue and the connection between the tongue and axle, consisting of the axle-clip into which the tongue fits, and the vertical pivot pin or bolt securing the tongue therein and permitting it to be turned to a plane parallel with the axle, substantially as described.

8. In a folding vehicle, and in combination with the axle, the tongue hinged or pivoted thereto, whereby it may be turned to a plane parallel with the axle, said tongue having a hinged joint in its own length, whereby one section may be folded over on the other section, substantially as described.

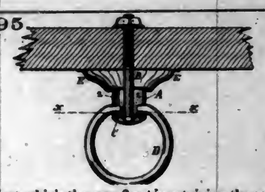
9. In a folding vehicle, and in combination with its wheeled axle and suitable seat-supports carried thereby, the seat hinged to said supports, whereby it may be turned from a horizontal to a vertical position, substantially as described.

10. In a folding vehicle, its wheeled axle, suitable seat-supports carried thereby, and its tongue, the seat hinged to said supports, whereby it may be turned from a horizontal to a vertical position, and the standard G, hinged to the tongue and adapted to support the seat in a horizontal position and to relieve it when about to be turned to a vertical position, substantially as described.

11. In a folding vehicle, its wheeled axle and the seat-supporting springs rising therefrom, in combination with the seat and the links hinged to both seat and springs, substantially as described.

12. In a folding vehicle, the combination of the hinged seat adapted to be turned from a horizontal to a vertical position, and the lazy-back hinged to the seat and supported by jointed braces, whereby said lazy-back may be folded down on the seat, substantially as described.

13. In a folding vehicle, and in combination with its tongue, the foot-rest pivoted upon said tongue and adapted to be turned from a position at right angles to said tongue to a position parallel therewith, substantially as described.

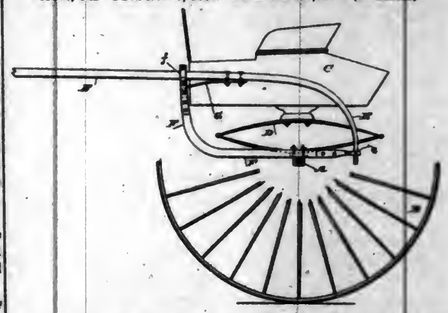


14. In a folding vehicle, the combination of the axle, the wheels having journals pivoted or hinged to said axle, whereby said wheels may be turned to the back of the axle in a plane parallel therewith, the seat-supporting springs rising from the axle and having backwardly-extending top portions avoiding the wheels when turned, and the seat supported by the springs, substantially as described.

15. In a folding vehicle, the combination of the axle, the wheels pivoted or hinged thereto, whereby they may be turned to the back of the axle in a plane parallel therewith, the seat-supporting springs rising from the axle, the folding seat hinged to said springs, the tongue hinged to the axle, whereby it may be turned to a plane parallel with the axle, and the seat-supporting standard hinged to the tongue, substantially as described.

16. A folding vehicle consisting of the axle, the wheels hinged thereto and adapted to be turned to the back of the axle, the springs rising from the axle, the seat hinged to the springs and adapted to be turned from a horizontal to a vertical position, the jointed tongue hinged to the axle and adapted to be turned to a plane parallel therewith, the seat-supporting standard hinged to the tongue, and the foot-rest pivoted on the tongue and adapted to be turned from a position at right angles to a position parallel with said tongue, substantially as described.

404,495. DRAWER-PULL. EDWARD P. HOBBS, Waterbury, Conn., assignor to the American Ring Company, same place. Filed Mar. 16, 1889. Serial No. 303,599. (No model.)



Claim.—1. The combination, with the screw B and ring D, of a socket A, having inwardly-projecting ears 2 cut from the socket at the openings into which the ends of the ring pass, and the washer or

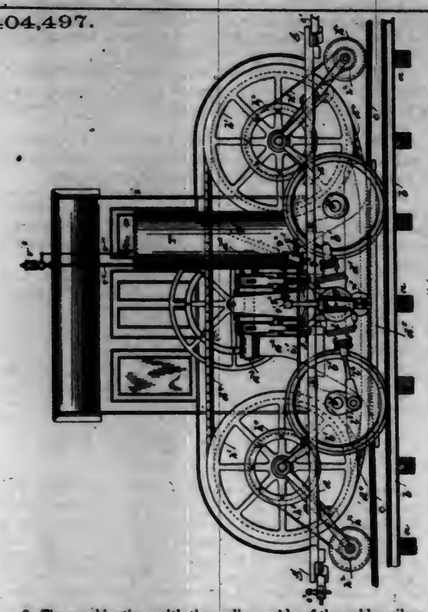
head C, against which the ears 2 act in retaining the socket and screw in their relative positions, substantially as set forth.

2. The combination, with the ring D and the socket A, having inwardly-projecting ears 2, of the screw B, passing between the ends of the ring and having a head or washer that is clamped toward the end of the socket A by the ears 2, the ends of the ring passing into the openings in the sides of the socket behind such ears, substantially as set forth.

404,496. TWO-WHEELED VEHICLE. WILFRED PAGE, Penn's Grove, Cal. Filed Nov. 3, 1888. Serial No. 289,917. (No model.)

Claim.—1. In a wheeled vehicle, the axle, in combination with the bars clipped to the axle and having upwardly-curved forward ends loosely embracing the shafts, the shafts having downwardly-curved rear ends, a pivot or hinge connection between the rear ends of the shafts and the bars, and a spring-connection between the forward ends of the bars and the shafts, substantially as herein described.

2. In a two-wheeled vehicle, the axle and the shafts, in combination with connecting-bars clipped to the axle and extending in front of and behind said axle, said bars having loops or eyes which loosely embrace the shafts, a pivot or hinge connection between the rear ends of the shafts and the rear ends of the bars, and a spring-connection between the forward ends of the bars and the shafts, substantially as herein described.



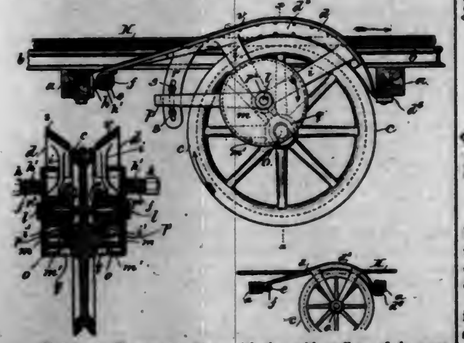
3. In a two-wheeled vehicle, the combination of the axle, the shafts extending over and past the axle and having downwardly-turned rear ends, the bars clipped to and extending on each side of the axle and having upwardly-turned forward ends loosely embracing the shafts, a pivot or hinge connection between the rear ends of the shafts and bars, and a spring-connection between the forward ends of said bars and shafts, substantially as herein described.

4. In a two-wheeled vehicle, the combination of the axle, the shafts extending over and past the axle, the bars clipped to and extending on each side of the axle, a pivot or hinge connection between the rear ends of the shafts and bars, a spring-connection between the forward ends of the bars and the shafts, and guide loops or eyes on said forward ends of the bars embracing loosely the shafts, substantially as herein described.

404,497. MEANS FOR OPERATING TRAINS UPON CABLE RAILWAYS. JOHN H. PENDLETON, Brooklyn, and ANDREW BETHOR, Jr., New York, assignors to the Rapid Transit Cable Company, New York, N. Y. Filed July 21, 1888. Serial No. 280,662. (No model.)

Claim.—1. The combination, with the endless traveling cable of the cable railway, the car wheels and axles of the motor-car and a grip for connecting the motor-car to the cable, of a reservoir upon said car for containing air under pressure, an air-pump oscillated by a connection to one of the car wheels or axle, a cock for admitting air to the pump, a pipe connecting the reservoir with the pump, a stationary cylinder and its piston and rod, a spring within said stationary cylinder and acting against its piston, a pipe connecting the stationary cylinder with said reservoir, and a connection from the stem of aforesaid cock to the piston-rod of the stationary cylinder, so that when air is being pumped into the reservoir said cock is more or less opened or closed automatically, according to the pressure of air in the reservoir, as set forth.

404,497.

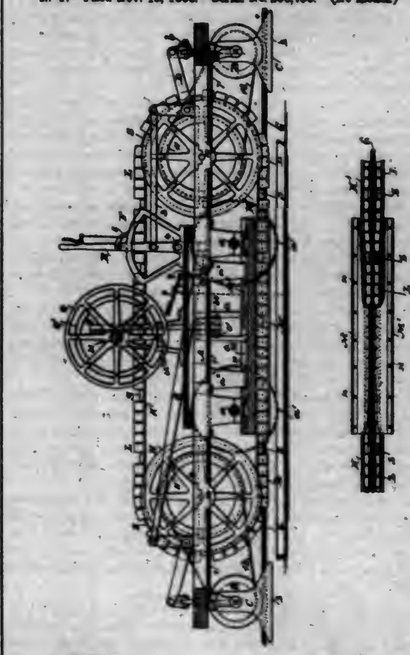


2. The combination, with the endless cable of the cable railway, the wheels and axles of the motor-car, and a grip for connecting said car to the cable, of the cylinder *l l*, and pistons l^v and rods l^6 connected with the axle or wheels of the car, bearings for said cylinders, valves and ports in said cylinders and bearings, a reservoir for compressed air connected with said cylinders, the cocks $p' p'$ and crank-arms $q' q^3$, links q^2 q^3 q^4, and rock-shaft q^4, for operating the cocks $p' p'$ simultaneously, as set forth.

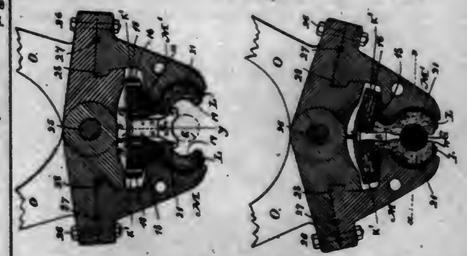
3. The combination, with the cylinder *l* and its pistons and rod and bearings for said cylinder, of the ports 2 3, valves 4, 5, 6, and 7, branch port p^4, port or passage-way p^3, and check-valve p^5, the cylinder n', piston n^2, rod n^3, and spring n^4, the cock p^7, an arm connecting the rod n^7 and stem of said cock, and connections from the cylinders *l n'* to an air-reservoir, substantially as and for the purposes specified.

4. The combination, with the cylinder *l* and its piston and rod, a connection from said cylinder to an air-reservoir, and the ports 2, 3, p^4, 8, and 9, valves 4, 5, 6, and 7 in said cylinder *l*, of the bearing l^3, having the ports or passage-ways 10 11 15 16 19 p^3, the check-valve p^5, the cock p', having the passage-ways 17 18, and the barrel of said cock having an exhaust-opening, substantially as and for the purposes set forth.

404,498. GUIDE-PULLEY FOR CABLE RAILWAYS. JOHN H. PENDLETON, Brooklyn, and LINCOLN MOSS, New York, assignors to the Rapid Transit Cable Company, New York, N. Y. Filed July 21, 1888. Serial No. 280,662. (No model.)



Claim.—1. The combination, with the guide-pulley, of the arms *d*, pivoted at one end and having inclined flanges adjacent to the guide-pulley, lifting-springs, and a stop at the other end of the arms to limit the upward movement, substantially as specified.



2. The combination, with the guide-pulley, of arms *d*, pivots at one end of such arms, and a spring for raising the arms and pulley, a stop to limit the upward movement, and flanged disks facing each other and receiving upon their flanges the axis of the guide-pulley, substantially as specified.

3. The combination, with the pivoted pulley-support and the guide-pulley and its axle, of disks or wheels at opposite sides of said pulley, pivots for said disks, circular flanges upon said disks for the ends of the axle of the guide-pulley to roll upon, and supports for the pivot-pins of the disks, substantially as specified.

4. The combination, with the pivoted pulley-support, guide-pulley and axle, flanged disks, and pivots and bearings for the same, of the swinging frame P, having forked ends to receive the axle *o*, the slotted arm *r*, and stops *s s*, substantially as and for the purposes specified.

404,499. GRIP FOR CABLE RAILWAYS. JOHN H. PENDLETON, Brooklyn, and CORNELIUS TIERS, ANDREW BETHOR, Jr., and LINCOLN MOSS, New York, assignors to the Rapid Transit Cable Company, New York, N. Y. Filed Nov. 13, 1888. Serial No. 290,730. (No model.)

Claim.—1. The combination, with the cable, of an endless belt, belt-wheels around which the belt travels, grip-blocks in pairs upon the endless belt adapted to swing apart for the reception or discharge of the cable, and mechanism for pressing the grip-blocks toward each other and at opposite sides of the cable, substantially as set forth.

2. The endless belt and belt-wheels around which the belt passes, in combination with grip-blocks connected to the endless belt, and sections of leather or similar material within the grip-blocks and recessed for the reception of the cable, and mechanism acting upon the grip-blocks for pressing them toward each other to grasp the cable, substantially as set forth.

3. The grip-blocks having convex exterior surfaces and sections

of leather or similar material in their inner faces, in combination with grip-jaws grooved to fit the convex exterior surfaces of the grip-blocks and mechanism for acting upon the grip-jaws to move them toward or from each other and grasp the cable between the surface of the grip-blocks, or to open such grip-blocks and allow the cable to drop, substantially as specified.

4. The grip-blocks L, formed as hollow castings with the bases 15, in combination with the sections or layers of leather or similar material introduced within the grip-blocks, the filling plates or layers 16, connected to the bases of the grip-blocks, and the endless belt K, to which the bases of the grip-blocks are fastened, substantially as set forth.

5. The combination, with the endless belt K and the wheels H H', of grip-blocks adapted to grasp the cable and provided with bases by which the grip-blocks are connected to the endless belt, and the pendent shields introduced at intervals and secured to the belt for preventing the cable being lifted too high and insuring the proper grasping of the cable as the grip-blocks are brought up at the sides thereof, substantially as set forth.

6. The combination, with the endless belt and the grip-blocks upon the same in pairs and adapted to receive the cable between them, of the grip-jaws having concave faces for acting against the grip-blocks, a pivot or hinge for connecting the grip-jaws together, and levers for acting upon the grip-jaws to open or close the same, substantially as set forth.

7. The combination, with the grip-jaws and the hinge or pivot for connecting the same together, of levers for acting upon the grip-jaws, links, a rack and pinion for opening or closing the grip-jaws, an endless belt between the grip-jaws, and grip-blocks in pairs connected upon the belt and passing between the grip-jaws, substantially as and for the purposes set forth.

8. The combination, with the guide-wheels B, lifters C, and mechanism, substantially as specified, for moving the same, of the endless belt, and grip-blocks in pairs, and the belt-wheels around which the endless belt passes, and pulleys and an endless band for giving motion to the belt-wheels from the guide-wheel when the cable is brought into contact with the latter, substantially as set forth.

9. The combination, with the endless belt and grip-blocks connected thereon, of grip-jaws, a pivot or hinge for connecting the jaws together, such grip-jaws being made in two parts and bolted together to allow for the removal of the portions or jaws that act on the grip-blocks for repair or renewal, substantially as set forth.

10. The endless belt or band and the two ranges of grip-blocks in pairs upon such belt, in combination with the belt-wheels around which the endless belt passes, and a wheel receiving rotation from the cable, and a connection therefrom to the belt-wheels for giving to the belt and the two ranges of grip-blocks a motion in the same direction as the cable, substantially as set forth.

11. The combination, with the guide-wheel B, of a cable-lifter having a hook-shaped shoe 2 at the lower end, an actuating-lever and connections from the same to the lifter for raising and lowering the lifter, and a cord or connection for drawing the lifter aside as it is lowered, so that the shoe may pass in below the cable, substantially as specified.

404,500. ENDLESS BELT FOR GRIPS FOR CABLE RAILWAYS.

JOHN H. PENDLETON, Brooklyn, and ANDREW BRYSON, Jr., CORNELIUS TIERS, and LINCOLN MOSS, New York, assignors to the Rapid Transit Cable Company, New York, N.Y. Filed Nov. 13, 1888. Serial No. 290,740. (No model.)

Claim.—1. The combination, with the band *f*, forming the body of the belt, of the blocks f^4, of layers of leather or similar material, secured to the same and forming the outer portion of the endless belt, substantially as and for the purposes specified.

2. The combination, with the band *f*, forming the body portion of the belt, of the blocks f^4 upon the outer portion of the band, metal plates at the inner part or back of said band, and means for securing the blocks and plates to the band, substantially as set forth.

3. The combination, with the band *f* and blocks-f^4 upon the outer portion of the same, of the metal plates f^7 at the inner part of said band *f*, and pins passing through the band and blocks for securing the plates and blocks to the band, substantially as set forth.

4. The combination, with the band *f*, blocks f^4, and plates f^7, having pins passing through the band and blocks, of wires f^{12}, passing through said pins and blocks, substantially as and for the purposes set forth.

5. The combination, with the band *f*, blocks f^4, and plates f^7, having pins passing through the band and blocks, of the metal case f^{14} around the sides of each block, substantially as specified.

6. The combination, with the band *f*, forming the body portion of the belt, of the blocks f^4 upon the same, each block being composed of layers of leather or other yielding material riveted together and secured to said band with the layers perpendicular to the band, substantially as and for the purposes set forth.

7. The combination, with the endless band *f*, forming the body portion of the belt, of metal plates f^7 at the inner part of said band, and blocks f^4, of leather or similar material, upon the outer portion of said band, each block having a semicircular groove in its outer face, substantially as and for the purposes set forth.

404,501. HAIR-CURLING DEVICE.

CARL A. G. PFANNE, Brooklyn, N. Y., assignor to Parker, Stearns & Sutton, same place. Filed Jan. 21, 1888. Serial No. 296,971. (No model.)

Claim.—1. A hair-curler composed of a stem upon which the hair is wound and an elastic retaining-cup on the end of the stem adapted to be turned inside out to uncover or to cover it, for the purpose stated.

2. A hair-curling device consisting of a stem upon which the hair is wound, having at each end an elastic retaining cup part, the length of both retaining parts being equal to the length of the stem, and adapted to be turned inside out upon the stem, for the purpose stated.

3. As a new article of manufacture, the herein-described rubber hair-curling device, consisting of a stem having on each end a cup-shaped retaining part adapted to be turned inside out, substantially as described, for the purpose specified.

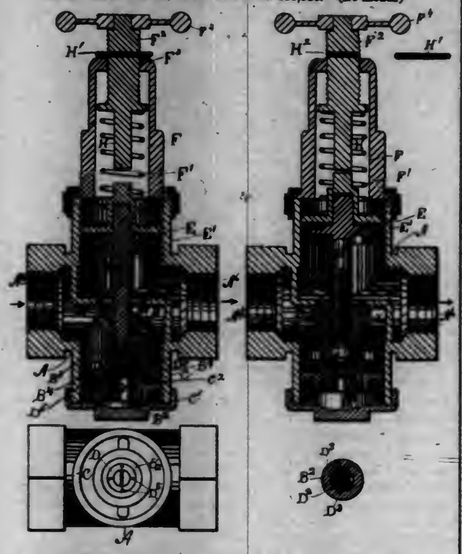
404,502. RANGE.

GEORGE H. PHILLIPS, Geneva, N.Y. Filed Mar. 20, 1889. Serial No. 304,035. (No model.)

Claim.—1. The combination, with the range-plate, of the herein-described range-shelf provided with the hook C^3, substantially as and for the purpose specified.

2. The combination, with the range-plate, of the herein-described range-shelf having the hook C^3 cast integral therewith, substantially as and for the purpose specified.

3. The combination, with the range-shelf having a hook C^3, of the herein-described collar B, provided with the recess or depression B', substantially as and for the purpose specified.



4. The combination of the top range-plate A and the collar B, provided upon said range-plate, with the shelf C, having the hook C^3, for engaging the range-plate, substantially as and for the purpose specified.

5. The combination of the top range-plate A, the collar B, provided upon said range-plate, the recess or depression B', provided in said collar, and an opening in the collar beneath said recess with the shelf C, and the hook C^3, provided upon the shelf for passing through the opening beneath the recess or depression B' and engaging the said range-plate, substantially as and for the purpose specified.

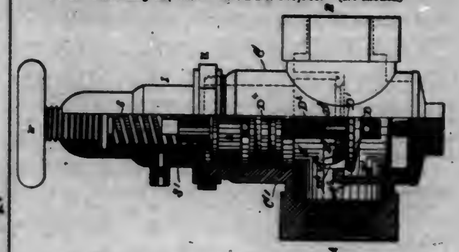
6. The combination of the top range-plate A with the shelf C, having the hook C^3, securing one side of the shelf to the said range-plate, and the shoulders *d'*, provided on the opposite side of said shelf and secured to the said range-plate by bolts E, substantially as and for the purpose specified.

404,503. FLUID-PRESSURE REGULATOR.

WILLIAM ROSS, Troy, N. Y. Filed Dec. 31, 1887. Serial No. 258,523. (No model.)

Claim.—1. A main-valve case having inlet and outlet chambers opening exteriorly and connected interiorly by a passage-way, in combination with the main valve controlling said passage-way, a connected valve-actuating piston and its cylinder closed at one end, the closed end being connected by runways with the inlet-and outlet chambers, and a runway-regulating valve, operated substantially as described, and linked to the main valve, for the purpose of regulating one of said runways and at the same time affording means for communicating positive movements to the main valve, substantially as described, and for the purposes set forth.

2. A main-valve case having inlet and outlet chambers opening exteriorly and connected interiorly by a passage-way, in combination with the main valve controlling said passage-way, a connected valve-actuating piston and its cylinder closed at one end, the closed end being connected by runways with the inlet and outlet chambers, a regulating-valve seat for each of said runways, and a regulating-valve located between said seats and common to both for the purpose of conversely and simultaneously controlling both of said runways, substantially as described, and for the purposes set forth.

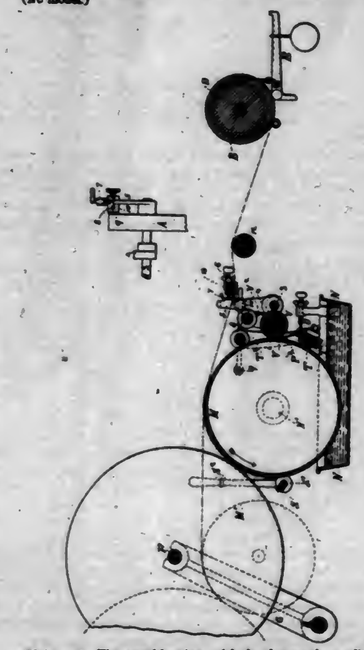


3. A main-valve case having inlet and outlet chambers opening exteriorly and connected interiorly by a passage-way, in combination with the main valve controlling said passage-way, a connected valve-actuating piston and its cylinder opened at one end, the closed end being connected by runways with the inlet and outlet chambers, a regulating-valve seat located upon the main valve, and a regulating-valve connected with and actuated by a movable part of the outlet-chamber case, the movable part being arranged to yield in a direction to seat both valves to an excess of pressure above a predetermined amount in the outlet-chamber, substantially as described, and for the purposes set forth.

4. A main-valve case having inlet and outlet chambers opening exteriorly and connected interiorly by a passage-way, in combination with the main valve controlling said passage-way, a connected valve-actuating piston and its cylinder closed at one end, the closed end being connected by runways with the inlet and outlet chambers, a runway-regulating valve located within the main valve and provided with a stem projecting from a loosely-fitting aperture in the face of the main valve through the chamber-connecting passage-way to a support in the outlet-chamber, whereby the supporting-stem of the regulating-valve serves to guide the main valve to its seat, substantially as described.

5. A main-valve case having inlet and outlet chambers opening exteriorly and connected interiorly by a passage-way, in combination with the main valve controlling said passage-way, a connected valve-actuating piston and its cylinder closed at one end, the closed end being connected by runways with the inlet and outlet chambers, a spring-inclosing chamber separated from the outlet-chamber by a movable spring-controlled bridge or section, a runway-regulating valve connected with the bridge, bridge-controlling spring, and spring-regulating screw fitting a threaded receiving-aperture opening out of the spring-chamber and provided with interiorly and outwardly projecting stems, the outward-projecting stem having a detachable stop for the purpose of changing a pressure-regulator from the control of a spring to the positive control of a screw, substantially as described.

404,504. FLUID-PRESSURE REGULATOR.



WILLIAM ROSS, Troy, N. Y. Filed May 28, 1888. Ser. .. No. 275,315. (No model.)

Claim.—In a fluid-pressure regulator, a valve-case having inlet and outlet chambers opening exteriorly and connected interiorly by a passage-way, in combination with a combined valve-seat and stop located at the junction of the passage-way and the outlet-chamber, a valve placed in the outlet-chamber and movable therein to and from said seat, a piston-cylinder, a piston-controlling spring, and two valve-actuating pistons connected by a common stem with the valve, one of the pistons fitting the cylinder more tightly than the other, and the cylinder-space between the pistons being connected with the outlet-chamber by a runway, substantially as described.

404,505. DAMPENING APPARATUS FOR ROLLS OF PAPER.

WALTER SCOTT, Plainfield, N. J. Filed Oct. 15, 1888. Serial No. 288,071. (No model.)

Claim.—1. The combination, with the dampening-cylinder M and water-trough N, of the cross-bar or scraper T, holder T', and pivoted arms for supporting the holder, and means for regulating the proximity of the cross-bar T to the surface of the dampening-cylinder, substantially as set forth.

2. The combination, with the dampening-cylinder M and trough, the scraper T and holder T', of the elastic roller V and the hanging arms for the same, the cross-shaft 3, and cams and lever for applying more or less pressure of the elastic roller upon the dampening-cylinder, substantially as set forth.

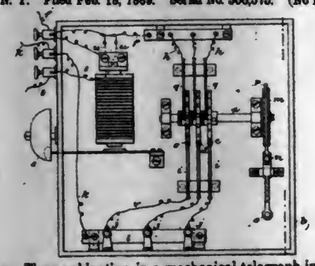
3. The combination, with the dampening-cylinder M and trough, of the cross-bar or scraper T and holder, the elastic roller V and its supporting-links, and the shaft 3, cams and lever-handle, and deflecting-plate F^2, substantially as specified.

4. The lever-handle 5, swinging block 7, pivoted to the same, and the set-screw 6, in combination with the dampening-cylinder M, the cams 4, cross-shaft 3, elastic roller V, and the links V^2 by which the same is suspended, for applying pressure to the elastic roller V or relieving the same by moving the swinging block, substantially as set forth.

5. The combination, with the frame and the roll for the web of paper, and the roll upon which the dampened paper is wound, of the water-trough N, dampening-cylinder M, over which the paper passes, the grooved spreader 13, with which the web of paper passes in contact to the dampening-cylinder, and the driving-pulley for rotating the winding-cylinder, and the brake for stopping the same and arresting the movement of the paper, substantially as set forth.

6. The combination, with the rollers for the web of paper, of the dampening-cylinder and a water-trough for supplying the water, and an elastic roller and mechanism, substantially as specified, for pressing the same against the dampening-cylinder to remove the surplus water, substantially as specified.

7. The combination, with the rolls for the web of paper, of a water-trough and a dampening-cylinder receiving the water from the said trough, and an elastic roll for removing the surplus moisture, the said dampening-cylinder also acting to give motion to the roll of paper as the web is wound up, substantially as set forth.

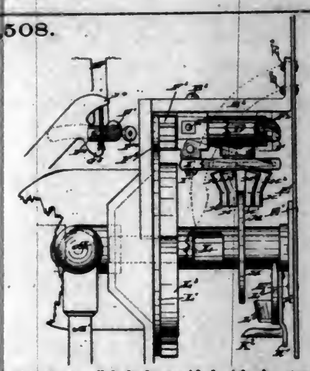


404,506. APLANATIC LENS. HENDRIK L. H. SCHRÖDER, 17 Alsharp Road, Upper Tooting, County of Surrey, assignor to John Stuart, Clapham, County of Surrey, England. Filed Mar. 13, 1888. Serial No. 303,120. (No model.) Patented in England Apr. 7, 1883, No. 5,194.

Claim.—1. An aplanatic lens composed of a plano-convex lens and a plano-concave lens joined together, the convex surface of the lens having a longer radius than that of the concave surface, substantially as described.

2. An aplanatic lens or objective giving a positive image, said lens or objective being composed of a plano-convex lens made of high refractive power and low dispersive power, and a plano-concave lens made of glass of lower refractive power and as high or higher dispersive power, the convex surface of said lens or objective having a longer radius than the concave surface, substantially as described.

404,507. TELEGRAPH APPARATUS. EBENEZER B. SHAFER, New York, N. Y. Filed Feb. 18, 1889. Serial No. 300,375. (No model.)



Claim.—The combination, in a mechanical telegraph-instrument, of the series of two or more contact-wheels keyed on but insulated from the carrying and operating shaft, the finger-pawl and ratchet-wheel for operating all the disks alike, the brushes and branch wire, and current-closing push-stud to each disk and separately connecting them in the circuit, substantially as described.

404,508. GRAIN-BINDER. OLE C. STORLE, Milwaukee, Wis., assignor of one-half to John H. Gordon, Rochester, N. Y. Filed Jan. 14, 1884. Serial No. 117,441. (No model.)

Claim.—1. The rotary knotter mounted in a stationary bearing and provided with the stop-pinion, in combination with the stop-motion gear engaging said pinion, the gear-shaft parallel with the axis of the knotter, and the stripper-arm secured to the gear-shaft and adapted, as shown, to extend beyond and sweep over the end of the knotter, and the knife secured to said stripper.

2. The rotary knotter provided with a stop-motion pinion, in combination with the parallel shaft provided with the stop-motion gear engaging the pinion, and with the stripper-arm adapted to extend across and sweep over the outer or under face of the knotter.

404,508.

3. The knotter provided with the stop-pinion, and adapted to form the knot by a revolution on its axis, and the cord-holder, all combined with the segment L^3, the arm K', knife K^3, and rack L^5, all revolving on a common axis, substantially as described.

4. The combination, with the knotter-driving shaft A, of the knotter F and the revolving knife K^3, arranged on axes substantially parallel with each other and provided with the cord-holder disk H, located between the axes and operated by means of pinion H^3, having stop-teeth H', tooth L^4, and notched flange M, revolving on the same axis with the knife, substantially as described.

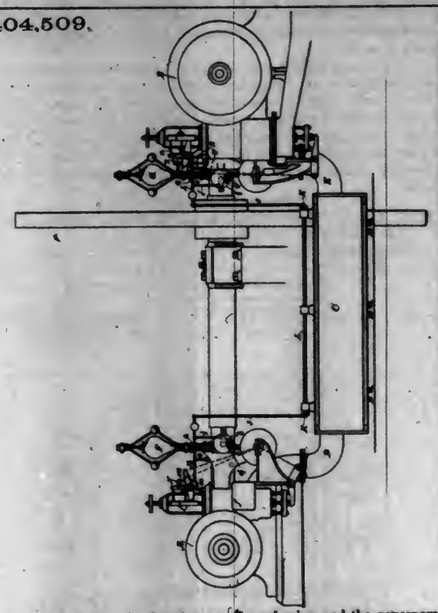
5. The combination, with the knotter F and the revolving knife K^3, arranged on axes substantially parallel with each other, of the cord-holder disk H, placed between the knotter and the axis of the revolving knife and operated by means of the pinion H^3, and tooth L^4, revolving on the same axis with the knife, substantially as described.

6. The knotter, the breast-plate having the slot with the lateral extension E^4 to permit the discharge of the knot from the knotter, combined with the tucker having the supplemental finger J^3, substantially as described.

7. The knotter and its delay-pinion, in combination with a driving-gear L', with the gear-segment and delay-surface to impart complete intermitting rotations to the knotter, the driving-gear shaft L, parallel with the axis of the tyer, the cord-holding disk with the series of peripheral notches therein, the disk-operating pinion H, and the pinion-extension H', having the series of cross-slots therein, the rack-arm L^5, carried by shaft L and adapted to give partial rotation to the pinion and disk, and the notched disk M, also carried by the shaft L, whereby the differential rotations are imparted to the knotter and the disk.

8. The knotter-frame having the sleeve B', the stud-bolt C, at a right angle thereto, the shaft A, having the gear A^3, the sleeve carrying the mechanism for giving motion to the parts, and the gear L^3, all combined substantially as described.

9. The knotter-frame and the breast-plate, combined with the connecting stud-bolt C, said bolt adapted to form an axis for the mechanism for moving the various parts, substantially as described.



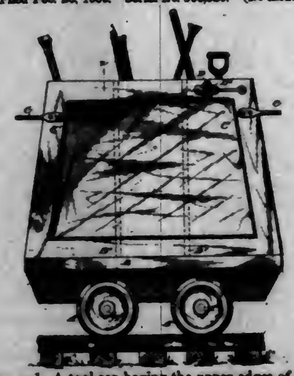
10. In combination with the rotary knotter and its stop-pinion and the adjacent cord-holder, a shaft parallel with the axis of the knotter, the knotter-driving pinion on said shaft, and the arm K, attached to said shaft, its outer end extended in the plane of rotation to sweep over the end of the knotter and strip the knot therefrom, and the knife secured to said arm at a distance from its end at substantially right angles to the plane of rotation, whereby it is adapted to pass between the knotter and holder.

404,509. VALVE-GEAR FOR COMPOUND ENGINES. JOHN C. H. STUT, San Francisco, Cal. Filed Dec. 26, 1888. Serial No. 294,065. (No model.)

Claim.—1. The initial and expansion cylinders, with their respective cut-off mechanisms and the governors by which said mechanisms are actuated, in combination with a connecting mechanism whereby said governors operate simultaneously and an oscillating link, together with a block adjustable in said link and connected with the cut-off mechanism of the expansion-engine, substantially as and for the purpose herein described.

2. The oscillating link connected with a lever which is moved by the action of the governors of the initial and of the expansion engines, a block fitted to said link and adjustable to either side of its center of oscillation, with a radius-rod connecting said block with the arm of the rocker-shaft, through which the cut-off mechanism of the engine is controlled, substantially as described.

404,509.



3. The engines having the cut-off mechanism and the governors by which said mechanisms are controlled, in combination with the mercury-air dash-pots by which the momentum of the governor is checked, substantially as described.

4. The dash-pot for checking the momentum of the governor, consisting of a circular hollow case mounted upon a horizontal shaft, a crank-arm connecting said shaft with a governor, a vertical partition separating the interior of said case, and a body of mercury partially filling said space and acting upon the confined bodies of air, substantially as described.

5. The mercury-air dash-pot for checking the momentum of the governors, consisting of a hollow case divided into two compartments by a vertical partition, the said compartments being partially filled with mercury, a connecting-pipe uniting the lower part of the compartments and having an adjusting cock or valve, said case being journaled upon a horizontal shaft and having an adjustable crank-arm, by which it is connected with the moving parts of the governor, so as to be oscillated from side to side, substantially as described.

6. The cut-off mechanisms of the initial and expansion cylinders of a compound engine, in combination with an intermediate mechanism whereby the cut-off of the expansion-cylinder is caused to take place either simultaneously with, later, or earlier than that of the initial cylinder, substantially as described.

404,510. TOOL-CAR FOR MINES. JOSEPH TREWEEK, Lead City, Dak. Filed Feb. 20, 1889. Serial No. 300,589. (No model.)

Claim.—1. A tool-car having the upper edges of its body disposed within the area of its bottom, substantially as specified.

2. A tool-car for mines, having inwardly-inclined side and end walls, substantially as specified.

3. A tool-car for mines, consisting of inwardly-projecting side and end walls, the body thereof being divided into compartments for the reception of tools, substantially as specified.

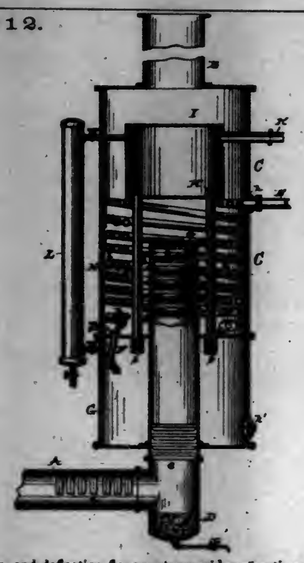
4. A tool-car for mines and similar places, consisting of inwardly-projecting side and end walls, the body thereof being divided into compartments, the opposite walls of which are inclined for the reception of tools, substantially as specified.

5. The combination, with a car for use in mines and similar places, consisting of the side and end walls projecting inwardly toward their top, divided into compartments for the reception of tools, of fastening-brackets at the sides thereof to hold the car on an elevator, substantially as specified.

6. The combination, in a car for carrying tools, consisting of the side and end walls projecting inwardly toward their top, of fastening-brackets at the sides thereof, and hand-holds at the ends for propelling the car backward and forward, substantially as specified.

404,511. ADJUSTABLE ATTACHMENT AND EXTENSION FOR FIRE-LADDERS. JAMES W. TULLY, San Francisco, Cal. Filed Oct. 3, 1888. Serial No. 287,545. (No model.)

Claim.—1. In combination with the main ladder, an auxiliary or supplementary ladder and bearing-hooks with protecting-springs attached to the auxiliary or supplementary ladder, whereby said ladder may be readily connected with the rounds of the main ladder and turned to any inclination, substantially as herein described.



2. In combination with the main ladder, a detachable auxiliary or supplementary ladder having bearing-hooks at one end, by which it is hinged to any of the rounds of the main ladder, the springs protecting the openings to the hooks, the ropes attached to the auxiliary or supplementary ladder and passing through sheaves on the main ladder, and a winding-drum or windlass at the foot of the main ladder, to which the ropes are attached, whereby the auxiliary or supplementary ladder may be extended from the main ladder and turned to any suitable inclination, substantially as herein described.

404,512. FEED-WATER HEATER. JONATHAN H. VAIL, New York, N. Y. Filed June 9, 1888. Serial No. 276,617. (No model.)

Claim.—1. The combination, with an exhaust-pipe, of a chamber surrounding a portion of the same wherein the feed-water is heated, a settling-chamber below said heating-chamber also surrounding the exhaust-pipe and receiving the heated water, and a chamber above said settling-chamber and connected therewith by tubes through which the clear hot water rises, substantially as set forth.

2. An exhaust-pipe having a number of small perforations in its

404,512.

upper portion, and deflecting flanges above said perforations, in combination with a chamber surrounding said perforated portion, and an exit from such chamber, substantially as set forth.

3. The combination of an exhaust-pipe having a number of small perforations, a chamber surrounding the perforated portion of said pipe, and a coil of pipe in said chamber through which feed-water passes, substantially as set forth.

4. The combination of an exhaust-pipe, a chamber surrounding a portion of the same, a feed-water coil in said chamber, a settling-chamber connected with said coil and also surrounding a portion of the exhaust-pipe, and a clear-water chamber receiving the water from said settling-chamber, substantially as set forth.

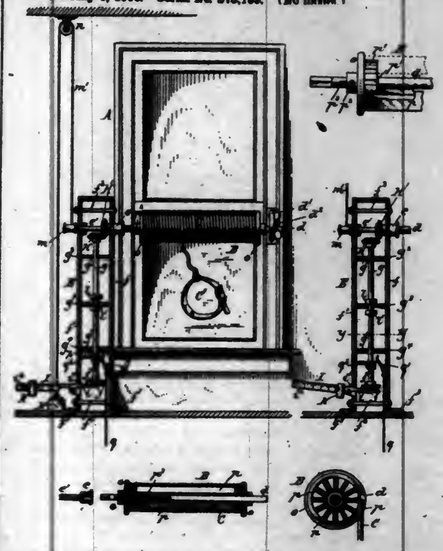
5. The combination of an exhaust-pipe, a heating-chamber surrounding a portion of the same, an outlet from said pipe into said chamber, an exit-pipe leading from the top of said chamber, a settling-chamber surrounding the exhaust-pipe below said feeding-chamber with which said feed-water coil communicates, a clear-water chamber within the heating-chamber and communicating with the boiler, and tubes extending from said settling-chamber to said clear-water chamber, substantially as set forth.

6. The combination of the settling-chamber, the clear-water chamber above the same, the scum-chamber, passages to said scum-chamber from near the top of said settling-chamber and of said clear-water chamber, and valves in said passages, substantially as set forth.

7. The combination, with a vertical exhaust-steam pipe, of annular downwardly-inclined flanges within the same, and a receptacle below said flanges for the water and oil which collect on said flanges, substantially as set forth.

8. The combination of an exhaust-pipe having a number of small perforations, a heating-chamber surrounding the perforated portion of said pipe, a coil of pipe in said chamber through which feed-water passes, a settling-chamber connected with said coil and also surrounding a portion of the exhaust-pipe, a clear-water chamber connected with said settling-chamber, and an exit from said heating-chamber, substantially as set forth.

9. The combination of the exhaust-pipe, the settling-chamber, the clear-water chamber receiving the purified water, and an annular passage around said clear-water chamber connected with said exhaust-pipe, whereby the exhaust-steam surrounds said clear-water chamber, substantially as set forth.



404,513. TEMPORARY BINDER. WILBUR F. WAKEMAN, Kansas City, Mo. Filed Dec. 20, 1888. Serial No. 294,294. (No model.)

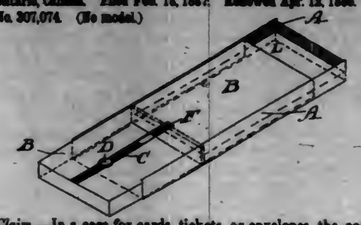
Claim.—1. The herein-described binder one of the covers of which is provided with a longitudinal joint and a transverse joint, substantially as set forth.

2. The combination, with a series of coupon-slips, of a binder for securing the slips together and for protecting them, one of the covers of said binder having a joint extending longitudinally thereof and a joint extending transversely thereof, whereby the right-hand portion of the coupon-slip may be exposed throughout its length without disclosing the left-hand portion, and whereby the top of the slip may be disclosed without disclosing the lower portion, substantially as set forth.

404,514. FIRE-ESCAPE. GEORGE W. WORDEN, Lewiston, N. Y. Filed May 8, 1888. Serial No. 273,189. (No model.)

Claim.—1. In a fire-escape, the combination, with a horizontal drum, of a friction-disk, connecting mechanism whereby the rotary motion of the drum is transmitted to the friction-disk, and a weighted lever bearing directly against said friction-disk for retarding the motion of the same, substantially as set forth.

2. The combination, with a horizontal drum, of a vertical shaft geared with said drum and provided with a friction-disk, and a weighted lever bearing against said friction-disk, substantially as set forth.



3. The combination, with a horizontal drum, of a gear-wheel mounted on said drum, a vertically-movable shaft provided with a gear-wheel meshing with the gear-wheel of the drum and having a friction-disk, and a lever bearing against said friction-disk, and provided with a movable counterpoise, whereby the pressure of the lever against said friction-disk may be regulated, substantially as set forth.

4. The combination, with the window-frame, the casing K, and the horizontal shaft c', mounted in said casing and provided with a bevel-wheel H' and at one end with a square or flat-sided socket c, of the removable drum B, having a shaft provided with a flat-sided end adapted to enter the socket c and formed at its opposite end to fit a hook-shaped bearing d', secured to the window-frame, a vertical shaft g, having a bevel-wheel H, meshing with the wheel H', a friction-disk j', secured to said shaft, and a weighted lever I, provided with a friction-disk j, bearing against the disk j', substantially as set forth.

5. The combination, with the rope C, the horizontal main drum B, and its shaft provided with the gear-wheel H', of the vertically-movable shaft g, provided with a gear-wheel H, meshing with the gear-wheel H' and with a friction-disk j', a lever I, provided at its inner end with a friction-disk j, bearing against the disk j', a counterpoise k, arranged upon the lever I, an auxiliary drum m, mounted on the shaft of the main drum, and a rope m', wound upon the auxiliary drum in an opposite direction to the rope C, attached to the main drum and provided with a weight N, whereby the rope C is automatically rewound upon the drum after being unwound, substantially as set forth.

6. In a fire-escape, the drum B, composed of hub-disks o, having radial grooves p', and removable radial slats or bars p, arranged in said grooves, substantially as set forth.

404,515. CARD OR TICKET CASE. ALEXANDER ALLEN, Toronto, Ontario, Canada. Filed Feb. 18, 1887. Renewed Apr. 12, 1888. Serial No. 307,074. (No model.)

Claim.—In a case for cards, tickets, or envelopes, the combination of knob D, sliding plate C, and the plate K, having the spring-strips cut and arranged substantially as described.

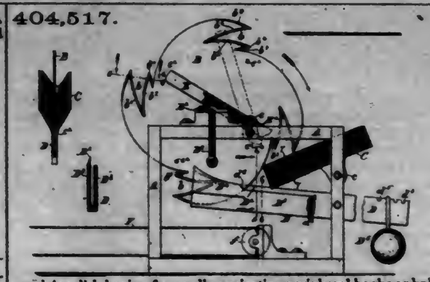
404,516. LOCK. ALVIN S. BOICE, New Richland, Minn. Filed Aug. 15, 1888. Serial No. 282,760. (Model.)

Claim.—1. In combination with the lock-bolt, a pivoted catch adapted to connect with said bolt when retracted, a loose trigger constructed to project through the face-plate of the lock and to be pressed inward, a sliding bar in position to engage with said trigger, and a suitable device connecting said bar with said catch, by which the said bolt may be released, substantially as set forth and described.

2. The combination, with the main bolt, of a lever connected therewith and provided with a spring which is adapted to thrust forward said bolt, a pivoted catch adapted to detain said bolt when retracted, a sliding bar, a loose trigger constructed to project through the face-plate of the lock, to be pressed inward, and to engage said sliding bar, and a pivoted angular lever which is loosely connected with said catch and the sliding bar, substantially as set forth and described.

3. The combination, with the main bolt provided with a shoulder c^3, of a pivoted catch H, provided with a stud c^2 in position to connect with said bolt, a spring-lever adapted to drive said bolt, and a rotative plug G, provided with an arm and adapted to engage said pivoted catch and said spring-lever successively, substantially as set forth and described.

4. In a lock, in combination with the knob-spindle, a circular plug fitting on said spindle and provided with a nipple m and an aperture p, a plate M, provided with an annular flange fitting around the said plug and provided with an aperture, with which the aperture p may be brought in line, a pin supported in position to enter said apertures and provided with means for projecting and withdrawing it, a series of notched tumblers adapted for engagement with said plug and said pin, a lock-bolt, a pivoted catch constructed to lock said bolt after it is driven forward, and a lever K, constructed to engage with plate M and with said pivoted catch, substantially as set forth and described.



5. In combination with the lock-case having an aperture in its face-plate, a push-button, a pivoted spring-lever connected with said button, a movable bar which is loosely connected with said lever and is provided with a curved arm w, a combination-pin which is movably connected with said curved arm, a knob-spindle provided with a perforated plug, and plate M, adapted for connection with said plug by means of said pin, substantially as and for the purposes described.

6. In combination with the knob-spindle, the rotative plug L, fitting thereon and provided with a nipple m, the notched ring T, with projection x^4, and a series of tumblers adapted to be engaged by said ring, substantially as set forth and described.

404,517. FRUIT-STONING MACHINE. JOHN S. BIXBY and WELLS R. LEACH, San Buenaventura, Cal. Filed Dec. 4, 1888. Serial No. 292,567. (No model.)

Claim.—1. A machine for the purpose described, comprising a

404,517.

revolving disk having forwardly-projecting peripheral hooks or knives and a knife or cutter yieldingly supported and moving in a plane parallel with the disk and in contact with the periphery of the latter, substantially as described.

2. A machine for the purpose stated, comprising a revolving cutting-disk having forwardly-projecting peripheral hooks or knives, a knife yieldingly supported and moving in a plane parallel with the disk and in contact with the periphery of the latter, and a movable inclined trough or guide for feeding the fruit to the disk and knife, substantially as described.

3. A machine for the purpose stated, comprising a revolving disk having forwardly-projecting peripheral hooks or knives, a knife yieldingly supported and moving in a plane parallel with the disk and in contact with the periphery of the latter, and divergent spreaders located at opposite sides of the disk adjacent to the end of the knife, substantially as described.

4. A machine for the purpose stated, comprising a revolving disk having forwardly-projecting peripheral hooks or knives, a knife yieldingly supported adjacent to the periphery of the disk, and yieldingly-supported parallel pit-guides arranged at opposite sides of the disk and adjacent to the said knife, substantially as described.

5. A machine for the purpose stated, comprising a revolving disk provided with forwardly-projecting peripheral hooks or knives, a knife yieldingly supported and moving in a plane parallel with the disk and in contact with the periphery of the latter, yieldingly-supported parallel pit-guides located adjacent to and at opposite sides of the periphery of the disk, and divergent spreaders located adjacent to and outside of the pit-guides, substantially as described.

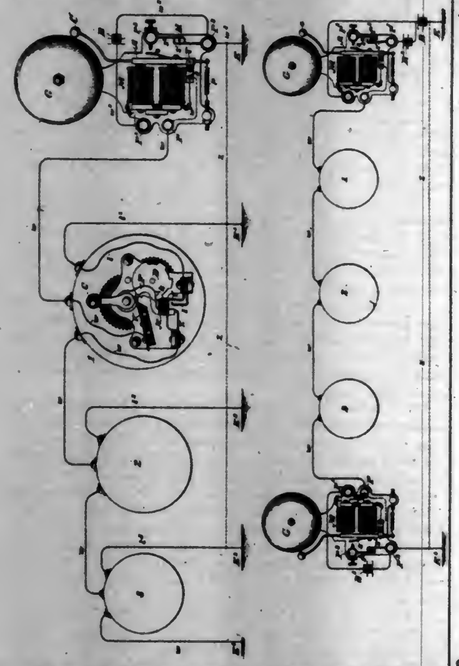
6. A machine for the purpose stated, comprising a revolving disk having forwardly-projecting peripheral hooks or knives, a knife yieldingly supported adjacent to the periphery of the disk, and a movable feed-trough having its end nearest the knife sustained in position for operation by and movable with the latter, substantially as described.

7. A machine for the purpose stated, comprising a revolving disk having forwardly-projecting peripheral hooks or knives, a knife yieldingly supported adjacent to the periphery of the disk, and a weighted lever carrying said knife, substantially as described.

8. A machine for the purpose stated, comprising a revolving disk having forwardly-projecting peripheral hooks or knives, a knife yieldingly supported adjacent to the periphery of the disk, yieldingly-supported pit-guides located at opposite sides of the periphery of the disk, and a weighted lever sustaining said knife and pit-guides, substantially as described.

9. A machine for the purpose stated, comprising a revolving disk having forwardly-projecting peripheral hooks or knives, a knife yieldingly supported adjacent to the periphery of the disk, yieldingly-supported pit-guides arranged at opposite sides of the periphery of the disk, yieldingly-supported divergent spreaders arranged at opposite sides of the said pit-guides, and a weighted lever supporting said knife, pit-guides, and spreaders, substantially as described.

10. A machine for the purpose stated, comprising a revolving disk having forwardly-projecting peripheral hooks or knives and sharpened points b^4, a knife yieldingly supported adjacent to the periphery of the disk, and a guide-trough, substantially as described.



11. A machine for the purpose stated, comprising a revolving disk provided with forwardly-projecting peripheral hooks or knives, a knife yieldingly supported adjacent to the periphery of the disk, and a V-shaped inclined feed-trough having its sides arranged at an acute angle with each other, substantially as described.

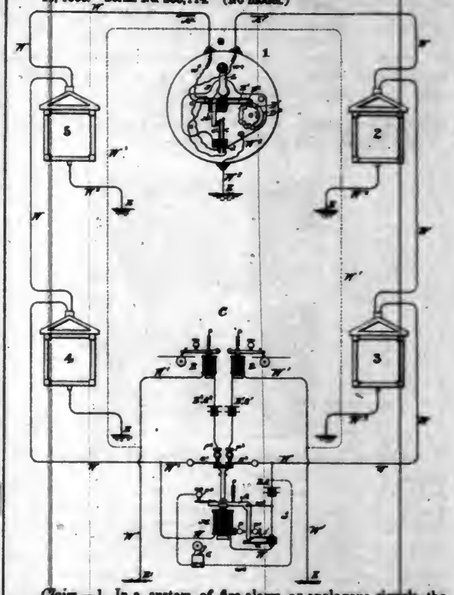
12. A machine for the purpose stated, comprising a revolving disk having forwardly-projecting peripheral hooks or knives, a knife yieldingly supported adjacent to the periphery of the disk, a feed-trough, and a movable knocker for dislodging pits or stones from the said disk, substantially as described.

13. A machine for the purpose stated, comprising a revolving disk having forwardly-projecting peripheral hooks or knives, a knife yieldingly supported adjacent to the periphery of the disk, and spread-

ers for separating the halves of the fruit, one of said spreaders being continuous with the yielding knife and the other having a blunt edge adjacent to the knife adapted to enter the cut made by the knife, substantially as described.

404,518. FIRE-ALARM TELEGRAPH. SIDNEY A. CRANE, Evart, Mich., assignor of one-half to William R. Mapes, same place. Filed May 24, 1888. Serial No. 274,892. (No model.)

Claim.—1. In a fire-alarm system, a trembler-bell having an electro-magnet included in the main-line circuit, the armature of which carries a contact-spring adapted to contact with a circuit-closer on its back contact, in combination with two circuit-closing springs connecting such back contact with the battery through a local circuit, said circuit-closing springs being provided with a plug for separating them electrically, substantially as described.



2. In a fire-alarm or signal system, a normally-closed conductor earthed at each end, one or more outlying signal or alarm stations having signaling mechanism, a vibratory electro-magnetic bell and battery located at the fire-alarm station, both connected directly in the main circuit with double circuit-connections, and a secondary circuit having a normally-closed contact between the back contact of the armature and the main circuit provided with an insulating-pin for electrically disconnecting the normally-closed contacts, whereby when a signal is transmitted the current generated from the main battery flows over the secondary circuit and vibratory impulse-signals are received, and when the main line is broken the normally-closed contacts may be opened electrically, substantially as described.

3. In a fire-alarm or analogous system, a vibratory electro-magnetic bell having an electro-magnet, the coils of which are connected in a closed main-line circuit, the armature having a contact-spring adapted to contact with a circuit-closer on its back contact, in combination with two contact-springs located between the back contact of the armature of the electro-magnet and the main circuit connecting the back contact electrically with the main battery through a secondary circuit, said contact-springs being provided with an insulating-pin for separating them, substantially as described.

4. In a fire-alarm system, a trembler-bell having an electro-magnet with double circuit-connections, the coils of the electro-magnet being included in the main-line circuit, the armature of the electro-magnet carrying a contact-spring adapted to contact with a circuit-closer on its back contact in electrical connection with two normally-closed contact-springs connecting the back contact with the battery, including the coils of the electro-magnet through a secondary circuit, said contact-springs being provided with an insulating-pin for separating them electrically, substantially as described.

5. In a fire-alarm system, the combination of two electro-magnetic vibrating gongs connected in a normally-closed main circuit, said gongs having double circuit-connections and a secondary circuit including electro-magnet, armature, and poles of a divided main-line battery, the secondary circuits having normally-closed contacts between the back contact of the armature and main circuit provided with an insulating-pin for electrically disconnecting the normally-closed contacts electrically, substantially as described.

404,519. DUPLEX FIRE-TELEGRAPH. SIDNEY A. CRANE, Evart, Mich., assignor of one-half to William R. Mapes, same place. Filed Sept. 11, 1888. Serial No. 285,114. (No model.)

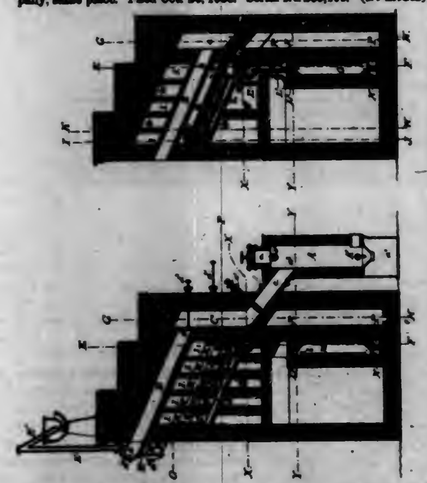
Claim.—1. In a system of fire-alarm or analogous signals, the combination of a two-way transmitter composed of two signal-disks having a character-signal on each disk and contact-springs, with a normally-closed circuit shunting the transmitter and including in its circuit a circuit-closer and an electro-magnet located at a signal-receiving station, the circuit-closer being held closed by the armature of the magnet, and one or more normally-open signal-receiving circuits, including one or more signal-receiving instruments, the contact making and breaking devices representing the characteristic signals being located on the same side of the disks, so that both signals are transmitted simultaneously, or so that the signal is sent in by whichever of the two lines remains intact, substantially as described.

2. A signal-transmitter for use in a duplex system of fire or analogous signals, consisting of three disks, two of which have a definite signal on the same side of their periphery, the third having constant metallic contact with an earth-circuit, while the others are connected by individual contact-springs and normally-open main-line circuits running by diverse routes to a receiving-station, said main lines including receiving-instruments, substantially as described.

3. A signal-transmitter for use in duplex fire or analogous systems of signals, consisting of a mechanically-impelled motor geared to a signal-wheel composed of two signal-disks having two characteristic signals—one on each disk—and located between the same radial portions of said disks, in combination with two main-line circuits running by diverse routes to a signal-receiving station, and a shunt around said transmitter, including a circuit-breaker normally held closed by an arm connected to the motor-shaft, substantially as described.

4. In a duplex fire, police, or analogous system of signals, the combination of the following elements: two receiving-instruments located in normally-open earth-circuits at a signal-receiving station, and independent all-metallic circuit including one or more outlying signal-boxes and an electro-magnet and circuit-closer held closed by the armature of said magnet, a two-way signal-transmitter in each box connected to a normally-open earth-circuit, and a shunt around said signal-transmitter held normally closed by a motor which propels the signal-transmitter, the latter having its duplicate signals in the same radial position, so that as it rotates duplicate signals are sent by diverse routes, substantially as described.

5. A signal-transmitter for use in a duplex fire or analogous signaling system, composed of two circuit-breakers each adapted to give the same signal at the same time, in combination with two independent circuits running in diverse directions to a receiving-station and two independent receiving-instruments, one located in each of said circuits at the receiving-station, the transmitter having a constant connection to earth and the receivers being located in normally-open earth-circuits, substantially as described.



6. A signal-transmitter for use in a duplex system of fire, police, or analogous signals, consisting of two disks which have each a definite signal located on the same side of its periphery, having constant electric connection with an earth-circuit, and having open-circuit independent contact-springs, and circuit-connections branching to closed main-line circuits running by diverse routes to a receiving-station, said main line containing receiving-instruments, substantially as described.

7. In a non-interfering fire, police, or analogous signaling system, a duplex signal-transmitter composed of two duplicate signaling-disks each having the same characteristic signal located on the same radial portion of its circumference, in combination with normally-open circuit signaling contact-springs and circuit-connections, an earth-circuit disk having a continually-closed ground-circuit connection, an automatic circuit-changer at the receiving-station, having earth-circuits and normally-open circuit-connections, whereby duplicate signals may be sent simultaneously to the receiving-station in opposite directions at every revolution of the signaling-circuit disks, substantially as described.

8. A signal-transmitter for use in a duplex fire, police, or analogous system of signals, consisting of a mechanically-impelled motor geared to a signal-wheel composed of two signaling-disks having duplicate signals on the same radial portions of their circumferences and continuous electric connection with an earth-circuit, in combination with independent normally-open circuit signaling contact-springs and circuit-connections connected to opposite sides of a normally-closed shunt-circuit closer, connected in a metallic circuit shunting the transmitter, said circuit running to a central station, including an electro-magnetic circuit-changer and armature, and contacts and connections which connect independent earth-circuits, including receiving-instruments, whereby duplicate signals are transmitted simultaneously, substantially as described.

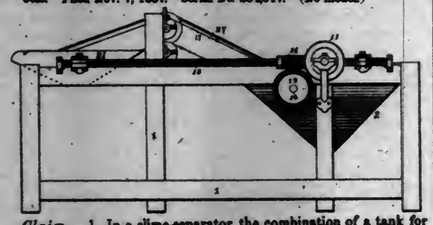
9. In a duplex fire, police, or analogous signaling system, the combination of the following elements: a main all-wire closed metallic circuit W, normally-open receiving earth-circuits W', transmitter ground-circuits W^2, with a series of duplex transmitters normally shunted out of the main circuit, but connected continually to earth-circuits, said transmitters composed of duplicate signaling-disks and continuity-preserving disks with definite signals located on the same radial portions of the circumferences of the transmitters, substantially as described.

404,520. APPARATUS FOR MANUFACTURING GAS. WALTON CLARK, Philadelphia, Pa., assignor to the United Gas Improvement Company, same place. Filed Oct. 26, 1883. Serial No. 289,198. (No model.)

Claim.—1. In an apparatus for manufacturing gas, the combination of a generator provided with air-blast and steam pipes, a set of retorts arranged above the generator, a chamber into which the retorts open freely at one end, a passage extending from said chamber downwardly into the generator, gas-pipes leading from the ends of the retorts opposite to those opening into the chamber aforesaid, combustion-chambers arranged externally around the retorts, said retorts being closed with respect to the combustion-chambers, a flue system leading from the generator into said combustion-chambers, an air-flue system also leading into the combustion-chambers, and valves in the inclined passage and flue leading from the generator, whereby both can be opened or closed at will, all as and for the purpose specified.

2. In an apparatus for manufacturing gas, the combination of a generator provided with air-blast and steam pipes, a set of inclined retorts arranged above the generator, a chamber into which the retorts open freely at one end, a passage extending from said chamber downwardly into the generator, gas-pipes leading from the ends of the retorts opposite to those opening into the chamber aforesaid, combustion-chambers arranged externally around the retorts, said retorts being closed with respect to the combustion-chamber, an independent flue system leading from the generator into said combustion-chambers, an air-flue system also leading into the combustion-chambers, and valves in the inclined passage and flue leading from the generator, whereby both can be opened or closed at will, all as and for the purpose specified.

3. In an apparatus for manufacturing gas, the combination of a generator provided with air-blast and steam-pipes, a set of retorts arranged above the generator, a chamber into which the retorts open freely at one end, a passage extending from said chamber downwardly into the generator, gas-pipes leading from the ends of the retorts opposite to those opening into the chamber aforesaid, combustion-chambers arranged externally around the retorts, said retorts being closed with respect to the combustion-chambers, an independent flue system leading from the generator into said combustion-chambers, an air-flue system also leading into the combustion-chambers, a flue system leading from the combustion-chambers to the stack arranged to heat the air-flue system, and valves in the inclined passage and flue leading from the generator, whereby both can be opened or closed at will, all as and for the purpose specified.

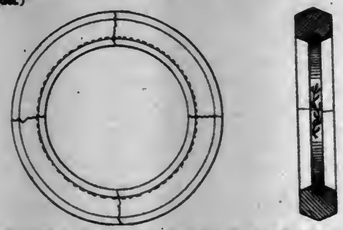


4. In an apparatus for manufacturing gas, the combination of two independent generators provided with air-blast and steam pipes, two sets of retorts arranged above the generators, two chambers, one for each set of retorts, into which said retorts open freely at one end, a passage leading downward from each chamber to the top of one of the generators, so as to connect each independent chamber with one of the generators, gas-pipes leading from each retort at the end opposite to that opening into the chambers aforesaid, combustion-chambers arranged externally around each set of retorts, said retorts being closed with respect to the combustion-chambers, an independent flue system consisting of separate and independent flues leading from each generator to a common flue-connection with both sets of combustion-chambers, air-flues also leading into the combustion-chambers, valves arranged to close the passage leading from the generators to the chambers into which the retorts open, and valves arranged to close each of the passages leading from the generators to the common flue aforesaid.

5. In an apparatus for manufacturing gas, the combination of two independent generators provided with air-blast and steam pipes, two sets of inclined retorts arranged above the generators, two chambers, one for each set of retorts, into which said retorts open freely at their lower ends, a passage leading downward from each chamber to the top of one of the generators, so as to connect each independent chamber with one of the generators, gas-pipes leading from each retort at their upper ends, combustion-chambers arranged externally around each set of retorts, said retorts being closed with respect to the combustion-chambers, a flue system consisting of independent flues leading from each generator to a common flue having connection with both sets of combustion-chambers, valves arranged to close the passages leading from the generators to the chambers into which the retorts open, and valves arranged to close each of the passages leading from the generators to the common flue aforesaid.

6. In an apparatus for manufacturing gas, the combination of two independent generators provided with air-blast and steam pipes, two sets of inclined retorts arranged above the generators, two chambers, one for each set of retorts, into which said retorts open freely at their lower ends, a passage leading downward from each chamber to the top of one of the generators, so as to connect each independent chamber with one of the generators, gas-pipes leading from each retort at their upper ends, combustion-chambers arranged externally around each set of retorts, said retorts being closed with respect to the combustion-chambers, a flue system consisting of independent flues leading from each generator to a common flue having connection with both sets of combustion-chambers, air-flues also leading into the combustion-chambers, a flue system leading from the combustion-chambers arranged in close contact with the air-flue system, so as to heat the entering air, valves arranged to close the passages leading from

the generators to the chambers into which the retorts open, and valves arranged to close each of the passages leading from the generators to the common flue aforesaid.



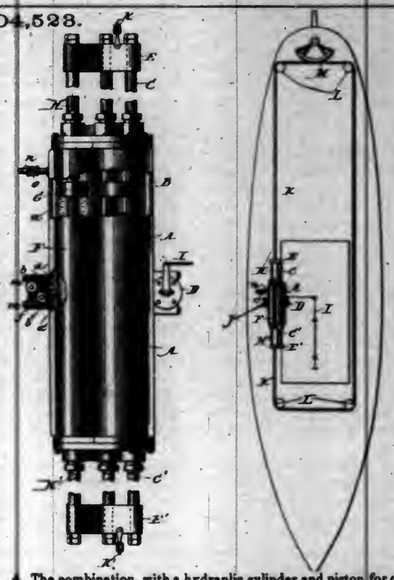
404,521. SLIME-SEPARATOR. PATRICK H. DUHAGAN, DENVER, Colo. Filed Nov. 7, 1887. Serial No. 254,517. (No model.)

Claim.—1. In a slime-separator, the combination of a tank for receiving the pulverized material and water, a second and independent tank for receiving the floats or slimes, a porous rough-surfaced belt dipping just below the water-line in the first tank to lift the slimes from the surface of the water, thence inclining upwardly and then downwardly to the slime-receptacle, rollers over which the belt passes at either end, central rollers in a higher position than the end rollers, and the means for communicating motion thereto, substantially as described.

2. In a slime-separator, the combination of a tank for receiving the pulverized material and water, a second and independent tank for receiving the slimes, a porous rough-surfaced belt dipping just below the water-line in the first tank to lift the slimes from the surface of the water, thence inclining upwardly and then downwardly to the slime-receptacle, rollers over which the belt passes at either end, central rollers in a higher position than the end rollers, and means for imparting to the end rollers both a rotary and a longitudinally-reciprocating motion, substantially as described.

404,522. METHOD OF MAKING RING-DIES. FREDERIC ECAUBERT, Brooklyn, N. Y. Filed Nov. 5, 1888. Serial No. 289,972. (No model.)

Claim.—The method herein specified of manufacturing annular dies, consisting in finishing up the ring of soft steel with the necessary contour, engraving, or ornamentation upon the interior surface thereof, hardening the said ring, and afterward breaking the ring apart into two or more sections adapted to being placed together for use or removed from the article that is rolled or otherwise formed to shape within such ring-shaped die, substantially as set forth.



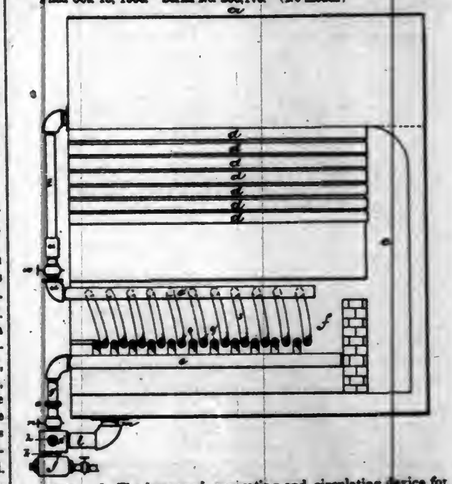
404,523. HYDRAULIC CYLINDER FOR CONTROLLING STEAM-CYLINDERS. CHARLES F. ELMER, Chicago, Ill. Filed Jan. 24, 1889. Serial No. 297,470. (No model.)

Claim.—1. The combination, with a hydraulic cylinder and piston for controlling the movements of a steam-cylinder piston, of valves located between the hydraulic cylinder ends operated in their movements solely by fluid-pressure, substantially as shown and described.

2. The combination, with the steam-cylinder and its piston, of a hydraulic cylinder having ports *a a'*, leading from its ends, a valve-chest *J'*, having the opposite ports *b b'*, communicating, respectively, with said hydraulic cylinder ports, the vertical passages *c c'*, rising, respectively, from the said valve-chest ports, the vertically-movable valves *d d'*, controlling said passages, the springs *f f'*, for closing the valves, the horizontal passages *k k'*, leading from the valve-spaces *j j'*, and the vertical passages *l l'*, leading, respectively, from said horizontal passages to the valve-chest ports *b b'*, substantially as described.

3. The combination, with a hydraulic cylinder and piston for controlling a steam-cylinder piston, of the valve-chest *J*, having the vertically-movable spring-closed valves *d d'*, provided with stems *f f'*, and the adjusting-screws *i i'*, operated from the exterior of the valve-chest and tapped therethrough to vary the height to which the valves and their stems rise, and thereby control the volume of liquid flowing through the valve-chest, substantially as described.

404,528.



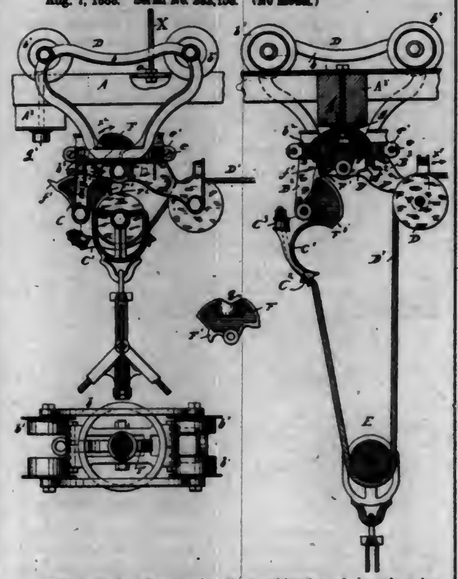
4. The combination, with a hydraulic cylinder and piston for controlling a steam-cylinder piston, of the valves *d d'*, controlling the liquid passage-way between the ends of the hydraulic cylinder, and the adjusting-screws *i i'*, movable in the valve-chest to and from the stems of said valves to vary their extent of movement and thereby control the volume of liquid flowing through the valve-chest, substantially as specified.

5. The combination, with the hydraulic cylinder F, having the passages or ports *a a'*, of the hydraulic chest J, having the ports *b b'*, passages *c c'*, valves *d d'*, and passages *k k'* and *l l'*, substantially as specified.

6. The combination, with the hydraulic cylinder F, adapted to control a steam-cylinder piston, of the pump-connecting pipe *n* and check-valve *o*, substantially as and for the purpose specified.

404,524. STEAM-GENERATOR. JOSEPH A. ESO, Newark, N. J. Filed Oct. 13, 1888. Serial No. 288,170. (No model.)

Claim.—1. The improved generating and circulating device for boilers, containing therein longitudinal pipes *c c*, supporting grate-bars *g*, and generating-pipes *p*, the latter being connected to a pipe *d'*, supply-pipes *g*, and return-pipes *t*, adapted to convey the water from the bottom of the boiler to said generating-pipes and from thence to return the same to the boiler, substantially as and for the purposes set forth.



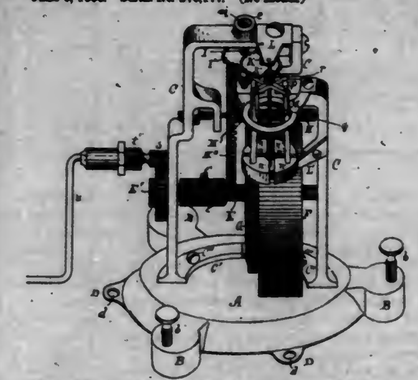
2. In combination with a boiler *a*, having a furnace *b*, longitudinal pipes *c c c'*, connecting-pipes *p'*, curved and conforming to the fire-chamber, jointed supply-pipes *g*, connecting with the bottom of the boiler, and jointed pipes *t*, connecting with the body of the boiler, all said parts being arranged and combined substantially as and for the purposes set forth.

3. In combination with the body of the boiler, pipes *c c*, generating-pipes bent to form a grate *g* and bent upward to connect with a pipe *c'*, lying at the top of fire-chamber, and said pipe *c'* and pipes *g* and *t* at the front of the boiler and connecting with the bottom and top thereof, respectively, and valved and jointed, substantially as and for the purposes set forth.

4. In combination with a boiler and suitable supply and return pipes, longitudinal pipes *c c* and *c'*, and generating-pipes *p*, extending from said pipes *c* upward and over the fire-chamber to the pipe *c'*, and being bent, as at *r*, to facilitate the movement of the water in the pipe *c'*, substantially as and for the purposes set forth.

5. In combination with a main boiler, the improved steam-generator combining therein jointed pipes *g* and *t*, connecting, respectively, with the bottom and top of the boiler, longitudinal pipes *c c* and *c'*, generating-pipes *p*, bent to form gratings *g* and connecting with said pipes *c c* and *c'*, all substantially as and for the purposes set forth.

404,525. HAY-CARRIER. JOHN FARRELL, Huntsville, N. J. Filed Aug. 7, 1888. Serial No. 282,153. (No model.)

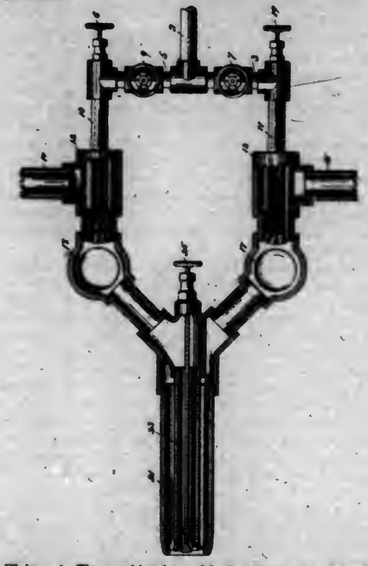


Claim.—1. In a hay-carrier, the combination of a carriage having a lower swiveled portion, a latch pivoted to said swiveled portion at the center of the same, and a locking-lever provided with an arc-shaped upper part having a stop at one end and an inclined portion at the other end, and with an arm at the lower end, substantially as set forth.

2. The combination, in a hay-carrier, with a track, of a carriage provided with a lower swiveled part, a latch pivoted centrally to said swiveled part and provided with a socket, a fixed stop on the track for engaging said socket, a fulcrumed locking-lever pivoted to the lower movable part of the carriage and provided with an arc-shaped upper part having a stop at one end and an inclined portion at the other end, and a guide-pulley for the fork-supporting rope, substantially as set forth.

3. The combination, in a hay-carrier, of a traveling carriage having a lower swiveled part provided with a fixed transverse stop, a latch pivoted centrally to said swiveled part and provided with a socket and with a stop at one end, a locking-lever provided with an arc-shaped upper part and a stop, a rope attached to the locking-lever, a traveling guide-pulley for the fork, and a pulley at the opposite end of the lower swiveled part, substantially as set forth.

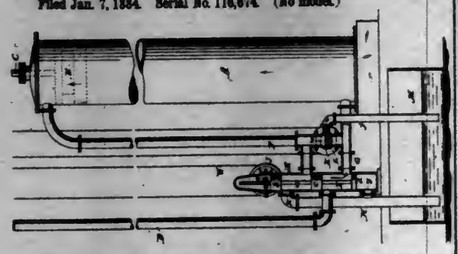
4. The combination, in a hay-carrier, of a carriage having a lower swiveled part, a latch pivoted centrally to said swiveled lower part and provided in its top with a socket having its top edges inclined from two diametrically-opposite points in the longitudinal plane of the latch to two diametrically-opposite points on the transverse line of the latch, a track on which the carriage runs, a stop on said track, which stop can enter the socket on the latch, and a pivoted locking-lever that can be engaged and locked in place by the above-mentioned latch, substantially as set forth.



404,526. SPRING-MOTOR. ROBERT FARIS, Decatur, Ill. Filed June 6, 1888. Serial No. 276,177. (No model.)

Claim.—1. A motor-regulator comprising the shaft *q*, carrying cross-head *p*, rods *n*, suspended vertically from the cross-head, and annular band M, encircling the rods below their points of suspension, as set forth.

2. A motor-regulator comprising the shaft *q*, carrying cross-head *p*, rods *n*, suspended vertically from the cross-head and having weights *n'*, and annular band M, encircling the rods below their points of suspension, as set forth.



404,527. COMPOUND HYDROCARBON-GAS GENERATOR. ROBERT FERGUSON, St. Paul, Minn. Filed Jan. 26, 1889. Serial No. 297,587. (No model.)

Claim.—1. The combination, with the burner-pipes 21 and 23, of the receivers 17 and 18, connected with said pipes, the oil and steam pipes connected with one of said receivers and the oil and hot-air pipe connected with the other receiver, substantially as described, and for the purpose set forth.

2. The hydrocarbon-burner, comprising, in combination, the burner-pipe 21 and 23, the receivers 17 and 18, connected with said pipes, the oil-pipes connecting with said receivers, the steam-pipes surrounding one of said oil-pipes and connecting with the receiver, and the hot-air pipe surrounding the other oil-pipe and connected with the receiver, substantially as described.

404,528. HYDRAULIC ENGINE. CHARLES E. FOSTER, Washington, D. C., assignor to The Hydraulic Elevator Company, Chicago, Ill. Filed Jan. 7, 1884. Serial No. 116,674. (No model.)

Claim.—1. In a hydraulic engine, a cylinder, a piston therein, a main-valve device opening and closing communication between the cylinder and its supply, and pipes connecting said main-valve device with the cylinder at opposit ends, in combination with a passage to permit circulation between said latter pipes independent of the main-valve device, a valve to close said passage, and connections between said valve and the elevator-cage, substantially as described.

2. A hydraulic engine provided with a cylinder, piston, circulating, supply, and discharge pipes, and stopping and starting valve device, whereby the water circulates while the supply is cut off from the cylinder, and with a supplemental-valve device and communication between the same and a tank, and with connections between said supplemental-valve device and the cage, whereby at the will of the operator in the cage to establish and cut off communication independent of the main-valve device between the circulating-pipes and the tank, substantially as described.

3. A cylinder, a piston operating therein, main valve and casing, and circulating-pipes F and G, to connect the opposite ends of said cylinder with the main-valve chamber, in combination with a circulating-pipe K, connecting said pipes F and G, a pipe connecting said circulating-pipe K with a water-tank, and a valve arranged in said pipe K to open or close communication between the circulating-pipes F and G and between the circulating-pipe K and the pipe connected thereto, substantially as described.

4. The combination, in a hydraulic engine, of the cylinder, its piston and rod, and its supply and discharge pipes and their operating-valves with a circulating pipe or channel, a supply and receiving tank in communication therewith, and a valve to control said communication independent of the main-valve device, substantially as described.

5. A cylinder, a piston operating therein, circulating-pipes F and G, connecting said cylinder with the main-valve chamber, and a valve in said chamber to close communication with the supply in circulating, in combination with a circulating-pipe K, interposed between said pipes F and G, and having a valve, and a communication with a tank independent of the main discharge-pipe, and means, substantially as described, to operate said valve from the cage, substantially as and for the purpose specified.

6. The combination, with the cylinder, the piston head and rod, the supply, discharge, and circulating pipes or channels and their controlling-valves of a double-acting hydraulic engine, of a supply and receiving tank communicating with the circulating pipe or channel through an opening controlled by a supplemental valve independent of said main valve, and means, substantially as described, to operate said supplemental valve, as and for the purpose specified.

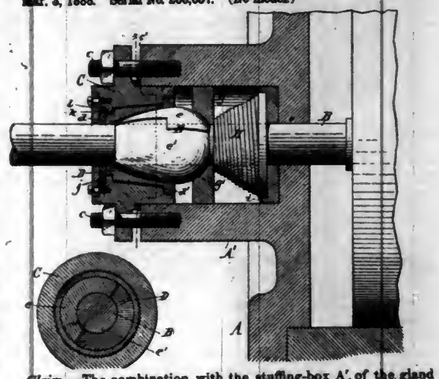
7. A cylinder, a piston operating therein, and circulating-pipes F and G, connecting the opposite ends of said cylinder with the main supply and discharge pipes, in combination with a circulating-pipe K, connecting said pipes F and G, a water-tank in communication with said pipe K, and a valve device adapted to simultaneously open or close communication between the circulating-pipes F and G and said pipe K and the water-tank, substantially as described.

8. In a hydraulic engine, a main supply-pipe, a valve-chamber communicating therewith, and pipes F and G, connecting said valve-chamber with the opposite ends, respectively, of a cylinder, in combination with a pipe or channel between said pipes F and G, a receiving and supply tank separate from the main supply, a pipe or channel forming a communication between said tank and the circulating-pipe, and a valve adapted to simultaneously open or close communication between the pipes F and G and pipe K and tank, substantially as described.

9. The combination of the cylinder, piston, and piston-rod, pipes F G, valve-case communicating with the water-supply channel and provided with a valve, pipe connecting the pipes G and F and valve in said pipe, supply and receiving tank, and connections between the platform and the valves, whereby both may be operated from the platform, substantially as set forth.

10. The combination of the cylinder, its piston and piston-rod, and circulating-pipes having a valve, and the supply-tank, with a case containing the main valve and provided with two discharge-ports and an intermediate port connecting with the supply-pipe, substantially as described.

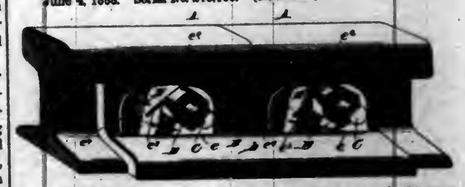
11. The combination, with the hydraulic engine and its circulating-pipes, of a main valve controlling the supply to and discharge from the cylinder, a supply and receiving tank, and an independent valve controlling communication therewith, and mechanism, substantially as described, to hold one of said valves in stationary position while the other is being operated, as and for the purpose specified.



12. In a hydraulic engine, the combination, with an independent valve to control communication through the circulating-pipe thereof, and a notched disk, and a locking-lever, of mechanism, substantially as described, to operate said disk and lever to hold said valve in fixed position, as and for the purpose specified.

13. The combination, with the main valve and its toothed operating-pulley, and the independent valve of the circulating-pipe, of a locking-bolt and lever controlled by said independent valve, substantially as described.

14. The combination, with the main valve, its toothed operating-pulley, and a bolt adapted to engage therewith, of a lever adapted to engage and hold a valve within the circulating-pipe in stationary position when the main valve is being operated, substantially as described.

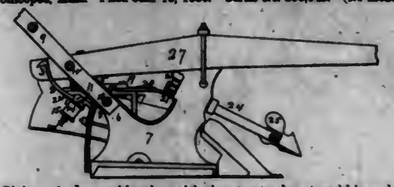


15. The combination, with the main valve, its toothed operating-pulley, and a bolt adapted to engage therewith, of an independent valve within the circulating-pipe, a notched disk secured to said independent valve, a locking-lever to engage said disk, and means, substantially as described, to move said lever into and out of engagement with said disk, as and for the purpose specified.

404,529. STUFFING-BOX. LOUIS C. S. FRICK, Buffalo, N. Y. Filed Mar. 3, 1888. Serial No. 266,057. (No model.)

Claim.—The combination, with the stuffing-box A', of the gland C, provided with a tapering cavity, the tapering bushing loosely fitting all around its sides in said cavity so as to leave an annular space, the flange *d'*, the shoulder *k*, the oval-shaped packing E, fitting in an oval cavity in the bushing so as to leave a space *d* between the two, and the ring *l*, loosely fitting around the piston, whereby provision is made for the settlement of the piston by wear, so as to preserve the fit of all the parts, substantially as set forth.

404,530. NUT-LOCK. GEORGE P. FULLER, Minneapolis, Minn. Filed June 4, 1888. Serial No. 276,160. (No model.)

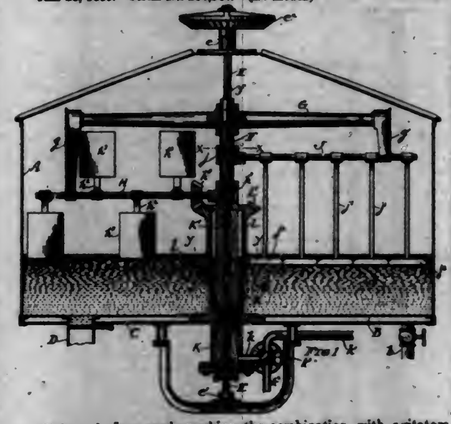


Claim.—1. A locking-plate for single nuts, constructed of heavy spring metal adapted to be secured beneath a nut to be locked and having an elongated end provided with a kerf-slit, forming a spring-tongue designed to engage the side of a nut, said elongated end being entirely free of any connection so as to be capable of springing outward upon depression of the tongue, substantially as and for the purpose described.

2. A locking-plate for single nuts, constructed of heavy spring metal adapted to be secured beneath a nut to be locked and having an elongated end located on one side of the nut and entirely free of any connection, and provided with a spring-tongue and capable of springing out upon depression of the tongue, said tongue being rounded off, whereby the elongated end is enabled to spring out with greater ease and readiness, substantially as and for the purpose described.

3. A locking-plate to lock single nuts made of heavy spring metal and provided with an opening so as to enable the plate to fit snugly on the bolt between the nut and the fish-plate, said plate being provided with a long slot extending at an angle less than a right angle to the nut, which slot extends nearly (more or less) half-way down the plate so as to form a tongue or lip, the end of which is turned outward from the point where the nut first touches the tongue, and the end of the plate on that side where the tongue is located being extended or elongated and left free of any connection, for the purpose set forth.

404,531. SWIVEL-PLOW. ANDREW GALE and EUGENE TREMBLAY, Chicopee, Mass. Filed Jan. 19, 1888. Serial No. 296,943. (No model.)

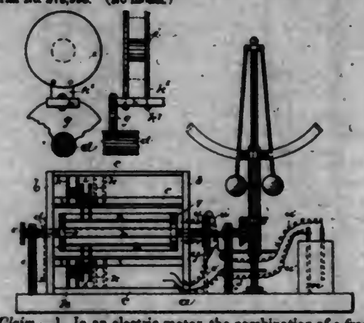


Claim.—1. In combination with the standard and mold-board of a reversible plow, the foot-latch having slotted plate 4, the slotted standard projection 17, the pivoted lever 20, pinion 23, and the jointer-arbor, substantially as shown and described.

2. The combination, with the reversible mold-board, of the plow-standard having the lug 11, the lock-plate 12, the foot-latch 1, the spring 14, and bolt 16, substantially as shown and described.

3. The foot-latch having the slotted plate 4 and its actuating mechanism upon the plow-standard, lever 20, having rack 21, and pin 22, in combination with the jointer 25, rotating stem 24, and pinion 23, substantially as shown and described

404,532. MASH-MACHINE. ROBERT GARDE, Chicago, Ill. Filed Jan. 23, 1889. Serial No. 297,317. (No model.)

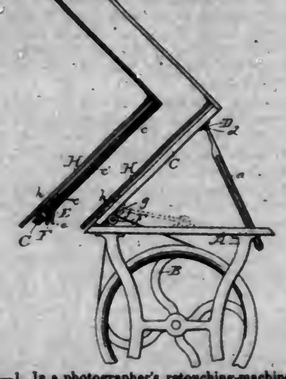


Claim.—1. In a mash-machine, the combination, with agitators arranged to rotate upon vertical and horizontal axes, respectively, of a single driving-shaft, a cylinder and piston in operative connection with said agitators and shaft, and means for lowering and raising said piston by hydraulic power, whereby said agitators may be positively and simultaneously rotated upon vertical and horizontal axes, respectively, and raised and lowered while in operation, substantially as shown and described.

2. In a mash-machine, the combination of a cylinder and piston, means for reciprocating said piston, a vertical shaft passing through the axis of said cylinder and piston, a non-rotating gear connected with said piston, a sliding sleeve splined to said shaft above said piston, a horizontal shaft radiating from said vertical shaft and having shovels thereon and a gear arranged to mesh into said non-rotating gear, a secondary radial shaft having scrapers depending from it, and means for driving said vertical shaft, substantially as shown and described.

3. The combination, in a mash-machine, of a vertical driving-shaft, a source of power, a sleeve loosely splined to said shaft, agitators, substantially as specified, attached to said sleeve, a cylinder and piston in operative connection with said sleeve, and means for actuating said cylinder, substantially as specified.

4. The combination, in a mash-machine, of a tub, vertical shaft E, a sleeve loosely splined thereon, arm G, having depending part *g*, horizontal shaft H, a hydraulic cylinder and piston, means for admitting water thereto, non-revolving gear L, in operative connection with said piston, and gear h^4 in engagement therewith.

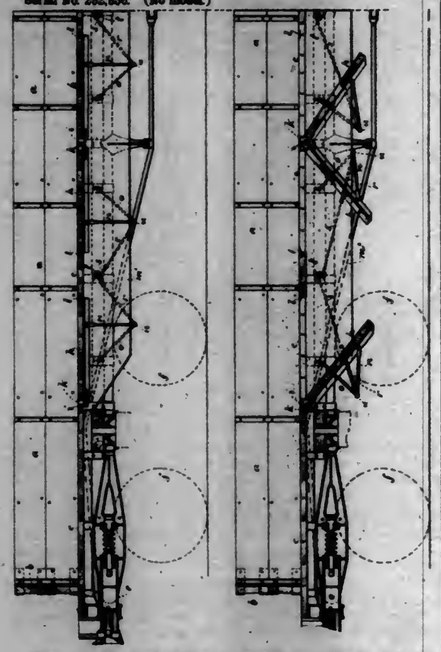


404,533. ELECTRIC MOTOR AND REGULATOR. ALFRED GARTNER, Newark, N. J., assignor, by mesne assignments, to the Continental Motor and Electrical Company, same place. Filed July 5, 1886. Serial No. 275,993. (No model.)

Claim.—1. In an electric motor, the combination of a frame and series of magnets secured therein, a shaft and a series of magnets secured thereon, the said magnets of one series alternating with those of the other series, and all of said magnets each having two end plates *k k'*, with a hub k^2 and wires k^3 between, all said parts being arranged and combined substantially as and for the purposes set forth.

2. In a motor, the combination, with a series of magnets having broad end plates with wires wound between, of another series of like construction, movable between the first, the plates of one series being presented to those of the other, substantially as and for the purposes set forth.

404,534. PHOTOGRAPHER'S RETOUCHING-MACHINE. LAURA O. GIRVIN and JOHN LOTZ, Chicago, Ill. Filed Apr. 18, 1887. Renewed Oct. 29, 1888. Serial No. 289,843. (No model.)



Claim.—1. In a photographer's retouching-machine, the combination, with a rectangular frame, of an independent oscillating vibratory negative-plate holder and means for actuating the same, as and for the purpose set forth.

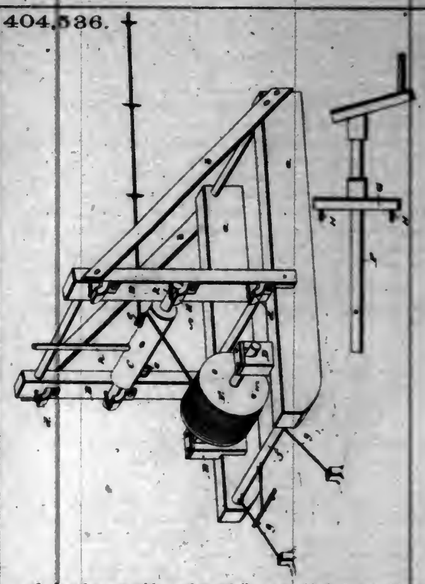
2. In a photographer's retouching-machine, the combination, with a rectangular frame and plate-holder, of transverse shaft suitably journaled in said rectangular frame having eccentrics G, leg E, secured to the back of the plate-holder and having elongated bearings through which the eccentrics G pass, and means for operating said shaft, as set forth.

3. In a photographer's retouching-machine, the combination, with the rectangular frame C, independent vibratory negative-plate holder, and means for actuating the same, of a stationary hand-rest corresponding in transverse construction to and hinged to said rectangular frame, as and for the purpose set forth.

4. In a photographer's retouching-machine, the combination, with the rectangular frame C, vibratory negative-plate holder *c*, and adjustable pivotal screws D, of the transverse shaft F, journaled in bearings secured to frame C, and having eccentrics G, lugs E, having vertically-elongated bearings for said eccentrics G, pulley *f*, and drive-wheel B, as set forth.

404,535. CAR-BODY. JAMES T. GOODFELLOW, Huntingdon, Pa., assignor to the Iron Car Company, of Connecticut. Filed Aug. 16, 1888. Serial No. 282,530. (No model.)

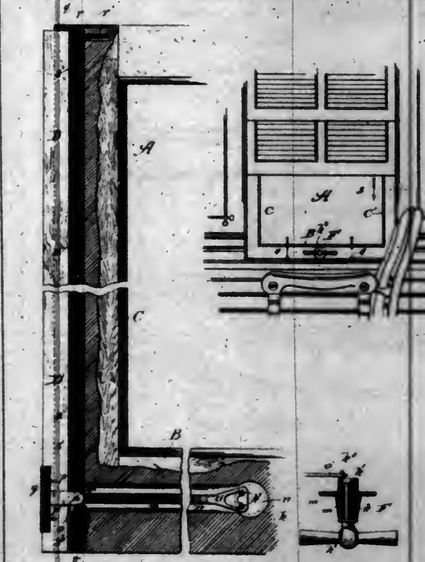
Claim.—1. The combination, in a freight-car, with the bottom *c*, of hinged doors *k*, connected to and, when closed, forming a portion of the level and even bottom of said car, and with mechanism, substantially as described, for dropping said doors to discharge the contents of the car, and for raising said doors and supporting them in place, substantially as set forth.



2. The combination, in a freight-car, with the bottom *c*, of the hinged doors *k*, connected to and, when closed, forming a portion of the bottom of said car, the strut-links *n*, connected at one end to the hinged doors, the tensile links *o*, connected at one end to the car-body, the shaft *u*, to which the other ends of the links *n* and *o* are pivoted, and operating-links *r*, connected at one end to the shafts *u*, the chains *s*, and cross-shafts *t*, by which the hinged doors are supported and operated, substantially as and for the purposes set forth.

3. The combination, in a freight-car, with the bottom *c*, of the hinged doors *k*, connected to and, when closed, forming a portion of the bottom of said car, the strut-links *n*, connected at one end to the hinged doors *k*, the tensile links *o*, connected at one end to the car-body, the shaft *u*, to which the other ends of the links *n* and *o* are pivoted, and operating-links *r*, connected at one end to the shafts *u*, the chains *s*, and cross-shafts *t*, by which the hinged doors are supported and operated, and the angle-iron bars *k' l*, connected to the bottom of the car and at two or more opposite edges of the hinged doors, substantially as and for the purposes set forth.

404,536. WIRE-STRETCHER. ELIJAH GUTHRIDGE, Fayette, Mo. Filed Feb. 26, 1889. Serial No. 301,483. (No model.)

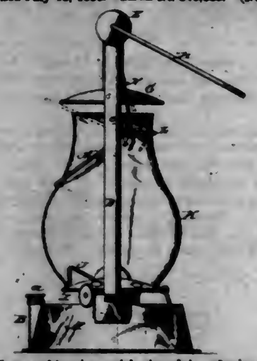


Claim.—1. The main frame composed of the runners *a* and cross-braces, in combination with the bearings D, secured to the runners, the standards B, also secured to the runners, the brackets *d*, secured to the forward sides of the standards, as shown, the spool journaled in the bearings D, the diagonal bars bracing the standards for the runners, and the tension-roll having lever-apertures to receive the removable levers, and also having staples or hooks for engaging the wire, one of said hooks being arranged near each end of a tension-roll, and the said roll being adapted to be placed in the brackets at different altitudes, substantially as specified.

404,536.

2. In a fence-machine, substantially as specified, the combination, with the main frame, of the standards having bearings, and the tension-roll having a staple near opposite ends to engage the wires, whereby the machine may be worked from the right or left hand side of a fence, substantially as specified.

404,537. SASH-HOLDER. OSCAR P. HAMMARLUND and EMIL LARSON, Chicago, Ill. Filed Oct. 30, 1888. Serial No. 289,523. (No model.)



Claim.—1. In combination with a window, a strip D on a lateral edge of the window-sash to bear against the widow-casing, and provided on its outer surface toward one end with a projection *q*, a resilient medium maintaining the strip normally beyond the lateral edge of the window, with force sufficient to sustain the window at any adjusted height by the engagement of the projection *q* with the adjacent surface of the window-casing, a handle F, affording a window-lift located toward the middle of a horizontal rail of the window and connected with the strip D near the projection *q*, substantially as described.

2. In combination with a window, a strip D at the lateral edge thereof to bear against the window-casing, a resilient medium maintaining the strip normally beyond the lateral edge of the window, a rod E, loosely connected with the strip to afford lost motion, a spring maintaining the rod E normally at the limit of its outward movement, and a handle connected with the said rod and operative to retract the rod and with it the strip, substantially as described.

3. In combination with a window, a strip D at the lateral edge thereof to bear against the window-casing, a resilient medium maintaining the strip normally beyond the lateral edge of the window, a rod E, loosely connected toward one end with the strip to afford lost motion, a spring e^3, maintaining the rod E normally at the limit of its outward movement, a yoke e' on the opposite end of the rod E, and a handle F, carrying pins f^2, engaging with the yoke e', and operative, when turned in either direction, to retract the rod E and with it the strip D, substantially as described.

404,538. TUBULAR LANTERN. ROBERT HERMANCE, Schuylerville, N. Y. Filed July 13, 1888. Serial No. 279,883. (No model.)

Claim.—1. The combination, with the globe of a lantern, of the rest I and the guide J, connected at one end to the top of said rest, with the other end inclined toward the center of the rest, substantially as and for the purpose specified.

2. In a lantern, the combination, with the globe-rest thereof, of a wire attached at one end to the top of said rest near its periphery, and comprising a substantially vertical portion forming a stop and a radial portion forming a guide and extending toward the center of the rest, substantially as shown and described.

3. In a lantern, the combination, with the guard L, of the pivoted yoke M, terminating in a finger or bearing extension, and the spring N, substantially as and for the purpose specified.

4. In a lantern, the combination, with a guard for the globe and a yoke pivoted thereto, of a spring bearing upon the end of the yoke to retain it in a raised or lowered position, substantially as and for the purpose set forth.

404,539. SELF-CLOSING COVER FOR INKSTANDS, &c. ISAAC W. HETHERER, Philadelphia, Pa. Filed June 16, 1888. Serial No. 277,289. (No model.)

Claim.—1. As an article of manufacture, a self-closing cover for ink-wells, consisting of the hollow metal hood B, open beneath and adapted to be attached to the margin of an ink-well, having flanged opening B^2 in front and a pivoted valve D, adapted to close from the rear within said hood against the flanged sides of said opening B^2, said valve supported in bearings in the sides of said hood B, substantially as described.

2. As an article of manufacture, the hollow metal hood B, expanded and open beneath to cover an ink-well, and tapered above to form a transverse apex with a sloped rear side, said hood vertically open in front, and a rearwardly-swinging valve pivoted to the upper margin of said opening B^1, said opening having flanged sides, and said valve adapted to be swung back against said sloped rear side of said cover and to close against said flanges B^4 B^4 by a counter-weight attached thereto, and said hood B having external overlapping shoulder B', adapted to embrace the projecting neck of an ink-well, substantially as described.

3. In combination with inkstand A, having ink-well C, with circular aperture and lip A', the self-closing cover having circular base with overlapping shoulders B' B', adapted to embrace said lip A' and be cemented or otherwise attached thereto, said cover having central hood B, open beneath and tapered above to a broad transverse valve-seat, and flanged opening B^1, together with valve D, pivoted to the upper margin of said opening B^1, closed against flanges B^2 B^2 by a counter-weight attached in rear of said valve, and adapted to be swung backward in said hood B by pressure applied to the front thereof and close automatically against said flanges B^2 B^2, substantially as described.

4. As an article of manufacture, the hollow hooded cover B, open beneath, having opening B^2 in front, and flanges B^2 B^2, shoulders B' B' around the base thereof, the whole formed integral, and the valve D, attached to the upper margin of said opening B^1, adapted to be swung to the rear in said hood, closed automatically against flanges B^2 B^2 by a counter-weight upon said valve D, said valve supported by bearings in the sides of said hood B, the whole adapted to be attached to an ink-well, substantially as and for the purposes described.

5. In combination with the ink-well C, the hooded cover B, separate therefrom and adapted to be fitted thereto, said hood having open front B^2 opening beneath into said ink-well, flanges B^2 B^2, and rearwardly-swinging pivoted valve D, supported above said opening B^1, adapted to close against said flanges B^2 B^2, said valve extended downward below the lower margin of hood B and adapted to be swung to the rear within said ink-well, substantially as and for the purposes described.

6. In combination with the inkstand A, having ink-well C, the separate metal cover having shoulders B' B' to support the said cover upon the margins of said ink-well, hollow hood B, open into said ink-well, having opening B^2 and flanges B^2 B^2, transverse bottom part B^3 of said opening B^2, sloped downward and backward into the concavity of said ink-well, the free edge thereof continuous with said flanges B^2 B^2, together with rearwardly-swinging valve D, adapted to close automatically against said flanges B^2 B^2 and the free edge of said bottom B^3, said valve D hung with its lower part within the concavity of said ink-well and forming with the sloped surface B^3 an acute angle, substantially as described.

7. As an article of manufacture, a self-closing cover for inkstands, consisting of the hollow hood B, cast in a single piece, except the valve, of white-metal or other material unaffected by the acids of ink, open and expanded beneath, having shoulders B' B', adapted to support the same upon the margins of an ink-well, tapered above to a transversely-flat apex, said cover having opening B^2 in the front thereof, side flanges B^2 B^2 within said opening B^2, downwardly-sloping extended bottom B^3, and transversely-pivoted flat valve D, supported along the flattened apex B^3 of said hood in bearings in the sides of said hood B, and adapted to be swung backward within said hollow hood when pressed against from the front through said opening B^2 and to be closed by gravity against said flanges B^2 B^2 and the free edge of said sloped bottom B^3 when said pressure has been removed, the whole constructed separately from and independent of said ink-well and adapted to be applied thereto for temporary or permanent use, substantially as described.

8. In combination with the hood B, having self-closing valve D, operated by the insertion or withdrawal of a pen-point through the opening B^1, the inkstand A A^2, having ink-well C, opening vertically above and adapted to support the said hood B upon the marginal surfaces thereof, the lateral supply-reservoir C', and the small connecting-passage *c*, connecting the bottom portions of C and C', said reservoir C' air-tight above and adapted to maintain a uniform level of ink-surface in the said ink-well C, substantially as and for the purposes herein shown and described.

9. In combination with the pneumatic ink-supplying reservoir C', an open ink-well C and connecting-passage *c*, the hood B, covering said ink-well C and supported by the margins thereof, said hood having supporting-shoulders B' B', opening B^2 in front thereof, flanged sides B^2 B^2, and sloping bottom B^3, together with rearwardly-swinging valve D, pivoted at its upper margin to the apex B^3 of said hood B, and adapted to close automatically against said flanges B^2 B^2 and said sloped bottom B^3 and close said opening B^2, substantially as described.

10. An inkstand having a pneumatic ink-supplying reservoir C', open vertical ink-well C, and passage *c*, connecting the lower parts of C and C', in combination with a self-closing valve and cover B D, fixed at a definite height above the ink-surface of said ink-well C, said ink-level made constant in said ink-well by automatic supply from said reservoir C' through said passage *c*, substantially as described.

11. In combination with the hollow hood B, expanded and open beneath, tapered and transversely flattened to an apex B^3, adapted to be applied to and supported by the margins of an open ink-well C,

and provided with opening B^5 in the front of said hood, the flanges B^6 B^7 along the sides of B^4, said flanges inclined to the rear from above downward, and the self-closing valve D, pivoted at E transversely along the said apex, and adapted to rest by gravity in an inclined position against the said sloped flanges B^6 B^7 and close the said opening B^4, substantially as described.

12. In combination with the glass valve D, the slotted metal tube F, adapted to embrace the free upper margin of said valve, said valve securely fixed therein, the free ends F' F' of said tube F, cylindrical in cross-section and projecting laterally from the sides of said valve, adapted to form supports for the same, and the bearings B^7 B^7 in hood B, substantially as described.

13. In a self-closing ink-well cover, the valve D, of glass or the like, having transverse grooves *d d'* near the margin and on opposite faces thereof, in combination with the slotted metal tube F, having opposite edges F^3 F^3 along said slot adapted to engage with said grooves *d d'* and securely hold said valve in place in said slotted metal tube and form a metallic support for the same, substantially as described.

14. In combination with the valve D, having transverse grooves *d d'* on opposite faces and near one of the free edges thereof, the slotted tube F, adapted to support the said valve in bearings, having edge F^3 along said slot adapted to engage with groove *d* entirely across said valve, and the spring-lip F^3, projecting from the middle of the opposite edge of said slot, said spring-lip adapted to engage with said groove *d'* and by its spring tension force the opposite edge F^3 into groove *d* and securely hold the said slotted tube F in place upon said valve D, substantially as described.

15. In a self-closing inkstand-cover, in combination with the glass valve D, transversely grooved at *d* and *d'* upon opposite faces, the slotted spring-metal clamping-tube F, adapted to embrace the free margin of said valve and engage along the edge of said slot with one of said grooves and prevent displacement thereof, together with pivoted valve-supports attached to said slotted tube and pivoted in said cover B, substantially as described.

16. In combination with a flat glass valve having a transverse groove near its margin, a slotted spring-metal tube adapted to engage by one of the edges of said slot in said groove to prevent displacement thereof, and held in place by the pressure of the opposite edge of said slot against the opposite face of said valve, said slotted tube adapted to form a metal support for said valve and to be supported in bearings to allow motion of said valve thereupon, substantially as and for the purposes herein shown and described.

17. In combination with the hollow hood B, open beneath and adapted to be supported upon the margins of the open well C and form a cover for the same, said hood having opening B^4 in front, a self-closing valve pivoted at its upper margin within said hood, adapted to swing to the rear upon said pivot by pressure applied to the front of said valve and close automatically against flanged sides B^6 B^7 of opening B^4 when said pressure has been removed, said valve having a notch D^4 in its lower margin, adapted to give room for and permit withdrawal of a mucilage-brush or the like from said well C when said valve is closed, substantially as described.

18. In a self-closing ink-well cover B, the hollow metal hood open beneath into the ink-well C, and having opening B^4 in front provided with flanged sides B^6 B^7, said hood expanded beneath, flattened and brought to a broad transverse apex above, said cover B extended to said apex B^2 and closed behind, in combination with a rearwardly-swinging valve D, supported in bearings in the sides of said cover B, and adapted to close from the rear against said flanged sides B^6 B^7, said valve D elongated from above downward and having its lower edge D' bent backward, said edge D' adapted to be swung to and fro beneath the surface of the ink in said ink-well C, and close against the rear side of the flanges B^6 B^7 and the rear edge of sloped bottom B^3 of open front B^4, said rear edge extended down within said ink-well into or near the surface of the ink therein, substantially as and for the purposes described.

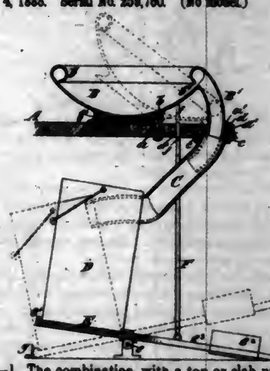
19. As an article of manufacture, a heavy cast white-metal cover B, provided with conical flattened hood open beneath, and open front, and having valve D supported therein, and shoulders B' B', the whole adapted to rest by its own weight upon ink-well C, substantially as described.

20. In combination with the inkstand A, having a vertically-sunk ink-well C in the upper face thereof, the hollow hooded cast-metal cover B, extended over said ink-space, having shoulders B' B', adapted to rest by gravity upon the sides of said ink-well open beneath, and having flanged opening B^4 in front, said opening vertical or inclined and in rear of the front margin of said ink-well opening, and sloped Bottom B^3, extending downward and backward from the front of said opening B^4, the rear edge thereof continuous with said flanged sides B^6 B^7, together with a valve supported above said opening B^4, extending downward into said ink-well C, adapted to close by a counter-weight attached to the rear side thereof against said flanges B^6 B^7 and said free lower edge of said sloped bottom B^3, the whole constructed substantially as and for the purposes herein shown and described.

21. In a self-closing inkstand-cover having hood B open beneath and opening B^4 in front of said hood, the glass valve D, in combination with a metallic strip attached to one margin thereof and adapted to form a pivot or support for the same, substantially as described.

404,540. LAMP-SHADE. Hugo Hohenstein, New York, N. Y.

Filed Apr. 16, 1888. Serial No. 270,809. (No model.)



Claim.—1. A lamp-shade consisting of a body having a contracted neck, a ring at the neck, and an outwardly-bent re-enforcing layer provided with tapering fingers at the lower inner end, substantially as set forth.

2. A lamp-shade composed of a body having a contracted neck, a ring for re-enforcing said neck, an outwardly-bent layer applied to said ring and provided with tapering fingers, and a covering-layer extending from the contracted neck of the body over the inner surface of the ring and re-enforcing layer, substantially as set forth.

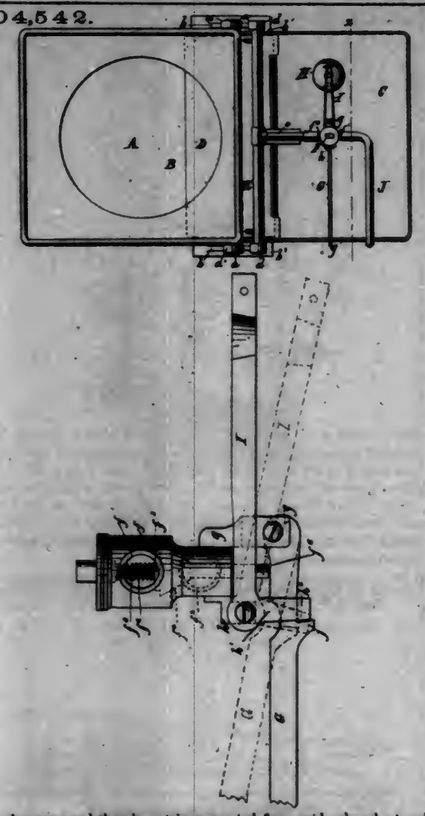
404,541. WASH-BASIN. Philip G. Hubert, New York, N. Y.

Filed Jan. 4, 1888. Serial No. 259,760. (No model.)

Claim.—1. The combination, with a top or slab provided with an opening, of a basin pivoted above the top or slab and having a curved discharge-nozzle working through said opening, a discharge-pipe in which said nozzle works, a tilting platform, a stop, and a connection between said tilting platform and stop, whereby when the platform occupies one position the rocking of the basin will be prevented, substantially as specified.

2. The combination, with a top or slab provided with an opening, of a basin pivoted above the top or slab and having a curved discharge-nozzle working through said opening, a discharge-pipe below said slab, a tilting platform, and a rod constituting a stop connected with said tilting platform and preventing the movement of the basin in one direction, substantially as specified.

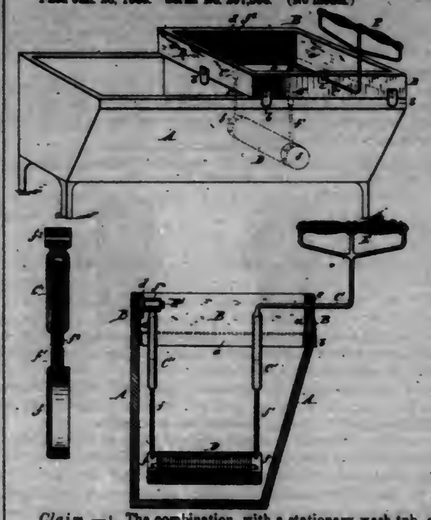
3. The combination, with a slab or stand-top and the discharge throat or pipe presented at an opening therein, of the pivoted basin B and and its discharge-nozzle B', the balancing-platform E and the stop-rod *f* operated thereby, and a lock with which the platform automatically engages in descending and which serves to lock the platform with the stop-rod in an elevated position, substantially as specified.



404,542. TIME-VALVE. Philip G. Hubert, New York, N. Y.

Filed Dec. 31, 1888. Serial No. 295,046. (No model.)

Claim.—In a time-valve, the combination, with a valve-chest, of



404,542.

a valve arranged therein, a trip supported from said valve-chest and adapted to come in contact with the valve or a part thereof to move the valve from its seat, a lever also supported from the valve-chest and operating to automatically lock said trip in a position to hold the valve open, and a float acting on said lever to release the trip, substantially as specified.

404,545. WASHING-MACHINE. Rosa Jane, New York, N. Y.

Filed Jan. 26, 1888. Serial No. 297,502. (No model.)

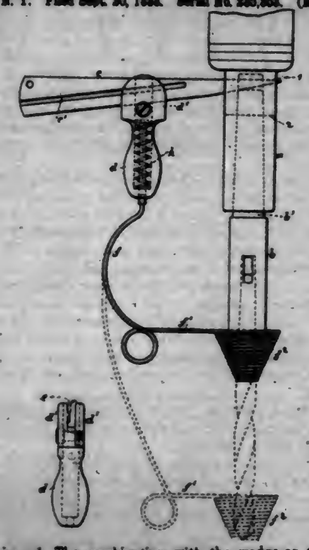
Claim.—1. The combination, with a stationary wash-tub, of a supporting-frame secured to the top of the same, a crank-shaft supported in bearings of said frame, a handle at the outer end of the crank-shaft, and a rubbing-roller at the lower part of the crank-shaft, substantially as set forth.

2. The combination, with a stationary wash-tub, of a supporting-frame secured to said tub, a crank-shaft supported in bearings of the frame and provided with tubular interiorly-threaded crank-arms, a handle at the outer upwardly-bent end of the crank-shaft, a rubbing-roller, and caps attached to the ends of the roller and provided with screw-rods for engaging the tubular crank-arms, substantially as set forth.

3. The combination, with an oscillating crank-shaft supported in suitable bearings and provided with tubular interiorly-threaded crank-arms, of a rubbing-roller and end caps attached to said roller and provided with screw-rods that engage the crank-arms, so as to adjust the roller higher or lower on the crank-arms, substantially as set forth.

404,548. METHOD OF REFINISHING CURTAINS. Christian Imandt, New York, N. Y. Filed Jan. 22, 1888. Serial No. 297,208. (No specimens.)

Claim.—The method herein described of refinishing lace curtains, which consists, first, in connecting a number of superposed curtains by basting their edges together; secondly, washing the so-basted curtains; thirdly, drying the same; fourthly, sizing the dried curtains, and, lastly, stretching and drying the same, substantially as set forth.



404,544. SHACKLE. John James and Alvin D. Goodenough, Henrietta, Tex. Filed Dec. 7, 1888. Serial No. 292,893. (No model.)

Claim.—1. A mitten provided with button-holes in its wrist, in combination with a handcuff provided with a fastening-button, substantially as specified.

2. A handcuff provided with a flexible wrist band or cuff and carrying devices whereby a mitten may be attached thereto, substantially as specified.

404,546. DRIFT AND DRILL CATCH. John T. Kenworthy, Flushing, N. Y. Filed Sept. 20, 1888. Serial No. 285,868. (No model.)

Claim.—1. The combination, with the wedge or drift tool for separating the shank of the tool or tool-holder from the vertical man-

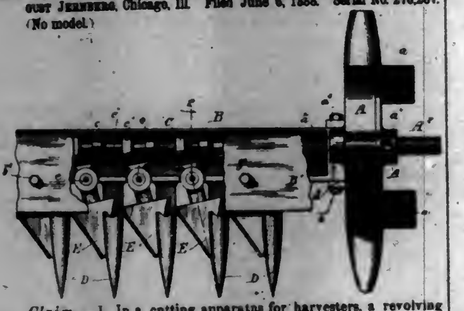
drel, of the basket for holding the tool, and a connection between the basket and drift-tool, substantially as set forth.

2. The combination, with the wedge or drift tool having grooves *c'* in its side, of the basket for holding the tool, the handle *d* for receiving the wedge, and a connection from the same to the basket, substantially as specified.

3. The combination, with the wedge or drift tool, of the handle *d*, a spring within the handle, a basket for holding the drill or its stock, and a connection between the basket and the spring within the handle, substantially as specified.

404,547. SKATE-ROLLER. CHARLES J. KINTNER, Philadelphia, Pa. Filed Apr. 11, 1887. Serial No. 234,451. (No model.)

Claim.—1. In a roller-skate, a roller having grooves in its lateral faces and absorbent material located in said grooves for retaining the waste oil, substantially as described.



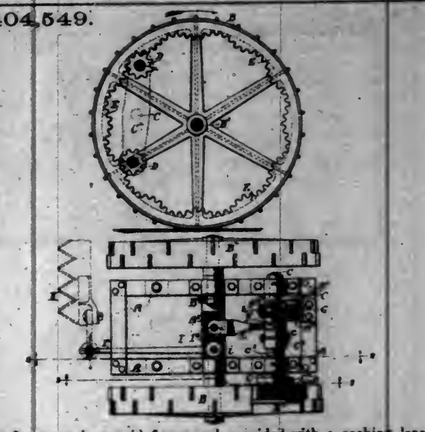
2. In a roller-skate, a roller having grooves in its lateral faces, absorbent material in said grooves, and means for retaining said absorbent material in place, substantially as described.

3. In a roller-skate, a roller having grooves in its lateral faces for catching the drip from the axle, in combination with oil-ducts running toward the center of the wheel, substantially as described.

4. In a roller-skate, a roller having grooves in its lateral faces, with absorbent material located therein, in combination with oil-ducts for conducting the oil to the axle of the skate.

5. In a roller-skate, a roller having grooves in its lateral faces for retaining the oil-drip, in combination with an oiling-groove and oil-ducts, substantially as described.

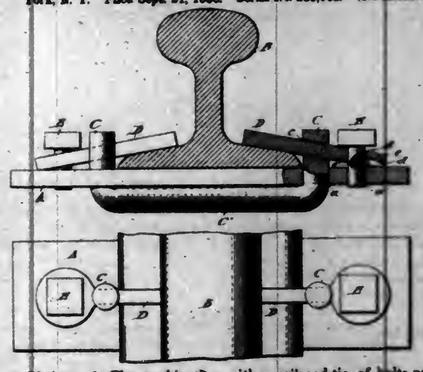
404,548. CUTTING APPARATUS. HJALMAR LINDSTRÖM and AUGUST JERNBERG, Chicago, Ill. Filed June 6, 1888. Serial No. 276,287. (No model.)



Claim.—1. In a cutting apparatus for harvesters, a revolving shaft mounted longitudinally in a suitable frame, a plurality of knives, each pivoted to said frame, and a plurality of cams, the cams for each knife being mounted in pairs on said shaft and at right angles to each other for the alternate engagement of said knife, substantially as specified.

2. In a cutting apparatus for harvesters, a revolving shaft mounted longitudinally in a suitable frame, a plurality of knives pivoted to said frame, said knives being formed with extensions *e'*, and a plurality of cams on said shaft mounted in pairs and at right angles to each other, said extensions *e'* being of such width as to engage at all times one cam of each pair of cams, substantially as described.

3. In a cutting apparatus for harvesters, a suitable frame, a shaft mounted thereon, a plurality of knives pivoted to the frame, and a plurality of cams on said shaft for engagement with the knives, the said frame being curved at its lower portion to form a trough or receptacle for oil or other lubricant into which the cams dip as they revolve and provided with a removable top plate B', all substantially as described.

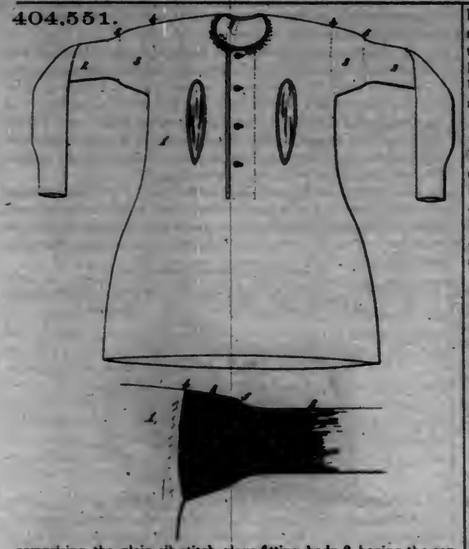


404,549. MOWER. HJALMAR LINDSTRÖM, Englewood, Ill., assignor of one-half to August Jernberg, same place. Filed Sept. 21, 1888. Serial No. 286,011. (No model.)

Claim.—1. The combination, with the frame and cutter-bar of a mower, of a drive-wheel provided with an annular scalloped toothed cam and a swinging lever provided with two toothed wheels or pinions upon its ends intermeshing with said toothed cam, substantially as described.

2. The combination, with the frame and cutter-bar of a mower, of a drive-wheel provided with a scalloped and toothed cam, a rock-shaft mounted on said frame and provided with a rocking lever, toothed pinions upon the ends of said lever engaging said cam, a longitudinally-grooved arm rigidly attached to said rock-shaft, a loose sleeve upon said rock-shaft provided with an arm adapted to engage the groove of the arm upon said rock-shaft, a hand-lever for moving said sleeve endwise upon the shaft, and a bell-crank lever, one arm of which is connected with the cutter-bar and the other with the arm upon the sleeve, substantially as described.

404,550. RAILROAD-RAIL FASTENER. CHARLES METZ, New York, N. Y. Filed Sept. 21, 1888. Serial No. 285,962. (No model.)

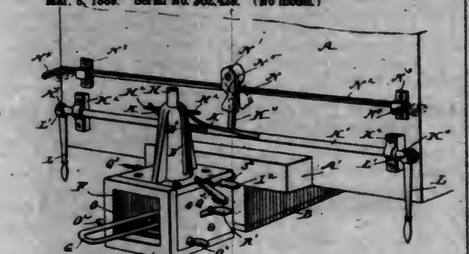


Claim.—1. The combination, with a railroad-tie, of bolts projecting upward therethrough at each side of the rail-flange and formed with a transverse slot, keys inserted in said slot to bear on the rail-flange at one end and formed with a vertical aperture at the opposite end, and bolts passing through the said apertures and corresponding apertures in the tie, substantially as described.

2. A rail-fastener comprising a bolt having a transverse slot, an elongated key adapted to said slot and formed with an aperture at one end, and a bolt adapted to said aperture, substantially as described.

3. The bolt E, formed with a transverse recess, and the spring-acted locking-pin *c* in said recess, in combination, substantially as described.

4. In a rail-fastener, the combination, with the tie, of a bar lying beneath the same and having upwardly-projecting ends extending through and above the tie at each side of the rail-flange, and keys or plates engaging said upwardly-projecting ends and bearing down on the rail-flange, the said keys being angular in cross-section, and thus adapted to be slid into position, substantially as described.



404,551. UNDER-VEST. CHARLES F. NORTH, Cohoes, N. Y. Filed Mar. 27, 1888. Serial No. 304,947. (Specimens.)

Claim.—1. As a new article of manufacture, a lady's under-vest consisting of a vest body and sleeves comprising a plain rib-stitch glove-fitting body 2, having a contracted cuff portion for the wrist, and the tuck-stitch section 3, sewed to the vest-body and gradually contracted from the latter to the rib-stitch glove-fitting sleeve-body, substantially as and for the purposes described.

2. A lady's under-vest consisting of the vest body and sleeves comprising the plain rib-stitch glove-fitting body 2, having the contracted gored cuff portion, and the tuck-stitch section 3, sewed to the vest body and contracted therefrom to the rib-stitch glove-fitting sleeve-body, substantially as and for the purposes described.

404,552. CAR-COUPLING. VINCENT NUBLY, Sandusky, Ohio. Filed Mar. 8, 1889. Serial No. 302,428. (No model.)

Claim.—1. The combination, with the draw-head and its notched pin, of a slide having an opening through which the pin passes, and a spring pressing the slide toward the car to bring the front wall of its opening into the notch at the front side of the pin, the rear end of the slide being adapted to abut against the car and be thrown forward when the draw-head moves rearwardly, substantially as set forth.

2. In a car-coupling, the combination, with a yielding draw-head, of a link-plate mounted to turn in the draw-head opening and adapted to raise and lower the link, a spring for holding the said link-plate in a lowermost position, an arm for raising said link-plate and provided with a notch, and a pin adapted to engage the said notch to lock the said arm in place, substantially as shown and described.

3. In a car-coupling, the combination, with a yielding draw-head, of a link-plate mounted to turn in the draw-head opening and adapted to raise and lower the link, a spring for holding the said link-plate in a lowermost position, an arm for raising said link-plate and provided with a notch, a pin adapted to engage the said notch to lock the said arm in place, and a yielding plate carrying the said pin, mounted to slide in the draw-head and provided with a projection adapted to engage the car when the draw-head is moved rearward, so as to automatically release the said link-plate, substantially as shown and described.

4. In a car-coupling, the combination, with a draw-head provided with an offset having slots, of a pin mounted to slide in the said draw-head and the said offset and provided with arms passing through the said slots, arms adapted to engage the said pin-arms, a shaft mounted to turn on the front of the car and carrying the said arms, and levers held on the said shaft for turning the latter, substantially as shown and described.

5. In a car-coupling, the combination, with a draw-head provided with an offset having slots, of a pin mounted to slide in the said draw-head and the said offset and provided with arms passing through the said slots, arms adapted to engage the said pin-arms, a shaft mounted to turn on the front of the car and carrying the said arms, and levers held on the said shaft for turning the latter, each of the said levers being provided with an offset adapted to engage the pin on the said shaft, substantially as shown and described.

6. In a car-coupling, the combination, with a draw-head provided with an offset having slots, of a pin mounted to slide in the said draw-head and the said offset and provided with arms passing through the said slots, arms adapted to engage the said pin-arms, a shaft mounted to turn on the front of the car and carrying the said arms, levers held on the said shaft for turning the latter, a vertically-extending arm held on the said shaft, and a lock-plate pivoted on the front of the car and adapted to engage the said vertical arm, substantially as shown and described.

7. In a car-coupling, the combination, with a draw-head provided with an offset having slots, of a pin mounted to slide in the said draw-head and the said offset and provided with arms passing through the said slots, arms adapted to engage the said pin-arms, a shaft mounted to turn on the front of the car and carrying the said arms, levers held on the said shaft for turning the latter, a vertically-extending arm held on the said shaft, a lock-plate pivoted on the front of the car and adapted to engage the said vertical arm, and a transversely-extending rod pivotally connected with the said lock-plate, and mounted to slide in bearings on the end of the car, substantially as shown and described.

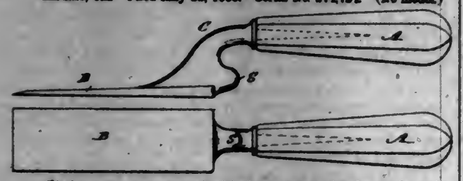
8. In a car-coupling, the combination, with a draw-head, and a pin held to slide vertically in the said draw-head and provided near its lower end with a notch, of a slide held to slide horizontally in the said draw-head and adapted to engage the said notch, a spring pressing on the said slide, and handles extending from the said slide to the outside of the draw-head, substantially as shown and described.

9. In a car-coupling, the combination, with a draw-head, of a link-plate held in the draw-head opening, a spring-pressed shaft carrying the said link-plate, an arm held on the end of the said shaft, a second arm pivoted on the said draw-head and connected by a spring with the said first-named arm, a pin adapted to engage a shoulder on the said second arm, and a yielding plate carrying the said pin and held to slide transversely in the said draw-head, substantially as shown and described.

10. In a car-coupling, the combination, with a draw-head, of a link-plate held in the draw-head opening, a spring-pressed shaft carrying the said link-plate, an arm held on one end of the said shaft, a second arm pivoted on the said draw-head and connected by a spring with the said first-named arm, a pin adapted to engage a shoulder on the said second arm, a yielding plate carrying the said pin and held to slide transversely in the said draw-head, and a projection formed on the said plate and extending to the rear end of the draw-head to engage the car when the draw-heads are pressed together, substantially as shown and described.

11. In a car-coupling, the combination, with a draw-head, of a link-plate held in the draw-head opening, a spring-pressed shaft carrying the said link-plate, an arm held on one end of the said shaft, a second arm pivoted on the said draw-head and connected by a spring with the said first-named arm, a pin adapted to engage a shoulder on the said second arm, a yielding plate carrying the said pin and held to slide longitudinally in the said draw-head, and crank-arms connected with the said second arm for turning the same, substantially as shown and described.

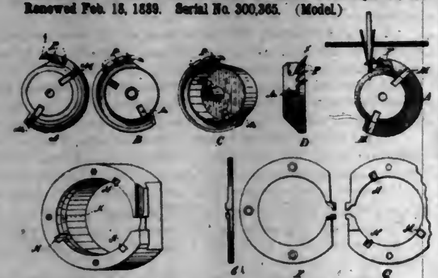
404,553. STOVE-PIPE ANCHOR AND FLUE-CLEANER. LEONIDAS H. OLDFIELD, Newton, Kans. Filed Nov. 24, 1888. Serial No. 291,796. (No model.)



Claim.—1. The combination, with a rod provided with a spur extending from one side, of a plate extending from the other side of the rod, and a handle connected with the rod, substantially as described.

2. The combination, with a rod provided with a spur which extends from one side, of a plate extending from the other side, a socket-tube connected with the rod, and a weighted handle connected to the socket-tube, substantially as described.

3. The combination, with a rod 13, provided with a spur 14 and a plate 16, of a socketed weighted handle 18 and an inclined faced washer, substantially as described.



4. The combination, with a rod provided with a spur 14 and a plate 16, of auxiliary plates 23, and connections between the rods and plates, substantially as described.

404,554. CARPENTER'S CHISEL. THERON H. PALMER, San Bernardino, Cal. Filed May 22, 1888. Serial No. 274,734. (No model.)

Claim.—In a carpenter's chisel or gouge, the forward cutting blade or portion, in combination with the attached crooked shank constructed to receive a handle out of line or plane with said cutting blade or portion and provided with an anvil or hammer-block in rear of the cutting blade or portion, substantially as and for the purposes herein set forth.

404,555. SHUTTLE AND RACE MECHANISM FOR SEWING-MACHINES. FRED D. PARKER, Denver, Colo. Filed Apr. 29, 1887. Renewed Feb. 18, 1889. Serial No. 300,365. (Model.)

Claim.—1. In a rotary or oscillating shuttle sewing-machine, a rotary or oscillating shuttle whose race-bearing surface is provided with one or more knives, in combination with the race having walls for engagement and co-operation with the knives on the shuttle, substantially as described, and for the purpose set forth.

2. In a rotary or oscillating shuttle sewing-machine, a rotary or oscillating shuttle whose race-bearing surface is provided with one or more knives, in combination with the thread-guard N, and the race having walls for engagement and co-operation with the knives on the shuttle, substantially as herein shown and set forth.

404,556. SPRING-HINGE. JOSEPH R. PAYSON, Jr., Chicago, Ill. Filed Nov. 6, 1888. Serial No. 290,069. (Model.)

Claim.—1. A door-butt comprising two members, one for attachment to a door and the other for attachment to a door-frame, one or more outward projections upon one of the members, a spring arranged to force the two members toward each other, and a pivot located substantially midway of the thickness of the door and engaging openings in both the said projection or projections and the other member, the opening or openings in one or both of said parts being larger than the pivot, substantially as described.

2. A butt for a lower part of a door, comprising two members for attachment, one to the door and the other to the door-frame, one or more outward projections upon one of the members, and a pivot located substantially midway of the thickness of the door and engaging openings in both the said projection or projections and the other member, the opening or openings in one or both said parts being a slot, substantially as described.

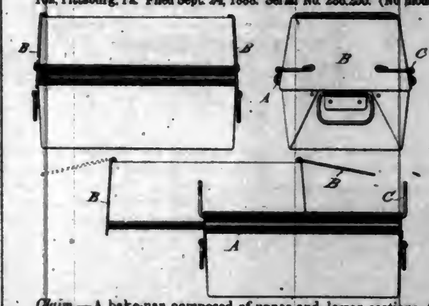
3. The combination, with the two members of the butt, one of which is provided with an outward projection or projections, of a central vertical pivot engaging the projection or projections and the other member by holes which in one or both are in oblong form, and a coiled torsion-spring surrounding the pivot and engaged with the several members, so that its force is exerted to draw the members toward each other, substantially as described.

4. In a centrally-pivoted butt, horizontal lateral extensions or cams upon one of the members having curved outer edges, and a spring arranged to draw the members toward each other.

5. In a centrally-pivoted butt, the horizontal lateral extensions or cams upon one of the members having curved edges, one or more friction-rollers upon the other member arranged to bear upon the curved faces of said cam-extensions, and a spring arranged to draw the members of the butt toward each other.

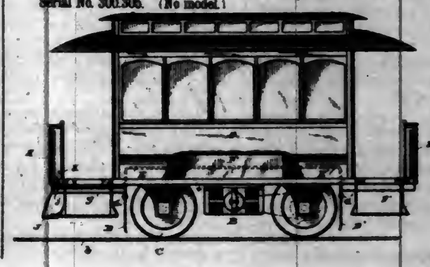
6. The combination, with the two members of a butt, of a central pivot attached to one of said members and having a bodily movement toward and from the other, and a spring engaged with the pivot and also with the member with respect to which said pivot is movable.

404,557. ROTARY STEAM-ENGINE. HOMER L. PHELPS, Athens, Pa. Filed Aug. 6, 1888. Serial No. 282,063. (No model.)



Claim.—1. In a rotary engine of the character described, the combination of the cylinder, a piston mounted eccentrically on a shaft passing through the same, a valve-chest at one side of said cylinder, the chambers G G', connected with said cylinder, separated from each other by a partition, and the valves E E', one in each chamber, substantially as and for the purposes set forth.

2. In a rotary engine, a sliding valve E, consisting of a flat body *f*, front *a*, projection *f''*, and side projections *g g'*, substantially as described.



3. In a rotary engine, the combination, with the piston made in two parts mounted eccentrically on a shaft, of the valves E E', working in conjunction with said piston and bearing in the tracks *h h'*, substantially as described.

404,558. PAN FOR BAKING AND ROASTING. CLARISSA PRESTON, Pittsburg, Pa. Filed Sept. 24, 1888. Serial No. 286,255. (No model.)

Claim.—A bake-pan composed of upper and lower sections, the lower section having closed sides and ends and provided with longitudinal grooves along its upper edge, and the upper section having closed sides and hinged doors at its ends and resting in the grooves of the lower section.

404,559. TRACK-MOISTENING APPARATUS FOR ELECTRIC RAILWAYS. EDWARD D. PRIEST, Lynn, Mass. Filed Feb. 18, 1889. Serial No. 300,305. (No model.)

Claim.—1. In an electric railway in which the rails form part of the supply-circuit, means for decreasing the resistance between the wheel or wheels and said track, comprising apparatus for supplying a moistening-liquid to the track, or to the wheels and track, substantially as described.

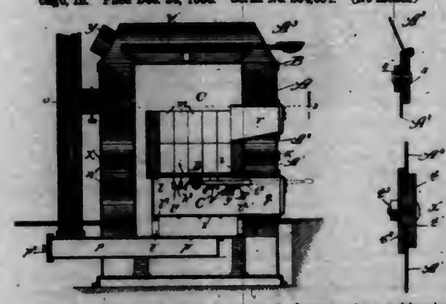
2. In electric railways, the combination, with a motor-car, of a tank for carrying a supply of liquid, connections extending from said tank to a point near the rail or rails of the track, and valves for controlling the flow of liquid from the tank, substantially as described.

3. In electric railways, the combination, with a motor-car, of a tank for carrying a supply of liquid, connections extending from the supply-tank to a point near the rail or rails of the track, valves for controlling the flow of liquid from the tank, and connections for operating the valves, substantially as described.

4. In electric railways, the combination, with a motor-car, of a tank for carrying a supply of liquid, separate distributing-pipes and connections extending from the supply-tank to points in advance of the wheels of the car, valves for controlling the flow of liquid in both sets of pipes, and means for opening and closing, and thereby permitting the liquid to flow from the tank through either of the sets of distributing pipes as desired, substantially as described.

5. In electric railways, the combination, with a motor-car, of a tank for carrying a supply of liquid, distributing-pipes and connections extending from the supply-tank to points adjacent to the track and roadway, valves for controlling the flow of liquid in the several sets of pipes, and means for opening and closing the valves, substantially as described.

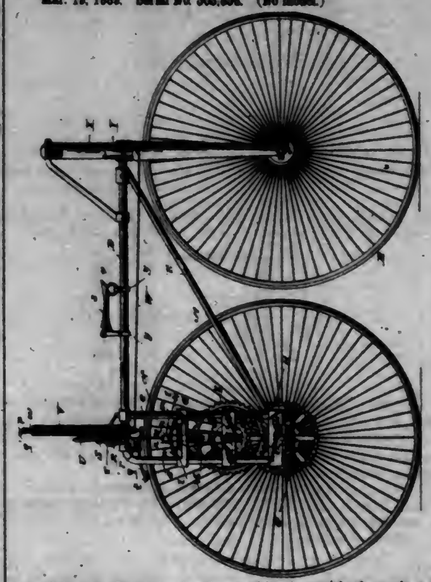
404,560. VEHICLE-SPRING. SILAS H. RAYMOND, Grand Rapids, Mich., assignor to George R. Raymond & Co., same place. Filed Mar. 2, 1889. Serial No. 301,782. (No model.)



Claim.—1. In a vehicle, the vehicle-body, two arms, each pivoted to the vehicle-body at a point near the center of said arms, two side bars supporting the outer ends of such arms, a longitudinal spring, a movable shackle at each end of the spring and connected to the vehicle-body, and two center shackles, each of which center shackles is secured to the spring between the end shackles and pivoted, one to the inner end of each arm, substantially as described.

2. In a vehicle, the combination of the vehicle-body, two movable shackles supported by the vehicle-body, a spring with each end secured to one of these shackles and spanning the space between such shackles, two arms, and two side bars, each arm attached at its inner end to the spring near the center of said spring and at its outer end to a side bar, and supported at a point between its inner and outer ends on a pivot connected with the vehicle-body, substantially as described.

3. In a vehicle, the combination of the vehicle-body, arms supported at the outer ends by side bars, a spring attached at each end of the body near the outer side thereof and spanning the space between such connecting-points, said arms pivoted near the center of each arm to the body at their inner ends connected to the spring near the center thereof, said body supported upon such arms, which are in turn supported upon the side bars, said spring and arms acting as an equalizer, always keeping the vehicle-body in a horizontal position, substantially as described.



404,561. WARM-AIR FURNACE. BENJAMIN F. REYNOLDS, Chicago, Ill. Filed Dec. 28, 1888. Serial No. 294,651. (No model.)

Claim.—1. In a rectangular warm-air furnace, the combination, with the radiator, fire-pot, and ash-pit, of a casing A, comprising sections A' and A^2, joined at the adjacent edges by a strap *t*, having a tongue *t'* extending between the sections, a strap t^2, having a groove to receive the tongue *t'*, and nut-bolts t^3, securing the strips together, and a top section A^3, supported on a re-enforcing strip *s*, secured to the section A^2, substantially as described.

2. In a rectangular warm-air furnace, the combination, with the casing, fire-pot, and ash-pit, of a rectangular radiator B, comprising metal plates riveted together, having riveted thereto chutes *r q*, an indirect flue *p*, a flue *o*, radial corner flanges *n*, and intermediate zigzag flanges *n'*, substantially as described.

404,562. BICYCLE. STEPHEN D. REYNOLDS, Nevada, Mo. Filed Mar. 19, 1889. Serial No. 303,856. (No model.)

Claim.—1. In a bicycle, the combination, with the main drive-wheel having a hollow shaft and hub-gears, of the shaft-carrying pedal-levers, gears fixed thereto, one of said gears having a ratchet and the other a pawl, and a sliding frame carrying gears adapted to engage and disengage the gears on the hub and axle, substantially as specified.

2. In a bicycle, the combination, with the main wheel having its shaft provided with a gear at opposite ends, of the pedal-lever shaft, gears carried by the pedal-lever shaft, and a pawl-and-ratchet connection for said gears, substantially as specified.

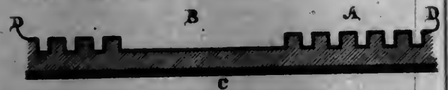
3. In a bicycle, the combination, with the main wheel having its shaft provided with a gear at opposite ends, of the pedal-lever shaft, gears carried by the pedal-lever shaft, a pawl-and-ratchet connection for said gears, and a movable frame carrying gears adapted to engage and disengage the gears of the main-wheel shaft and those of the pedal-lever shaft, respectively, as set forth.

4. In a bicycle, the combination, with the main wheel having its shaft provided with a gear at opposite ends, of the pedal-lever shaft, gears carried by the pedal-lever shaft, a pawl-and-ratchet connection for said gears, and a movable frame carrying gears connected by pawl and ratchet and adapted to engage and disengage the gears on the main-wheel shaft and the gears on the pedal-lever shaft, substantially as specified.

5. The combination, with the main frame, of the drive-wheels having hub-gears, the sliding frames carrying gears, the sliding arms, the horizontal rock-shaft, the segmental levers secured to the rock-shaft, and the rods connecting the sliding arms with said levers, substantially as specified.

6. In a bicycle, substantially as described, the combination, with the main frame and the sliding frame, of the two oppositely-sliding blocks carrying lag-eyes, an interposed spring for keeping the blocks moved outwardly, the sliding arms, and the pivoted arms connecting the sliding blocks with the said sliding arms, substantially as specified.

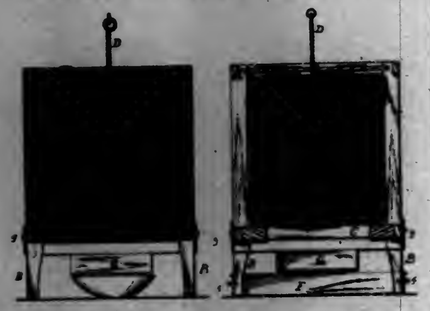
7. In a bicycle, the combination, with the hollow guide-post, of the hollow guide-shaft arranged therein, the brake-rod passing through the shaft, the brake-lever fulcrumed on the main frame and connected with the brake-rod, and a hand-lever, also connected with the rod and fulcrumed on the cross-bar, substantially as specified.



404,563. CAR-STARTER. GUSTAV SCHMIDT, Rhaine, Prussia, Germany. Filed Mar. 11, 1889. Serial No. 302,812. (No model.)

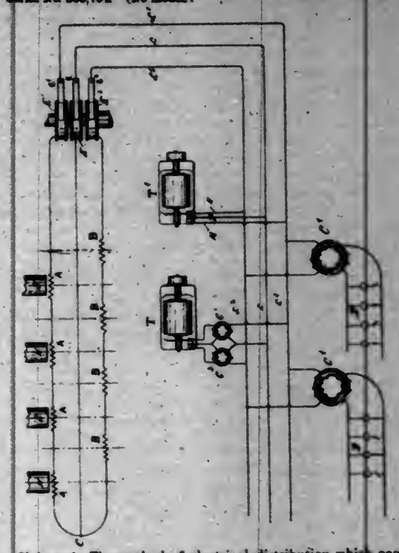
404,568.

Claim.—A car-starter consisting of the base A, with inclined shank A', pawl *c*, mounted thereon, and tubular inclined handle B, the arm C, with detachable plate *d*, and the grooved roller *a*, having flanges *b b'*, and ratchet-teeth *d'* on flange *b*, with which the pawl *c* engages, substantially as shown and described.



404,564. MATRIX FOR STEREOTYPING. FRIEDRICH SCHREINER and ARNOLD SCHOTT, Philadelphia, Pa. Filed May 9, 1888. Serial No. 273,274. (No model.)

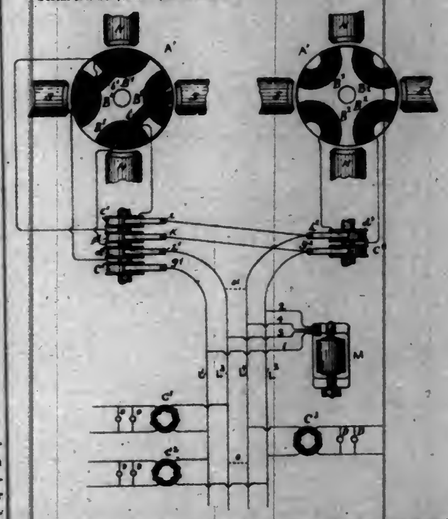
Claim.—1. A matrix for stereotyping, composed of a sheet of fabric coated and partly impregnated with a semi-dry plastic mass and having a backing of pulp firmly connected with the back, substantially as herein shown and described.



2. A matrix for stereotyping, composed of a sheet of fabric coated and partly impregnated with a semi-dry plastic mass, a sheet of fiber paper on the plastic mass, and a backing of pulp firmly connected with the back of the sheet of fabric, substantially as herein shown and described.

404,565. FLY-TRAP. ALBERT S. SCHUYLER, Pennington, N. J. Filed Oct. 31, 1888. Serial No. 289,647. (No model.)

Claim.—The combination, in a fly-trap, with the inclosed gauze-wire cage A, having legs B, removable cone-shaped bottom C, with opening *c* therein, suspending-hook D, and bait-hook E, of the bait-pan F, inclosing the bottom of the legs B, and bait-pan G, of smaller size than the pan F, and arranged between said pan F and the bottom C, and both of said pans F and G removably secured in position, as described, for the purposes specified.

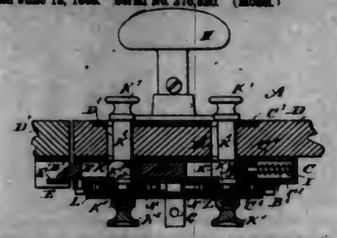


404,566. METHOD OF DISTRIBUTION BY ALTERNATING ELECTRIC CURRENTS. OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Aug. 22, 1888. Serial No. 283,764. (No model.)

Claim.—1. The method of electrical distribution which consists in the generation of an alternating current by the superposition of two alternating currents differing in phase and the derivation of currents therefrom, some dependent upon the component currents and some upon the resultant currents formed by their combined action.

2. The method of electrical distribution which consists in producing two alternating electric currents the phases of which differ in time and superposing portions of such currents, and thereby producing a resultant alternating current the phases of which differ in time from those of the original currents, utilizing such resultant current for operating translating devices, and causing the balance of the original currents to traverse independent circuits.

404,567. SYSTEM OF GENERATORS FOR ALTERNATING ELECTRIC CURRENTS. OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Sept. 8, 1888. Serial No. 284,896. (No model.)



Claim.—1. The combination of two alternating-current electric generators and synchronizing-coils applied to the armature of one of the generators and connected in parallel with the coils of the other generator.

2. The combination of two alternating-current electric generators and their circuits and synchronizing-coils applied to the armature of one of the generators and connected in parallel with the coils of the other generator and having their magnetic axis at an angle with reference to the main coils of the first-named generator.

3. The combination, with two alternating-current electric generators, of synchronizing-coils applied to the armature of one of the generators and connected in parallel with the coils of the other generator, translating devices operated from the respective circuits of said armatures, and a single apparatus deriving independent currents from the circuits of said generators.

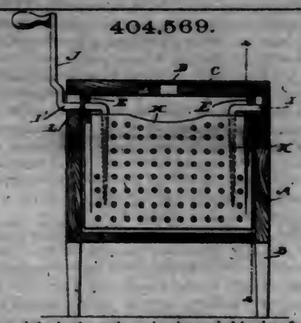
4. The combination, with two alternating-current electric generators delivering two currents differing in the time of their phases, of translating devices deriving currents from the respective generators and other translating devices deriving currents due to the superposition of the two currents of the said generators.

404,568. COMBINATION-LOCK. IRVIN A. SHAW, Kinsley, Kans. Filed June 13, 1888. Serial No. 276,920. (Model.)

Claim.—1. The combination, with a sliding bolt having a longitudinally-extending slot and a circular opening communicating with the inner end of said slot, of a shaft having a flat part, a circular tumbler having a slot receiving said flat part and turning in said circular opening, whereby, when said flat part and tumbler-slot are perpendicular to the bolt-slot, the bolt will be locked and when turned flatwise into the plane of the bolt-slot the bolt may be retracted, said tumbler sliding with the bolt, substantially as set forth.

2. In a combination-lock, the combination, with a locking-bolt provided with a circular slot connecting with a longitudinal slot, of a shaft provided with knobs and having a flat part, a tumbler held on the said flat part and fitting into the circular slot of the locking-bolt, a ratchet-wheel held on the said shaft and turning with it, and a spring engaging with its free end the teeth of the said ratchet-wheel, substantially as shown and described.

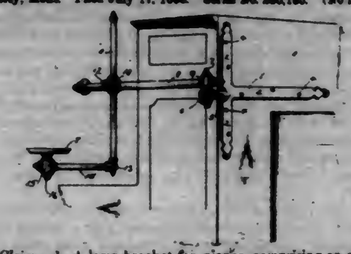
3. In a combination-lock, a locking-bolt provided with a circular slot continuing into a longitudinal slot, and a knob-shaft provided with a pin for operating said locking-bolt, in combination with a shaft provided with a knob on the inside and on the outside of the door, and also having a flat part adapted to engage the longitudinal slot of the said locking-bolt, a slotted tumbler held on the said flat part and fitting into the circular slot of the said locking-bolt, a ratchet-wheel held on and turning with the said shaft and provided with a space in its periphery, said space being formed by the breaking out of several teeth, and a spring engaging with its free end the teeth and space of the said ratchet-wheel, substantially as shown and described.



4. In a combination-lock, a locking-bolt provided with a circular slot continuing into a longitudinal slot, and a knob-shaft provided with a pin for operating said locking-bolt, and a spring bearing against said locking-bolt, in combination with a shaft provided with a knob on the inside and on the outside of the door, and also having a flat part adapted to engage the longitudinal slot of the said locking-bolt, a slotted tumbler held on the said flat part and fitting into the circular slot of the said locking-bolt, a ratchet-wheel revoluble on the said shaft and provided with a space in its periphery, said space being formed by breaking out several teeth, a knob screwed on the shaft against said ratchet-wheel and clamping it in place, and a spring engaging with its free end the teeth and space of the said ratchet-wheel, substantially as shown and described.

404,569. CHURN. WILLIAM M. SHIRA, Butler, Pa. Filed Nov. 12, 1888. Serial No. 290,667. (No model.)

Claim.—1. In a churn, the combination, with a perforated dasher, of the angular supporting-arms I I', each of said arms having a threaded tapering member K, adapted to enter the dasher, the horizontal members resting in the sides of the body, and a handle J, attached to the arm I', substantially as shown and described.

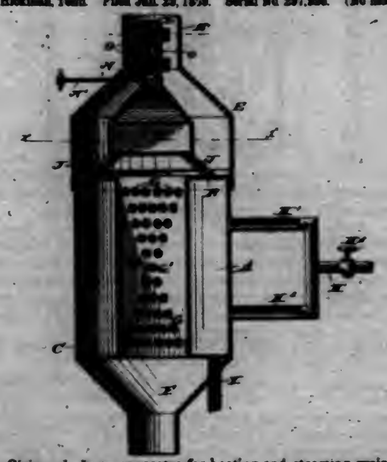


2. In a churn, the combination, with a body, of a perforated dasher H, having rabbeted ends *h*, as shown, the angular supporting-arms I I', having the threaded tapering portion K, adapted to enter

404,569.

the dasher, and the horizontal portion journaled in slots formed in the sides of the box, and a handle J, formed integral with supporting-arm I', substantially as shown and described.

404,570. PIANO LAMP-BRACKET. WILLIAM A. SMITH, Butte City, Mont. Filed July 17, 1888. Serial No. 280,183. (No model.)



Claim.—1. A lamp-bracket for pianos, comprising an apertured base-plate provided with an arm, a horizontal arm secured to the arm of the base-plate, a sleeve on the said horizontal arm, an elbow-lever adjustably secured in the sleeve, and a lamp-stand secured to the horizontal member of the elbow-arm, substantially as described.

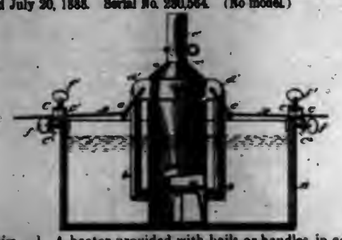
2. A lamp-bracket for pianos, comprising a four-armed base-plate having three of its arms apertured, a horizontal arm pivoted to one of the arms of the base-plate, a sleeve on the horizontal arm, a vertical arm adjustably secured in the sleeve and provided with a horizontally-projecting member, and a lamp-stand on the said horizontal member, substantially as herein shown and described.

3. A lamp-bracket consisting of base-plate 1, with arm 5, socket 6, horizontal rod 8, with socket 9, secured to socket 6 by pivot-pin 7 and having vertical sleeve 10, with set-screw 12 and vertical rod 11, held in sleeve 10 by set-screw 12, and having horizontal arm 14, with vertical socket 15, and lamp-standard 17, substantially as described.

404,571. HEATING AND STEAMING GRAIN. WILLIAM H. SMITH, Hickman, Tenn. Filed Jan. 29, 1889. Serial No. 297,998. (No model.)

Claim.—1. In an apparatus for heating and steaming grain, the combination, with a closed steam-vessel provided on top with a hood, of

a drying-chamber located centrally in the said steam-vessel and opening at its upper end into the said hood, and a steam-chest located in the said hood above the said drying-chamber and in communication with the said steam-vessel, substantially as shown and described.



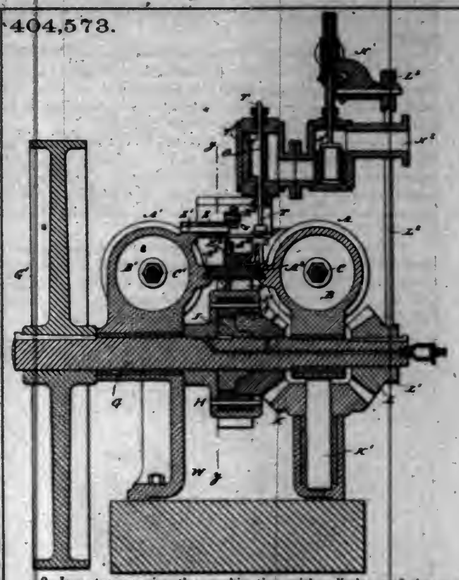
2. In an apparatus for heating and steaming grain, the combination, with a closed steam-vessel provided on top with a hood, of a drying-chamber located centrally in the said steam-vessel and opening at its upper end into the said hood, a steam-chest located in the said hood above the said drying-chamber and in communication with the said steam-vessel, perforated pipes held in the upper end of the said steam-chest and projecting into the inlet of the said hood, substantially as shown and described.

3. In an apparatus for heating and steaming grain, the combination, with a closed steam-vessel provided on top with a hood, of a drying-chamber located centrally in the said steam-vessel and opening at its upper end into the said hood, a steam-chest located in the said hood above the said drying-chamber and in communication with the said steam-vessel, perforated pipes held in the upper end of the said steam-chest and projecting into the inlet of the said hood, and a valve held in the said steam-chest for opening and closing the said perforated pipes, substantially as shown and described.

4. In an apparatus for heating and steaming grain, the combination, with a closed steam-vessel connected with a suitable source of steam-supply, a hood held on top of the said steam-vessel and provided with a grain-inlet pipe and a spout supported on the lower end of the said steam-vessel, of a drying-chamber held centrally in the said steam-vessel and opening at its upper end into the said hood and at its lower end into the said spout, pipes extending through the said drying-chamber into the said steam-vessel, a steam-chest held in the said hood above the said drying-chamber and in communication with the said steam-vessel, a pipe extending from the upper end of the said steam-chest, and perforated pipes extending transversely through the said pipe into the grain-inlet pipe, substantially as shown and described.

5. In an apparatus for heating and steaming grain, the combination, with a closed steam-vessel connected with a suitable source of steam-supply, a hood held on top of the said steam-vessel and provided with a grain-inlet pipe, and a spout supported on the lower end of the said steam-vessel, of a drying-chamber held centrally in the said steam-vessel and opening at its upper end into the said hood and at its lower end into the said spout, pipes extending through the said drying-chamber into the said steam-vessel, a steam-chest held in the said hood above the said drying-chamber and in communication with the said steam-vessel, a pipe extending from the upper end of the said steam-chest, perforated pipes extending transversely through the said pipe into the grain-inlet pipe, and a valve held in the said pipe to connect the same with or disconnect it from the steam-chest, substantially as shown and described.

404,572. WATER-HEATER. SIMON SPIRO, Birmingham, Ala. Filed July 30, 1888. Serial No. 280,564. (No model.)



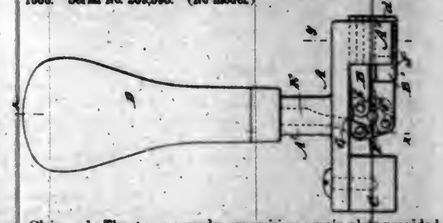
Claim.—1. A heater provided with bails or handles, in combination with the retaining-vessel, securing-straps engaging the handles or bails, and means for adjustably and detachably connecting the said straps to the retaining-vessel, substantially as described.

2. The heater provided with bails or handles, in combination with the brackets applied to a containing vessel or receptacle and having closed loops or eyes and flanges, the hooked plates or straps connecting with said bails or handles, and screws in the said brackets for adjustably connecting the plates to the brackets and detachably connecting the brackets to the receptacle, substantially as specified.

404,573. STEAM-ENGINE. ALFRED H. F. STRAUB, Los Angeles, Cal. Filed July 30, 1888. Serial No. 281,369. (No model.)

Claim.—1. In a steam-engine, the combination, with cylinders and pistons operating in the same, of steam-chests held on the said cylinders, slide-valves held in the said steam-chests, a valve-rod connecting the said slide-valves, a lever pivotally connected with the said valve-rod, and a bar secured to the pistons and sliding between the cylinders and operating on the said lever to shift the said slide-valves, substantially as shown and described.

404,573.

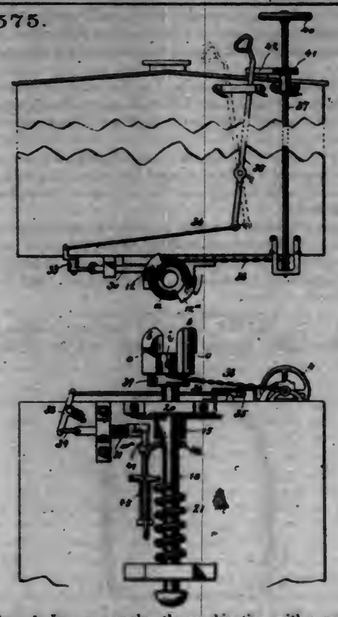


2. In a steam-engine, the combination, with cylinders and pistons operating in the same, of steam-chests held on the said cylinders, slide-valves held in the said steam-chests, a valve-rod connecting the said slide-valves, a lever pivotally connected with the said valve-rod, a bar having a reciprocating motion derived from the said pistons and operating on the said lever to shift the said slide-valves, and a cut-off valve connected with the said steam-chest and controlled by the said bar, substantially as shown and described.

3. In a steam-engine, the combination, with a cut-off valve, of a valve-stem carrying the said valve, a forked arm held on the said valve-stem and provided with friction-rollers, and a bar having a reciprocating motion derived from the action of the pistons, the said bar being provided with guideways for the said friction-rollers, substantially as shown and described.

4. In a steam-engine, the combination, with two slide-valves and a valve-rod connecting the said slide-valves, of a lever pivotally connected at one end with the said valve-rod and provided at its other end with a friction-roller, a bar having a reciprocating motion derived from the pistons, guideways formed on the top of the said bar and on which travels the said friction-roller, and stop-wheels held on the top of the said bar for reversing the said lever, substantially as shown and described.

404,574. STAMP-CANCELER. BENJAMIN SUMMERS, Petersburg, assignor of one-half to Caleb C. North, Huntingdon, Pa. Filed Apr. 4, 1888. Serial No. 269,595. (No model.)



Claim.—1. The stamp-canceler comprising a main plate provided with a handle and parallel cheek-pieces, in combination with a tumbler, a rod connected thereto, and blocks held between the cheek-pieces in ways and connected to the tumbler, whereby the downthrust of the handle will move the said blocks in a straight line between the cheek-pieces, substantially as described.

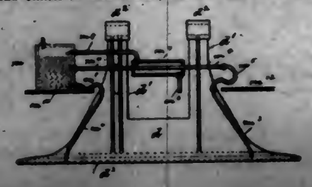
2. The plate A, having projection G and tumbler F pivoted thereto, and the rod E, attached to the tumbler, in combination with the blocks B B', connected to the tumbler on opposite sides of its pivot, substantially as described.

404,575. CAR-COUPLING. ALFRED SWENSON, Greenview, assignor to Peter J. Palmquist, Menard, Ill. Filed Mar. 12, 1889. Serial No. 302,948. (No model.)

404,575.

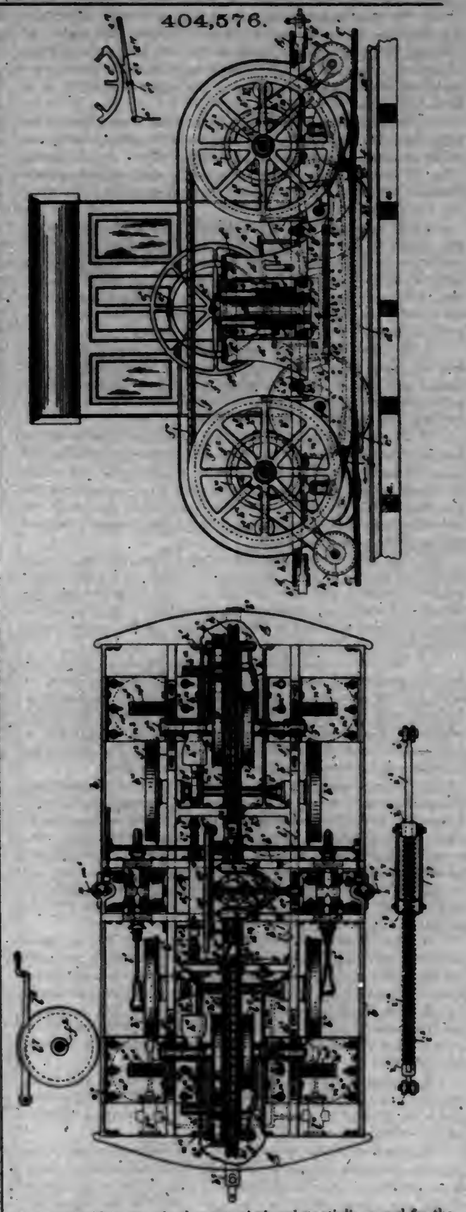
Claim.—1. In a car-coupler, the combination, with a spring-actuated draw-bar mounted to turn in its bearings and provided with beveled hooks, of a spring-actuated bolt for engaging the draw-bar and an operating-lever connected to said bolt, substantially as described.

2. In a car-coupler, the combination, with a draw-bar formed with a rib 14 and a boss 15, of a spring connected to the draw-bar and to a fixed portion of the car, a bolt arranged to engage the boss 15, a draw-head formed with hooks 12 and 12a, having inclined faces b, a chain connected at one end to the draw-bar, and a shaft to which the other end of the chain is connected, substantially as described.



3. In a car-coupler, the combination of the following elements: a draw-bar 10, formed as described, a spring 21, bolt 30, spring 31, arranged in connection with the bolt, a bolt 44, a spring 45, arranged in connection therewith, an arm 46, extending therefrom, a lever 33, connected to the bolt 30, a lever 35, a rod connecting the levers 33 and 35, a chain 38, and a shaft 37, all the parts being arranged substantially as described.

404,576. GRIP FOR CABLE RAILWAYS. CORNELIUS TIERS, New York, JOHN H. PENDLETON, Brooklyn, and ANDREW BRYSON, Jr., New York, assignors to the Rapid Transit Cable Company, New York, N. Y. Filed July 21, 1888. Serial No. 280,668. (No model.)



Claim.—1. The combination, with the stationary part of the grip and a support for the same, of a moving part having a hook at its lower end, a pivot-shaft for said hook to swing upon, means for raising and lowering said shaft, an endless belt against which the cable is clamped, and drums for supporting said belt, substantially as specified.

2. The combination, with the stationary part of the grip and a support for the same, of a moving part having a hook at its lower end, a pivot-shaft for said hook to swing upon, means for raising and lowering said shaft, an endless belt against which the cable is clamped, drums for supporting said belt, and means for rotating said drums and endless belt, substantially as specified.

3. The combination, with the stationary and moving part of the grip, the latter having a hook-shaped lower end, of an endless belt against which the cable is clamped, shafts and drums for supporting said belt, means for rotating said shafts and drums, a brake-wheel upon one of the shafts of said drums, and a brake for arresting the

404,576.

rotation of said brake-wheel and its shaft, substantially as and for the purposes specified.

4. The combination, with the stationary part of the grip and a support for the same, of the moving part of the grip, having a hook at its lower end, the cylinder d^9 and its plunger, the shaft d^{12}, passing through the plunger and supporting the moving part of the grip, the lever e' and arms e, the shaft e^3, ratchet-wheel e^4, and pawl-lever e^5 and the chain e^7, connecting the shaft e^3 to the lever e', substantially as specified.

5. The combination, with the stationary part of the grip, a support for the same, the moving part of the grip, the cylinder d^9, plunger d^8, and shaft d^{12}, of the lever e', arms e, the shaft e^3, ratchet-wheel e^4 and its pawl, the chain e^7, connected with said shaft e^3 and toggle-lever, and a spring connected with said chain, for the purposes specified.

6. The combination, in a gripping device for cable railways, of the stationary part of the grip, a pivoted moving part, means for lowering and raising said moving part of the grip, and a yielding connection to the moving part of the grip, so that said moving part may yield if the cable is obstructed in its passage in the grip, as set forth.

7. The combination, with the stationary and moving part of the grip, means for operating said moving part, the endless belt f, and shafts and drums for supporting said belt f, of the arm h', pivoted upon one of said shafts, the wheel h, carried by said arm h', the pulleys h^3 h^4 and band h^{12}, and means, substantially as specified, for lowering the wheel h, for the purposes set forth.

8. The combination, with the stationary and moving part of the grip, means for operating said moving part, the endless belt f, shafts and drums for supporting said belt, the arms h', wheels h, pulleys h^3 h^4, bands h^3, levers h^5, i, and i^3, links i', the arms h^{13} and rollers h^6, a connection between the arms h' and h^{13}, and a yielding connection between the lever i and the lever i^3, substantially as and for the purposes set forth.

9. The combination, with the stationary and moving part of the grip and means for operating said moving part, of the endless belt f, formed of bands of leather or other material, to which blocks of leather are secured, and means for supporting said endless belt, substantially as and for the purposes specified.

10. The combination, with the gripping device and the car-frame and its wheels and axles, of the pairs of pulleys n, supports for said pulleys fitted to move upon the car-frame, the springs n^6, the wheels n^3, carried by said pulley-supports, and a rail n^7, supported upon the cross-ties for moving and keeping the pulleys upon one side of the car into contact with the cable when the car is traveling upon a curved portion of the road, as set forth.

11. The combination, with the cable railway, the car, and its wheels and axles, a gripping device upon the car, and guide-pulleys and their supports, also upon the car, of a rail supported upon the railway structure at the curved portion thereof to act upon said guide-pulleys and keep the cable toward the center of the curved track, substantially as set forth.

12. The combination, with the stationary and moving part of the grip, the toggle-arms, chain, shaft, ratchet-wheel, and pawl-lever for holding up the moving part of the grip, of the lever o^2, connected to the pawl-lever by a link, an incline o^4 upon the roadway for disconnecting the pawl-lever and allowing the moving part of the grip to drop, and the shear o^5, for moving the hook of the grip from under the cable, substantially as and for the purposes specified.

13. The combination, with the stationary and moving part of the grip, of the plunger d^4, connected to said moving part of the grip, the toggle-arms, shaft c^3, chain, ratchet-wheel, and pawl-lever, the spring p', connected to said shaft c^3, the cylinder d^1, a reservoir containing compressed air, a pipe connecting said reservoir with the plunger-cylinder, a cock in said pipe, an arm connected with the plug of said cock, and an incline o^3 upon the roadway for moving said arm and opening the cock to admit compressed air to the plunger-cylinder and lift said plunger and the moving part of the grip, as specified.

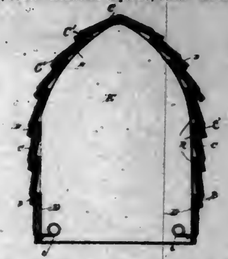
14. The combination, with the gripping device, the car upon which it is mounted, a reservoir containing compressed air upon said car, the inclines o^4 o^5 o^3, and shear o^5 upon the roadway, and mechanism, substantially as specified, operated by said inclines, so that at the terminals of cable-sections the moving part of the grip is dropped and swung out from beneath one section of cable and then swung under and lifted to connect the cable of the next section with the grip, as specified.

15. The combination, with the stationary and moving part of the grip and means, substantially as specified, for supporting said moving part of the grip, of the links c^{11} c^{12} and rod c^{13}, for swinging the moving part of the grip by hand, as set forth.

16. The combination, with the stationary and moving part of the grip and the endless belt against which the cable is clamped, of a shoe of wrought-iron or other suitable material upon the stationary portion of said grip, against which shoe the inner surface of the endless belt is pressed when the cable is clamped by the grip, as set forth.

17. The combination, with the stationary part of the grip, of the moving part of the grip, having a hollow hook, a tank containing water or other fluid, and pipes connecting the respective ends of the hook with said tank, so that water or other fluid is caused to circulate through the hook as soon as the latter becomes heated, as set forth.

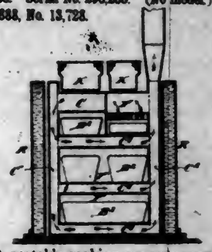
18. The combination, with the stationary part of the grip, of the moving part having a hollow hook, a tank containing water or other fluid, pipes connecting the respective ends of the hook with the tank, and a jacket for receiving exhaust compressed air surrounding the return water-pipe, so that the water or other fluid in the pipes and tanks is cooled by exhaust compressed air, as set forth.



19. The combination, with the stationary part of the grip, of the moving part having a hollow hook, a tank containing fluid, and pipes connecting the grip with said tank, so that the fluid is caused to circulate through the grip as the latter becomes heated, substantially as set forth.

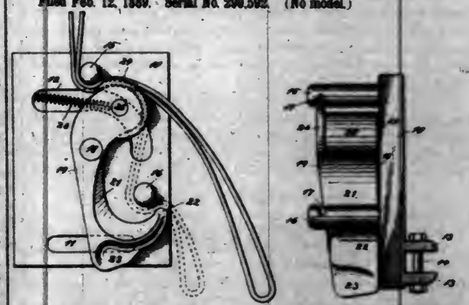
20. The combination, with the grip mechanism, one part of which is hollow, of a fluid-supplying device that causes the fluid to pass through the hollow part of the grip for cooling the same, substantially as specified.

21. The combination, in a grip for cable railways, of an endless belt against which the cable is clamped and means for putting said belt in motion prior to the contact of the cable with said belt, substantially as specified.



22. The combination, in a grip for cable railways, of an endless belt against which the cable is clamped, drums for supporting said belt, a wheel that is rotated by the cable, and a connection between said wheel and one of said drums for giving motion to said endless belt, substantially as specified.

404,577. HAY-CAP. WALTER R. THATCHER, Oskaloosa, Iowa. Filed May 18, 1887. Renewed Sept. 28, 1888. Serial No. 286,704. (No model.)



Claim.—The herein-described hay cap, roofing, and siding for temporary structures, consisting of the overlapping boards A, having perforations B at the ends near the lower edges thereof, and the single securing-wire C, passing over the outer surface of the one board A and through the apertures B therein and down over the outer surface of the next board and throughout the series, and secured by its end loops c, as set forth, substantially as described.

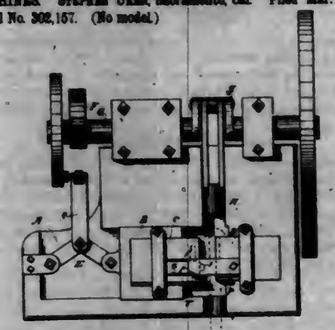
404,578. PORTABLE COOKING STOVE AND UTENSILS. ALFRED S. TORKINS, Holmwood, Caterham, County of Surrey, England. Filed Nov. 7, 1888. Serial No. 290,235. (No model.) Patented in England Sept. 22, 1888, No. 13,728.

Claim.—A portable cooking apparatus consisting of fire-place F, flues C C C^3, chimney C^4, ovens F', and boilers K, in combination with water-casing R, substantially as described.

404,579. REIN-HOLDER. WILLIAM F. TURNAM, Weatherford, Tex. Filed Feb. 12, 1889. Serial No. 299,502. (No model.)

Claim.—1. The combination, with a base-plate provided with spaced posts attached to one side thereof, of a lever pivoted to said

plate and provided with a cylindrical surface at one end and an essentially hook-shaped extremity at the opposite end adapted for engagement with the said posts, substantially as shown and described.



2. The combination, with a base-plate provided with spaced posts upon one surface, of a lever pivoted upon said base-plate, provided with a cylindrical surface at one end, with a flange integral with the outer face projecting beyond said cylindrical surface, and an essentially hook-shaped extension at the other extremity, all combined for operation substantially as shown and described.

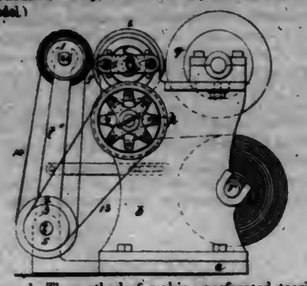
3. The combination, with a base-plate and spaced posts upon one face of the said plate grooved on their adjacent sides, of a spring-actuated lever provided with a cylindrical surface at one end and a flange projecting from the outer face beyond said surface, the opposite extremity of the lever being curved to form, essentially, a hook, the cylindrical surface being adapted for engagement with one post and the hook extremity with the other post, substantially as shown and described.

4. The combination, with a base-plate provided with a curved slot near one end and posts projecting at a right angle from one face of the plate at opposite sides of the said slot, of a lever pivoted below the slot, provided with a cylindrical upper end, and a flange projected from the outer surface beyond the said cylindrical end and grooved on their adjacent sides, and a concaved inner face terminating in a hook-extension, a stud projected downward from the lever through the curved slot, and a spring secured to one wall of the slot and to the said stud, all combined for operation substantially as specified.

5. The combination, with a base-plate provided with a curved slot near one end, a transverse slot near the opposite end, a rib or flange extending downward from the under face of the said base-plate at each side of the transverse slot, and posts projected from the outer face of the said base-plate at opposite sides of the curved slot, of a lever pivoted upon the outer face of the base-plate, provided with an upper cylindrical end surface, and a flange projecting from the outer face beyond the cylindrical surface, a concave inner face, and a hook-extension at the lower end continuous with the said concave inner side, a stud projected downward from the inner face of the lever through the curved slot, and a spring connected with one wall of the slot and the said stud, substantially as shown and described.

404,580. SLOT-MAKING ATTACHMENT FOR BOLT-HEADING MACHINES. STEPHEN UREN, Sacramento, Cal. Filed Mar. 6, 1888. Serial No. 302,157. (No model.)

Claim.—1. In a bolt-heading machine and in combination with its dies, between which the bar is clamped, a fixed punch in one die adapted to make a slot or keyway in the end of the bolt, a punchway in the other die for receiving the punch after it passes through the bolt, and a guard-plate for preventing the bolt from spreading, substantially as described.



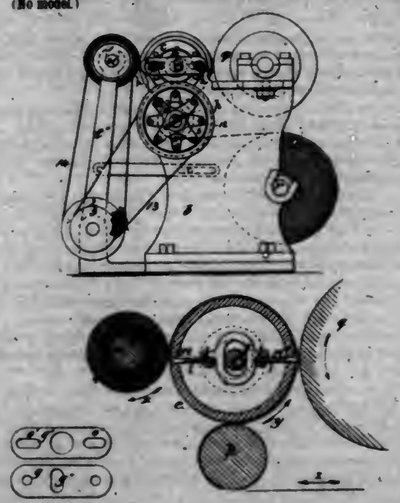
2. In a bolt-heading machine and in combination with its dies, between which the bar is clamped, a fixed punch in one die adapted to form a slot or keyway in the end of the bolt, a fixed guard-plate above and below said punch for preventing the bolt from spreading as the punch passes through it, and suitable ways in the opposing die for receiving the punch and guard-plates, substantially as described.

3. In a bolt-heading machine, the movable die C and the fixed die D, between the faces of which the bar is clamped, and a reciprocating plunger for upsetting the end of the bar to form the head of the bolt, in combination with the punch-strip secured in and projecting from the face of the movable die and adapted to make the slot or keyway in the end of the bolt, the punchway in the opposing face of the fixed die adapted to receive the punch-strip, and a guard-plate for preventing the bolt from spreading, substantially as described.

4. In a bolt-heading machine, the movable die C and the fixed die D, between which the bar is clamped, and the reciprocating plunger for upsetting the end of the bar, in combination with the punch-strip projecting from the face of the movable die and adapted to make a slot or keyway in the end of the bolt, the projecting guard-plates above and below said punch-strip and secured to the movable die, and the ways in the opposing fixed die for receiving the punch-strip and the guard-plates, substantially as described.

5. In a bolt-heading machine and in combination with the opposing dies by which the bar is gripped and held, said dies being made in two parts, as described, in combination with the independent guard-plates secured between the parts of one of the dies and projecting from its face, the independent punch-strip secured between said guard-plates and projecting from the face of the die, and the grooved punchway-shoes secured between the parts of the opposing die, substantially as described.

404,581. METHOD OF MAKING PERFORATIONS IN PAPER. SETH WHEELER, Albany, N. Y. Filed May 2, 1885. Serial No. 164,196. (No model.)



Claim.—1. The method of making perforated tearing-lines in paper, consisting of presenting plain paper to an abrading-surface and thereby grinding away portions of the paper in the lines desired, substantially as described.

2. The method of making perforated tearing-lines in paper, consisting of projecting plain paper by a series of teeth against a rotating abrading-surface and thereby grinding away the paper on said teeth, substantially as described.

3. The method of making perforated transverse tearing-lines in a web of paper, consisting of continuously moving the web and intermittingly projecting it by a series of teeth against a rapidly-moving abrading-surface and thereby grinding away the paper on said teeth, substantially as described.

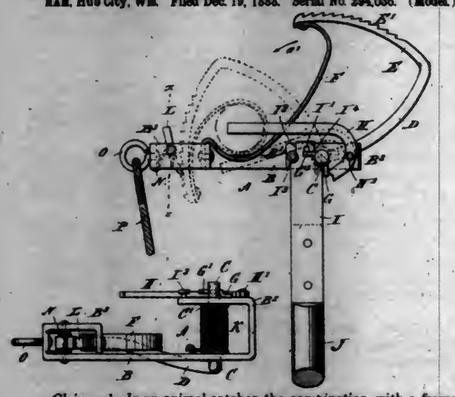
404,582. MACHINE FOR MAKING PERFORATIONS IN PAPER. SETH WHEELER, Albany, N. Y. Filed May 2, 1885. Serial No. 164,197. (No model.)

Claim.—1. In a paper-perforating machine, the roller having an abrading-surface, in combination with the rotating cylinder carrying the intermittingly-projected teeth, substantially as described.

2. In a paper-perforating machine, the roller having an abrading-surface, in combination with the rotating cylinder, the eccentric shaft, and the plates having teeth intermittingly projected, substantially as described.

3. In a paper-perforating machine, the roller having an abrading-

surface, in combination with the rotating cylinder, the adjustable eccentric shaft, and the plates having teeth intermittingly projected, substantially as described.



4. In a paper-perforating machine, the roller having an abrading-surface and the cylinder in which are mounted intermittingly-projected teeth, in combination with the rotating feeding and winding rolls by which a web of paper is continuously fed between said roller and cylinder, substantially as described.

5. In a paper-perforating machine, the combination of a roller having an abrading-surface, the cylinder carrying intermittingly-projected teeth, the feed-roll, the winding-roll having a friction-pulley on its shaft, and the driving-belts, substantially as described.

6. In a paper-perforating machine, the roller having an abrading-surface and the cylinder carrying intermittingly-projected teeth, in combination with the feeding-roll, the winding-roll and its adjustable friction-pulley, and the driving-belts, substantially as described.

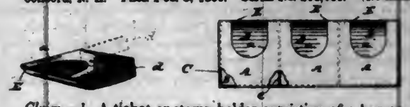
7. The combination, with an abrading-roll, of a cylinder containing slots n and n', through which project teeth m and m', constructed on plates, such plates being attached to yokes, a shaft f set eccentric to the cylinder e and the plates $g\,g\,g\,g'$, so that the teeth $m\,m'$ will alternately project beyond the periphery of the cylinder e when opposite the periphery of the abrading-roll q and be withdrawn within such slots during the remainder of the revolution of such cylinder, substantially as described.

404,583. DEVICE FOR CATCHING ANIMALS. THOMAS WICKHAM, Hub City, Wis. Filed Dec. 19, 1888. Serial No. 294,036. (Model.)

Claim.—1. In an animal-catcher, the combination, with a frame, of a segmental arm fulcrumed on the said frame and actuated by a spring, and a band secured to the said frame and the said segmental arm, substantially as shown and described.

2. In an animal-catcher, the combination, with a frame, of a segmental arm fulcrumed on the said frame and actuated by a spring, a band secured on the said segmental arm and the said frame, and a tripping device for locking the said segmental arm in an open position, substantially as shown and described.

3. In an animal-catcher, the combination, with a frame, of a segmental toothed arm fulcrumed on the said frame and actuated by a spring, a band secured to the said frame and the said segmental arm, and a spring-pawl fulcrumed on the said frame and adapted to engage the said toothed segmental arm, substantially as shown and described.



4. In an animal-catcher, the combination, with a frame, of a segmental toothed arm fulcrumed on the said frame and actuated by a spring, a band secured to the said frame and the said segmental arm, a spring-pawl fulcrumed on the said frame and adapted to engage the said toothed segmental arm, and a rope connected with one end of the said frame, substantially as shown and described.

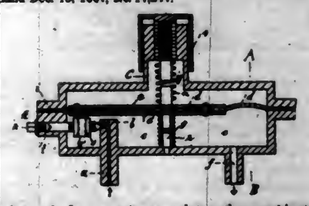
5. In an animal-catcher, the combination, with a frame, of a segmental toothed arm fulcrumed on the said frame and actuated by a spring, a band secured on the said segmental arm and the said frame, a spring-pawl fulcrumed on the said frame and adapted to engage the said toothed segmental arm, and a handle for holding the said frame and adapted to be detached, substantially as shown and described.

6. In an animal-catcher, the combination, with a frame and a handle held on the said frame and adapted to be detached, of a shaft mounted to turn in the said frame and actuated by a spring, a tripping-arm held on the said shaft and adapted to hold the said handle in place, a tripping-lever fulcrumed on the said frame and engaged by the said tripping-arm, a segmental arm held on the said shaft, and a band secured to the said segmental arm and the said frame, substantially as shown and described.

7. In an animal-catcher, the combination, with a frame and a handle held on the said frame and adapted to be detached, of a shaft mounted to turn in the said frame and actuated by a spring, a tripping-arm held on the said shaft and adapted to hold the said handle in place, a tripping-lever fulcrumed on the said frame and engaged by the said tripping-arm, a segmental arm held on the said shaft, a band secured to the said segmental arm and the said frame, and a spring-pawl fulcrumed on the said frame and adapted to engage notches in the said segmental arm, substantially as shown and described.

404,584. TICKET AND STAMP HOLDER. ALFRED WILLIAMSON, Concord, N. H. Filed Feb. 5, 1889. Serial No. 298,709. (No model.)

Claim.—1. A ticket or stamp holder consisting of a box or case having vertical sides and back, the latter being open, a flat top having a curvilinear opening at its front, a curved bottom converging to a point adjacent with the front edge of said top, whereby a slot is formed for the extraction of a single ticket or stamp, and a hinged cap for normally closing the open back of said box or case, all substantially for the purpose set forth.

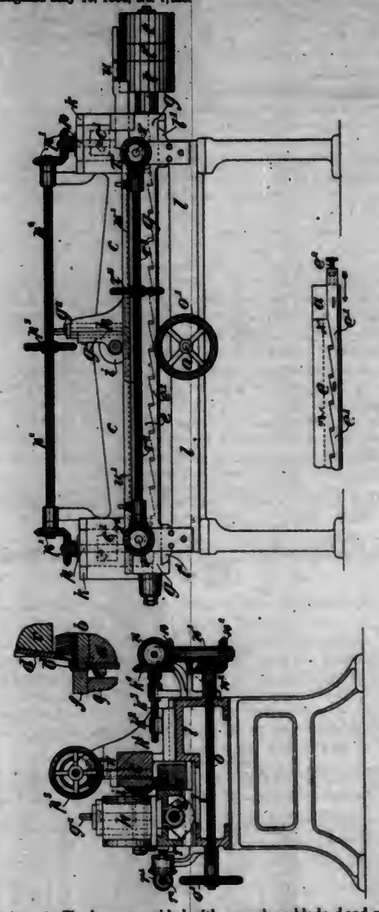


2. A ticket or stamp holder consisting of a box or case having vertical sides and back, the latter being open, a flat top having a curved opening at its front, a curved bottom converging to a point adjacent with the front edge of said top for the extraction of a single ticket or stamp, and a hinged cap for normally closing the open back, and the curvilinear opening in the flat top of said box or case.

404,585. COMBINED POT AND PROTECTOR FOR SEEDLINGS, &c. WILBUR L. WRIGHT, Bristol, Conn., assignor of one-half to Sigourney Bros., same place. Filed Feb. 11, 1889. Serial No. 299,397. (No model.)

Claim.—As a new article of manufacture, a combined pot and protector for seedling and other plants, made of paper and having a folded bottom, the folds whereof are adapted to be pulled out when the plant is set out, so as to permit the pot to be pulled up over and away from the roots of the plant and form a protector for the stem and leaves thereof.

404,586. PRESSURE REGULATING OR REDUCING VALVE. EMIL ANDER, Hanover, Germany, assignor to Franz Honser & Co., same place. Filed May 17, 1888. Serial No. 274,180. (No model.) Patented in Germany May 15, 1886, No. 40,647, and Mar. 3, 1887, No. 42,336; in France June 24, 1886, No. 176,992; in Belgium Apr. 26, 1887, No. 77,223; in Austria-Hungary July 22, 1887, No. 3,814 and No. 30,450, and in England Dec. 15, 1887, No. 17,277.



Claim.—1. In a pressure-regulator, the combination, with the casing, of a flexible diaphragm provided with stiffening-plates and a spring secured at one end to the casing, a valve connected with the diaphragm, two springs in positions to press, respectively, the opposite sides of the diaphragm, and a screw-cap by which one of said springs may be compressed, substantially as described.

2. The combination, with a flexible diaphragm d, which is provided with stiffening-plates, of a spring i, connected with the casing, a valve b, provided with a nut s, and a collar d', which is firmly connected with the diaphragm, substantially as and for the purposes described.

3. In combination with the casing provided with an aperture and a screw-plug to close the same, a needle-valve b, which extends into said aperture, a flanged nut on said valve, a collar placed loosely on said nut, and a flexible diaphragm with which said collar is firmly connected, substantially as set forth and described.

404,587. MACHINE FOR SECURING CLOTHING TO CARDING-ENGINES. ELIJAH ASHWORTH, Manchester, County of Lancaster, England. Filed July 10, 1888. Serial No. 279,513. (No model.) Patented in England May 19, 1888, No. 7,495.

Claim.—1. The bar c, provided with a comb or blade d and vertically and horizontally sliding carriage carrying the said bar, in combination with a vise or bed for holding the carding-engine flat-bar while the said comb or blade is pressed down upon the fabric of the card-clothing on such flat-bar and is moved in a direction across the flat-bar to stretch the said fabric, substantially as set forth.

2. The combination, with a vise or bed for holding a carding-engine flat-bar, of the bar c, provided with a comb or blade, carriages k', upon which the bar is mounted to slide in a direction at right angles to the face of the flat-bar, feed-screws for the bar, devices connecting the feed-screws to operate them together, feed-screws to move the carriage in a direction parallel with the face of the flat-bar, and devices, substantially as described, connecting these latter feed-screws to operate them together, substantially as and for the purpose set forth.

3. The combination of a vise or bed for holding the carding-engine flat-bar, a clamp for holding a clip to the under side of the flat-bar, and mechanism for bending the upper flange of the clip, with a clamping-plate f, a carriage g, upon which the plate is mounted and which can be moved toward and from said flat-bar, and coupled screws for moving the carriage to and fro and maintaining its parallelism with the edge of the flat-bar, all substantially as set forth.

4. The combination of a vise or bed for holding a carding-engine flat-bar with a clamping-plate e to hold a metal clip to the under side of the bar, means for pressing the said clamping-plate upward toward the back of the flat-bar, and mechanism, substantially as set forth, for bending the clip down onto the upper side of the bar, all substantially as set forth.

5. The combination of a vise or bed for holding a carding-engine flat-bar with a bar having a comb or blade to hold down the fabric of the card-clothing upon the said bar, a clamping-plate e and means for pressing it up toward the back of the bar, a clamping-plate f to hold the metal clip against the edge of the bar, and mechanism for bending the clip down onto the edge of the card-clothing.

6. The combination of a vise or bed for holding a carding-engine flat-bar with a bar having a comb or blade to hold the card-clothing in position upon the bar, clamps for holding a metal clip against the edge and back of the bar, and a rotating pressing-disk and a sliding carriage carrying the disk to close down the upper flange of the clip upon the margin of the card-clothing, substantially as set forth.

404,588. BRUSH. CHARLES J. BAILEY, Newton, Mass. Filed Nov. 9, 1888. Serial No. 290,357. (No model.) Patented in England Oct. 27, 1887, No. 14,630; in France Oct. 27, 1887, No. 186,635; in Canada Nov. 3, 1887, No. 27,920, and in Belgium June 6, 1888, No. 82,074.

Claim.—The back a and the cylindrical flat-ended teeth b, made integral with the back and of soft or flexible rubber and constituting a brush soft or flexible throughout, substantially as described.

404,589. FOLDING CHAIR FOR STEAMERS, &c. CHARLES P. BATT, Brooklyn, N. Y. Filed Feb. 13, 1888. Serial No. 299,702. (No model.)

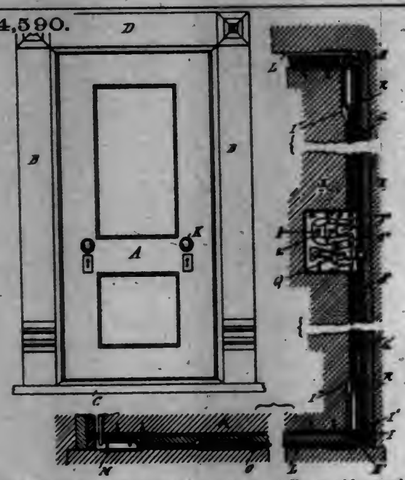
Claim.—1. The combination of the seat and back of a folding chair pivoted together, with side arms connected to the seat and resting upon supports on the chair-back, and having a brace resting against the rear of the side bars of the latter to support the seat, substantially as described.

2. The combination of the seat and back of a folding chair pivoted together, with side arms pivoted to the seat and resting upon supports on the chair-back and provided with stops near their ends which engage with the rear edges of the side bars of the back to support the seat, the said side arms hanging down behind the back when the chair has been folded up with the seat against the back, all substantially as described.

3. The combination of the seat and back of a folding chair pivoted together, with side arms pivoted to the chair-seat near the front of the latter, the side arms having supports on the chair-back, and being connected together behind the latter by a cross-brace bearing on said back to support the seat, substantially as described.

4. The combination of the seat and back of a folding chair pivoted together, with front legs forming a continuation of the chair-back, and back legs forming a continuation of the chair-seat, and side arms pivoted to the chair-seat and resting upon supports on the chair-back, and having a cross-brace behind the latter to support the seat, all substantially as described.

5. The combination of the seat of a folding chair with side arms connecting the seat with the back, and headed bolts passing through the seat and pivot-pins connecting the bolts with the ends of the arms, substantially as described

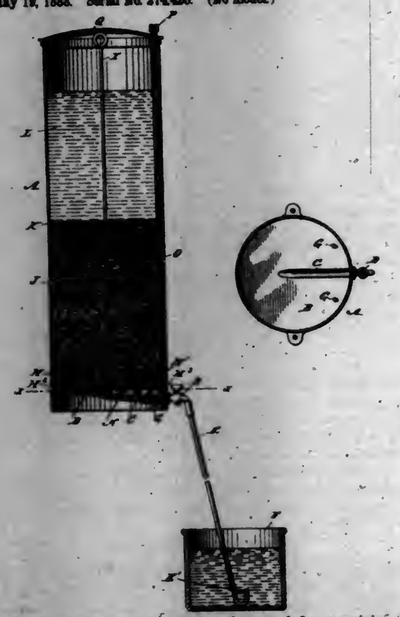


404,590. COMBINED DOOR LOCK AND HINGE. LOUIS BENFELDT and JOHN CHATEAU, Detroit, Mich. Filed Dec. 10, 1888. Serial No. 293,089. (No model.)

Claim.—1. A combined door lock and hinge, consisting of vertical rods normally extended and adapted to enter suitable apertures in the threshold and top rail of a door-frame, combined with a latch arranged at right angles to said rods to engage the extended ends thereof, substantially as described.

2. A combined door lock and hinge, consisting of two pairs of vertical rods, a spring adapted to normally expand them, suitable apertures in the threshold and top rail, and spring-catches adapted to engage with the extended ends of the rods, substantially as described.

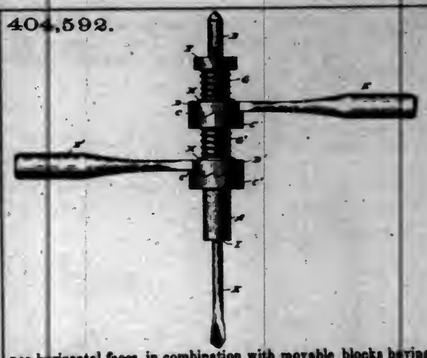
3. In a combined door lock and hinge, the combination of two pairs of vertical rods normally extended by a spring beyond the top



404,590.

and bottom of the door, the notches—such as J J'—in said extended portions, the spring-latches K', adapted to engage in said notches, and suitable latch mechanism for operating the vertical rods, substantially as described.

4. In a door provided upon both edges with vertical grooves, caps or moldings, two pairs of spring-actuated rods in said grooves adapted to be used as a lock or hinge for the door, combined with spring-catches movable at right angles to said rods, substantially as described.



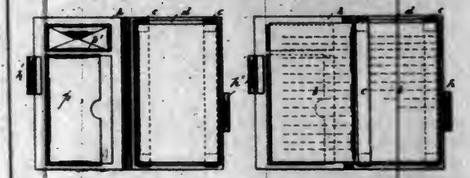
404,591. PERCOLATOR. THOMAS BOTCH, New York, N. Y. Filed May 19, 1888. Serial No. 274,420. (No model.)

Claim.—A percolator comprising the vessel for containing the menstruum and drug, having the chamber in its bottom under the strainers, a suction-tube leading down into the chamber and having a closure at its upper end, a discharge-cock leading from the chamber, and a tube depending from said cock and provided with an upward bend at its lower end, substantially as set forth.

404,592. RATCHET-DRILL. HENRY REINEMANN, Philadelphia, Pa. Filed Feb. 26, 1889. Serial No. 301,022. (No model.)

Claim.—1. In a ratchet-drill, a stem and permanent blocks rigidly secured thereto, said blocks having recesses cut into their upper horizontal faces, in combination with movable blocks having recesses cut into their lower horizontal faces and adapted to correspond with the ratchet formed by the recesses in said permanent blocks, said movable ratchet-blocks having handles rigidly secured to them, substantially as described.

2. In a ratchet-drill, a stem having ratchet-blocks rigidly secured thereto, said rigid blocks having recesses cut in their upper faces, in combination with movable ratchet-blocks adapted to rotate upon said stem and resting on the tops of said rigid blocks, and coiled springs on the tops of said movable blocks for holding said movable blocks in place independently, said movable blocks provided with handles rigidly secured thereto, substantially as described.



404,593. RULER. ARTHUR BROWN and PETER C. PAYETTE, Detroit, Mich. Filed Jan. 3, 1889. Serial No. 295,283. (No model.)

Claim.—1. The combination of a ruler grooved on both its edges and a metal straight-edge secured to the ruler and projecting centrally therefrom, one of the grooved edges of said ruler having inches and fractions of inches indicated thereon, substantially as described.

2. The combination, with a ruler grooved on both its edges, of a metal straight-edge set out centrally therefrom and secured to said ruler at its ends only, substantially as described.

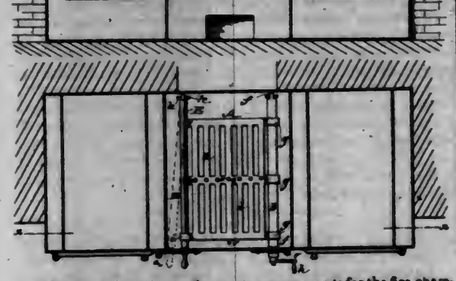
404,594. PAPETERIE. ADOLPH BÜHLER, Reichenhall, Bavaria, Germany. Filed Sept. 14, 1888. Serial No. 285,421. (No model.)

Claim.—1. The combination, with a package of double sheets of letter-paper or of a plurality of superposed envelopes arranged with their sealing-flaps overlapping one another, of a holder c, of greater length than the paper or envelopes, and inserted between the two pages of the inner sheet of paper or under the flap of the upper envelope of the package along the fold thereof, and a backing of more or less rigid material to which said holder is secured, as described, for the purposes specified.

2. A block of letter-paper comprising a backing of more or less rigid material, a plurality of superposed packages of double-sheet letter-paper, said packages being arranged with their folded portions alternating with the edges of the sheets, and a holder c for each package inserted in the inner sheet along the fold thereof, the ends of said holder being secured to the backing, as described, for the purposes specified.

3. The combination, with a package of envelopes arranged with their sealing-flaps overlapping one another, of a holder consisting of a strip c, of more or less flexible material, provided with a slit or slot for the passage of said sealing-flaps, and a backing to which the strip c is secured, as described, for the purposes specified.

4. The combination, with two packages of envelopes c, arranged relatively to each other, as described, the holder or holders c for said packages, and a backing, of more or less rigid material, to which said holder or holders are secured, of a fastener secured to said backing and arranged to overlap the contiguous edges of the packages of envelopes, substantially as described, for the purposes specified.



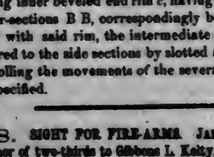
5. A block of letter-paper or envelopes comprising a plurality of superposed packages of such, arranged as described, and the holders c for the individual packages, and a backing or wrapper to which said holders are secured, said backing or wrapper being constructed to inclose the block of paper or envelopes, substantially as described, for the purposes specified.

6. The herein-described article of papeterie, comprising a doubled or folding wrapper, a block of envelopes consisting of a series of packages of such, holders for each individual package secured to the wrapper, as described, and a block of letter-paper consisting of a plurality of packages of such, holders for each individual package thereof, and a backing to which said holders are secured, said parts being arranged and combined substantially as described, and for the purposes specified.

7. The herein-described article of papeterie, comprising a double or folding wrapper A, provided on its edges with loops K, a block of envelopes consisting of a series of packages c of such, holders for each individual package secured to the wrapper, and a block of letter-paper consisting of a plurality of packages a of such, holders for each individual package thereof, and a backing to which said holders are secured, said parts being arranged and combined substantially as shown and described, and for the purposes specified.

8. The herein-described article of papeterie, comprising a double or folding wrapper A, provided on two of its meeting edges with loops K, and on one-half of its inner face with receptacles p and p, a block of envelopes consisting of a plurality of packages c of such, holders for each individual package secured to the wrapper, and a block of letter-paper consisting of a plurality of packages a of such, holders for each individual package thereof, and a backing d, to which such holders are secured, said parts being arranged and combined substantially as shown and described.

404,595. GRATE FOR RANGES, STOVES, OR FURNACES. SALVATORE J. DOMINI, New York, N. Y. Filed Feb. 13, 1889. Serial No. 299,710. (No model.)



Claim.—1. In reciprocating-grate arrangements for the fire-chambers of ranges and other heating structures, the combination, with the reciprocating fire-grate A, composed of a series of connected parallel grate-bars a, all made to reciprocate in common, of the bed-plate B of the fire-chamber, beneath which the upper surfaces of said bars at their ends work, provided on its opposite sides, which are transverse to the line of motion of the grate, with projections c, arranged to enter down between the grate-bars, whereby and without specially constructing the grate-surface for the purpose fuel is prevented from being carried by the reciprocating grate beneath the bed-plate to jam or interfere with the free motion of the grate, essentially as shown and described.

2. In a shaking grate for ranges and other heating structures, the combination, with the bed-plate of the fire-chamber, of the reciprocating grate arranged below said bed-plate and provided with one or more clips on its one side and one or more toe rests or supports on its opposite side, a rocking bar fitted to pass loosely through the clip or clips of the grate and adapted to rock or turn the grate in common with it, and a laterally-movable rod or lever on the opposite side of the grate adapted to pass either under or from beneath the toe rests or supports of the grate, substantially as specified.

3. The combination, in a range or other heating structure, of the reciprocating and laterally-damping grate A, provided with socket-like clips g on its one marginal side and toe-rests i on its opposite marginal side, the laterally-adjustable rod or lever E on the toe-rest side of the grate, and the rocking bar D, adapted to pass loosely through said clips and to turn the grate in common with it and detachably fitted to its place and through the clips, whereby the grate may be readily removed when required, substantially as specified.

404,596. SHEET-METAL PACKAGE. FRANK G. CALDWELL, Wheeling, W. Va. Filed Feb. 26, 1889. Serial No. 301,070. (No model.)

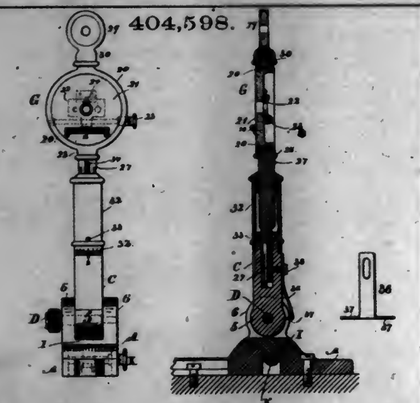
Claim.—1. As an article of manufacture, a sheet or sheets of metal rolled into cylindrical form and having folds or laps formed on the side edges of the outer portion of the outer sheet and surrounded at each end with metal guards having lapped or folded edges that engage the folds or laps on the metal sheet, said guards being also secured to wooden cross-pieces at the ends of the roll, substantially as described.

2. As a new article of manufacture, a sheet or sheets of metal rolled into cylindrical form and having folds or laps formed on the side edges of the outer portion of the outer sheet and surrounded at each end with metal guards having lapped or folded edges that engage the folds or laps on the metal sheet, said guards being secured to wooden cross-pieces at the ends of the roll, and the inner cross-pieces being provided with circular blocks or projections that are closely surrounded by the metal sheet or sheets, substantially as described.

3. The combination, with a sheet-metal roll, of the metal guards 5, engaging the side edges of the outer portions of the outer sheet of said roll, and the wooden cross-strips 6 and 7 at the ends of the roll and secured to said guards, substantially as described.

4. The combination, with a sheet-metal roll, of the metal guards 5, engaging said roll at both ends, the recessed wooden strips 6, having blocks or projections 8, entering the said roll, and the wooden strips 7, engaging the recesses in the strips 6, said strips being secured to the metal guards, substantially as described.

404,597. COVER FOR BUTTER-TUBS, &c. HENRY C. CARTER, New York, N. Y. Filed Mar. 5, 1889. Serial No. 301,947. (No model.)



Claim.—1. An expanding and contracting cover for tubs and other vessels or packages, composed of independent side sections, a sliding wedge-shaped section in between the side sections, secured to the latter by slotted attachments, and pins or studs controlling the movement of the wedge-section and side sections relatively to each other, substantially as specified.

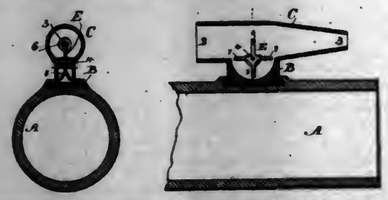
2. In sectionally-constructed covers for tubs and other vessels or packages, the sections B B, having grooves f in their inner edges, in combination with the intermediate sliding web-section C, provided on each of its opposite edges with a longitudinally-slotted web adapted to fit within the grooves f, and pins or studs g, passing through said slotted webs and securing the several sections together and controlling their movement relatively to each other, essentially as described, and whereby the wedge-section is made to form a handle for lifting and placing the cover, as set forth.

3. In combination with a tub or vessel provided with a shoulder b and projecting inner beveled end rim c, having opposite recesses d d in it, the cover-sections B B, correspondingly beveled on their outer edges to lock with said rim, the intermediate sliding wedge-shaped section C, secured to the side sections by slotted attachments, and pins or studs controlling the movements of the several cover-sections, substantially as specified.

404,598. SIGHT FOR FIRE-ARMS. JAMES W. CARVER, Pawlet, Vt., assignor of two-thirds to Gibbons L. Kelly, Brooklyn, N. Y. Filed Nov. 24, 1888. Serial No. 291,781. (No model.)

404,598.

Claim.—1. The combination, with the sight G, having a circular rim 20, of a screw at the top thereof and a screw-socket 28 at the bottom of the screw-rod 27, and a support for the same, there being a screw-thread at the top fitting the socket 28 and the second sight 29, with a screw-socket 30 fitting either the screw on the ring 20 or on the standard 27, substantially as specified.



2. The standard C and base A, hinged together, the screw-rod 27, having a prismatic lower end and entering a corresponding longitudinal hole in the standard C, in combination with the sight supported by the rod 27, the tubular nut 32, surrounding the upper end of the standard C and acting upon the screw-threaded exterior of the rod 27, substantially as specified.

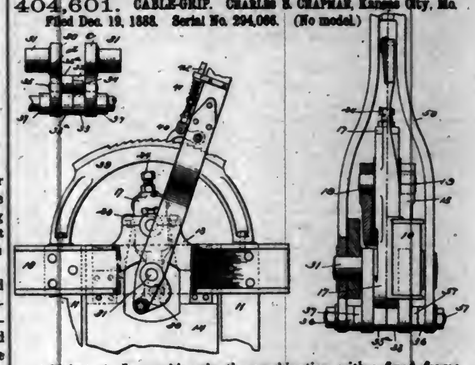
3. The combination, with the base A, joint-pieces 6, and hinge-pin D, of the standard C, through the lower portion of which the hinge-pin D passes, a spring 36, having T-shaped projections for passing into grooves in the hinge-pieces 6, and the attaching-screw passing through the slot in the spring, whereby the standard can be adjusted and held in a vertical position, substantially as set forth.

4. The combination, with the sight and the screw-rod 27, connected therewith, of the standard C, into which the lower end of the rod 27 passes, the tubular nut 32, surrounding the upper end of the standard and having an internal screw-thread receiving the screw-rod 27, there being divisions upon the standard C and upon the nut 32 and rod 27, for indicating the vertical adjustment of the sight, substantially as set forth.

5. The base A, having a transverse groove, in combination with the transverse slide I, adjusting-screw K, the standard C, hinged to the transverse slide, the tubular nut around the upper end of the standard, the screw-rod within the tubular nut and a sight attached to the screw-rod and adjusted vertically by the tubular nut, substantially as set forth.

404,599. SIGHT FOR FIRE-ARMS. JAMES W. CARVER, Pawlet, Vt., assignor of two-thirds to Gibbons L. Kelty, Brooklyn, N. Y. Filed Jan. 7, 1889. Serial No. 295,623. (No model.)

Claim.—1. The combination, with the bead or sight and the base that is connected with the gun-barrel, of a tubular shield surrounding the sight and having the rear end larger than the forward end, for the purposes and substantially as specified.



2. The combination, with the sight or bead and the base that is attached to the barrel, of a tubular shield surrounding the sight, the rear end of which is larger than the front end, and the rear portion of such shield is cylindrical, or nearly so, and the front portion tapering to the smaller end, substantially as set forth.

3. The combination, with the base, of the tubular shield the opening through which is larger at the rear end than at the front end, and a movable sight-holder within a channel or longitudinal groove in the base and having arms upon the ends of which are beads or sights of different sizes or shapes, substantially as specified.

404,600. DETERMINING THE TEMPER OF IRON OR STEEL. CARL A. CARPENSTEN, Forsbacka, Marrstahill, Sweden. Filed Feb. 12, 1889. Serial No. 299,649. (No model.)

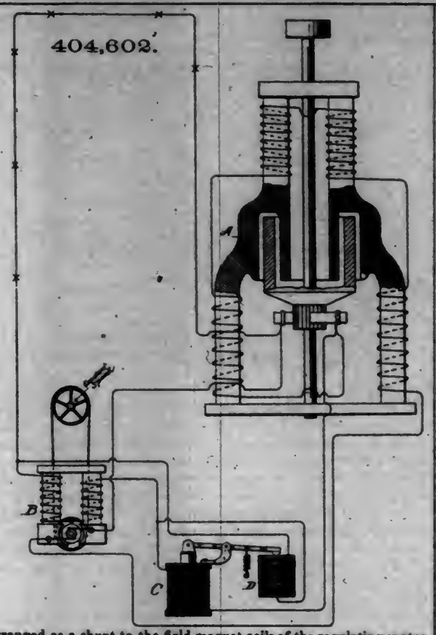
Claim.—A method of determining the temper of iron or steel, consisting in conducting an electric current through a sample or test-piece of the iron or steel the temper of which is to be determined, melting it off, and comparing the intensity of the current requisite with the strength of the current required to melt off pieces of normal steel of the same minimum cross-section as the sample and of known temper, either directly by placing the above-mentioned normal pieces in the same electric circuit or indirectly by the aid of an amperometer, substantially as described.

404,601. CABLE-GRIP. CHARLES S. CHAPMAN, Kansas City, Mo. Filed Dec. 19, 1888. Serial No. 294,066. (No model.)

Claim.—1. In a cable-grip, the combination, with a fixed frame to which the grip-heads are connected, of a movable frame arranged for connection with the toggles of the grip, a link pivoted in the movable frame, a crank pivoted in the fixed frame and pivotally connected to the lower end of the link, and a lever mounted upon the pivots of the crank and having the lower end of its short arm connected to the lower portion of the said crank, substantially as herein shown and described.

2. The combination, with a fixed frame arranged for connection with the heads of a grip and with a car-body or platform, of a movable frame arranged for connection with the grip-jaws, a crank carried by the fixed frame, a link connected to the crank and to the movable frame, a lever fulcrumed on the crank-trunnions and connected to the lower crank-arms, a pawl carried by the lever, and a toothed rack with which the pawl engages, substantially as described.

3. The combination, with a frame made up of castings that are bolted or riveted together, of shanks 11, held by the casting-uniting rivets, said shanks being arranged for connection with a grip-head, a body-sheet 14, arranged for connection with the grip-jaws, a casting 13, carried by said body-sheet, a crank 30, formed with trunnions 31, journaled in bearings formed in the castings first referred to, a link 17, pivotally connected to the crank, a cross-head carried by the link and journaled upon the casting 13, a lever fulcrumed upon the trunnions 31 and connected to the crank 30, a retaining-pawl carried by the lever, a rack with which said pawl engages, and a pawl-operating attachment, substantially as described.

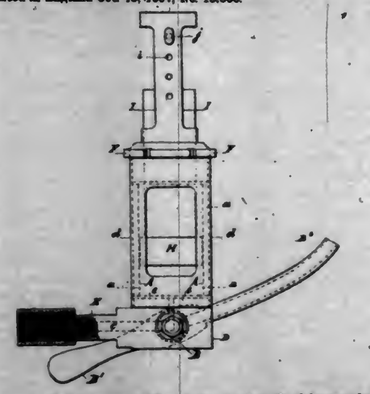


404,602. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. ERNEST P. CLARK, New York, N. Y., assignor to the Clark Electric Company, same place. Filed Oct. 8, 1888. Serial No. 287,498. (No model.)

Claim.—1. A regulator for a shunt-wound dynamo, consisting of an electromotor whose armature is maintained at a constant speed and is included in the field-magnet circuit of the dynamo, and whose field-magnet coils are included in the main circuit of the dynamo for the purpose of varying the counter electro-motive force of the motor as the main current varies in strength.

2. A regulator for shunt-wound dynamo-electric machines, having its armature included in the field-magnet circuit of the dynamo and its field-maget coils included in the main circuit, a variable resistance arranged as a shunt to the field-magnet coils of the regulator, and an electro-magnet in the main circuit arranged to control said variable resistance for the purpose of magnifying the variations in magnetic strength of the regulator field-magnets caused by changes in strength of the current in the main circuit.

3. The combination of a dynamo-electric machine having its field-magnet coils in shunt or derived circuit, an electromotor maintained at a certain unvarying speed and having its armature in circuit with the field-magnet coils of the dynamo and its field-magnet coils in circuit with the lamps or other translating devices, a variable resistance



404,602.

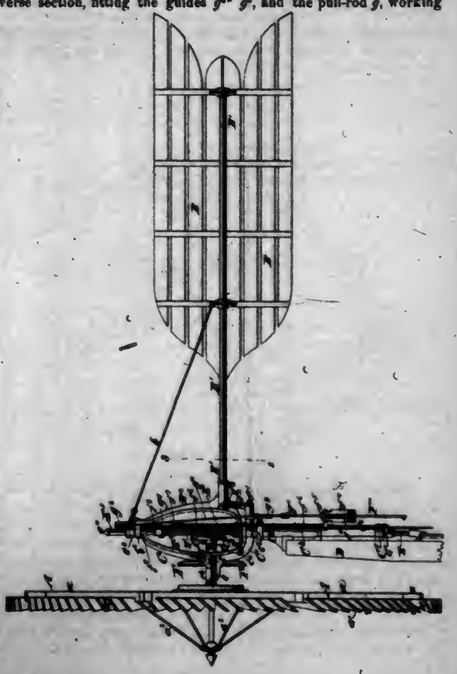
arranged as a shunt to the field-magnet coils of the regulating-motor, and an electro-magnet or solenoid located in the main circuit, controlling said variable resistance and so arranged as to intensify the variations in magnetism of the field-magnets of the regulator caused by variation in the main current for the purpose of maintaining a constant strength of current in the main or working circuit, notwithstanding variations in potential or a varying speed of the dynamo.

4. A regulator for a shunt-wound dynamo, consisting of an electromotor whose armature is included in the field-magnet circuit of the dynamo and whose field-magnet coils are arranged so that the full current on the main circuit of the dynamo will pass through them for the purpose of varying the counter electro-motive force of the motor as the main current varies in strength.

404,603. MEASURING-VESSEL. THOMAS S. COCKCROFT, Liverpool, County of Lancaster, assignor to John Goldie Chapman, Birkenhead, England. Filed Mar. 6, 1889. Serial No. 302,073. (No model.) Patented in England Oct. 13, 1887, No. 13,860.

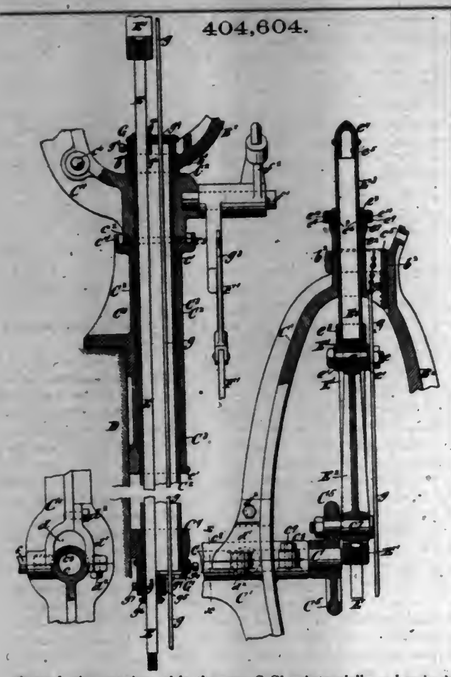
Claim.—1. In apparatus of the character described for supplying gaged quantities of liquids, the combination of a measuring-vessel having a plunger movable therein and automatically raised by the pressure exerted by the liquid flowing by gravity into said measuring-vessel, a valve having radial ports and a longitudinal duct *b*, and a swinging lever-handle B', fixed upon the outer end of the valve to oscillate in a vertical plane for turning the valve, said lever-handle containing a continuation of said valve-duct and provided with an attached discharge-nozzle B^3, that swings with the lever-handle and communicates with the duct therein, substantially as described.

2. In apparatus for supplying gaged quantities of liquids, the combination of the measuring-vessel A, having a valve-case provided with two separated ports *m* and *n*, arranged in alignment and having the lateral duct C, the oscillating valve B, having a longitudinal duct *b*, and two radial separated ports *k* and *l*, located out of alignment, and one of which is to communicate with the duct in the valve and the other with a supply-port in the valve-case, and a plunger H, automatically raised by the pressure of the liquid flowing by gravity into the measuring-vessel, substantially as described.



404,604. WINDMILL. ANDREW J. CONCORAN, Jersey City, N. J. Filed Mar. 19, 1888. Serial No. 267,590. (No model.)

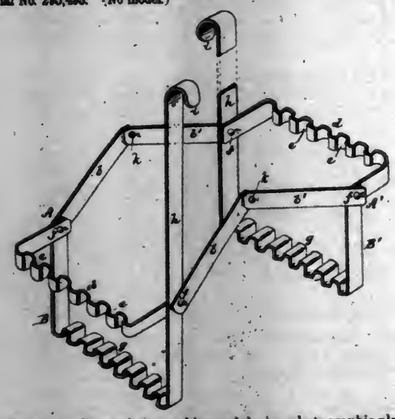
Claim.—1. The combination, in a windmill, of a main frame having an upper vertical bearing, a reciprocating rod surmounted by an upper guide-rod fitting said bearing, the portion of the guide-rod working in said bearing being hollow to form a reservoir for lubricant, and having in its portion working in said bearing one or more lateral openings for the escape of lubricant to the bearing-surfaces, substantially as herein described.



2. The combination, in a windmill, of a tubular main pivot and surmounting frame, a hollow post or support wherein the pivot may turn, a reciprocating rod working through the pivot and having its transverse section such that its exterior surface is at different distances from its center in different directions, and guides for said rod having surfaces against which said rod bears, conforming in shape to the shape of the rod, said guides being secured on the pivot so as to move with the pivot, one of said guides being arranged near the top of said pivot and the other near the bottom thereof, substantially as specified.

3. The combination, in a windmill, of a tubular main pivot and a surmounting frame, a hollow post or support wherein the pivot may turn, a reciprocating rod working through the tubular pivot and having such a transverse section both near the top and the bottom of the pivot that its outer surface is at different distances from its center measuring in different directions from its center, a cap applied to one end of the pivot and having a guide fitting the said rod, and a cap applied to the other end of the pivot and turnable thereon, and having a bore or socket, and a guiding-bushing conforming in shape internally to the rod and turnable in said bore or socket to guide said rod without twisting, substantially as herein described.

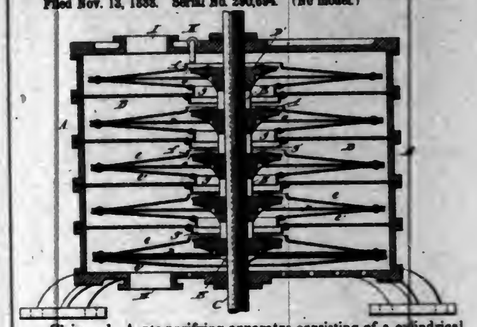
4. The combination, with the main pivot C^2 and its surmounting frame C', of the hollow support C^3, the caps G G', applied to opposite ends of the pivot, the cap G having a guide g^{4*}, and the cap G' having a guiding-bushing g^4, turnable within it, and both caps having the openings g^3, the reciprocating rod E, of square or analogous transverse section, fitting the guides g^{4*} g^4, and the pull-rod *g*, working



404,604.

through the openings g^2 in the caps G G', substantially as herein described.

5. The combination, with a wind-wheel A and a main shaft on which it is supported, of a main pivot C', and a surmounting main frame C, having a yoke d, wherein is the bearing for the main shaft, and one side of which is formed by a removable side piece, d', and a cap for the said bearing held within the yoke and secured in place independently of the said removable side piece d', substantially as herein described.



404,605. RACK FOR WASHING AND DRYING PHOTOGRAPHIC PLATES. WALTER S. CULLEN, Kearney, N. J. Filed Jan. 5, 1889. Serial No. 295,493. (No model.)

Claim.—1. In a rack for washing and drying photographic plates, the combination of an expansible and contractible main or body frame provided with opposite end strips having a series of plate-holding grooves in them and an open bottom support for the plates of U or stirrup shape construction pivoted to the main frame of the rack and capable of being closed into line therewith, essentially as specified.

2. In a rack for washing and drying photographic plates, the combination of the jointed or pivoted folding and angling side bars b b', the lower frame-plate supports B B', having side arms, to which said side bars are pivoted at their outer ends, and the opposite pivoted end strips d d, having a series of plate-holding grooves in them, substantially as shown and described.

404,606. GAS-WASHER. JOSEPH DE BROUWER, Bruges, Belgium. Filed Nov. 13, 1888. Serial No. 290,694. (No model.)

Claim.—1. A gas-purifying apparatus consisting of a cylindrical casing provided with a lower plate having a gas-supply opening and exit-openings for the purifying-liquids, a vertical shaft journaled centrally of said casing, and a turbine mounted on said shaft in said casing and apertured in its top and bottom sections for the passage of said gas and purifying-liquids, substantially as shown and described.

2. A gas-purifying apparatus consisting of a cylindrical casing provided with a lower plate having a gas-supply opening and exit-openings for the purifying-liquids and divided by fixed horizontal diaphragms having a central aperture into a series of overlying chambers, a vertical shaft journaled centrally of said casing, and a series of apertured horizontal drums mounted on said shaft to rotate in said chambers, the apertures in said drums being in the top and bottom sections thereof and in register with the diaphragm-aperture, whereby a vertical central passage is formed from end to end of the casing, substantially as set forth.

3. In a gas-purifying apparatus, the combination, with a cylindrical casing provided with a lower plate having a gas-supply opening and exit-openings for the purifying-liquids, and fixed horizontal centrally-apertured diaphragms dividing said casing into compartments, of a vertical shaft journaled in the casing and provided with horizontal drums rotating in said compartments, said drums consisting of upper and lower spaced plates or members, each having a central aperture or opening, the openings in the diaphragms registering with the openings in the upper members of the drums, substantially as set forth.

4. In a gas-purifying apparatus, the combination, with a cylindrical casing provided with a lower plate having a gas-supply opening and exit-openings for the purifying-liquids and horizontal centrally-apertured diaphragms dividing it into compartments, of a vertical shaft having horizontal drums rotating in said compartments, and each consisting of a hub and upper and lower spaced centrally-apertured members or plates, the openings in the lower members or plates registering with the diaphragm-openings to discharge through the upper opening of the next drum below upon the upper side of the hub therein, substantially as set forth.

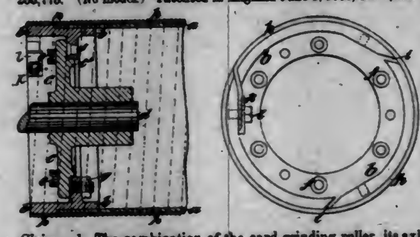
5. In a gas-purifying apparatus, a purifying-drum consisting of a hub and the centrally-apertured spaced concave members e e, secured with their concave sides toward each other, the opening in the upper member e being of greater diameter than the hub, which in turn is of greater diameter than the opening in the member e, substantially as set forth.

6. In a gas-purifying apparatus, the combination, with a cylindrical casing provided with a lower plate having a gas-supply opening and exit-openings for the purifying-liquids and horizontal centrally-apertured diaphragms forming a series of overlying compartments in said casing, said diaphragms having annular depending flanges g around their openings, of a vertical shaft, horizontal two-part drums thereon within said compartments, the drums being formed of a hub having an annular deflector f on its upper face, and upper and lower centrally-apertured spaced parts e e, the upper aperture having a diameter larger than the annular flange g and the lower aperture having an annular flange g, entering the diaphragm-opening and of a smaller internal diameter than the deflector f, to discharge thereupon substantially as set forth.

404,607. RUNNER FOR GRINDING-MILLS. JOHN C. DELL, Philadelphia, Pa. Filed Jan. 25, 1889. Serial No. 297,497. (No model.)

Claim.—1. A runner having a wall formed with a throat, and a hub having an ear which is adapted to enter the runner through said throat, said ear being connected with the back of said wall within the runner and screwed or secured thereto, substantially as described.

404,607.



2. A runner formed of a hollow body and a separate hub, said body having a wall provided with a throat and an opening, and said hub having an ear which is secured to said wall by a screw which passes through said opening and enters said ear, substantially as described.

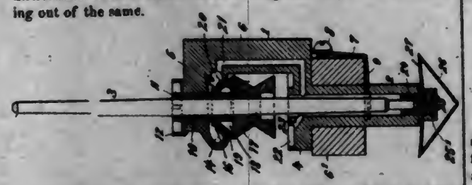
3. A runner with wall having a throat and an opening leading into a chamber in said runner, a hub with an ear in said chamber, a lug on the inner wall of said chamber, and a fastening-screw passing through said ear and bearing against said lug, said parts being combined substantially as and for the purpose set forth.

4. A runner with wall having a throat and opening leading into an inner chamber, a hub with ear in said chamber, a shaft on which the hub is mounted, and a key encircling the shaft and having its ends in the recesses in the walls of the runner, said parts being combined substantially as described.

5. A runner with wall having a throat and an opening leading into a chamber in said runner, a hub with an ear, a shaft on which the hub is mounted, a key encircling the shaft and having its ends in recesses in the runner, and a spring-bar passing through an opening in the shaft and seated in a recess in the key, said parts being combined substantially as and for the purpose set forth.

404,608. CARD-GRINDING ROLLER. JOSEPH S. BROOMFIELD, Oldham, County of Lancaster, England. Filed Apr. 5, 1887. Serial No. 233,775. (No model.) Patented in England June 5, 1886, No. 7,553.

Claim.—1. The combination of the card-grinding roller, its axle, and the ring b, adapted to the end of the roller, and having recesses f and slit i, with the clamp at the slit, and the flanged boss c, fixed to the axle and secured to the said ring, all substantially as set forth.



2. The combination of the card-grinding roller, its axle, and the ring b, adapted to the end of the roller, and having recesses f for weights, with the flanged boss c, secured to the axle and to the said ring and closing the said recesses in the latter, all substantially as specified.

3. The combination of the card-grinding roller, its axle, and the ring b, adapted to the end of the roller, and having a slit i, with the clamp at the slit, and the flanged boss fixed on the axle and secured to the ring, substantially as set forth.

4. The combination of the card-grinding roller, having at one flanged end thereof a slit i, with a spirally-wound fillet, the end of which passes through the slit, and a clamping-plate k, to bind the end of the fillet to the flange of the grinding-roller, and a screw l to secure the plate, substantially as specified.

404,609. SUPPORT FOR SPINNING-SPINDLES. JOSEPH DUFFY, Passaic, N. J. Filed Jan. 24, 1889. Serial No. 297,408. (No model.)

Brief.—The object of the invention is to provide for the proper distribution of the lubricant to the bearings and to prevent the throwing out of the same.

Claim.—1. A spindle-support provided with a socket in its lower portion, an apertured oil-chamber in its upper portion, and an oil-passage leading from the chamber to the socket, in combination with a spindle fitting in the socket, and a whirl on the spindle and having its upper end projecting into the said chamber, substantially as herein shown described.

2. The combination, with a spindle-support provided with a socket in its lower portion, an oil-chamber in its upper portion, with an opening in its bottom, and an oil-passage leading from the chamber to the socket, of a spindle seated in the socket, a chambered whirl on the spindle and having its upper end projecting into the oil-chamber, and a tubular bearing held in the support and projecting through the said oil-chamber into the chamber of the whirl, substantially as described.

3. The spindle-support 1, formed with the upper horizontal arm 5, the lower horizontal arm 4, the vertical portion 6, connecting arms 4 and 5, the depending tubular socket portion 2 to project through the rail, the annular oil-chamber 12 on the upper side of the arm 5, the annular oil-chamber 14 on the under side of arm 5, with opening 15 in its bottom surrounded by the upwardly-inclined annular portion 20, the opening 10, for the passage of the spindle connecting the oil-chambers 12 and 14, and the oil-passage 21, leading from the side of oil-chamber 14 down through the support to tubular socket portion 2, substantially as shown and described.

4. The spindle-support 1, formed with the upper horizontal arm 5, the lower horizontal arm 4, the vertical portion 6, connecting the arms 4 and 5, the depending tubular socket portion 2 to project through the rail, the annular oil-chamber 12 on the upper side of arm 5, the annular oil-chamber 14 on the under side of arm 5, with opening 15 in its bottom surrounded by the upwardly-inclined annular portion 20, the spindle-passage 10, connecting chambers 12 and 14, and the oil-passage 21, leading from the side of oil-chamber 14 down through the support to tubular socket portion 2, in combination with the spindle 3, having its lower end mounted in the tubular socket portion 2, the whirl 17, with the oil-chamber 18 in its upper portion having inclined sides 19 bearing against the upwardly-inclined portion 20 of chamber 14, and the neck 16, projecting through opening 15 in the latter, and the tubular spindle-bearing 11, extending through passage 10, with its upper end having oil-passages 13 opening into chamber 12 and its lower end projecting into chamber 18, substantially as shown and described.

5. The combination, with the rail 6', of the spindle and support, the latter having a tubular socket portion 2 projecting through the rail, and a lock consisting of the L-shaped metallic spring-strip 7, with an inclined arm secured by a detachable fastening to rail 6', and having the fork-shaped end 9 engaging the tubular socket portion 2, substantially as shown and described.

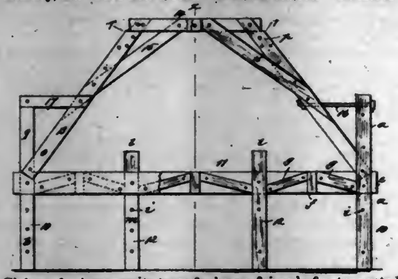
6. The combination, with the spindle and support, the latter having a tubular socket portion 2 projecting through the rail, with projections 29 on its lower end, of a trough 26, with a cross-strap 27, having an oblong aperture 28, with which the tubular socket portion 2 engages, substantially as shown and described.

7. A spindle-support having the tubular socket portion 2, to project through the rail and receive the lower end of the spindle, and a socketed spindle-bearing plug 24, inserted in the end of tubular socket 2 and secured by a solder filling 25, substantially as shown and described.

404,610. PORTABLE CHAIR. LARS EGGERSTSEN, Kampen, Christiania, Norway. Filed Dec. 19, 1888. Serial No. 294,049. (No model.) Patented in Norway Sept. 5, 1888, No. 913.

Claim.—In a portable chair, the combination, with the legs adapted to fold into compartments under the chair-body, of the boards b, hinged to the sides of the chair-seat and adapted to fold under and partially close the said compartments, substantially as described.

404,611. METALLIC WHEEL. FRANK H. RHODES, Toledo, Ohio. Filed Dec. 7, 1888. Serial No. 292,807. (No model.)

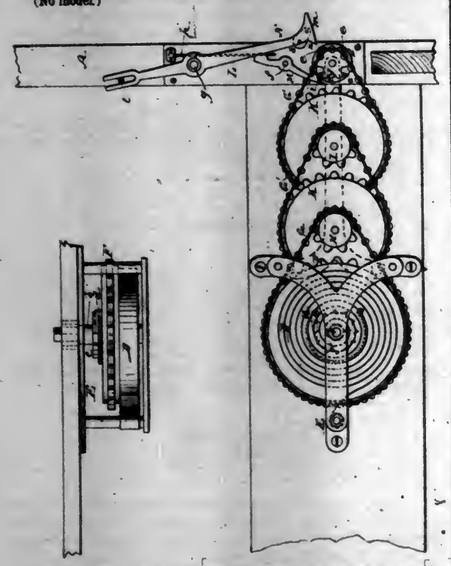


Claim.—1. In a metal wheel, hub-sections formed with oppositely-arranged circular projections and oppositely-arranged metal flanges adapted to meet when the sections are assembled to cause the annular faces to impinge spokes placed between the same, as and for the purpose set forth.

2. In a metal wheel, hub-sections formed with circular projec-

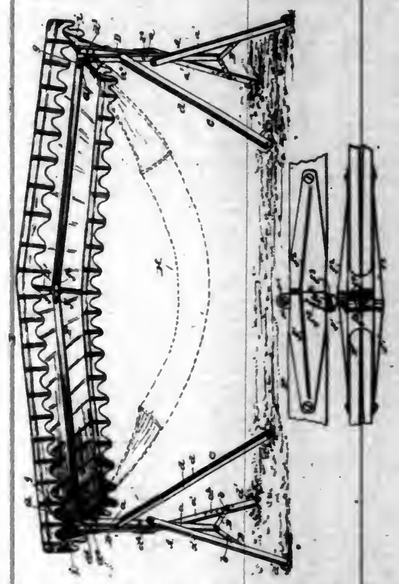
tions adapted to telescope within the hub, one projection being formed with a feather and the coacting projection with a groove, as and for the purpose set forth.

404,612. COMPOSITE TRUSS FOR BARNS. JAMES W. EVANS, Kearney, Mo. Filed Dec. 4, 1888. Serial No. 292,000. (No model.)



Claim.—1. A composite truss for barns, formed of outer posts 10, consisting of central planks *a*, shorter outer pieces *b*, secured thereto, chord 11, consisting of inner and outer planks embracing at their ends the plank *a* and resting thereat on the upper ends of pieces *b b*, the spacing-blocks between the chord-planks, the planking sub-rafters 13, secured at their lower ends to posts 10, straining-pieces 14, connecting the upper ends of the sub-rafters, and the braces connecting the upper ends of the central planks *a* with the sub-rafters, substantially as set forth.

2. A composite truss for barns, formed of the outer posts 10, consisting of central planks *a*, shorter outer pieces *b*, secured thereto, the chord 11, consisting in inner and outer planks embracing planks *a* between their ends and resting thereat on upper ends of pieces *b*, the shorter similarly-formed posts 12, the inner planks of which pass up between the chord-sections, the sub-rafters 13, secured at their lower ends to planks *a* at ends of chords 11, and the straining-piece 14, secured to upper ends of said rafters, substantially as set forth.



3. A truss for barns, consisting in the outer composite posts 10, having central planks *a* and shorter planks *b*, the chord 11, embracing the plank *a* at the upper ends of the planks *b*, the sub-rafters 13, secured to planks *a* and connected at their upper ends by straining-pieces 14, the braces connecting the upper ends of planks *a* with the said rafters, and the braces 15, connecting the said rafters with the straining-piece, substantially as set forth.

404,613. MOTOR FOR OPERATING SWINGING DEVICES. CHARLES J. R. GAUME, Brooklyn, N. Y. Filed Mar. 15, 1889. Serial No. 303,473. (No model.)

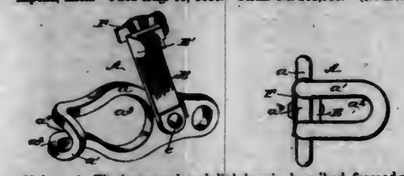
Claim.—In clock-work-escapement mechanism for actuating swinging cradles and other swinging structures, the combination, with the escapement-wheel J, provided with a series of pins *e*, of the stop-pawl M, controlled by a spring and having a concave shoe *i*, adapted to successively engage with said pins, and the releasing-lever N, adapted to operate the swinging structure, and having a shoe *m* for operation by the escapement-wheel, and a soft cushion or pad *s*, operating to release the stop-pawl from the escapement-wheel, essentially as shown and described.

404,614. COMBINED HAMMOCK AND CANOPY SUPPORT. JOHN GIFFORD, Watertown, N. Y. Filed Oct. 13, 1888. Serial No. 287,982. (No model.)

Claim.—1. As an improvement in hammock-supports, the supporting-frames having the vertical bars or uprights, the adjustable brace-legs secured thereto and provided with pivoted hooks at their outer lower ends, the double brace-legs pivotally secured to said vertical bars or uprights and having pivoted hooks at their outer ends, and the arms connecting the lower ends of said bars or uprights with said brace-legs, substantially as described.

2. As an improvement in combined hammock and canopy supports, the supporting-frames herein described, having vertical bars or uprights, and the arms pivotally secured at their lower ends to said bars or uprights, and the canopy attached to the upper projecting ends of said arms, which have a limited movement on either side of their pivots, substantially as set forth.

3. As an improvement in combined hammock and canopy supports, the supporting-frames having vertical bars or uprights, the arms pivotally secured to said bars or uprights, the cords or chains secured to said bars or uprights, and arms for limiting the movement of the latter and the canopy, substantially as described.



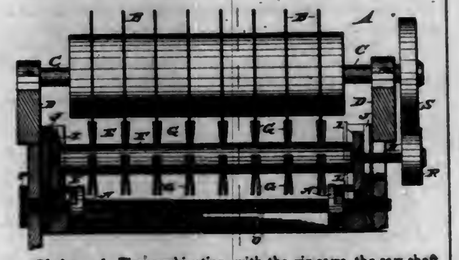
4. As an improvement in combined hammock and canopy supports, the supporting-frames herein described, having vertical bars or uprights, and the arms pivotally secured at their lower ends to said bars or uprights, and the canopy pivotally connected to the upper ends of said arms so as to be capable of being tilted and adjusted at the desired angle, said arms having a limited movement on either side of their pivots, substantially as set forth.

5. The supporting-frames having the vertical bars or uprights, the pivoted arms secured thereto, and the spring-tongues secured to said arms, in combination with the canopy attached to the upper ends of said arms, and having depending cords designed to be secured by said tongues by being passed thereunder for holding the canopy at the desired angle, substantially as described.

6. The supporting-frames having the pivotally-secured arms provided with upper recessed ends, and the spring-tongues secured to said pivoted arms, in combination with the canopy having the projecting studs resting in said recessed ends, and the depending cords designed to be secured by said tongues by being passed thereunder for holding the canopy at the desired angle, substantially as described.

7. In a hammock-support, the longitudinal connecting-bar composed of sections, the hinge connected to the inner meeting ends of said sections and having abutting ribs or flanges on their sides, the lower overlapping apertured ears projecting therefrom, and the pin designed to be inserted through said ears, substantially as set forth.

404,615. GRAB-LINK FOR TRACE-CHAINS. JOSEPH E. GIROUX, Alpena, Mich. Filed Aug. 13, 1888. Serial No. 282,506. (No model.)



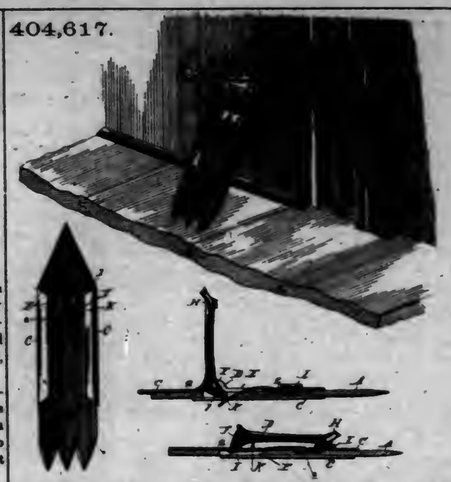
Claim.—1. The improved grab-link herein described, formed with a body part or portion and a gripping portion *a'*, having a narrow opening a^3, into which the chain may be slipped sidewise, and a fastening for holding the chain in said opening a^3, the latter being adapted to prevent any longitudinal movement of the chain when adjusted, substantially as set forth.

2. The improved grab-link herein described, having a body portion *a* and gripping portion *a'*, provided, respectively, with openings a^2 a^3, communicating, as described, and a fastening consisting of a bar pivoted at one end and movable at its other end into position to secure the chain in the opening a^3 of portion *a'*, substantially as set forth.

3. The improved grab-link herein described, formed with a body part or portion and with a gripping portion *a'*, and provided with a fastening consisting of a bar pivoted at one end and movable at its other or free end into position to secure the chain in the gripping portion *a'*, and the clamp whereby to hold said free end adjacent to the gripping portion *a'*, substantially as set forth.

4. The grab-link herein described, having a body portion and gripping portion provided, respectively, with openings a^2 a^3, and provided with a fastening pivoted at one end and provided at its opposite end with a clamp consisting of a spring secured at one end to the fastening and arranged to bear against the opposite side of the link from said fastening, substantially as set forth.

404,616. CLEANER FOR COTTON-GIN SAWS. JOHN C. GODWIN, Lloyd, Tex., assignor to himself and W. C. Godwin, same place. Filed Sept. 27, 1888. Serial No. 286,573. (No model.)



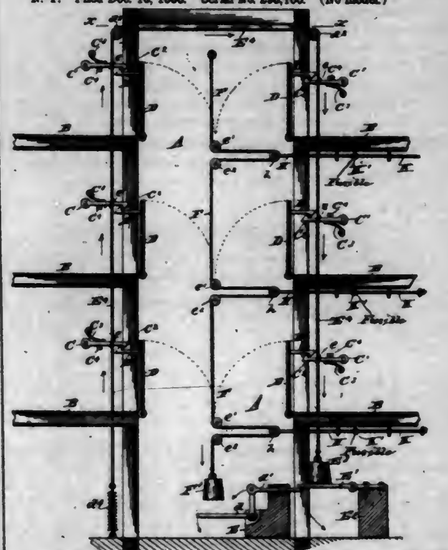
Claim.—1. The combination, with the gin-saws, the saw-shaft, and a friction-pulley on said shaft, of a drum mounted to rotate and to slide vertically, arms held radially on the said drum and adapted to engage the faces of the saws, a pulley held on the said drum, and means, substantially as described, for moving the drum up and down so that the arms engage or are disengaged from the saws as the said pulley is moved into frictional contact with the saw-shaft pulley, so as to impart a rotary motion to the drum, as set forth.

2. In a cleaner for cotton-gin saws, the combination, with a frame provided with standards, of plates held to slide in the said standards, a shaft journaled in the said plates, a drum on the said shaft, pairs of arms secured on the said drum, pins projecting from the said plates, cams operating on the said pins, and a shaft mounted to rotate in the said frame and carrying the said cams, substantially as shown and described.

3. In a cleaner for cotton-gin saws, the combination, with a frame provided with standards, of plates held to slide in the said standards, a, shaft journaled in the said plates, a drum held on the said shaft, pairs of arms secured on the said drum, pins projecting from the said plates, cams operating on the said pins, a shaft mounted to rotate in the said frame and carrying the said cams, and a hand-wheel for turning the said shaft, substantially as shown and described

404,617. COMBINED DOOR-FASTENER AND ALARM. SAMUEL GOULDEN, Newark, N. J. Filed Feb. 23, 1889. Serial No. 300,938. (No model.)

404,617.



Claim.—1. The combination, with the plate or resisting-bar A and slide B, moving parallel therewith, of a hammer carried by one of said instruments and tripped by the other, and a spring for operating the hammer, substantially as described.

2. The combination of the plate A, slide B, embracing said plate and moving parallel therewith, the hammer mounted on said slide, and a spring attached to said slide for operating the hammer, substantially as described.

3. The combination, with the perforated plate A, the slide B, having its edges turned over the sides of the plate A, and ears formed on the face of said slide, of a hammer mounted in said ears, a spring acting on the hammer and attached to the slide, and a cup to receive a cap, substantially as described.

404,618. SELF-CLOSING HATCHWAY. FRANK J. GRIDLEY, New York, assignor to the Underwriters Hatch Door Company, Brooklyn, N. Y. Filed Dec. 10, 1888. Serial No. 293,100. (No model.)

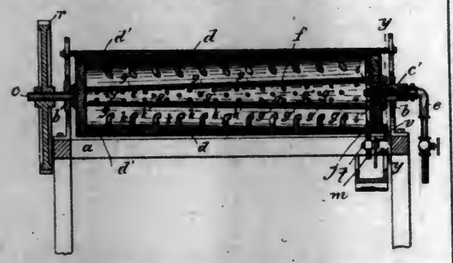
Claim.—1. The combination, with a series of doors and pivoted latches capable of engaging with said doors, of a drop or trap door, a lever engaging with said door, a weighted trip-rope suspended over said lever, a rope connected to the latches and having a weight supported on the drop or trap door, a retaining-rope, and a fusible connection between said retaining and trip ropes, substantially as shown and described.

2. The combination, with a series of doors, latches to engage said

doors and hold them open facing, respectively, in opposite directions, a spring-actuated weighted rope connected with said latches, and a drop or trap door supporting said weight, of a lever engaging with the trap-door, a weighted trip-rope suspended over said lever, a retaining-rope, and a fusible connection between said trip and retaining ropes, substantially as shown and described.

3. The combination, with a series of doors provided with fixed latch-pins, pivoted latches engaging with the fixed latch-bars, a spring-actuated weighted rope connected with said latches, and a drop or trap door supporting the weight of said rope, of a weighted trip-rope, a lever pivoted beneath said trip-rope, a sliding trip-arm attached to the lever and engaging the trap-door, a release-bar connected with the trip-rope, a retaining-rope, and a fusible connection between said releasing-bar and retaining-rope, substantially as shown and described.

4. The combination, with a series of doors provided with fixed latch-pins, pivoted latches to engage said doors, a spring-actuated rope attached to said latches carrying a weight, and a trap or drop door supporting said weight, of pulleys arranged in pairs, a weighted trip-rope passing over said pulleys and provided with horizontal open loops, a release-bar having a pulley attached engaging with the said loops, a retaining-rope united to said release-bar by a fusible connection, an angled lever below the trip-rope, and a sliding trip-arm attached to said lever and supporting the trap-door, substantially as shown and described.

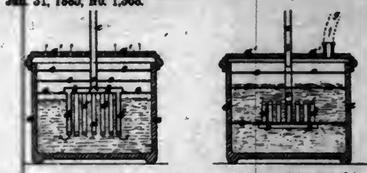


5. The combination, with the hinged doors and latches engaging with said doors, having a weighted operating-rope, of a retaining-rope, a trip-rope, a release-bar connected therewith, and a fusible link uniting the retaining-rope and release-bar, all arranged to operate substantially as shown and described.

404,619. PIPE-WRENCH. JOHN T. HAWKINS, Taunton, Mass. Filed Dec. 7, 1888. Serial No. 292,886. (No model.)

Claim.—In combination with a pipe-wrench constructed of a serrated or toothed jaw, as 2, and an opposite smooth or unserrated jaw, as 3, forming an acute angle with each other, an adjustable stop or tooth, as 4, supported upon or within a recess formed in the smooth jaw and adjustable practically in line with said smooth jaw, whereby said stop or tooth may be adjusted for any given diameter of pipe or rod within the range of said wrench's embrace, so as to allow the entrance of the pipe or rod into the angle formed by the jaws, by sliding upon said smooth jaw until the serrated jaw has taken firm hold upon said pipe or rod, and then preventing any further entrance of and resulting tendency to crush said pipe, to assist as a nearly oppositely applied stop or tooth in rotating said pipe, substantially as set forth.

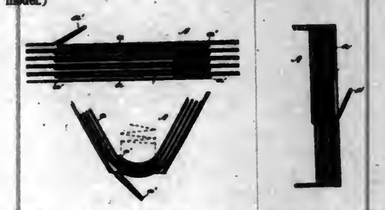
404,620. MACHINE FOR SPONGING CLOTH. WILLIAM HENDON Boston, Mass. Filed Feb. 23, 1889. Serial No. 300,875. (No model.)



Claim.—1. In a cloth-finishing apparatus, a horizontal rotary perforated cylinder fitted to receive steam and provided with a tapered lining, whereby the lower internal surface of the cylinder is given a continuous incline from one end to the other, said cylinder being also provided with inwardly-projecting tubes having bent or hooded inner ends and with an outlet for the escape of water, as set forth.

2. In a cloth-finishing apparatus, the combination of a horizontal rotary perforated cylinder having inwardly-projecting pipes with bent or hooded ends, a perforated cone or cone-frustum having guard-tubes d', and a steam-supply pipe entering said cone, as set forth.

3. In a cloth-finishing apparatus, the combination of a horizontal rotary perforated cylinder having an outlet or waste pipe, an automatically-closed valve therefor, and means for opening said valve at a given point in the rotation of the cylinder.



404,621. APPARATUS FOR PURIFYING ATMOSPHERIC AIR. WILLIAM HISBERT, Manchester, County of Lancaster, England. Filed Oct. 30, 1888. Serial No. 289,511. (No model.) Patented in England Jan. 31, 1885, No. 1,368.

Claim.—1. An apparatus for washing, purifying, and imparting medicinal properties to air, consisting of a vessel partly filled with an antiseptic mixture, an inner compartment, a series of finely-perforated tubes extending from the said compartment into the mixture, and a supply-pipe through which compressed air may be forced into the compartment and tubes, substantially as set forth.

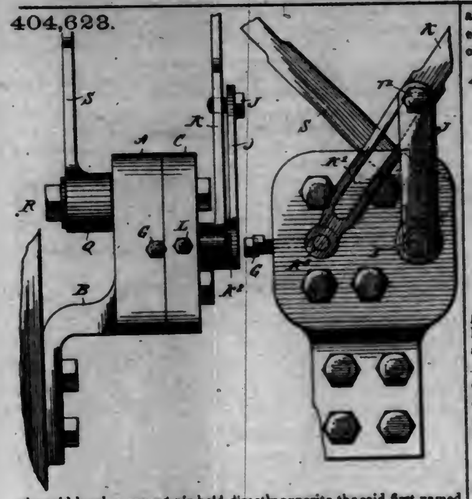
2. A portable apparatus for cleansing and purifying air, consisting of a vessel containing an antiseptic mixture and a compartment having finely-perforated tubes, said compartment provided with an attachment consisting of a rubber pipe having a bulb and inlet-valve, whereby air is forced into the compartment, an outlet from the vessel, and a pipe connecting the outlet to a mouth-piece provided with a double-acting valve, substantially as set forth.

404,622. PACKAGE OF TOILET-PAPER. OLIVER H. HESS, Chicago, Ill. Original application filed Mar. 27, 1886, Serial No. 196,799. Divided and this application filed May 26, 1888. Serial No. 275,206. (No model.)

Claim.—1. The combination, with a package such as described, composed of a series of sheets, each containing a fold or overlapping portion, of a support for said bundle, provided with a slot or opening to which the fold or overlapping portion of each sheet is successively presented, substantially as described.

2. A bundle or package such as described, composed of a series of separable sheets superposed the one upon the other, each of said sheets being provided with a free edge projecting above the face of the sheet and formed by folding the sheet twice in its length and bending the overlapping portion down upon the face of the sheet, as and for the purpose set forth.

3. A bundle or package composed of separable sheets superimposed one upon another, each sheet folded twice, and the overlapping edge or fold bent down upon the face of the sheet, the bundle or package so formed being bent in line with the folds, substantially as described.

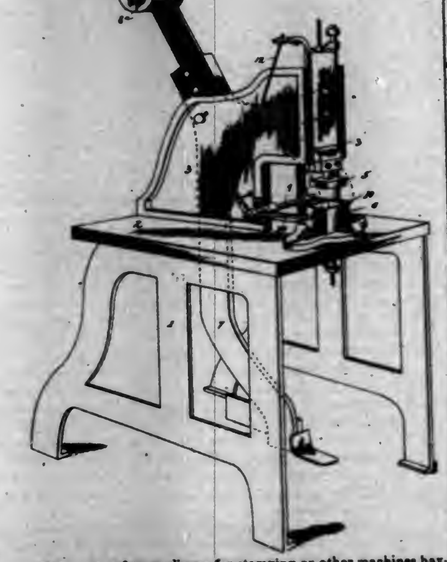


4. In combination with a box or case having a slot and supports or inclined walls on opposite sides of the opening, a bundle or package composed of separable sheets, each sheet containing a free fold or edge, the said bundle being bent in the line of the folds and resting within the case with the folds of the sheets in line with the slot, substantially as described.

404,623. SAW-SWAGING MACHINE. THOMAS B. HITT, Seattle, Wash. Filed Dec. 18, 1888. Serial No. 294,009. (No model.)

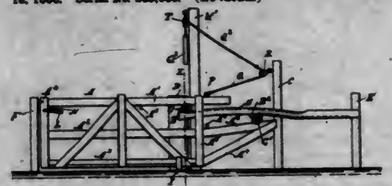
Claim.—1. In a saw-swaging machine, the combination, with a die-plate having recesses and a head secured on the front of the said die-plate, of a die having a beveled end and held adjustably in one of the said recesses, a cam located at the beveled end of the said die, a shaft mounted to turn in the said die-plate and head and carrying the said cam, an arm secured on the said shaft and provided on its outer end with a pin, and a slotted lever fulcrumed on the said head and connected with the pin of the said arm, substantially as shown and described.

2. In a saw-swaging machine, the combination, with a die-plate and a head secured on the same, of a die held adjustably in the said head and provided with a beveled end, a cam located in front of the said die, a shaft carrying the said cam and mounted to turn in the said die-plate and head, an arm projecting from the said shaft, a pin held on the said arm, a lever fulcrumed on the said head and provided with a slot into which projects the pin on the arm, a pin held in the said head, a second pin held directly opposite said first-named pin in the said die-plate, a second cam for operating said second-named pin, and a lever for operating said second cam, substantially as shown and described.



404,628.

the said head, a second pin held directly opposite the said first-named pin in the said die-plate, and a second cam for operating the said second-named pin, substantially as shown and described.

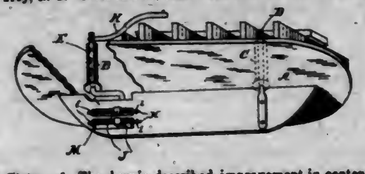


3. In a saw-swaging machine, the combination, with a die-plate and a head secured on the same, of a die held adjustably in the said head and provided with a beveled end, a cam located in front of the said die, a shaft carrying the said cam and mounted to turn in the said die-plate and head, an arm projecting from the said shaft, a pin held on the said arm, a lever fulcrumed on the said head and provided with a slot into which projects the pin on the arm, a pin held in the said head, a second pin held directly opposite said first-named pin in the said die-plate, a second cam for operating said second-named pin, and a lever for operating said second cam, substantially as shown and described.

404,624. SAFETY APPLIANCE FOR STAMPING OR OTHER MACHINES. THOMAS J. HOLMES, Chicago, Ill. Filed Aug. 9, 1888. Serial No. 282,206. (No model.)

Claim.—A safety appliance for stamping or other machines having a reciprocating plunger, comprising, in combination with said plunger, a rock-shaft provided with fenders, a rock-arm rigidly secured to the rock-shaft, and a link pivotally connecting the rock-shaft arm with the plunger, whereby, when the plunger descends, the fenders are operated to force the hands of an attendant out of the path of the plunger, substantially as described.

404,625. GATE. WILLIAM C. HOOKER, Abingdon, Ill. Filed Sept. 12, 1888. Serial No. 285,683. (No model.)



Claim.—1. The combination, with a rearward extension of the gate A, of the curved beam B, provided with grooves in its upper and lower edges, and the rollers G and G', adapted to travel in said grooves and supporting said gate, substantially as shown and described.

2. The combination, with the rearward extension of the gate A, of the curved beam B, provided with grooves in its upper and lower edges, the rollers G and G', adapted to travel in said grooves and support said gate, and means, substantially as described, for imparting an endwise motion to said gate, as set forth.

3. The combination, with the gate A, of the curved beam B, provided with grooves on its upper and lower edges, the rollers G and G', supporting said gate and adapted to travel in said grooves, and means, substantially as shown and described, for automatically locking said gate when in a closed position, as set forth.

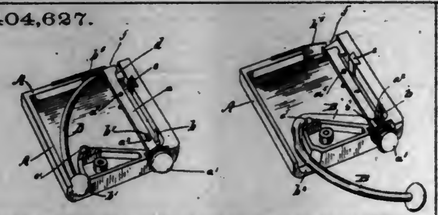
4. In a gate, the combination, with the longitudinal bar A' and the extension A^4, of the curved fixed beam B and the rollers G and G', held, respectively, between said bar A' and the top of the beam B and the extension A^4 and the bottom of the beam B, substantially as shown and described.

404,626. STEERING CENTER-BOARD. JOSEPH H. HUFF, West Troy, N. Y. Filed Jan. 30, 1889. Serial No. 298,190. (No model.)

Claim.—1. The herein-described improvement in center-boards, consisting of a pivotal board provided with a permanent pivotal bearing at its forward portion, in combination with a pivotal shifting lever or crank at its rear portion, substantially as and for the purposes set forth.

2. The herein-described improvement in center-boards, which consists of a center-board pivoted near its forward end, in combination with a shifting lever or crank and a pivotal support for the center-board, said crank being provided with friction-bearings and connected to the rear portion of the center-board, substantially as and for the purposes described.

3. The herein-described improvement in center-boards, consisting of a board pivoted near its forward end, provided with metallic friction-bars secured to said board at their ends, in combination with a pivotal shifting lever and crank provided with friction-bearings and connected to said center-board back of the permanent pivotal-point support, substantially as and for the purposes set forth.



4. The herein-described improvement in center-boards, consisting of a board pivoted near its forward end and provided with metallic friction-bars secured to said board at their ends, said board partly cut away at its top to make room for the movement of the shifting-lever, in combination with a pivotal shifting lever and crank provided with friction-blocks and secured to said bars and located back of the permanent pivotal point of the board, substantially as described.

5. The herein-described improvement in center-boards, consisting of a board pivoted near its forward end and provided with metallic friction-bars secured to said board at their ends and partly cut away at its top to make room for the movement of the shifting-lever, in combination with pivotal shifting lever and crank secured to the rear portion of the center-board and metallic bearing-blocks pivoted thereto, said blocks being provided with perforations embracing said friction-bars and shifting-lever, substantially as described.

404,627. DOOR-CHECK. ABRAM HUBER, Yellow Springs, Ohio. Filed June 21, 1888. Serial No. 277,780. (Model.)

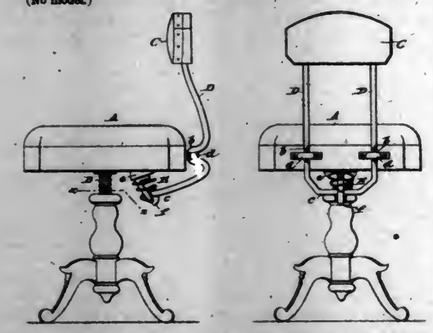
Claim.—1. In a door-check having a suitable frame or casing, a

404,627.

spring-actuated arm, a catch to engage said arm, and an operating-plunger adapted to release said catch, substantially as specified.

2. A door-check having a suitable frame or casing, a spring-actuated arm, a catch to engage said arm, a plunger to release said catch, and means, substantially as described, for connecting said arm and plunger, so that a longitudinal movement of said plunger will cause said arm to be engaged with said catch, substantially as specified.

3. An operating-plunger, a curved pivoted arm, a catch to engage said arm, adapted to be operated by said plunger, a projecting stud in said arm engaging in a slotted opening in said plunger, and a spring connected to said arm and adapted to move the same when released by said catch.



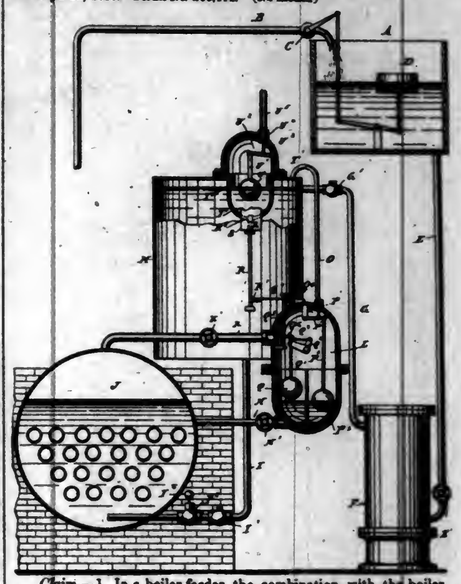
4. The outer casing, the operating-plunger therein, a curved arm pivoted to said casing, a catch operated by said plunger, adapted to engage said arm, and elastic cushions in said casing to limit the movement of said arm, substantially as specified.

5. The outer casing, the door-holding arm pivoted therein, the spring-catch for retaining said arm, a plunger for releasing said spring-catch, the operating-spring for said arm, and means, substantially as described, for connecting said plunger and arm, whereby the arm may be returned to its normal position by pressing on said plunger, substantially as specified.

6. The outer casing, the operating-plunger having a cushioned end extending into said casing, a swinging door-holding arm operated by said plunger, and a pin, substantially as described, for connecting the operating parts to the casing and thus holding said arm from movement when the cushioned end of said plunger is used as a simple door-stop.

7. The outer casing, the pivoted arm therein, the spring-catch adapted to engage said arm, the plunger adapted to operate said spring-catch, the operating-spring connected to said arm, the projecting stud on said arm engaging with the slotted opening in said plunger, and the spring adapted to hold said plunger in its normal position, substantially as and for the purpose set forth.

404,628. SPRING-BACK FOR STOOLS OR CHAIRS. WILLIAM P. JAMES, Lincolnton, N. C. Filed Oct. 13, 1888. Serial No. 287,995. (No model.)



Claim.—1. In spring-backs for music and other stools or chairs, the back composed of the upper piece C and the frame D, constructed of a bar bent to form downwardly-projecting limbs, crooks *b b*, and a forwardly-projecting lower loop *c*, in combination with the loops *d d*, for connecting the back to the seat.

2. The combination, with the seat of the stool or chair, of the upper back support or piece C, the rod or bar, frame D, having crooks *b b*, and a forwardly-projecting lower loop *c*, the loops *d d*, secured to the back of the seat and receiving within them the crooks *b b*, and a spring beneath the seat operating to control the crooked or hinged and looped frame D, essentially as described.

3. The combination, with the stool or chair seat, of the plate *e*, with its attached hook *f*, secured to the under side of the seat, the spiral spring E, and the rocking or hinged back composed of the upper piece C, the frame D, bent to form crooks *b b*, and forwardly-projecting loop *c*, arranged for movement within the hook, and the loops *d d*, receiving the crooks *b b* within them, substantially as shown and described.

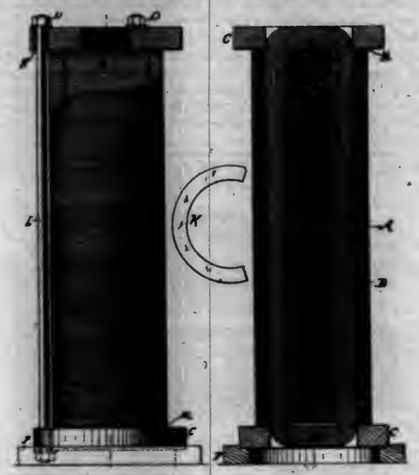
404,629. BOILER-FEEDER. ALBERT F. JONES, Salem, Mass. Filed Sept. 22, 1888. Serial No. 286,111. (No model.)

Claim.—1. In a boiler-feeder, the combination, with the boiler, of a closed reservoir connected by a pipe having a check-valve with the said boiler, a closed vessel in communication at the top and bottom with the said boiler, a pipe leading from the top of the said closed vessel into the top of the said reservoir, a valve held on the said pipe, and a float located in the said vessel and connected with the said valve to open and close the said pipe, substantially as shown and described.

2. In a boiler-feeder, the combination, with a closed reservoir connected with a water supply and with the boiler, of a pipe leading from the top of the said reservoir, a closed vessel in communication with the steam and water compartment of the boiler and connected at its upper end with the said pipe, a valve adapted to close the said pipe, and a float held in the said closed vessel and operating the said valve, substantially as shown and described.

3. In a boiler-feeder, the combination, with a closed reservoir in communication with the boiler and provided with a supply-pipe having a check-valve, of a steam-pipe leading from the upper end of the said reservoir, a closed vessel connected at its top with the said steam-pipe and held in communication with the steam and water compartment of the boiler, a valve for opening and closing the said pipe, and a float held in the said closed vessel to open and close the said valve and the said check-valve, substantially as shown and described.

4. In a boiler-feeder, the combination, with a reservoir connected with the boiler, of a supply-pipe having a check-valve and discharging into the top of the said reservoir, a receptacle held in or near the top of the said reservoir and in communication with the latter, a float held in the said receptacle, and a valve operated by the said float and adapted to close or connect the outside with the interior of the said receptacle, substantially as shown and described.



5. In a boiler-feeder, the combination, with a reservoir connected with the boiler, of a supply-pipe having a check-valve and discharging into the top of the said reservoir, a receptacle held in or near the top of the said reservoir and in communication with the latter, a float held in the said receptacle, a valve operated by the said float and adapted to close or connect the outside with the interior of the said receptacle, and a steam-pipe leading from the top of the said reservoir and connecting with the live steam in the boiler, substantially as shown and described.

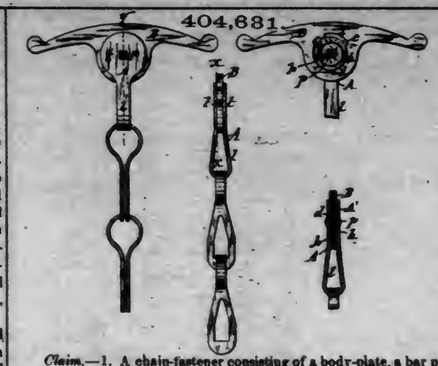
6. In a boiler-feeder, the combination, with a reservoir connected with the boiler, of a supply-pipe having a check-valve and connected with the said reservoir, a receptacle held in or near the top of the said reservoir and in communication with the latter near its top, a float held in the said receptacle, a valve held in the said receptacle and opening to the outside, the said valve being operated by the said float, a steam-pipe leading from the said reservoir, a closed vessel connected with the said pipe and in communication with the steam and water compartments of the boiler, a valve for closing and opening the said steam-pipe, and a float held in the said closed vessel and operating the said valve, substantially as shown and described.

7. In a boiler-feeder, the combination, with a reservoir connected with the boiler, of a supply-pipe having a check-valve and connected with the said reservoir, a receptacle held in or near the top of the said reservoir and in communication with the latter near its top, a float held in the said receptacle, a valve held in the said receptacle and opening to the outside, the said valve being operated by the said float, a steam-pipe leading from the said reservoir, a closed vessel connected with the said pipe and in communication with the steam and water compartments of the boiler, a valve for closing and opening the said steam-pipe, a float held in the said closed vessel and operating the said valve, and a second float held in the said closed vessel and operating a plug-valve in the bottom of the said closed receptacle, substantially as shown and described.

8. In a boiler-feeder, the combination, with the boiler, of a closed reservoir located above the said boiler, a pipe connecting the bottom of the said reservoir with the bottom of the boiler, a check-valve held in the said pipe, a second valve held in the said pipe between the outer and the said check-valve, and a weighted ball secured to the valve-stem of the said second valve, substantially as shown and described.

404,630. INDUCTION-COIL. JOHN F. KELLY, Hoboken, N. J., assignor to the United States Electric Lighting Company, same place. Filed Oct. 30, 1886. Serial No. 217,563. (No model.)

Claim.—1. The combination, with a sectional longitudinally-grooved core and primary and secondary coils wound thereon, of a sectional casing or armature surrounding and inclosing the core and coils, as set forth.



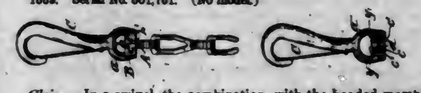
2. The combination, with a core formed of recessed iron plates with interposed sheets of insulating material and primary and secondary coils wound longitudinally around the core in the grooves formed by the recesses of the plates, of a casing composed of perforated plates or rings of iron with interposed insulating material built up around the coils and core, as set forth.

3. The combination, with a core composed of recessed iron plates with interposed sheets of insulating material and primary and secondary coils wound longitudinally around the core in the grooves formed by the recesses of the plates, of a casing composed of a series of iron rings with interposed insulating material, closely fitting the core, and means for binding the parts together, as and for the purpose set forth.

4. An induction coil or transformer of alternating electric currents, consisting of a sectional iron core provided with grooves or channels, primary and secondary conductors, and an outer sheathing, the primary and secondary conductors being wound in the same grooves or channels, and being equally close to both the core and the sheathing, as set forth.

404,631. CHAIN-FASTENER. HARRY E. KELLEY, Niagara Falls, assignor to the Oneida Community, (Limited,) Community, N. Y. Filed Nov. 28, 1888. Serial No. 292,094. (No model.)

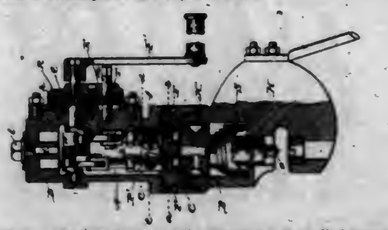
404,631.



Claim.—1. A chain-fastener consisting of a body-plate, a bar pivoted to the body-plate, a stop arranged to arrest the movement of the aforesaid bar in one direction, and a coiled spring holding the bar normally resting on the stop, as set forth.

2. The improved chain-fastener consisting of a body-plate, a bar pivoted to the body-plate and provided with a chamber at its pivot, a stop in position to arrest the movement of the aforesaid bar in one direction, and a coil-spring seated in the aforesaid chamber and holding the bar normally resting on the stop, as set forth.

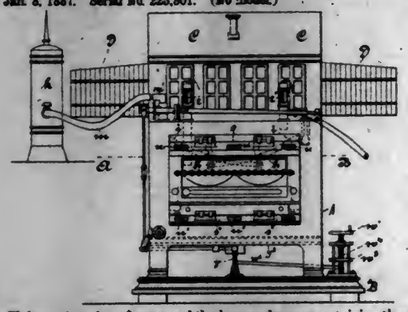
3. The combination of the body-plate A, formed with the case A', the bar B, pivoted in said case, a stop arranged to arrest the swinging of the aforesaid bar in one direction, and a coil-spring inclosed in the aforesaid case and holding the bar normally resting on the stop, substantially as described and shown.



4. The combination of the body-plate A, formed with the case A', the disk *d*, confined in the said case and provided with the projection *e*, the bar B, formed with the eye *b*, and pivoted thereby on the aforesaid disk, and provided with the elongated notch *f* for the reception of the projection *e*, and the coil-spring *h*, seated in the eye *b* and connected at opposite ends, respectively, to the bar B and disk *d*, substantially as described and shown.

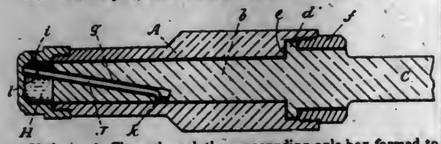
404,632. SWIVEL. HARRY E. KELLEY, Niagara Falls, assignor to the Oneida Community, (Limited,) Community, N. Y. Filed Mar. 2, 1889. Serial No. 301,761. (No model.)

Claim.—In a swivel, the combination, with the headed member, of the sleeved member formed with the yoke *a*, semi-cylindrical sleeve portion *c* on the ends of said yoke and axially in line with the article to which it is attached, and clinching-prongs *c' c'*, extending from the sleeve portion *c* and adapted to fold around the neck portion of the aforesaid headed member, substantially as described and shown.



404,633. HYDRAULIC PUNCHING-MACHINE. CONSTANTIN C. KLIMM, FRIEDRICH PIENKOWSKI, and AUGUST GROSS, Königshütte, Prussia, Germany. Filed Nov. 7, 1887. Serial No. 254,729. (No model.) Patented in Germany Feb. 12, 1887, No. 41,746.

Claim.—The combination of the reservoir A, the cylinder secured to the base thereof and having the pressure-piston, the pumps arranged within the reservoir and having their lower ends screwed to the base thereof, the cap D, secured to the upper end of the reservoir, said cap and reservoir having the bearings formed in their meeting ends, the plate *t*, secured to the cap and reservoir, the housing E, bolted to the cap and reservoir, the crank-shaft journaled in the bearings in the reservoir and cap and in openings in the plate *t* and housing E, the cranks of the said shaft being connected to the pump-plungers, the wheel *h* on the said shaft, the shaft *m*, journaled in bearings in the housing and in the reservoir, and having the pinion *r*, meshing



with wheel *h*, and the crank F', adapted to fit on the outer ends of either the crank-shaft or shaft *m*, substantially as described.

404,634. INCUBATOR. WILHELM KNOFF, Berlin, Germany. Filed Jan. 8, 1887. Serial No. 223,801. (No model.)

Claim.—A series of nests and the box or drawer containing them, in combination with a hot-water receptacle or artificial mother arranged for contact with said eggs, and a screw-shaft, nut, and levers for raising and lowering said artificial mother at will, substantially as set forth.

404,635. CARRIAGE-AXLE. FLORIAN LEBEL, Levis, Quebec, Canada. Filed July 16, 1888. Serial No. 280,049. (No model.)

Claim.—1. The axle and the surrounding axle-box formed to leave a chamber between them, the said axle having the oil-passage extending from the chamber to its periphery, in combination with the agitating-rod located within said oil-passage and arranged to be moved therein by the revolution of the wheel.

2. A carriage-axle provided with a rod J, playing loosely in the opening *g*, and held against the end of the chamber in the cap H by the spiral spring *l*, substantially as shown and specified.

3. The combination of the axle C, with the cap H secured to the box A, having the interior of its end wall indented or otherwise uneven, and provided with a filling-hole closed by the screw-plug *i*, substantially as specified.

4. The combination of the chambered cap H, having an indented interior surface and an opening fitted with a screw-plug *i*, with the rod J lying loosely in the opening *g* in the axle and held against the uneven wall of the cap H by the spiral spring *l*, as shown and described.

404,636. HOLDER AND PACKING-FRAME FOR HATS. WILLIAM M. LEVY, St. Louis, Mo., assignor of two-thirds to Adolph Bernd and Rothschild Brothers, all of same place. Filed Mar. 5, 1889. Serial No. 301,965. (No model.)

Claim.—1. In a holder and packing device for hats, the combination of sides or frames, each composed of bars jointed together on the lazy-tong principle, and bars or holders connecting the said frames, with means for locking the frames in the extended and closed positions, substantially as shown, and for the purpose described.

2. In a holder and packing device for hats, the combination of sides or frames, each composed of bars jointed together on the lazy-tong principle, bars or holders connecting the said frames, and means for locking the frames in the extended and closed positions, with means for securing the hats to the said connecting bars or holders, substantially as shown, and for the purpose described.

404,637. CURTAIN-RING. JOHN LINES, Waterbury, Conn., assignor to The Scovill Manufacturing Company, same place. Filed Mar. 15, 1889. Serial No. 303,382. (No model.)

Claim.—The herein-described curtain-ring, consisting of a tube bent into ring shape, the ends of the tube introduced the one within the other, one end overlapping the other, combined with a metal eye B, constructed with a loop *b*, embracing the overlapping ends of the ring, and struck down upon the said overlapping ends to form indentations in the two, whereby the ring is secured in place and the ends united to complete the ring.

404,638. CURTAIN-RING. JOHN LINES, Waterbury, Conn., assignor to The Scovill Manufacturing Company, same place. Filed Mar. 15, 1889. Serial No. 303,383. (No model.)

Claim.—The herein-described curtain-ring, consisting of a tube bent into ring shape, one end of the tube inserted into the other end to complete the ring, the overlapping ends pierced from the outside, combined with an eye made from wire bent into ring shape with radially-projecting ends, the said projecting ends introduced through the said perforation in the overlapping ends of the tube and struck down upon the inside as a means for securing the eye to the ring, and also serving to secure the two ends of the ring together, substantially as described.

404,639. COFFIN. EDWIN C. MANNING, Washington, D. C. Filed May 25, 1888. Serial No. 275,094. (No model.)

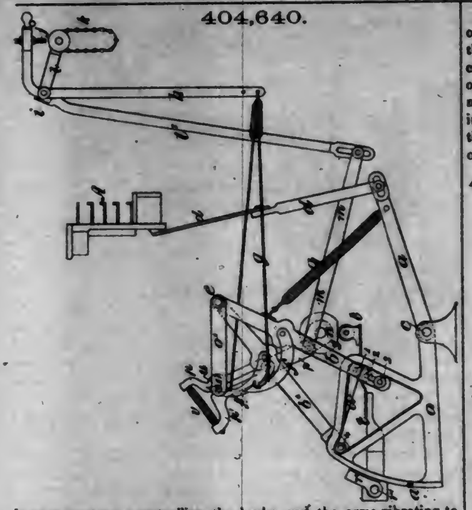
Claim.—1. The combination, with a coffin constructed with open ends, of frames having wire fabrics attached thereto, said frames secured to the open ends of the said coffin, and removably-secured end pieces, substantially as set forth.

2. A coffin provided with a reticulated basket suspended within its walls, free therefrom, in combination with ventilating-passages covered with wire-gauze, substantially as described.

3. The combination of a coffin, a corpse-supporting reticulated basket suspended therein, opposite openings through its walls covered with wire-gauze, and removable air-tight-fitting covers for said openings, substantially as and for the purposes described.

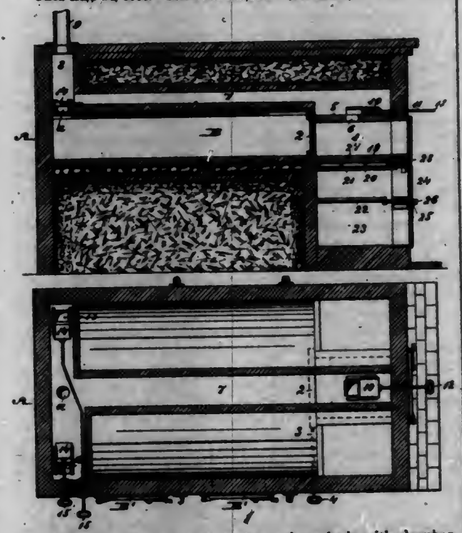
4. A ventilating coffin having openings at both ends covered with a fine-wire fabric, for the purpose specified.

5. The combination, with a coffin having open ends covered by a wire fabric, of the end pieces or covers H, the center pieces G, and the fastening-screws for securing said end pieces to the said center pieces, substantially as specified.



404,640. SHUTTLE-BOX MECHANISM FOR LOOMS. JOHN MATHIESON, Glasgow, County of Lanark, Scotland. Filed Nov. 8, 1887. Serial No. 254,662. (No model.) Patented in England Apr. 14, 1887, No. 5,407, and in France July 9, 1888, No. 184,708.

Claim.—1. In a loom drop-box motion, the lever *a*, the operating-spring, and the drop-box connected to the lever, in combination with vibrating arms provided with hooks, pattern mechanism controlling the hooks, a lifter for the hooks, and mechanism to operate the lifter, all substantially as set forth.

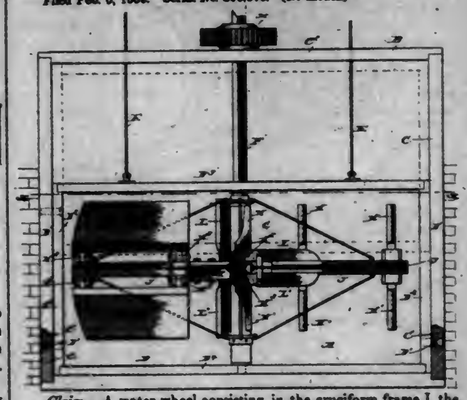


2. In a loom drop-box motion, the lever *a*, the drop-box, a spring to raise the drop-box, a brake to hold the lever, a holding or releasing cam or tappet controlling the brake, and the arms vibrating to raise one arm of the lever *a*, and thereby to lower the drop-box, in combination with hooks on the vibrating levers, pattern mechanism acting on the hooks, a lifter-bar, and means for operating the latter, all substantially as described.

3. The drop-box, the lever *a* controlling the drop-box, vibrating arms of varying length to rock the said lever on its fulcrum in one direction, and a spring to move the lever in the other direction, in combination with pattern mechanism for selecting the arms to be vibrated and with hooks connected to the arms, a vibrating lifter-bar, and mechanism to operate the latter, all substantially as set forth.

404,640.

404,641. BAKER'S OVEN. JOHN H. MEIER, Philadelphia, Pa. Filed Aug. 24, 1888. Serial No. 283,612. (No model.)



Claim.—1. A baker's oven having an inner body with chamber, a fire-chamber between said inner body and outer casing or wall, and a horizontal wall above the fire-chamber and connecting said inner body and outer casing or wall, said horizontal wall having an opening with valve, said parts being combined substantially as described.

2. A baker's oven having an inner body with chamber, a fire-chamber between said inner body and outer wall, a horizontal wall above said fire-chamber and having an opening with valve, and a channel above said inner body leading from said fire-chamber to a flue at the discharge end of the oven, said parts being combined substantially as described.

3. In a baker's oven, an inner body with chamber having an opening in its top, a fire-chamber, a slide between said chamber of the inner body and fire-chamber, a horizontal wall above said fire-chamber and connecting said inner body with outer wall and having an opening with valve, a channel above said inner body, and a flue communicating with said channel at the end of the oven and having openings with valve at its base, the opening in the top of the chamber of the inner body communicating directly with the flue, said parts being combined substantially as and for the purpose set forth.

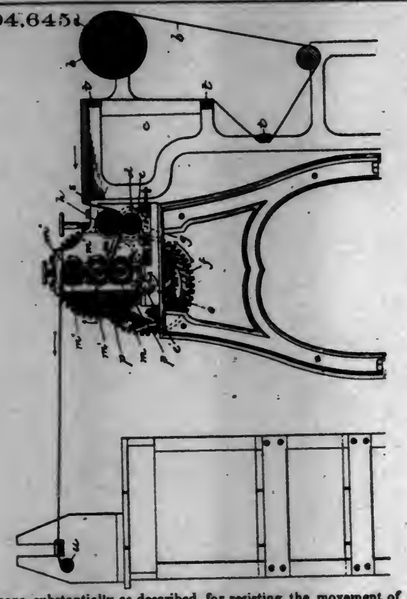
404,642. WATER-WHEEL. LEE MIDDLETON, Clarksville, Mo. Filed Feb. 6, 1889. Serial No. 298,876. (No model.)

Claim.—A water-wheel consisting in the cruciform frame I, the arms J, bolted thereto and provided with vertical bars K K' projecting from their upper and lower sides, upper and lower pairs of horizontal lugs K^3 K^4, projecting at right angles to the arms J, and the upper and lower gates L L', hinged at their adjacent edges to said lugs to swing vertically toward and from each other, the said arms K K' forming stops for the gates when they are in their vertical positions one above the other, substantially as set forth.

404,643. CHECK-REIN-HOOK. GEORGE W. MOLIERE, Ocean View, Cal. Filed Sept. 1, 1888. Serial No. 284,380. (No model.)

Claim.—As an improved article of manufacture, the check-rein hook herein shown and described, consisting of the main part or hook proper A, having the two parallel shanks *a a'* provided with coincident holes to receive the screw which attaches the device to a harness-saddle, as specified.

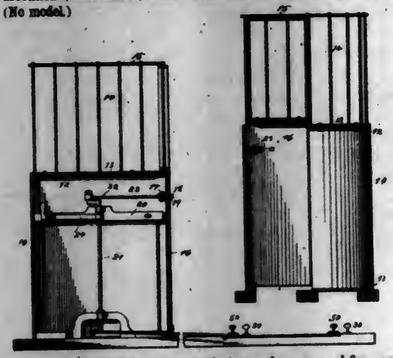
404,644. CIGAR-HOLDER. HEINRICH MACHTANS, Hanau, Prussia, Germany. Filed Mar. 23, 1888. Serial No. 268,313. (Model.) Patented in England Dec. 19, 1887, No. 17,443, and in Germany Jan. 6, 1888, No. 42,913.



Claim.—1. A cigar-holder consisting of a smoke-tube, a holding-point on said tube provided with an opening leading to the interior of the tube, and a movable cap for covering said point when the holder is not in use, substantially as described.

2. A cigar-holder consisting of a smoke-tube, a holding-point, a box on said tube having threads on its periphery, and a covering-cap surrounding said box and in engagement with the threads thereof, substantially as described.

404,645. MACHINE FOR CUTTING CLOTH INTO STRIPS. JOHN G. MCCARTER, Boston, Mass. Filed Jan. 12, 1889. Serial No. 296,189. (No model.)



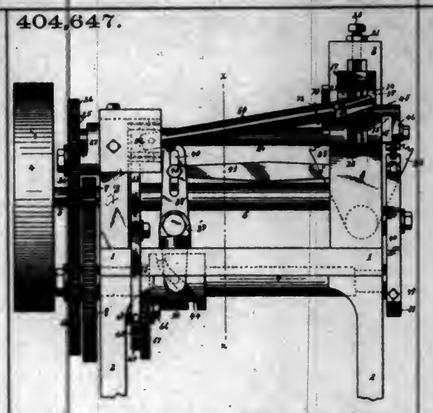
Claim.—In a machine for cutting sheet material into strips, the combination of a grooved idle-roll, a roll or shaft having a series of disk-knives coinciding with and entering the grooves of the idle-roll,

404,645.

means, substantially as described, for resisting the movement of the material to the knives and grooved roll, a support *s*, arranged as described with relation to the grooved roll and knives, whereby the material is held upon a portion of the periphery of said roll before reaching the knives, feed-rolls arranged at the opposite side of the grooved roll and knives from the support *s*, mechanism for rotating the feed-rolls in the direction required to draw the material from the grooved roll and knives, and mechanism for rotating the knives in a direction opposite to the movement imparted by the feed-rolls to the material, as set forth.

404,646. LOCK-HOUSE FOR SWITCH-STANDS. WILLIAM J. MCCARTHY, Menominee, Mich. Filed Feb. 4, 1889. Serial No. 298,606. (No model.)

Claim.—1. A lock-house for switch-stands, arranged for connection with the switch-ties and formed with an upper barred section, substantially as described.



2. In a lock-house for switch-stands, the combination, with a lower sheet-metal section, of an upper barred section and a roof, substantially as described.

3. The combination, with a switch-stand, of a shaft formed with an upper crank, a house within which the stand is arranged, an eye connected to the house-door, and a link connecting the upper crank and the eye, substantially as described.

404,647. HAT-WIRE MACHINE. BERNARD MCCORMICK, Bridgeport, Conn., assignor of one-half to George J. Brown, same place. Filed Sept. 14, 1888. Serial No. 285,370. (No model.)

Claim.—1. In a machine of the class described, the combination, with the feed-rollers, of the twisting-sleeve 30, provided with a holding device and with a pinion 31, the segment-gear engaging said pinion, the

404,647.

lever 38, the cam for operating said lever, and the link 41, connecting said lever with said segment-gear.

2. In a machine of the class described, the combination, with the feed-rollers, of the twisting-sleeve 30, provided with a holding device and with a pinion 31, the segment-gear engaging said pinion and provided with the slot 37, the link 41, adjustably attached at its forward end to said segment-gear at said slot, the lever 38, to which the rear end of said lever is connected, and the cam for operating said lever.

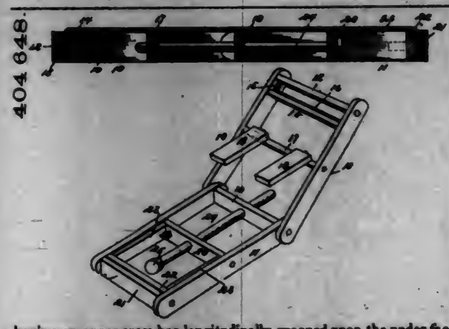
3. In a machine of the class described, the combination, with the feed-rollers, of the twisting-sleeve 30, provided with a holding device and with a pinion 31, the segment-gear engaging said pinion and provided with slot 37, the lever 38, provided with slot 40, the cam for operating said lever, the link 41, and screw-studs 42 for adjustably attaching said link to said lever and segment-gear.

4. The combination, with the feed-rollers and the shaping-roller, of a lever 46, whereby said roller is carried, a lever 47, engaging lever 46, a rotating cam engaged by lever 47, and adjustable contact portions on said levers, whereby the movement of the shaping-roller may be varied to give any desired shape to the hat-wires.

5. The combination, with the feed-rollers, of a tube provided with a longitudinally-extending stationary cutter, a movable cutter pivoted to said tube and having a lug 54, and a rock-shaft within said tube, and provided at its end with a cam engaging said lug to operate said movable cutter.

6. The combination, with the feed-rollers, of a tube provided at the end with a stationary cutter extending lengthwise thereof, a movable cutter pivoted to said tube and provided with a lug 54, a rock-shaft within said tube and having at one end a cam to engage said arm to operate said cutter and provided at its opposite end with an arm, and a rotating disk having a cam to engage said arm to operate said rock-shaft.

7. The combination, with the feed-rollers, the tube carrying a stationary cutter and a movable cutter pivoted within the tube and having a lug 54, of a rock-shaft within the tube having a cam engaging said lug, a universal joint connecting the tube with the frame-work, a bracket to support the forward end of the tube, and a spring whereby it is retracted to position.



8. In a machine of the character described, the combination, with the feed-rollers, of an oscillating twisting-sleeve provided with a holding device and through which the wire passes to said rollers, a shaping-roller adjacent to said feed-rollers, a vibrating lever to carry said shaping-roller in the arc of a circle, and a cutting device to sever the wire at predetermined times, and consisting of a tube provided at one end with a longitudinally-extending stationary cutter, a movable cutter pivoted to said tube and having a lug 54, and a rock-shaft within said tube and having at one end a cam engaging said lug to operate said movable cutter.

404,648. TROUSERS-STRETCHER. DAVID F. MCHAIL, Wilkes-Barré, Pa. Filed Feb. 12, 1889. Serial No. 299,586. (No model.)

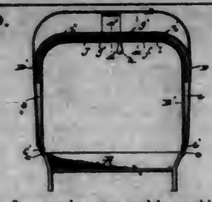
Claim.—1. In a trousers-stretcher, the combination, with an upper frame and a lower frame pivoted therein, of a clamp-bar sliding in the frame and capable of contact with the under face of the upper cross-bar of the upper frame, and a similar clamp-bar capable of contact with the inner face of the lower cross-bar of the lower frame, wedge-bars hinged to the upper and lower frames, engaging respectively the upper and lower sliding clamp-bars, and a lock-bolt capable of sustaining both frames in the same plane, substantially as shown and described.

2. In a trousers-stretcher, the combination, with an upper frame

404,648.

having an upper cross-bar longitudinally grooved upon the under face and a sliding clamp-bar provided with a rib adapted to enter said groove, of a lower frame pivoted in the upper frame, having a lower cross-bar grooved upon the upper face, a sliding clamp-bar provided with a rib capable of entering the groove of the lower cross-bar, a bolt locking the two frames in the same vertical plane, and means, substantially as shown and described; for locking the clamp-bars against the cross-bars, all combined for operation as and for the purpose specified.

3. In a trousers-stretcher, the combination, with an upper frame provided with an upper cross-bar having a groove in the under face, a sliding clamp-bar having a rib produced upon the upper face capable of entering the said groove, and an intermediate cross-bar, of a lower frame pivoted to the upper frame, provided with an intermediate cross-bar, a lower cross-bar having a groove in the under face, a clamp-bar sliding in the lower frame and provided with a rib adapted to enter the said groove of the lower cross-bar, wedge-bars hinged to the intermediate cross-bars of the upper and lower frames capable of exerting pressure upon the clamp-bars, and a bolt held to slide through the intermediate cross-bars of the frames, locking the same in a parallel vertical position, substantially as shown and described.



404,649. SHUTTLE-BINDER FOR LOOMS. SAMUEL J. HOSMER, Somerville, Conn. Filed Apr. 25, 1888. Serial No. 271,794. (No model.)

Claim.—1. The spine or back having the slots or openings and the spring or bow having rods or bolts loosely secured thereto, and provided with guide-blocks resting in said slots or openings, and having threaded apertures through which said rods or bolts project, substantially as shown and described.

2. The combination, with the spine or back, of the spring or bow, the notted rods or bolts secured thereto and projecting through apertures in said spine or back, and the guide-blocks wherein work said rods or bolts, substantially as shown and described.

404,650. CARRIAGE-TOP. JOHN T. HOOVER, Laramie, Wyo. Filed Nov. 6, 1888. Serial No. 290,131. (No model.)

404,650.

Claim.—1. In a carriage-top, and in combination with the longitudinally-slotted bow, the two curtains passed therethrough and arranged to slide vertically therein, said curtains being connected and constructed to operate in unison.

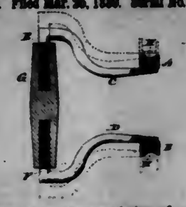
2. In a folding carriage-top, a series of bows jointed together to open and close, each bow provided with a longitudinal slot extending therethrough from front to rear, in combination with side curtains passing through the bars and arranged to slide upward and downward therein, and a sliding connection between the upper edges of said curtains.

3. In a carriage-top, a series of bows, each having a longitudinal slot opening therethrough from front to rear, curtains passing loosely through said slots and adapted to slide vertically therein, in combination with the operating device connected to said curtains and located within reach of the occupant of the vehicle, whereby he is enabled to raise or lower the curtains at will.

4. In a carriage-top, and in combination with the vertically-sliding curtains D D', the two guide-rods, the handle A, the guide-pulleys *i i'* at the opposite sides, and the two cords extended around said guide-pulleys and connecting the curtains, as described.

404,651. SAFETY ATTACHMENT FOR ELECTRIC MOTORS. WILLIAM S. PAGE, Baltimore, Md., assignor of one-half to John P. Page, same place. Filed Jan. 11, 1889. Serial No. 296,073. (No model.)

Claim.—1. In combination with an electrical motor, a short circuit around the motor and a circuit-closer sustained from contact with the terminals of the short-circuit wires by means of the driving-belt, substantially as specified.



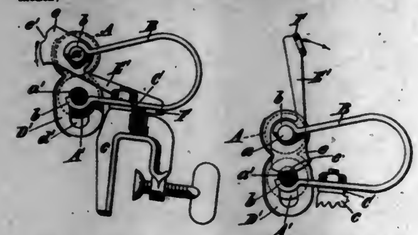
2. In combination with an electrical motor, a short circuit around the motor having spring-terminals, and a bell-crank one arm of which carries a short-circuit closer and the other a roller adapted to rest on the driving-belt, substantially as specified.

3. In combination with an electrical motor, a short circuit around the motor, and a bell-crank one arm of which carries a short-circuit closer and the other a roller adapted to rest on the driving-belt, substantially as specified.

4. In combination with an electrical motor, a short circuit around the motor and a short-circuit closer sustained from contact with the said short circuit by means of a roller, which rests on the driving-belt, substantially as specified.

5. In combination with an electrical motor, a short circuit around the motor and a pivoted arm sustained by the driving-belt carrying a short-circuit closer, substantially as specified.

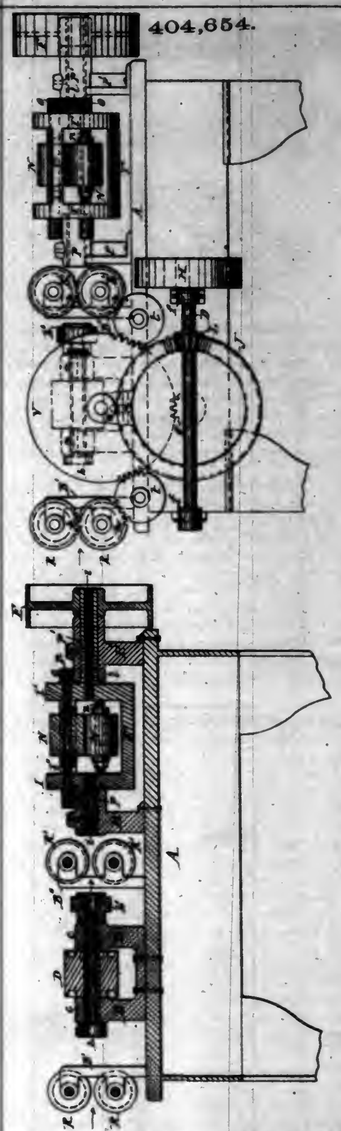
404,652. VETERINARY MOUTH-SPECULUM. CHAS. H. PALMER, New Haven, Conn. Filed Mar. 26, 1889. Serial No. 304,634. (No model.)



Claim.—1. A mouth-speculum consisting of a vertical handle provided with arms extending from the respective ends of the handle, combined with jaw-plates pivoted to the end of said arms, substantially as and for the purpose described.

2. The combination of the two jaw-plates, arms extending from said plates, the outer ends of the arms turned toward and into line with each other, a handle arranged upon the said ends of the arms and so as to rotate thereon, one of the said arms screw-threaded, and the handle correspondingly screw-threaded, and whereby under the rotation of the handle the said arms and the jaw-plates separate or approach each other, as the case may be, substantially as described.

3. A mouth-speculum consisting of a pair of arms, with means, substantially such as described, for supporting the said arms distant from each other, a jaw-plate pivoted upon the ends of said arms, the said jaw-plates provided with india-rubber cushions, substantially as and for the purpose described.

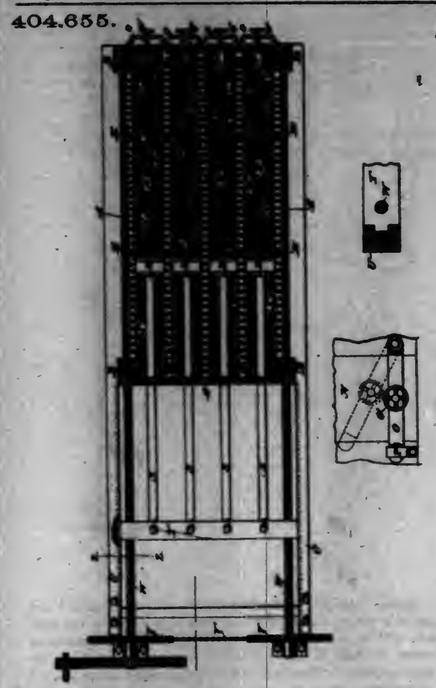


404,653. CLOTHES-WRINGER. LEWIS C. PARKER and BERNHARD VOGEL, Cincinnati, Ohio. Filed Feb. 11, 1889. Serial No. 299,470. (No model.)

Claim.—1. In a clothes-wringer, the combination, with the rubber rolls A A', having shafts *a a'*, and U-springs B B, having outer sockets or bearings *b b* for said shafts, of the inflexible or stiff levers E E', having longitudinal projections or cams *c* at their inner ends, and a flat cross-bar F, connecting their outer ends, the said levers being pivotally mounted upon the upper roll-shaft intermediate the opposite ends of the rubber roll and the U-springs, with their cams *c* normally out of engagement with any of the parts and readily brought into engagement with the periphery or face of the lower roll-shaft to spread the two rolls apart and relieve them of unnecessary pressure when not in use, substantially as herein set forth.

2. In a clothes-wringer, the combination, with the rolls A A', shafts *a a'*, U-springs B B, shields D D', and the bracing or tie bar C, of the levers E E', having cams *c*, and cross-bar or apron F, journaled to one of said shafts, said cams having concave notches *c c'*, which engage the other of said shafts, substantially as and for the purpose specified.

404,654. MACHINE FOR MANUFACTURING CYLINDRICAL RODS. HENRY H. POST, Oswego, N. Y. Filed Oct. 1, 1888. Serial No. 286,880. (No model.)



Claim.—1. The combination, with the pedestals P P', formed with journal-boxes, hollow shafts *i i*, mounted in said boxes, heads I I', rigidly attached to said shafts, driving-pulley F, attached to one of said shafts, shafts *n n*, journaled in said heads, and abrading-cylinders N N, and pinions *o o*, attached to the latter shafts, as shown, of the stationary gear-wheel *l*, meshing with the said pinion and rigidly attached to the journal-box of one of the pedestals, substantially as described and shown.

2. The improved machine for forming cylindrical rods, consisting of the bed A, pedestals B B B' B'' and P P', mounted on said bed, the hollow shaft *a*, journaled in the pedestals B B, pulley D, secured to said shaft between the pedestals, cutter-heads *b b'*, secured to opposite ends of the aforesaid shaft, feed-rollers R R, pivoted to the pedestal B' and formed with V-shaped grooves in their peripheries, guide-rollers R' R', pivoted to the pedestal B'' and formed with U-shaped grooves in their peripheries, the heads I I', rigidly united and having hollow journals *i i*, mounted in the boxes of the pedestals P P', the gear-wheel *l*, fixed to one of said boxes, the shafts *n n*, journaled in the heads I I', the abrading-cylinders N N, secured to said shafts, pinions *o o* on the ends of the shafts, meshing with the aforesaid gear-wheel, and the pulley F, attached to one of the journals *i*, substantially as described and shown.

404,655. GRAIN-PRESS. WILLIAM PRESTON, Brooklyn, N. Y., assignor of one-half to James J. Kelly, same place. Filed Aug. 17, 1888. Serial No. 283,080. (No model.)

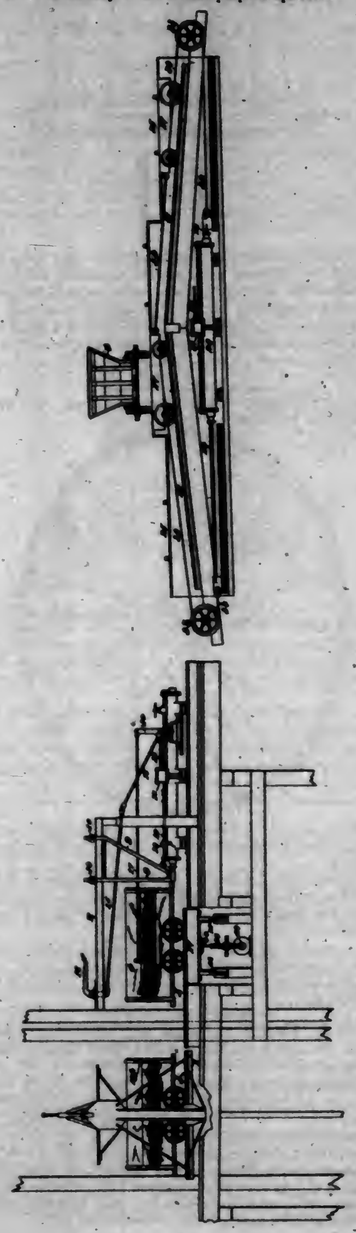
Claim.—1. The combination, with an outer supporting-casing having perforated inner side walls, a perforated bottom, and a solid end wall, of a series of double partition-walls severally formed of detachable perforated plates and interposed transverse cleats, and which abut against the solid wall of the casing at one end and its uprights at the other, hinged doors closing the openings between said uprights, followers moving longitudinally in the compartments formed by the double partition-plates between the solid wall at one end and the doors at the other, and mechanism, substantially as described, for actuating

404,655.

said plungers and moving them to and from the end door of each compartment, substantially in the manner and for the purpose herein set forth.

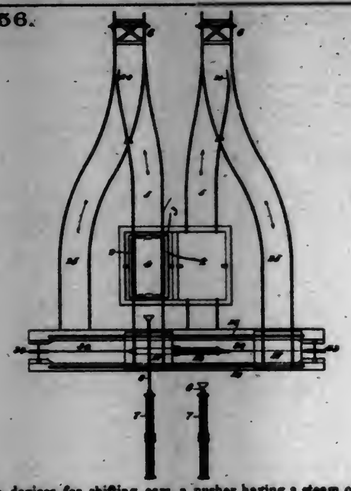
2. The combination, with an outer supporting-casing having perforated inner side walls, a perforated bottom, and a solid end wall, of a series of double partition-walls severally formed of detachable perforated plates and interposed transverse cleats and which abut against the solid wall of the casing at one end and its uprights at the other, doors closing the openings between said uprights, followers moving longitudinally in the compartments formed by the double partition-plates between the solid wall at one end and the doors at the other, mechanism, substantially as described, for actuating said plungers and moving them to and from the end door of each compartment, a yoke spanning the openings for each door to limit its outward movement, and a set-screw working through said yoke to control said movement, all substantially in the manner and for the purpose herein set forth.

3. The combination, with an outer supporting-casing having perforated inner side walls, a perforated bottom, and a solid end wall, of a series of double partition-walls severally formed of detachable perforated plates and interposed transverse cleats, and which abut against the solid wall of the casing at one end and its uprights at the other, doors closing the openings between said uprights, followers moving longitudinally in the compartments formed by the double partition-plates between the solid wall at one end and the doors at the other, mechanism, substantially as described, for actuating said plungers and moving them to and from the end door of each compartment, double doors hinged at the top of the casing to extend transversely over its compartments, a batten-plate to cover the joint between each pair of doors, and a set-screw working against said batten through an upper cross-piece to fasten and secure the doors against internal pressure, substantially in the manner and for the purpose herein set forth.



4. The combination, with an outer supporting-casing having perforated inner side walls, a perforated bottom, and a solid end wall, of a series of double partition-walls severally formed of detachable perforated plates and interposed transverse cleats and which abut against the solid wall of the casing at one end and its uprights at the other, doors closing the openings between said uprights, followers moving longitudinally in the compartments formed by the double partition-plates between the solid wall at one end and the doors at the other, a cross-head to which the followers are all secured, endless screws working through said cross-head, one at either end, gearing connecting said screws to cause them to rotate in unison, and mechanism for driving the same, substantially in the manner and for the purpose herein set forth.

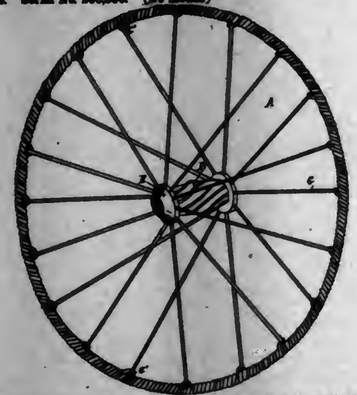
404,656. APPARATUS FOR SHIFTING CARS. ROBERT RAMSAY, Mount Pleasant, Pa. Filed Feb. 25, 1889. Serial No. 301,004. (No model.)



Claim.—1. In devices for shifting cars, the combination of an inclined delivery-track, a pusher, an inclined return-track, a transverse carriage, and apparatus for operating the pusher and the transverse carriage, substantially as and for the purposes described.

2. In devices for shifting cars, a pusher having a steam or hydraulic cylinder, a piston or pushing-rod, and a reversing-valve, substantially as and for the purposes described.

3. In devices for shifting cars, a pusher having a steam or hydraulic cylinder, a piston or pushing-rod, a reversing-valve, and a check-valve, substantially as and for the purposes specified.



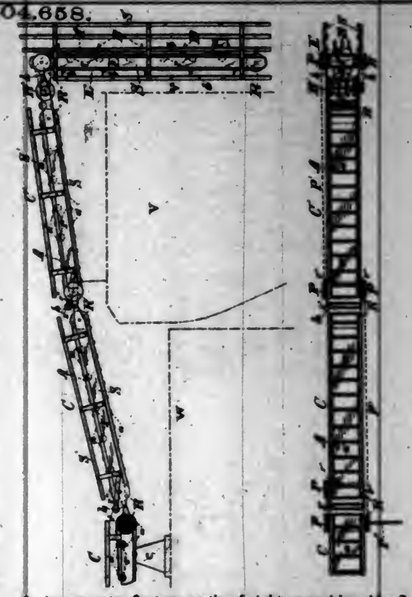
404,656.

4. In devices for shifting cars, a pusher having a steam or hydraulic cylinder, a piston or pushing device, a reversing-valve, and an arm connected with the reversing-valve and arranged to be operated automatically, substantially as and for the purposes described.

5. In devices for shifting cars, a pusher having a steam or hydraulic cylinder, a piston, a reversing-valve, and a hand-lever connected with the reversing-valve, substantially as and for the purposes described.

404,657. WHEEL. MILES C. ROOT, Toledo, Ohio. Filed Nov. 12, 1888. Serial No. 290,590. (No model.)

Claim.—1. In a metal wheel, a rim and spokes formed integral by coiling the ends of the spokes to form the rim, as and for the purpose set forth.



2. In a metal wheel, a hub, in combination with spokes formed with horizontal portions confined upon the hub and bent at right angles thereto and spirally twisted to form a rim or tire, as and for the purpose set forth.

3. In a metal wheel, a hub, in combination with spokes secured to the hub and twisted at their free ends to form a rim or tire, each spoke being secured to any desired succeeding spoke, as and for the purpose set forth.

404,658. FREIGHT ELEVATING AND TRANSPORTING APPARATUS. WILLIAM H. RUSSELL, Vancouver, British Columbia, Canada, assignor of one-third to Gideon Robertson. Filed May 10, 1888. Serial No. 273,503. (No model.) Patented in Canada Feb. 18, 1888, No. 28,542.

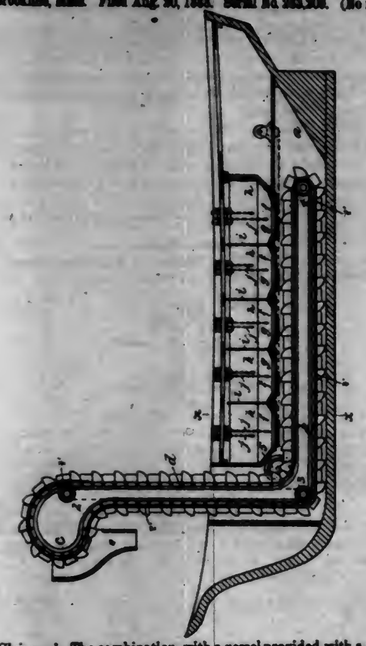
Claim.—1. An apparatus for elevating and transporting freight, comprising a series of carriers and an elevator hinged together endwise to assume different elevations and angles, said carriers and elevator consisting of channels the bottoms of which consist of traveling aprons running over a driving-roller at each end and intermediate friction-rollers, said driving-rollers connected for transmitting motion from one to another, and said elevator-apron provided with brackets or tables to receive the packages, substantially as set forth.

404,658.

2. An apparatus for transporting freight, comprising sides S and framing S', forming a channel, driving-rollers R, journaled at the ends, and some of them provided with pulleys P, friction-rollers r, journaled at intervals between the driving-rollers, suspended rollers r' at the joint, endless apron A, running over the driving-rollers and supported upon the friction-rollers, the hinges h at the ends of said sides, the rollers R' r', and chains P' upon the said pulleys P, for receiving and transmitting motion, substantially as set forth.

3. An apparatus for elevating freight, comprising sides S and frames S', forming a channel, driving-rollers R, journaled at the ends, and some of them having pulleys P, friction-rollers r, journaled at intervals between the driving-rollers, endless apron A', running over the driving-rollers and supported upon the friction-rollers, and tables B b, secured to said apron, substantially as set forth.

4. An apparatus for elevating and transporting freight, comprising hinged carriers C, consisting of sides S S', rollers R, r, and r', apron A, and pulleys P, hinged carriers C', consisting of sides S, rollers R and r, apron A, pulleys P, and grooved roller E', elevator E, consisting of sides S S'', rollers R and r, apron A', tables B b, and a pulley upon one of said rollers R, and the connecting-chains P', substantially as set forth.



404,659. SWIVEL. JOHN F. SEARS, Clifton, Ontario, Canada, and HARRY R. KELLEY, Niagara Falls, N. Y., assignors to the Oneida Community, (Limited,) Community, N. Y. Filed Oct. 20, 1888. Serial No. 288,695. (No model.)

Claim.—1. A swivel consisting of a member formed with a neck and head on its coupling end, and a member formed of a metal plate folded upon itself with the end portions contiguous to each other and formed with semi-cylindrical recesses in the adjacent sides of said end portions embracing the aforesaid neck and provided with an aperture through the two thicknesses of metal between the integral end of folded plate and rear ends of the semi-cylindrical recesses, substantially as described and shown.

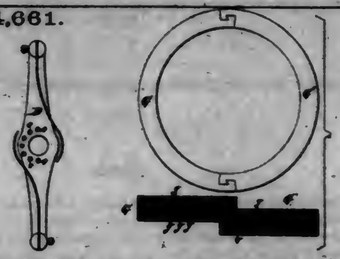
2. A swivel consisting of a member composed of a metal plate folded upon itself with the ends contiguous to each other and formed with a coinciding neck and head on said ends, and a member having its coupling end composed of two thicknesses of metal firmly united and formed in the adjacent sides of said thicknesses with semi-cylindrical recesses embracing the aforesaid necks and provided with an aperture at the rear ends of said recesses for the reception of the aforesaid head, substantially as described and shown.

404,660. ELEVATOR AND CONVEYER. CHARLES J. SEYMOUR, Brookline, Mass. Filed Aug. 30, 1888. Serial No. 283,909. (No model.)

Claim.—1. The combination, with a vessel provided with a trough or way beneath the floor and above the keel, of a vertically-arranged elevator-frame at the end of such trough or way, an endless chain of buckets and pans arranged in said trough or way and on said elevator-frame, and wheels to move and guide said chain, whereby the coal or other contents of the vessel may be taken therefrom and carried directly to and up the elevator-frame to be discharged, as set forth.

2. The combination, with a vessel provided with a trough or way beneath the floor and above the keel, of a vertically-arranged elevator-frame at one end of such trough or way, said elevator-frame being provided with an overhanging head c, an endless chain of buckets and pans arranged in said trough or way and on said elevator-frame, and wheels or pulleys and tracks t to move and guide said chain of buckets and pans, as set forth.

3. The combination, with a vessel provided with delivering holes or ports in its floor, of movable sections g of the floor, hinged at points at or near said delivering holes or ports, and leaves or shelves h, hinged to the side of the vessel, with their free edges in contact with said hinged sections of flooring, as set forth.

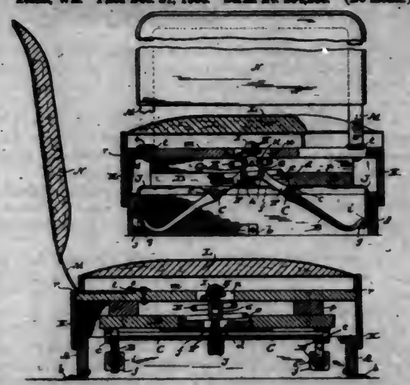


4. The combination, with a vessel provided with delivering holes or ports in its floor, of movable sections g of the floor, hinged at points at or near said delivering holes or ports, leaves or shelves h, hinged at the side of the vessel, with their free edges in contact with said hinged sections of flooring, and partitions i between each two sections, as set forth.

5. The combination, with a vessel provided with delivering holes or ports in its floor, of covers or cut-offs for said holes or ports, said covers or cut-offs being pivoted beneath the floor and provided with cables, whereby they may be swung around to close the ports or holes, or be moved in the opposite direction to open the same, tracks m beneath the free ends of the corners or cut-offs to support the same, and stops to limit the movement of the covers or cut-offs, as set forth.

404,661. ELECTRIC MOTOR. ROBERT D. SLATER, Detroit, Mich., assignor to the Bolding Motor and Manufacturing Company, Chicago, Ill. Filed Dec. 15, 1887. Serial No. 258,027. (No model.)

Claim.—1. In a dynamo-electric machine or motor, the combination, with its commutator and brushes, of a brush-holder provided



404,661.

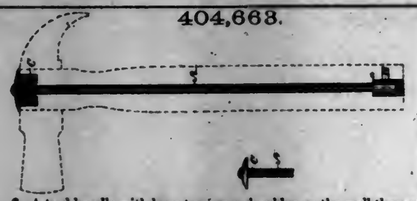
with a series of hollow cavities e and a spring pawl or detent d' for giving to it a substantially rigid engagement at each of a series of adjustments, said spring-detent and cavities being housed between the face of the brush-holder and the adjacent supporting part of the frame, substantially as and for the purposes described.

2. An armature-ring made in sections, having a dovetail tenon and groove, whereby said sections are adapted to be slipped together and engaged at their extremities, each said section composed of lamine g, substantially as and for the purpose described.

404,662. LOCOMOTIVE-CAB SEAT. GEORGE W. STONE, Jr., Waukesha, Wis. Filed Dec. 21, 1888. Serial No. 294,289. (No model.)

Claim.—1. A locomotive-cab seat comprising a stationary frame, a spring-platform having a yielding connection with the stationary frame and adjustable as to tension, and a seat-supporting frame arranged on the spring-platform to surround said stationary frame and have telescopic movement with relation thereto, substantially as set forth.

2. A locomotive-cab seat comprising a stationary frame, a spring-platform having a yielding connection with the stationary frame and provided with brackets that extend down within the same and come close against the inner sides thereof, and a seat-supporting frame arranged on the spring-platform to surround said stationary frame and have telescopic movement with relation thereto, substantially as set forth.



3. A locomotive-cab seat comprising a stationary frame, a spring-platform having a yielding connection with the stationary frame, the seat proper, a supporting-frame therefor arranged on the spring-platform to have telescopic movement with relation to said stationary frame, eyes secured to the supporting-frame, and a back-rest having depending braces turned up at their ends to form hooks for engagement with said eyes, substantially as set forth.

4. A locomotive-cab seat comprising a stationary frame provided with lateral ears for attachment to a side box in a locomotive-cab, a spring-platform having a yielding connection with the stationary frame, and a seat-supporting frame arranged on the spring-platform to surround said stationary frame and have telescopic movement with relation thereto, substantially as set forth.

404,668. DEVICE FOR SECURING TOOLS TO HANDLES. FRANK H. THOMPSON and GEORGE P. TURNEY, Philadelphia, Pa. Filed Apr. 26, 1888. Serial No. 271,895. (No model.)

Claim.—1. A tool-handle with a bore extending lengthwise thereof, a rod with head and a screw-threaded end, and a wedge interiorly screw-threaded, said wedge being driven into said handle and the screw end of said rod inserted in said wedge and riveted to the wedge, said parts being combined substantially as described.

404,663.

2. A tool-handle with bore having a shoulder on the wall thereof, as described, a wedge with an opening therein, a headed rod having one end inserted in said wedge and riveted thereon and its headed portion bearing against said shoulder, said parts being combined substantially as described.

3. A tool-handle with bore, a wedge with an opening therein, a rod having one end inserted in said wedge and riveted thereto, the other end having an attachment or projection adapted to engage a wall on the inner portion of the handle at an angle to the bore, substantially as described.

404,664. HAIR-CURLING IMPLEMENT. BENJAMIN I. TOQUET, Westport, Conn. Filed Jan. 16, 1889. Serial No. 296,501. (No model.)

Claim.—1. The combination, in a hair-curling implement, of the iron and its handle, the clamp, and an operating-sleeve which encircles the curling-iron and on the movement of which the clamp can be raised or lowered, substantially as described.

2. The combination, in a hair-curling implement, of the iron, the clamp pivoted thereto and having an arm connected to a plunger, a sleeve connected to the plunger, and a spring moving said plunger and tending to close the clamp, substantially as described.

3. The combination of the handle and the curling-iron extending into the handle with a pivoted clamp, a sliding sleeve connected to the clamp to open it, and a spring acting to close the clamp, substantially as described.

4. A curling implement having an iron with a pivoted clamp and a sleeve and a handle inclosing the working parts for moving the clamp.

5. The combination, in a hair-curling implement, of the iron hollow at its rear part and its handle with a clamp pivoted to the iron, a plunger in the hollow part of the iron, and a spring acting on said plunger to close the clamp, and a sleeve by which the clamp is opened and which incloses the working parts of the implement, substantially as described.

404,665. SMOKER'S SET. WILLIAM S. WHITING, Waterbury, Conn., assignor to Charles F. Trott, same place. Filed Jan. 23, 1889. Serial No. 297,769. (No model.)

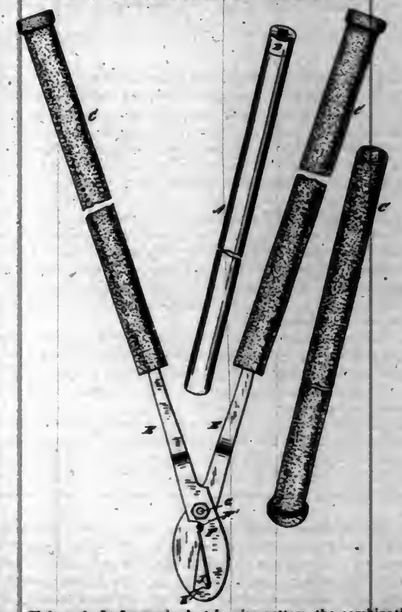
Claim.—1. A smoker's set consisting of a case the front wall of which is hinged at the bottom and is provided with a cigar-holder, a hinged cover, a hinged operating-lever, and connecting mechanism, substantially as described and shown, operated by said lever, whereby the cover is raised and the front wall with the cigar-holder turned outward to place the cigars in position for use.

2. The case having a hinged front wall carrying a cigar-holder and a hinged cover having a downwardly-projecting arm 12, in combination with an operating-lever having a curved arm with an incline which engages arm 12 to raise and lower the cover, a bell-crank lever, and links 15 and 17, whereby the front wall and cigar-holder are moved, respectively, to the open and closed positions.

3. The case consisting of end and back walls 1, a front wall hinged to the end walls, and a hinged cover having an arm 12, in combination with an operating-lever having a curved arm extending into the case and provided with an incline which engages arm 12 to raise and lower the case, a bell-crank lever 13 within the case, and links 15 and 17, connected to the bell-crank lever and to the front wall and, operating-lever, respectively, as and for the purpose set forth.

4. The combination, with the side and back walls, of a front wall hinged at the bottom and carrying a cigar-holder, an operating-lever, a bell-crank lever, and links connected, respectively, to the front wall and to the operating-lever, whereby said front wall and cigar-holder are thrown to the open and closed positions.

5. The combination, with the walls, of a hinged cover having a depending arm 12 and a hinged operating-lever having a curved arm 8, provided with an incline adapted to engage arm 12, whereby the cover is raised and lowered, respectively, when the operating-lever is moved inward or outward.



6. The combination, with the end and back walls, the front wall hinged thereto and carrying a cigar-holder, and an operating-lever having a curved arm extending within the case, of a hinged cover having an arm engaged by said curved arm, and mechanism, substantially as described and shown, operated by said lever, whereby the front wall is moved to the open or closed position and the cover is raised or lowered.

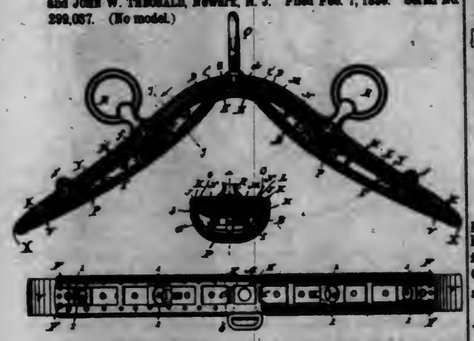
404,666. SASH-LIFT. WILLIAM A. WILLIAMSON, Newark, N. J. Filed Feb. 1, 1889. Serial No. 298,355. (No model.)

Claim.—A sash lift or pull made from a continuous piece of wire doubled and bent in the middle to form an eye for the reception of a screw or pin, and twisted, as at a^2, and the free ends thereof bent into hooks to form a pull portion, substantially as and for the purposes set forth.

404,667. FIREMAN'S ELECTRIC-WIRE CUTTER. DANIEL A. WOODHOUSE, Elizabeth, N. J., and THOMAS V. FORSTER, Brooklyn, N. Y. Filed Mar. 2, 1889. Serial No. 301,762. (No model.)

Claim.—1. In firemen's electric-wire cutters, the combination of metal handles for the said cutters, a wooden core provided with a hole in one end and fitted detachably upon each one of the metal handles, and a rubber tube surrounding and fitting tightly upon the said wooden cores.

2. In combination with the metallic handles of a pair of wire-cutters, detachable insulated handles.



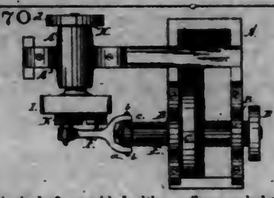
3. Insulated handles consisting of wooden cores provided with holes in the ends, in combination with rubber tubes having enlarged portions and passed over the said cores, the enlarged portions being at the ends of the said tubes and located upon the said cores at those ends opposite the ends of the cores containing the said holes.

404,668. WHIP-SOCKET. EZRA ALLEN, Freeport, Ill. Filed Oct. 26, 1888. Serial No. 289,190. (No model.)

Claim.—As an improved article of manufacture, the tubular whip-socket B, provided with spring-metal tongues *b*, continuous therewith, and forming a contracted neck and a flaring mouth for the socket, and with the U-shaped clips for attaching the socket to a vehicle.

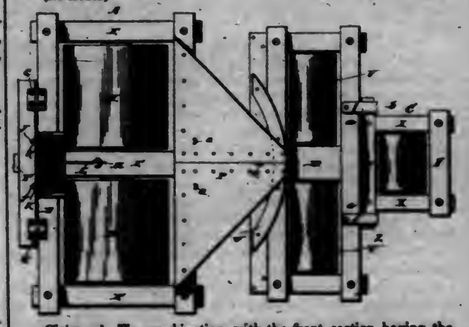
404,669. HARNESS-SADDLE. HENRY ASCHENBACH, South Orange, and JOHN W. THEOBALD, Newark, N. J. Filed Feb. 7, 1889. Serial No. 299,037. (No model.)

Claim.—1. The combination, in a harness-pad, of the trough-shaped top plate A, having adjacent to the middle of its length the slots D and cross-bars E, with the under plates B, fixed at their outer ends to the top plate and having their inner ends passed through the said slots and loosely overlying the cross-bars, the cover-sections H I, surrounding the united plates, and the top pad-frame located in the trough of the top plate, substantially as described.



2. The combination, in a harness-pad, of the trough-shaped top plate A, provided with holes 4, and having the guiding-ribs 2 beside the holes 4, and provided with the slots D and cross-bars E, the under plates B, having their side edges turned upward and resting against and supporting the edges of the top plate, said under plates fixed at their outer ends to the top plate, bearing upon the guiding-ribs, and at their upper ends passing through the slots and overlying the cross-bars of the top plate, the cover-sections H I, surrounding the united plates, the top pad-frame L M N, located in the trough of the top plate, the nuts T between the guiding-ribs, and the terrets R, engaging the nuts, substantially as described.

3. The combination, in a harness-pad, of the top plate A, provided with holes 4, and having the guiding-ribs 2 at the sides of the holes 4, and provided with the pendent stop-hooks U, the nuts T, located between the ribs and bearing against the stop-hooks, the under plates B, and the terrets R, substantially as described.



4. The combination, in a harness-pad, of the metallic top plate A, trough-shaped on its upper side, the under metallic plates B, having their side edges bent upwardly and supporting the edges of the top plate, said under plates being fixed at their outer ends to the top plate and loosely connected to the latter at their inner ends, the cover-sections H I, surrounding the united plates, and the top pad-frame L M N, located in the trough-shaped upper side of the metallic top plate, substantially as described.

404,670. GRINDSTONE AND MECHANISM FOR THE SAME. ROBERT A. AXTELL, Montague, Mass. Filed July 27, 1888. Serial No. 281,130. (No model.)

Claim.—The combination, with a rotary shaft and a pulley fixed thereon, the grooved head-block fixed to said shaft, and the block K, adjustably secured to said head-block by a bolt, the head of which fits in the groove of the said block, of a shaft arranged at right angles to the head-block shaft, provided with a pulley, a grindstone, and a loose collar, substantially as described, and the pitman, as described, pivoted to the said loose collar, and the block K, as and for the purpose described.

404,671. ROLLER FOR LEVELING SNOW OR ROADS. ISAAC R. BABCOCK, Newport Centre, Vt. Filed Jan. 23, 1889. Serial No. 297,260. (No model.)

Claim.—1. The combination, with the front section having the platform P, of the loops K M on the front cross-bar and the central longitudinal bar of the frame, respectively, the loops Q R on the platform, the seat having the hooks J, adapted to engage the loops K or Q, and the brace L, pivoted to the seat and having its lower end adapted to engage the loops M or R, as set forth.

2. The combination of the front section having a central rearwardly-extended bar, the vertically-disposed roller O, secured to the end of said bar, the middle section having a forwardly-extended central bar connected by a universal joint with the front section, and the curved track U, secured on the upper side of the middle section, over which the roller O moves, as set forth.

3. The combination of the middle section having its front cross-bar provided with circular ends, the keepers pivoted to the rear cross-bar of the middle section and adapted to be swung over the circular ends of the front cross-bar of the rear section, and the locking-pins passed vertically through the keepers into the bar, to which they are pivoted, as set forth.

4. The combination of the middle section, the keepers pivoted thereto, and the rear section having its front cross-bar provided with a front convex side and engaged by said keepers, as set forth.

5. The combination of the front section having the rearwardly-extended bar E, the roller O on the rear end of said bar, the tongue hinged to the front end of said section, the seat movably mounted thereon, the middle section loosely connected to the front section, the track U on said section, over which the roller O moves, and the rear section hinged to the middle section, as set forth.

404,672. ROAD-CART. MONROE BARBER, Mossington, Ill. Filed Mar. 7, 1888. Serial No. 302,316. (No model.)

Claim.—1. In a vehicle, the combination, with the body and shafts, of a spring secured to the body and connected at its ends with the front face of the shafts, and a sliding connection between the shafts and body.

2. In a vehicle, the combination, with the body, of the shafts, a

sliding connection between the body and shafts at the forward end of the body, a spring secured to the body near the rear end, and supports for the ends of the springs pivoted to the shafts.

3. In a vehicle, the combination, with the shafts, of the body connected therewith at its forward end by a sliding joint and a spring adapted to support the rear end of the body and pivotally connected with the shafts, said spring being adapted to adjust itself upon its supports as the body rises and falls.

4. In a vehicle, the combination, with the shafts, of the body connected at its forward end with the shafts by a sliding connection and a spring supporting the rear end of the body and pivotally connected with the shafts, said spring being adapted to be extended lengthwise and to rock upon its supports as the body rises and falls.

5. In a vehicle, the combination, with the shafts, of the body connected at its forward end with the shafts by a sliding connection, a spring supporting the rear end of the body, and laterally swinging supports for the ends of the spring secured to the shafts, whereby when a weight is applied to the body it will move downward and backward and cause the spring to rock or tip relatively to its supports.

6. In a vehicle, the combination, with the shafts, of the body provided with forwardly-extending arms slotted, as shown, U-shaped clips on the under side of the shafts, a cushion within the clips, and a bolt for each clip, all arranged substantially as shown.

7. In a vehicle, the combination, with the shafts and the body connected therewith at its forward end by a sliding joint, of hooks secured to the shafts on their forward faces and adapted to swing only laterally or at right angles to the line of draft, and a spring secured to the body and provided with rounded bearing-faces where it connects with the hooks, all substantially as shown.

8. In combination with the shafts, the sleeved washer secured thereto, the hook mounted on the washer, a bolt and nut securing the washers to the shafts and the hooks to the washers, a body, and springs connecting the body and the hooks.

9. In combination with an axle or bar, a brace-rod provided with an eye, and a plate O, provided with a socket in its upper face to receive and hold the eye against the bar or axle, all substantially as shown.

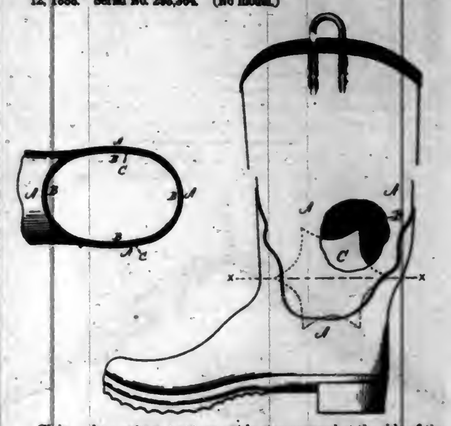
10. In combination with an axle and the shafts, the plates L, provided with threaded tangs, a brace-rod provided with an eye, a plate O, provided with a socket in its upper face to receive the eye, and bolts applied to the tangs.

11. In combination with an axle and the shafts, a brace-rod M, provided with an eye N, a plate O, provided with a socket in its upper face to receive the eye, plates L L, applied to the shafts and provided with tangs to pass through the eye, and means for securing the parts in position.

12. In combination with the axle and shafts, the brace-rod M, provided with an eye N, a plate O, provided with a socket in its upper face to receive and hold the eye, and provided also with a rearward extension P, plates L L, provided with tangs passing through the eye N and plate O, and nuts applied to the tangs.

13. In a road-cart, the combination, with the wheeled frame and the shafts rigidly attached thereto, of the body connected at its forward end with the shafts by a sliding connection, a spring supporting the rear end of the body, and laterally-swinging supports for said spring, all arranged substantially as shown, whereby when a load is applied to the body it will move downward and backward, and thereby cause the spring to be extended lengthwise and to rock forward or backward relatively to and upon its supports.

404,673. CORE FOR CASTING. GEORGE H. BENNETT, Brooklyn, N. Y. Filed Dec. 20, 1888. Serial No. 294,178. (No model.)



Claim.—1. A core for casting consisting of the sectional expansible shell having inclines, the travelers having screw-threaded sockets extending therethrough, and the rotary shaft supported in end bearings and having screw-threads engaging the screw-threads of the sockets to adjust the travelers, substantially as described.

2. A core for casting consisting of the sectional expansible shell having attached inclines provided with revolving rollers projecting beyond their inclined faces, the travelers having screw-threaded sockets and resting against the rollers on the inclines, and the rotary shaft mounted in end bearings and having screw-threads engaging the screw-threads of the sockets to adjust the travelers, substantially as described.

3. The combination of the sectional expansible shell having lips or projections M, the end bearings having flanges L joined to the lips or projections by pin-and-slot connection, the rotary shaft E, and means, substantially as described, for expanding the shell by the rotation of the shaft, substantially as described.

4. The combination of the expansible shell having lips or projections M, the end bearings having flanges L, arranged in pairs, receiving between them and guiding the lips or projections, the rotary shaft, and means for expanding the shell by rotation of the shaft, substantially as described.

404,674. RUBBER BOOT. ERSKINE P. BICKFORD, Malden, Mass., assignor to the Boston Rubber Shoe Company, same place. Filed Dec. 12, 1888. Serial No. 293,364. (No model.)

Claim.—In a rubber boot, an ankle-stay secured at the side of the ankle portion of the boot-leg between the lining and the rubber body, said stay having a series of radial points projecting in different directions laterally and vertically, which cross the lines on which there is any tendency to wrinkle and thereby prevent any continuous wrinkling and consequent breaking, substantially as set forth.

404,675. DOUBLE-POINTED PIN. JAMES H. BERRY, Flintsburg, Md. Filed Nov. 9, 1888. Serial No. 290,352. (No model.)

Claim.—The double-pointed pin or hook having a central looped or coiled portion forming a spring and having arms extending in the same straight line, and provided with inwardly curved and pointed ends, substantially as shown and described.

404,676. CAR-TRUCK. GEORGE R. BLAINE, Dayton, Ohio. Filed Oct. 5, 1888. Serial No. 287,262. (No model.)

Claim.—1. A bolster for railway-car trucks, consisting of a single plate of metal bent or rolled into the form, or substantially the form, of a hollow cylinder, with the longitudinal opposite or meeting edges of the plate unjoined, substantially as described.

2. A railway-car-truck bolster consisting of a single metal plate bent or rolled so that its longitudinal edges are brought opposite or directly meet, in combination with saddles and braces strengthening the bolster and preventing the longitudinal opposite ends of the plate from spreading, substantially as described.

3. In a car-truck, the combination, with a tubular bolster, of saddles secured upon and extending above the bolster and having openings or sockets extending therethrough, and arms located in said openings and supported by the saddles and provided with caps or seats on their upper ends, for the purpose set forth.

4. In a car-truck, a bolster composed of a bent or rolled metal plate and means for preventing the adjoining longitudinal ends of the same from spreading, in combination with the frames secured to the ends of the bolster for supporting the wheel-journal boxes, substantially as described.

5. A car-truck comprising a cylindrical bolster formed of a bent or rolled metal plate, in combination with saddles secured upon said bolster across and connecting the opposite ends of the plate forming the same, and thereby preventing the longitudinal edges from spreading, substantially as described.

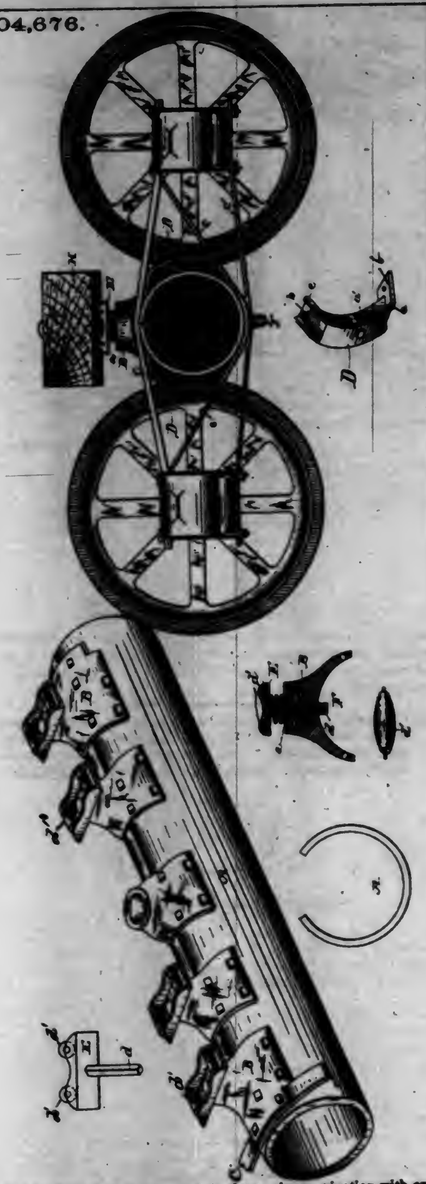
6. A car-truck comprising a bolster formed of a metal plate rolled or bent into the form of an unjoined tube, in combination with exterior strengthening-braces secured to and partially embracing the same and preventing the bolster from spreading, substantially as described.

7. A tubular car-truck bolster, in combination with braces rigidly secured to the ends of the same, each provided with an inwardly-extending flange fitting upon the exterior of the bolster, and with wings at its opposite ends having side flanges forming seats and the arch and truss bars secured in said seats, substantially as described.

8. A tubular car-truck bolster and the arch and truss bars, in combination with curved strengthening-braces secured upon the exterior of the bolster and provided with end seats in which said bars are secured to prevent the same from bending, substantially as described.

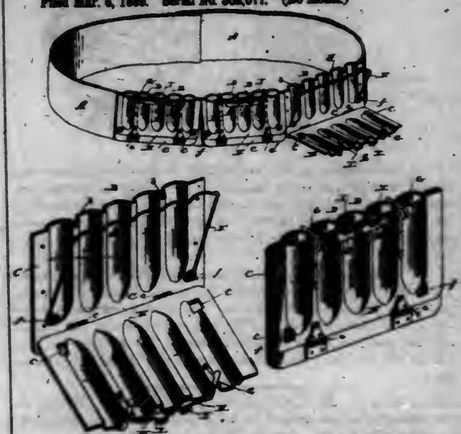
9. In a car-truck, the combination of a metallic bolster, yielding arms supported by and extending above the bolster, and anti-friction rollers carried by the arms upon which the car-body rests, substantially as described.

10. In a car-truck, a bolster, in combination with vertically-yielding caps or seats supported by and located above the bolster, and anti-friction rollers mounted in the caps or seats, substantially as described.



11. A tubular car-truck bolster, in combination with saddles secured upon the same and provided with openings extending therethrough, and vertically-movable arms carried by and extending above the saddles and provided with springs to yieldingly hold their upper ends at the limit of upward movement, for the purpose set forth.

12. In a car-truck, the combination of a bolster, saddles secured to the same and provided with openings or sockets, springs in the openings, caps or seats yieldingly supported by the springs and provided with downwardly-extending arms, and rollers mounted on the caps or seats, substantially as described.



13. In combination, a car-truck bolster provided with saddles, caps or seats yieldingly supported and carrying rollers, the central saddle having an opening, and a king-bolt secured to the car and extending through said opening, substantially as described.

14. In combination, a car-truck bolster having saddles, the central saddle having a socket and opening therethrough, a spring in the socket, a king-bolt carried by the car and extending through the spring and opening, and a cap or socket moving with the bolt and bearing on the spring, substantially as described.

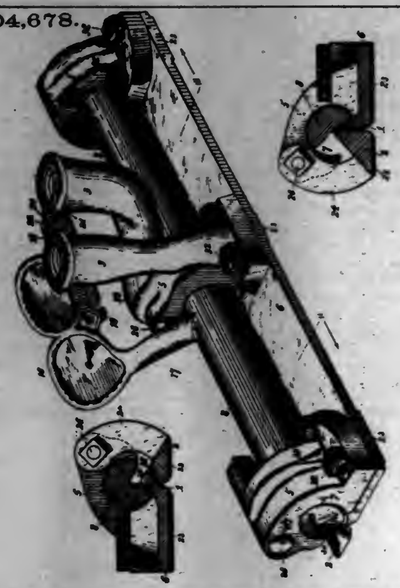
404,676.

404,677. CARTRIDGE-BELT. ANTHONY J. BLIX, Anaconda, Mont. Filed Mar. 6, 1888. Serial No. 302,077. (No model.)

Claim.—1. The combination, with the belt, of the individual holders or cartridge-carriers, each comprising a hinged recessed flap adapted to open outwardly and downwardly, a corresponding-recessed body-piece and a spring-catch for locking the free end of the hinged plate to the top of the recessed body-piece, substantially as and for the purpose shown and set forth.

2. The combination of the recessed body-piece or back plate, the correspondingly-recessed front plate hinged to the lower end of the recessed back, a spring snap or lock for closing the front plate upon the back, and the spring guard or keeper disposed between the hinged front and fixed back and adapted to guide the cartridges as these slide out of their respective recesses or chambers, substantially as and for the purpose shown and set forth.

404,678. ROOFING-TONGS. CHRISTIAN G. BLUM and PHILIP LEUTHAM, Collinsville, Ill. Filed Aug. 28, 1888. Serial No. 283,963. (Model.)



Claim.—1. In roofing-tongs, the right and left foot-treadles secured to the bending-bar to enable the operator to work it from either the right or left, substantially as and for the purpose set forth.

2. In roofing-tongs, the combination of the angular projections 41 from the end lower corners of the bending-bar and the recesses in the stationary jaw of the tongs which receive said projections, substantially as and for the purpose set forth.

3. In roofing-tongs, the combination of the right and left foot-treadles and the reactionary spring connected to the treadles and the handle of the movable jaw to have a reciprocating movement in unison with both parts with which it connects, substantially as and for the purpose set forth.

4. In roofing-tongs, the combination of the three journal-boxes, each having peripheral bearings for the bending-bar, the three journals of the movable jaw, and the rest-plate secured to the bottom of the bed-plate of the stationary jaw and to the bottom of the movable jaw to raise them above the cross-seams, substantially as and for the purpose set forth.

404,678.

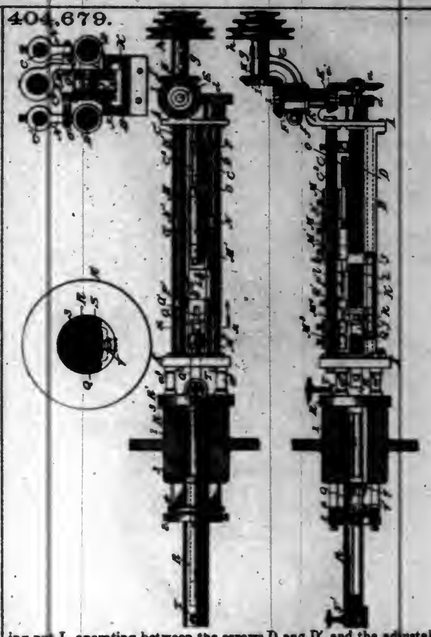
5. In roofing-tongs, the combination of the three journal-boxes having the triple peripheral bearings for the bending-bar and the journals for the movable jaw, and the ogee working-face of the bending-bar which turns the overlap tin in a curve at the apex of the seam and tightly presses its under lip, substantially as and for the purpose set forth.

6. A roofing-tongs comprising a stationary jaw having three journal-boxes, each having a peripheral bearing for a bending-bar and a journal for a movable jaw above and in front of the peripheral bearing, a bending-bar supported in the peripheral bearings, and a movable jaw having a handle-shank and arms 24, pivoted upon the journals of the stationary jaw, substantially as and for the purpose set forth.

404,679. MACHINE FOR CUTTING KEY-SEATS. THOMAS W. BROOMELL, Erie, Pa., assignor of one-half to Frank C. Burton, same place. Filed Nov. 28, 1888. Serial No. 291,715. (No model.)

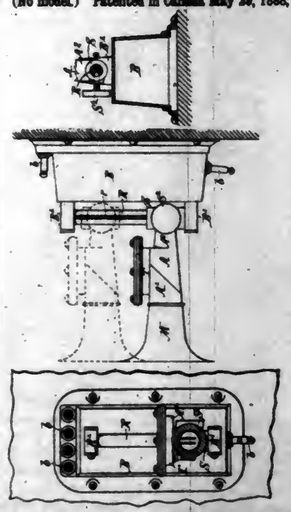
Claim.—1. The combination, in a key-seating machine, of two parallel screws revolving in opposite directions, and a carriage adapted to be moved longitudinally by said screws with a nut operating in a transverse slot in said carriage, a guide-nut M, and cam mechanism secured to the machine-frame near each end of the nut-guide, adapted to engage with the nut as it leaves the end of said guide and automatically move the nut out of engagement with one of said screws and into engagement with the other, substantially as and for the purpose set forth.

2. The combination, in a key-seating machine, of two parallel screws revolving in opposite directions, and a laterally-moving nut adapted to engage alternately with each of said screws, with an adjustable guide to retain the nut in contact with said screws, and springs adapted to move said nut out of contact with one of said screws after it has passed the guide and into contact with the other screw, substantially as and for the purpose set forth.



3. The combination, in a key-seating machine, of a reciprocating cutter-bar inclosed and traveling in an adjustable semicircular shell with an outer semicircular shell inclosing said inner shell, and adjusting-screws for adjusting said inner shell, substantially as and for the purpose set forth.

4. The combination, in a key-seating machine, of the screws D and D′, geared together so as to run in opposite directions, and a traveling carriage K, operating on ways parallel to said screws, with a reciprocating nut L, operating in a transverse slot in said carriage, and the sectional guide M, for retaining the nut in position during its traverse, substantially as and for the purpose set forth.

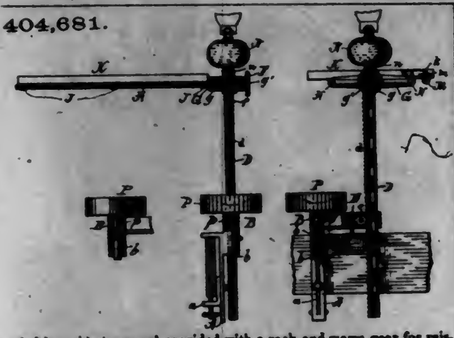


5. The combination, in a key-seating machine, of the frame-work A A′ B and the screws D and D′, geared together so as to run in opposite directions, with the reciprocating nut L, operating in the carriage K, between said screws, substantially as and for the purpose set forth.

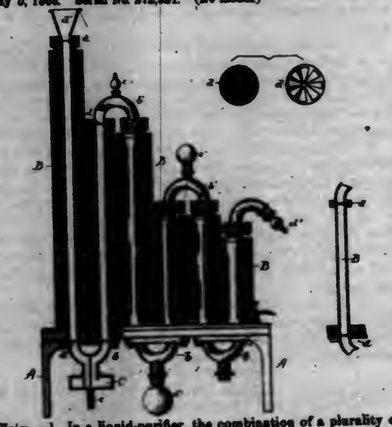
5. The combination, in a key-seating machine, of the reciprocating nut L, operating between the screws D and D′, and the adjustable guide M, with the springs O and O′, for changing the position of the nut after it has passed the guide M, substantially as and for the purpose set forth.

404,679.

404,680. TELEPHONE-SUPPORT. CHARLES W. BROWN, Montreal, Quebec, Canada, assignor to the Bell Telephone Company of Canada, same place. Filed Mar. 31, 1888. Renewed Feb. 26, 1889. Serial No. 301,135. (No model.) Patented in Canada May 29, 1888, No. 29,234.



Claim.—A telephone-transmitter carried in a cup formed on a casting to which the mouth-piece is attached, said casting having an extension terminating in a sleeve sliding on a vertical rod secured to box containing induction-coil, or to any other suitable base, and means for securing sleeve at desired height, as set forth.



404,681. APPLIANCE FOR SICK-BEDS. GEORGE S. BROWN, Atlanta, Ga. Filed June 25, 1888. Serial No. 278,156. (No model.)

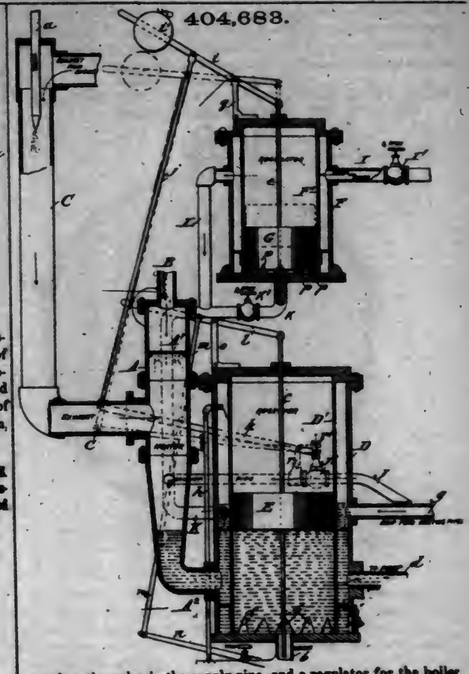
Claim.—In an apparatus for sick-beds, the combination of the clamp attached to the side rail of the bedstead, the standards D, carried by said clamp and provided with a rack and worm gear for raising and lowering the same, the spring-actuated clutch consisting of the arm F, provided with dentations, and the head G, having corresponding dentations, and the stud g′, the table E, having a hinged part h, the strap M, and screw m, for adjusting said hinged part of the table, all arranged to secure said table at any desired inclination, substantially as and for the purpose set forth.

404,681.

404,682. APPARATUS FOR PURIFYING AND AGING LIQUORS. SAMUEL G. GAMBLE, Washington, D. C., assignor, by direct and mesne assignments, to the Liquid Purifying Company, of West Virginia. Filed May 5, 1888. Serial No. 272,921. (No model.)

Claim.—1. In a liquid-purifier, the combination of a plurality of vertically-arranged hollow cores or legs connected together by return-couplings and corresponding electro-magnetic coils around said cores, substantially as described.

2. In a liquid-purifier, a conduit consisting of a series of tubular sections of magnetic material and an electro-magnetic helix surrounding said sections, the same being connected at the top by non-magnetic material and at the bottom by magnetic material, substantially as described.



3. In a liquid-purifier, the combination of a hollow core of magnetic material serving as a conduit for the passage of liquid, interposed foraminated diaphragms, and an electro-magnetic helix or coil around said core, substantially as described.

4. In a liquid-purifier, an electro-magnetic conduit having a plurality of coupled tubes and foraminated diaphragms at the joints of the coupling, substantially as described.

5. In a magnetic purifier, the combination of a series of tubes of magnetic material arranged in pairs, which are connected magnetically at their lower ends and non-magnetically at their upper ends, and a series of electro-magnetic helices corresponding with the cores or tubes, substantially as and for the purposes specified.

6. The combination, with a series of electro-magnetic tubes, of a sediment drum or receptacle located below and connected with said tubes, substantially as and for the purposes specified.

404,683.

404,683. FEED-WATER HEATER AND REGULATOR. NICHOLAS CLUTE, Schenectady, N. Y. Filed Jan. 23, 1889. Serial No. 297,291. (No model.)

Claim.—1. As an improvement in feed-water heaters, the combination, with the boiler, of the water-receiver having a float connected to the valve in the supply-pipe, and a regulator for the boiler connected to the valve in the relief-pipe, substantially as described.

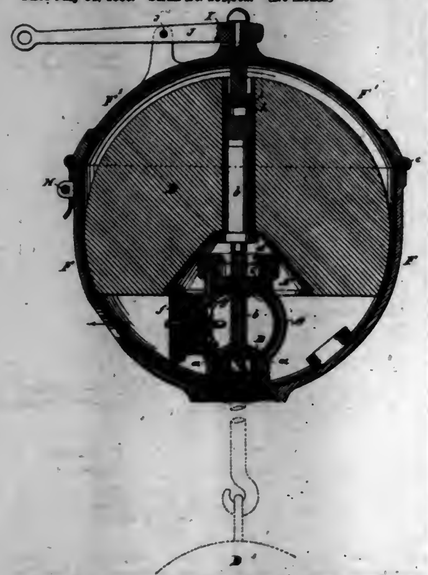
2. The combination, with the water-heating chamber having a transverse perforated diaphragm, of the water-supply pipe entering the upper end thereof, the water-receiver entered by the lower end of the heating-chamber, and a float within the receiver, and connecting mechanism between it and a valve in the supply-pipe, substantially as described.

3. The combination, with the water-heating chamber having a perforated diaphragm, of the water-supply pipe entering the top thereof, the steam-exhaust pipe entering the chamber below the perforated diaphragm, the water-pipe spraying into the exhaust, the receiver entered by the lower end of the heating-chamber, and the float within the receiver connecting by suitable mechanism with a valve in the supply-pipe, substantially as described.

4. The combination, with the water-heater and the water-supply pipe entering it, of the boiler, the water-receiver entered by the lower end of the heater, the float in said receiver, the connecting mechanism between the float and a valve in the supply-pipe, and the regulator for the boiler, substantially as described.

5. The combination of the boiler, its feed, overflow, and relief pipes, the regulator-chamber, a float therein, and connecting mechanism between it and a valve in the relief-pipe, substantially as described.

6. The combination, with the boiler, of the regulator-chamber, an overflow-pipe leading from the boiler to said regulator-chamber, a float within the regulator, the receiver from which the water is conveyed to the boiler, the water-heater connecting with the receiver, the relief-pipe leading from the boiler-feed to the water-heater, and connecting mechanism between the float and a valve in the relief-pipe, substantially as and for the purpose described.



7. The combination of the boiler, its feed, overflow, and relief pipes, the regulator-chamber, the float therein, connecting mechanism between it and a valve in the relief-pipe, the water-heater entered by the relief, a supply-pipe entering the heater, the water-receiver, a float within the receiver, and connecting mechanism between it and a valve in the supply-pipe, substantially as described.

8. The combination of the boiler, the water-receiver, the pump, the pipe leading from the receiver to the pump, and the pipe leading from the pump to the boiler, the water-heater, the water-supply pipe entering the float in the receiver, and the connecting mechanism between the float and a valve in said supply-pipe, substantially as described.

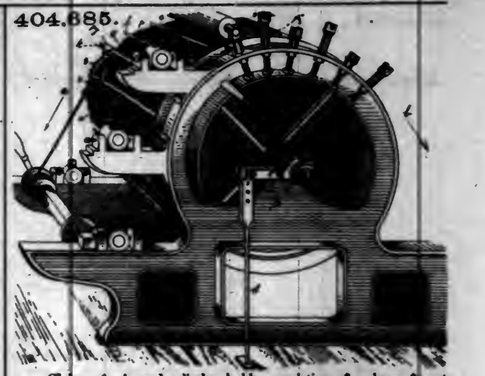
9. The combination of the boiler, the pump, a passage from the pump to the boiler, the water-receiver having a float connected to a

valve in the supply-pipe, a water-passage between the receiver and pump, the regulator for governing the water-level in the boiler, having a float connected to a valve in the relief-pipe, and the water-heater, all arranged and operating substantially as described.

404,684. SAFETY-VALVE. JAMES M. COLVER, New York, N. Y. Filed July 31, 1888. Serial No. 281,502. (No model.)

Claim.—1. The combination of the shell A, having the valve-seat *a* at its lower end portion, the cylinder A' at its upper end portion of a diameter greater than the valve-seat, and the lateral steam-outlet *f*, located at a point between the said cylinder and valve-seat, the solid valve B, having a rigid stem *b*, of less diameter than the valve, the piston C, arranged on the stem and fitting the cylinder, and a weight D, acting on the stem, substantially as described.

2. The combination, with the shell A, of the solid valve B, seated in said shell, the cylinder A', formed in the shell and having a larger diameter than the valve, the solid piston C, fitted into said cylinder and being rigidly attached to the valve-stem *a*, a weight acting upon the valve-stem, a steam-inlet below the valve B, a steam-outlet which communicates with the shell A between the valve B and the piston C, and a movable check against the escape of steam through the steam-outlet, substantially as shown and described.



3. The combination, with the valve-shell A, having a valve-seat *a*, a cylinder A', and a lateral steam-outlet *f*, located between the cylinder and valve-seat, of a solid valve B, the piston C, the lengthwise-movable and axially-revoluble valve-stem *b*, rigidly connecting the valve and piston, and the spiral projection *k* on the valve, substantially as described.

4. The combination of a valve-shell A, the solid valve B, having the rigid valve-stem and the weight D on the stem, of the lock-box F, mounted on the valve-shell, inclosing said shell, stem, and weight, or spring, and a vertical lifting-rod I, extending through the top of the lock-box, and on the lower end of which rod the valve-stem is movable lengthwise, substantially as described.

5. The combination of a valve-shell A, the solid valve B therein, having a rigid valve-stem provided at its upper end with a recess *h*, the weight D on the stem, the lock-box F, inclosing the shell, spring, and stem, the rigid vertical rod I, projecting through the top of the lock-box and having a head *i* at its inner end loosely engaging the recess of the stem, and the pivoted lever J, engaging the upper end of the rigid rod, substantially as described.

6. The combination, with the valve-shell A, having the steam-inlet *e* and lateral steam-outlet *f*, the valve B, the stem *b*, and the weight D on the stem, of the lock-box F, carried by the valve-shell, inclosing said shell, weight or spring, and stem, and provided with orifices in line with the steam inlet and outlet of the valve-shell, substantially as described.

404,685. DEVICE FOR HOLDING CYLINDERS WHILE ATTACHING CARD-CLOTHING THERETO. IRVING R. COBURN, Worcester, Mass. Filed May 19, 1888. Serial No. 274,444. (No model.)

Claim.—1. A card-cylinder holder consisting of a sleeve for attachment to the shaft of the main cylinder, a collar having a roughened periphery secured to said sleeve, a retaining device for engagement with said collar, a movable support for said retaining device, and means for sustaining said support, all substantially as shown and described.

2. A card-cylinder holder consisting of a sleeve with a collar having a toothed or ratchet periphery attached to said sleeve, a pawl for engagement with said ratchet, a movable support for said pawl, and means for sustaining said support, all substantially as shown and described.

3. A card-cylinder holder consisting of a sleeve for attachment to the shaft of the main cylinder, a collar having a roughened periphery secured to said sleeve, a retaining device for engagement with said collar, a movable support for said retaining device, means for sustaining said support, and a bar for releasing the retaining device from engagement with the collar, all substantially as shown and described.

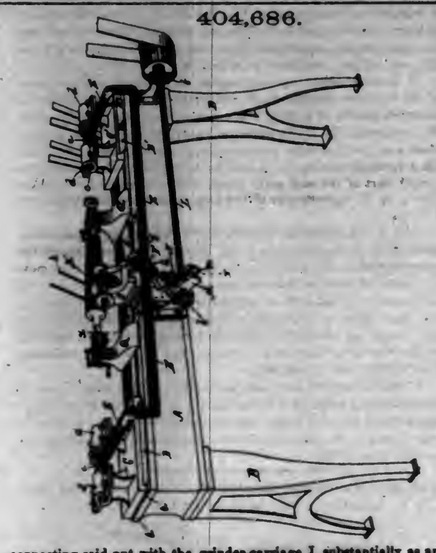
4. The combination of the sleeve 1, having a collar with a roughened periphery attached thereto, the bars 2, having the rings 20, a retaining device for engagement with said collar, and a support for said bars and retaining device, all substantially as shown and described.

5. The combination of the sleeve 1, having a collar with a roughened periphery attached thereto, the bars 2, having the rings 20, a retaining device for engagement with said collar, a support for said bars and retaining device, and the bar 9, all substantially as shown and described.

6. The combination of the sleeve 1, having a collar with a roughened periphery attached thereto, the bars 2, having the rings 20, a retaining device for engagement with said collar, and the brace 18, all substantially as shown and described.

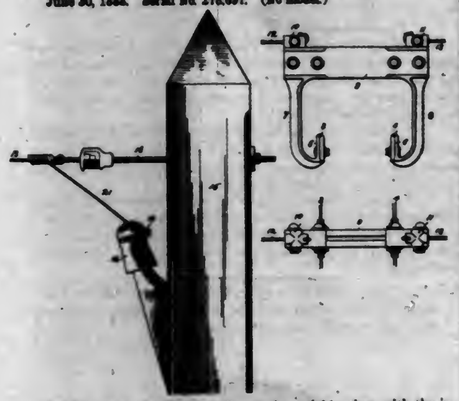
404,686. GRINDING-MACHINE. RUDOLPH CONRADER, Erie, Pa. Filed Aug. 13, 1888. Serial No. 282,606. (No model.)

Claim.—1. The combination, in a grinding-machine, of a grinding-carriage supported by and traveling on an oscillating supporting-bed, with a traveling feed-nut, a feed-screw operating said nut, and a flexible connection between said grinder-carriage and said feed-nut, substantially as and for the purpose set forth.



2. The combination, in a grinding-machine, of adjustable head-blocks on the machine-frame, an oscillating bell-crank shaft mounted in said head-blocks, and an adjustable traveling grinder-carriage mounted on said shaft and supported thereby, with a shaft and crank mechanism connecting with and operating said oscillating shaft, substantially as and for the purpose set forth.

3. The combination, in a grinding-machine, of adjustable tail-blocks mounted on ways on the machine-frame and adapted to support work to be ground, with a grinder-frame mounted upon an oscillating bell-crank shaft adapted to be moved in and out to and from the work to be ground, said grinder frame being adapted to travel laterally along said work on an adjustable bed secured to said oscillating bell-crank shaft, substantially as and for the purpose set forth.

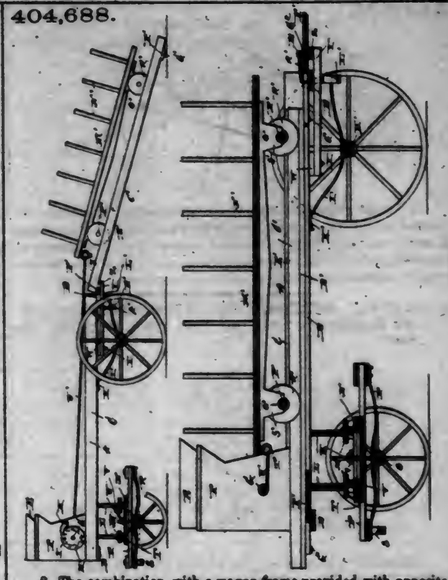


4. The combination, in a grinding-machine, of a grinder-carriage traveling on an adjustable bed mounted upon a laterally-adjustable oscillating bell-crank shaft, with a flexible arm connecting said carriage with a feed-nut, and a reversible feed-screw operating said feed-nut, substantially as and for the purpose set forth.

5. The combination, in a grinding-machine, of the heads O O', adapted to be adjusted across the bed A, and the oscillating bell-crank shaft E, mounted thereon, with the adjustable bed H, mounted on the shaft E, the grinder-carriage J, a rotary grinder K on said carriage J and traveling on said bed H, the crank M, connected to and operating to oscillate the shaft E and the grinder mechanism mounted thereon, and the reversible feed-screw P, nut O, and jointed arm *l e*, connecting said nut with the grinder-carriage J, substantially as and for the purpose set forth.

404,686.

404,687. ELECTRIC RAILROAD. LEO DAFT, Plainfield, N. J. Filed June 20, 1888. Serial No. 278,097. (No model.)



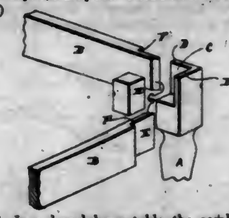
Claim.—1. In an electric railway, the combination, with the insulated plate, of the vise-grips secured thereto and supporting the trolley-conductors, posts arranged along each side of the track supporting the main-current conductors, wire-connectors between the posts and plate serving to support the plate and conduct the main current to the trolley-conductors, and electric connections between the connectors and the main-current conductors, substantially as described.

2. In an electric railway, the combination, with the insulated plate, of the vise-grips supporting the trolley-conductors at their ends, posts arranged along each side the track supporting the main-current conductors, wire-connectors attached to the insulated plates at one end and having their other ends attached to the posts and provided with tension-adjusting devices, and electric connections between the connectors and main-current conductors, substantially as described.

404,688. DRAY. JAMES L. DAVIS, Kimberton, Pa. Filed Mar. 23, 1889. Serial No. 304,260. (No model.)

Claim.—1. The combination, with a wagon-frame provided with opposite tracks, one arranged at each side thereof, of a skid provided with opposite side bars adapted to register in width with the side tracks of the wagon and loosely connected to be collapsed laterally and adapted to be inserted between the side tracks of the wagon, substantially as specified.

404,688.

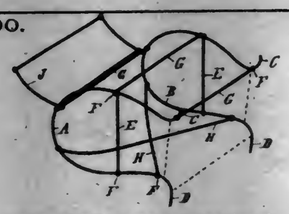


2. The combination, with a wagon-frame provided with opposite side tracks, of a truck mounted for movement thereon, and a laterally collapsible and movable skid designed to fit within the side tracks of the wagon and withdrawn and extended to register with said tracks, substantially as specified.

3. The combination, with the frame A, having the removably-extending bars Y, terminating in the chamfered bar Z, and having the bar D, provided with chain A', terminating in the hook B', of the skid provided with the staple G^3, adapted to engage with the hook and to rest upon the chamfered edge of the bar Z, substantially as specified.

4. The dray having the body provided with the longitudinal track boards or bars B, the bed or body having the supporting wheels or rollers, and the skid or inclined track comprising the side-track boards D', and the cross-bars F', pivotally connected thereto, whereby said skid or inclined track is adapted to be collapsed, substantially as described.

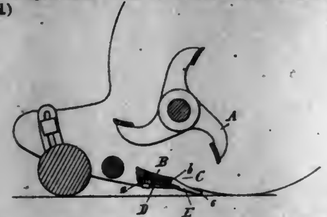
404,689. TABLE. JAMES M. DAVIS, Hudson, Ind., assignor of one-half to Silas Taylor, same place. Filed Feb. 2, 1888. Serial No. 298,422. (No model.)



Claim.—1. In a knockdown table, the combination of the leg flanged at its upper end along its outer sides, a clamping-block seated in the recess thus formed, a screw or bolt passing diagonally through said block and through the corner of the flanges, and the frame-sides having mitered ends abutting against each other, substantially as herein set forth.

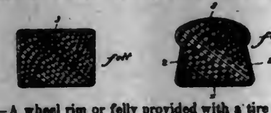
2. The combination of the table-leg having a rectangular recess at its upper end forming flanges D, the frame-sides B, having recesses E, forming shoulders F, and beveled or mitered ends, the clamping-blocks H, and screws or bolts I, substantially as and for the purpose set forth.

404,690. ATTACHMENT FOR LAWN-MOWERS. FRANK A. DELAND, Memphis, Mich. Filed Sept. 26, 1888. Serial No. 286,455. (No model.)



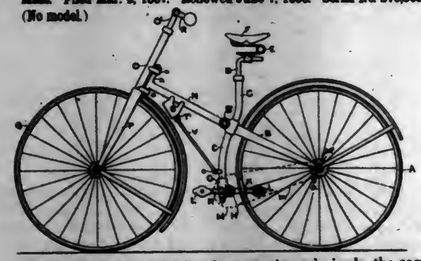
Claim.—1. An attachment to lawn-mowers, consisting of a receptacle made of a skeleton frame of spring-wire bent to form a contracted mouth, and said wire having projecting ends to engage parts of the mower to hold said frame thereto, and a fabric covering said frame, substantially as described.

404,690.



2. An attachment to lawn-mowers, consisting of a flexible receptacle made of a skeleton spring-wire frame formed of the loops A and B, connected by transverse and diagonal bars, substantially as described, and with the projecting ends C and D, and of an outer covering of fabric, substantially as and for the purpose described.

404,691. ATTACHMENT FOR LAWN-MOWERS. FRANK A. DELAND, Memphis, Mich. Filed Oct. 3, 1888. Serial No. 287,057. (No model.)



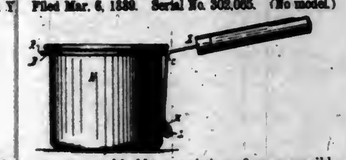
Claim.—In a lawn-mower, the combination, with the stationary knife-bar thereof, of a comb integrally cast in one piece, provided with a flat body D, having suitable means of attachment to said knife-bar, and provided with the tapering and forwardly-projecting teeth E, the upper faces of which are flush with the upper surface of the knife-bar at their rear ends, forming shoulders *b*, and inclined downwardly and forwardly therefrom, substantially as described.

404,692. WHEEL-TIRE. RUDOLPH W. DOMBOYER, South Bend Ind. Filed Mar. 14, 1889. Serial No. 303,205. (No model.)

Claim.—A wheel rim or felly provided with a tire of felt, as and for the purposes set forth.

404,693. VELOCIPEDE. ALFRED EASTHOPE, Wolverhampton, County of Stafford, England, assignor to Albert H. Overman, Boston, Mass. Filed Mar. 8, 1887. Renewed June 7, 1888. Serial No. 276,305. (No model.)

Claim.—1. In a rear-driving front-steering velocipede, the combination, with a steering-frame carrying one or more steering-wheels and having a transverse handle-bar connected with it, of a main frame having the said steering-frame movably connected with its forward end, carrying one or more driving-wheels, having a seat-support and a crank-shaft support and provided with a vertically-acting hinge, and an elastic connection joining parts of the main frame on opposite sides of the hinge, whereby the frame cushions vertically, substantially as set forth.



2. In a rear-driving front-steering velocipede, the combination, with a steering-frame carrying one or more steering-wheels and having a transverse handle-bar connected with it, of a main frame having the said steering-frame movably connected with its forward end, carrying one or more driving-wheels, having a seat-support and a crank-shaft support and provided with a vertically-acting hinge, and an elastic connection joining the forward part of the said main frame with the crank-shaft support which is on the opposite side of the hinge therefrom, substantially as set forth.

3. In a velocipede, the combination, with a steering-frame carrying one or more steering-wheels and having a transverse handle-bar connected with it, of a main frame having the steering-frame movably connected with its forward end, carrying one or more driving-wheels and provided with a seat-support, a crank-shaft support, and with a vertically-acting hinge, and an elastic connection joining the forward part of the said main frame with the crank-shaft support which is on the opposite side of the hinge therefrom, substantially as set forth.

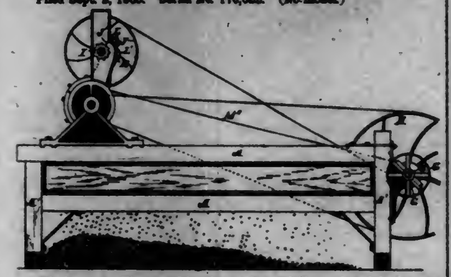
4. In a velocipede, the combination, with a steering-frame carrying one or more steering-wheels and having a transverse handle-bar connected with it, of a main frame having the said steering-frame movably connected with its forward end, carrying one or more driving-wheels and provided with an upright seat-support and a depending crank-shaft support, substantially as shown, and with a vertically-acting hinge, and an elastic connection joining parts of the frame on opposite sides of the said hinge, whereby the same has a cushioning action, substantially as set forth.

5. In a velocipede, the combination, with a main frame having a vertically-acting hinge, of a tie connecting parts of such frame on opposite sides of the said hinge, and consisting, essentially, of a rod, a spring located at one end thereof, and a box inclosing such spring, substantially as set forth.

404,694. HOLDER FOR VESSELS. JOHN P. BUSTIS, New York, N. Y. Filed Mar. 6, 1889. Serial No. 302,065. (No model.)

Claim.—1. A vessel-holder consisting of an expansible and contractible spring-clamp, a handle, and a hooked catch connected with the handle, for steadying the bottom of the vessel, said clamp and handle joined by a hinge which permits the clamp to move to and fro, substantially as described.

2. A vessel-holder consisting of the catch for steadying the bottom of the vessel, the handle connected with the catch, and the expansible spring-clamp connected with the handle for encircling the top part of the vessel, substantially as described.



3. A vessel-holder consisting of a catch for steadying the bottom of the vessel, the handle connected with the catch, and the ring-clamp connected with the handle for encircling the top part of the vessel, said ring-clamp being provided with supporting-lugs R, substantially as described.

404,695. UMBRELLA OR PARASOL. FRENCH S. EVANS, Washington, D. C., assignor of one-fourth to Aldis D. Browne, same place. Filed Sept. 15, 1883. Serial No. 285,442. (Model.)

Claim.—The combination, with the frame and stick of an umbrella or parasol of ordinary form, of a removable cover, made of textile or other suitable material, provided with socketed tips in correspondence with the ribs of the frame, an externally-screw-threaded sleeve removably attached to said stick, and an internally-screw-threaded flaring or bell-mouthed cap to connect with said sleeve and the notch of the frame for the purpose of securing the cover in place, constructed and arranged substantially as and for the purpose described.

404,696. COTTON-SEED HULLER. WILLIAM R. PEE, Cincinnati, and JAMES S. ZERBE, Hartwell, Ohio, assignors, by mesne assignments, to the National Cotton Seed Oil and Huller Company, Memphis, Tenn. Filed Sept. 2, 1885. Serial No. 176,022. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, in a cotton-seed huller, of the hopper, the fluted feed-roll mounted to revolve therein, a hinged gate having a flange projecting inward in the direction of and above the feed-roll, and a set-screw for adjusting said flange with relation to the feed-roll, so as to regulate the feed from the hopper.

2. The conveyer-shaft C, having its ends convexed, in combination with gudgeons D, having concaved seats and provided with tapering bores, and adjusting-rods for adjustably securing said gudgeons to the end of the shaft, substantially as set forth.

3. The hollow cylinder N, cast in one piece, having ribs S, and curved depressions between said ribs and shoulders or offsets T, forming cutting-edges upon said ribs, substantially as set forth.

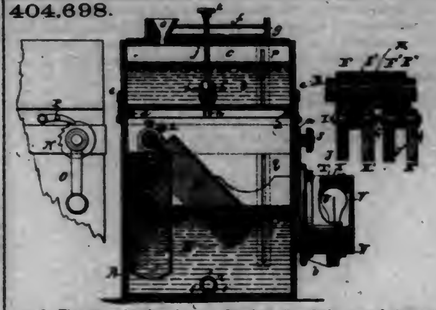
4. A concave V for cotton-seed hullers, substantially as hereinbefore set forth, having zigzag ribs W, arranged in pairs, as shown, the ribs of each pair being parallel with each other and the ribs of each pair being arranged at an angle to the ribs of the adjacent pair.

5. The combination, substantially as specified, in a cotton-seed huller, of the hollow hulling-cylinder having longitudinal ribs S and the concave V, having zigzag ribs arranged in pairs, as shown, the line of the ribs of each pair being parallel to each other and at an angle to the line of the pair adjacent.

6. The combination, substantially as specified, of the reversible hulling-cylinder having ribs S, intervening depressions S', and shoulders T, forming edges upon each side of the ribs, and the concave V, having zigzag ribs W.

7. In a cotton-seed huller, the combination, substantially as specified, of the frame A A', the separator consisting of the perforated screen B and separator-shaft within it mounted in said frame, the huller consisting of the hulling-cylinder and its concave mounted upon said separator, the hopper and its fluted feed-roll mounted upon the huller, and suitable means, such as shown, to transmit power from the same shaft to the feed-roll, huller, and separator.

404,697. SPRING HOLDER OR CLASP FOR PENS OR PENCILS. FREDERICK J. W. FISCHER, New York, N. Y., assignor to the Eagle Pencil Company, same place. Filed Mar. 22, 1889. Serial No. 304,283. (No model.)



Claim.—The combination, with the base or supporting plate of the clasp, of spring wires or shanks secured at one end thereto, and at their free ends bent over upon themselves to form roll-supports, and rolls, of rubber or other suitable material, mounted on said supports, these parts being constructed and arranged for the purposes hereinbefore set forth.

404,698. PORTABLE ELECTRIC LANTERN. WILLIAM FRIEDMUTH, Philadelphia, Pa. Filed Nov. 8, 1888. Serial No. 290,222. (No model.)

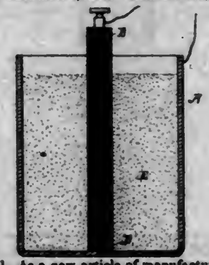
Claim.—1. The combination, in a galvanic cell, of a containing-vessel, a rock-shaft extending across the same, an electrode rigidly secured at its upper portion to said shaft, and an electrode loosely secured to said shaft, the said shaft freely rotating in said last-mentioned electrode and carrying said first-mentioned electrode with it during its movement of rotation, substantially as described.

2. The combination, in a galvanic cell, of the vessel A, rock-shaft D, electrodes H' J', and rings E' F', supporting said electrodes, substantially as described.

404,698.

3. The combination, in a galvanic cell, of the vessel A, rock-shaft D, of insulating material, electrodes H' J', rings E' F', supporting said electrodes, and interposed ring M, of insulating material, substantially as described.

4. In a galvanic cell, the combination of a vessel containing the electrodes and electrolyte, a closed chamber or compartment detachably supported upon and hermetically closing the said vessel, and a valve in the lower part of said chamber, the said chamber being adapted to contain a supply of electrolytic liquid, and the said valve being disposed so as to govern the escape of said liquid from said chamber into said vessel, substantially as described.



5. In combination with the vessel A, containing the elements of a galvanic cell and provided with the slot *q*, covered with transparent material, of the closed chamber *c*, supported upon and hermetically closing said vessel and provided with the slot *p*, covered with transparent material, a valve arranged in the bottom of said chamber and operating to govern the escape of liquid from said chamber, and a means of operating said valve outside of said chamber, substantially as described.

6. The combination of a containing-vessel divided into compartments, as B B', a rock-shaft D, extending across said compartments, a pair of electrodes, as J H J' H', in each of said compartments, a series of conducting-rings, as E F E' F', upon said shaft and supporting said electrodes, the rings, as F E', supporting the positive and negative electrodes, respectively, of adjacent compartments being in electrical contact, and the rings, as E F', supporting the positive and negative electrodes in the same compartment being insulated from each other, substantially as described.

7. The combination of the vessel A, containing the elements of a galvanic cell, plates R R' upon the exterior of said vessel and respectively electrically connected to the electrodes of said cell, an incandescing electric lamp and support T therefor, and means, such as clamping-screws S S', for detachably connecting said support to said plates R R', substantially as described.

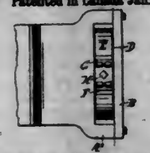
8. The combination, with the vessel A, containing the elements of a galvanic cell, circuit-connections, and clamping devices, such as screws S S', of the cylinder T, circuit-connection, and lamp U therein, substantially as described.

404,699. GALVANIC BATTERY. WILLIAM FRIEDMUTH, Philadelphia, Pa. Filed Nov. 8, 1888. Serial No. 290,223. (No model.)

Claim.—1. As a new article of manufacture, a non-conducting porous insoluble refractory solid in dry comminuted form, containing in its pores a substance or substances capable of acting as a depolarizer in a galvanic cell, substantially as described.

2. As a new article of manufacture, pumice-stone in dry comminuted form, containing in its pores a substance or substances capable of acting as a depolarizer in a galvanic cell, substantially as described.

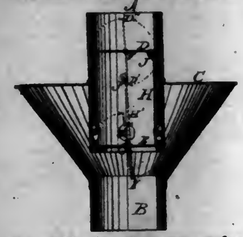
3. As a new article of manufacture, pumice-stone in dry comminuted form, containing in its pores bichromate of potash, substantially as described.



4. In combination with the electrodes of a galvanic cell, a mass of pumice-stone in comminuted form interposed between said electrodes, containing in its pores a depolarizing substance, and saturated with an electrolytic solvent of said substance, substantially as described.

404,700. PACKING FOR METALLIC BOXES. HENRY R. GILLINGHAM, Baltimore, Md., assignor to M. C. Cook, same place. Filed Mar. 15, 1889. Serial No. 303,423. (No model.)

Claim.—A packing for cans provided with screw-covers, and for other vessels of capacity, composed of comminuted cork saturated with linseed-oil and provided with a backing of canvas, substantially as shown.



404,701. DUST-GUARD FOR CAR-AXLE BOXES. LOUIS GOULLOUD, Montreal, Quebec, Canada, assignor to the Union Bearing and Lubricator Company, Portland, Me. Filed Jan. 4, 1889. Serial No. 295,478. (No model.) Patented in Canada Jan. 31, 1889, No. 30,680.

Claim.—1. The combination, with the back plate of an axle-box, of a supplementary plate secured thereto, leaving space between them, the inner faces of both plates being trued up, a cork disk mounted on the axle, and a band partially surrounding the periphery of the disk and provided with a device for tightening it up on same, all substantially as herein set forth.

2. The combination, with the back plate A of an axle-box, of the plate B, secured to same, single cork disk D, mounted on axle between plates, strap E, encircling such disk, plates F and G, and set-screw H, all substantially as herein described.

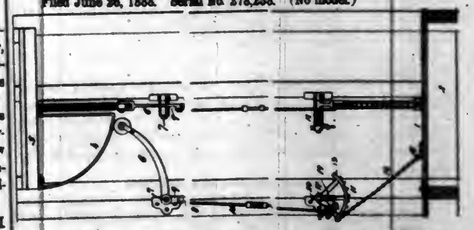
404,702. FUEL-SAVING DEVICE. ARTHUR C. GREENLEE, Fergus Falls, Minn. Filed June 18, 1888. Serial No. 277,451. (No model.)

Claim.—1. The combination of an entrance-flue B, a radiating-chamber C, escape-flue A, with openings K from radiating-chamber, primary damper D, hung on shaft F, joint J, connecting-rod H, secondary damper E, hung on shaft G, counterpoised on side N, and stops O, all substantially as described.

2. The combination of an escape-flue having lateral openings near one end, a radiating-chamber surrounding the laterally-open portion of the said flue, dampers arranged in the flue above and below the lateral openings, respectively, and a rod connecting the said dampers, whereby both may be operated together, substantially as specified.

404,703. MOLD FOR THE MANUFACTURE OF ARTIFICIAL TEETH. WILLIAM R. HALL, Philadelphia, Pa. Filed Oct. 29, 1888. Serial No. 289,431. (No model.)

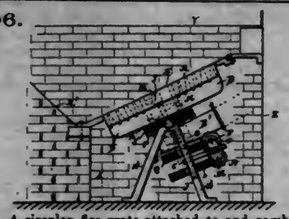
Claim.—In an artificial-tooth mold, the molding-frame A A', in combination with the mold-shells *a a'*, the backing-plate *b*, in which the mold-shells are set, the frame provided with the pins *c c*, and the orifices *c' c'*, substantially as hereinbefore set forth and described.



404,704. PIANO-ACTION. SIEGFRIED HARNISS, New York, N. Y. Filed Nov. 8, 1888. Serial No. 290,296. (No model.)

Claim.—1. In a grand-piano action, a hammer the shank of which is extended beyond the pivot and provided with a perforated enlargement or eye at the rear end, substantially as set forth.

2. In a grand-piano action, a hammer the shank of which is extended beyond the pivot of the hammer-pivot, the extension being provided with a slotted opening and with a perforated enlargement or eye at the rear end, substantially as set forth.



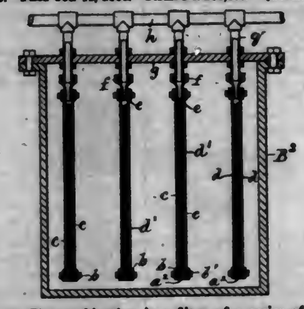
404,705. SELF-CLOSING HATCHWAY. EMIL J. HERRAN, St. Louis, Mo., assignor to the Safety Hatch-Door Company, same place. Filed June 26, 1888. Serial No. 278,238. (No model.)

Claim.—In a self-closing hatchway, the combination of the door, segment, chain 14, connecting the door to the segment, rod 10, lever 6, and spring 18, having arm 21, against which the segment bears when the door has nearly reached its closed position and not until then, substantially as and for the purpose set forth.

404,706. SELF-FEEDING FURNACE-GRATE. LEWIS HOPCRAFT, Stamford Hill, County of Middlesex, England. Filed Mar. 26, 1889. Serial No. 304,967. (No model.) Patented in England Nov. 22, 1886, No. 13,135.

404,706.

Claim.—A circular fire-grate attached to and combined with a central tube containing a worm, which grate and tube can be made to revolve in one direction while the worm is made to revolve in the opposite direction for the purpose of feeding fuel to the furnace and distributing it over the grate, the whole combination being capable of being tilted and worked at any desired angle.

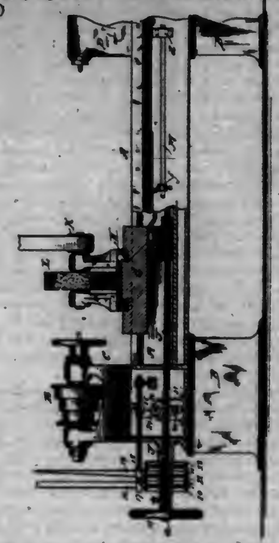


404,707. COFFEE-POT. FRANK A. HOVEY, Farmington Falls, assignor of one-half to Herbert Hivell, East Wilton, Me. Filed Feb. 26, 1888. Serial No. 301,865. (No model.)

Claim.—1. The pot A, having the imperforate truncated-cone-shaped concavity B, in combination with the perforated receiving-cylinder having its bottom concaved to fit the bottom B, substantially as specified.

2. The combination of the coffee-pot provided with a concave bottom, the perforated receiver provided with a concave bottom fitting around the concave bottom of the pot, the lid on the receiver, and the vertical rod or handle affixed at its lower end to the center of the bottom of the receiver and passing through a central opening in the lid thereof, substantially as and for the purpose specified.

404,708. APPARATUS FOR FILTERING. JOHN W. HYATT, Newark, N. J. Filed Oct. 11, 1888. Serial No. 287,852. (No model.)



Claim.—1. The combination, in a filter, of a series of sheets of filtering material clamped together in pairs, with intervening packings between the pairs at their peripheries, heads pressed upon the entire series at its opposite ends, a discharge-pipe, a series of outlet-apertures formed through all the pairs of sheets and connected together and to the discharge-pipe by intermediate packings, and a series of openings formed through all the pairs to distribute the inlet-fluid between the same as an inlet, as and for the purpose set forth.

2. The combination, in a filter, of a series of sheets of filtering material clamped together in pairs, with intervening packings between the pairs at their peripheries, heads pressed upon the entire series at its opposite ends, a discharge-pipe, loose abrading material inserted in the separate spaces between the pairs, a series of outlet-apertures formed through all the pairs of sheets and connected together and to the discharge-pipe by intermediate packings, an outlet, and a series of openings formed through all the pairs of sheets to distribute the inlet-fluid between the same, as and for the purpose set forth.

3. A filter consisting in a series of pairs of flexible sheets and provided with an outlet-aperture, and a plate of metal having granular material cemented thereto being inserted between the sheets of each pair, as and for the purpose set forth.

404,709. DRIVING AND BELT-SHIFTING MECHANISM. ELWIN R. HYDE, Springfield, Mass. Filed Feb. 1, 1888. Serial No. 262,603. (No model.)

Claim.—1. In combination, a bed having slideways, a carriage capable of a reciprocatory movement thereon, a feed-screw shaft engaging said carriage, provided with loose and fixed pulleys 10, 12, and 11 and having a fixed momentum-wheel 15, the reversely-speeded belts 13 and 14, and a belt-shifter engaging said belts, substantially as described.

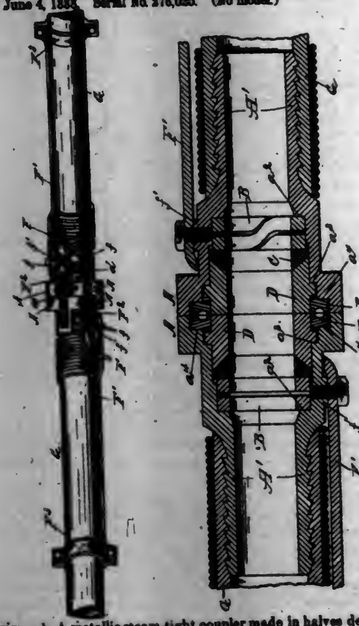
2. The combination, with a reciprocating carriage and a suitably-journaled feed-screw engaging therewith, having loose and fixed pulleys 10, 12, and 11 and a balance-wheel, of a belt-shifter shaft engaging said belts, a horizontal transverse shaft 20, provided with a crank-arm 24, engaging said belt-shifter shaft and having the arrow-head 28, and an independent spring-actuated arrow-head 30, substantially as and for the purpose described.

3. The combination, with a suitably-journaled feeding-screw shaft J, provided with a gear, and a reciprocating bed engaging said shaft J, a rotable shaft having a gear meshing with said feed-screw gear and having mounted thereon loose and fixed pulleys 10, 12, and 11, and reversely-speeded belts 13 and 14, of a belt-shifter shaft engaging said belts, a horizontal transverse rotatable shaft 20, provided with a crank-arm 24, engaging said belt-shifter shaft, which has the arrow-head 28, and an independent spring-actuated arrow-head 30, substantially as and for the purpose described.

4. The combination, with a suitably-journaled feeding-screw shaft J, provided with a gear, and a reciprocating bed engaging said shaft J, a rotatable shaft having a gear meshing with said feed-screw gear and having mounted thereon loose and fixed pulleys 10, 12, and 11 and a balance-wheel, and reversely-speeded belts 13 14, of a belt-shifter shaft engaging said belts, and a transverse rotatable shaft 20, provided with a crank-arm 24, engaging said belt-shifter shaft, substantially as and for the purpose described.

5. The combination, with a suitably-journaled feeding-screw shaft J, provided with a gear, and a reciprocating bed engaging said shaft J, a rotatable shaft having a gear meshing with said feed-screw gear and having mounted thereon loose and fixed pulleys 10, 12, and 11 and a balance-wheel, and reversely-speeded belts 13 14, of a belt-shifter shaft engaging said belts, a transverse rotatable shaft 20, provided with a crank-arm 24, engaging said belt-shifter shaft, and having the arrow-head 28, and an independent spring-actuated arrow-head 30, substantially as and for the purpose described.

6. The combination, with a bed or frame, a suitably-journaled feeding-screw shaft J, provided with a gear, and a carriage engaging said feed-screw shaft and adapted to travel along said bed, the shaft M, provided with the dogs *f f*, a rotatable shaft having a gear mesh-



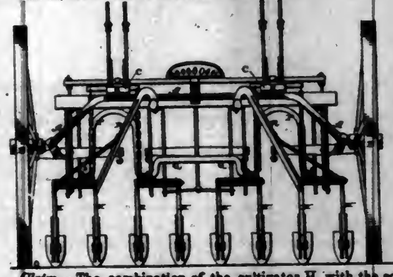
ing with said feed-screw gear and having mounted thereon loose and fixed pulleys 10, 12, and 11, and reversely-speeded belts 13 14, of a belt-shifter shaft engaging said belts, a horizontal transverse shaft 20, provided with a crank-arm 21, engaging said dog-shaft M, and a crank-arm 24, engaging said belt-shifter shaft, which has the arrow-head 28, and an independent spring-actuated arrow-head 30, substantially as and for the purpose described.

7. The combination, with a bed or frame, a suitably-journaled feeding-screw shaft J, provided with a gear, and a carriage engaging said feed-screw shaft and adapted to travel along said bed, the shaft M, provided with the dogs *f f*, a rotatable shaft having a gear meshing with said feed-screw gear and having mounted thereon loose and fixed pulleys 10, 12, and 11 and the balance-wheel 15, and the reversely-speeded belts 13 14, of a belt-shifter shaft engaging said belts, a horizontal transverse shaft 20, provided with a crank-arm 21, engaging said dog-shaft M, and a crank-arm 24, engaging said belt-shifter shaft, which has the arrow-head 28, and an independent spring-actuated arrow-head 30, substantially as and for the purpose described.

8. The combination, with a bed or frame, a suitably-journaled feeding-screw shaft J, provided with a gear, and a carriage engaging said feed-screw shaft and adapted to travel along said bed, the shaft M, provided with the dogs *f f*, and the adjustable collar 23, having lug 22, a rotatable shaft having a gear meshing with said feed-screw gear and having mounted thereon loose and fixed pulleys 10, 12, and 11 and the balance-wheel 15, and the reversely-speeded belts 13 14, of a belt-shifter shaft 16, engaging said belts provided with the adjustable collar 27, having lug 26, a horizontal transverse shaft 20, provided with a slotted crank-arm 21, engaging said lug 22, and a slotted crank-arm 24, engaging said lug 26, provided with the arrow-head 28, and an independent spring-actuated arrow-head 30, substantially as and for the purpose described.

9. The combination, with a bed or frame, a suitably-journaled feeding-screw shaft J, provided with a gear, and a carriage engaging said feed-screw shaft and adapted to travel along said bed, the shaft M, provided with the adjustable dogs *f f*, a rotatable shaft having a gear meshing with said feed-screw gear and having mounted thereon loose and fixed pulleys 10, 12, and 11 and the balance-wheel 15, and the reversely-speeded belts 13 14, of a belt-shifter shaft 16, having belt-shifting hooks 17 18, and the supplemental parallel guiding-shaft 19, a horizontal transverse shaft 20, provided with a crank-arm 21, engaging said dog-shaft M, and a crank-arm 24, engaging said belt-shifter shaft, the latter having the arrow-head 28, and an independent spring-actuated arrow-head 30, substantially as and for the purpose described.

404,710. STEAM-TIGHT COUPLER. THOMAS M. JENKS, Chicago Ill., assignor to the Jenks Railway Car Signal Company, same place. Filed June 4, 1888. Serial No. 276,035. (No model.)



Claim.—1. A metallic steam-tight coupler made in halves detachable from each other, having a central hole for the passage of steam, corrugated stems to be inserted and secured in flexible hose, two annular compositions packings of expansible material in the central hole meeting at the section of the coupler and making a tight joint, and flat zinc rings at the opposite ends of the packings, substantially as stated.

2. In a metallic steam tight coupler, the two similar parts A A, united by a hinge and clasps and detachable from each other, and having a continuous hole provided in the respective parts with the shoulders a^3, a^3, and a^4, in combination, in its respective parts, with the spiral spring B, resting against the shoulder a^3, the zinc expansion-ring C, resting against said spring, the composition annular packing D, having an external circular ledge resting against the shoulder a^3, and the retaining-ring E, externally screw-threaded and screwed into internal screw-threading in the coupler until it rests against the shoulder a^4, substantially as and for the purposes specified.

3. In a metallic steam-tight coupler, substantially as described, the lever F, pivoted between the lugs *f*, formed on a side of the coupler near its central section and having the end of its short arm under the clasp *a'*, in combination with the lever F', pivoted on the lug *f'*, formed on the coupler immediately below the lug *f*, having its short arm curved upward and passed beneath the short arm of the lever F, and its long arm, near its end, curved under and about the hose G, secured on a stem of said coupler, as and for the purpose stated.

4. In a metallic steam-tight coupler, substantially as described, the combination of the clasps *a'*, secured to and holding together the respective halves of said coupler, and the levers F F, pivoted between the lugs *f f*, formed on the respective halves of said coupler and having their long arms curved upward and the end of their short arms under the ends of said clasps, as and for the purpose stated.

404,711. CULTIVATOR. JAMES W. JOHNSON, La Due, Mo. Filed Mar. 19, 1889. Serial No. 303,886. (No model.)

Claim.—The combination of the cultivator H, with the sockets N secured thereto, the castings placed upon the sockets, and the connecting-rods P Q, for connecting the cultivators together, substantially as described.

404,712. DETACHABLE BRUSH-HOLDER FOR DYNAMOS. JESSE F. KNEPER, Terre Haute, Ind., assignor of three-fourths to Joseph H. Briggs, same place. Filed Oct. 20, 1888. Serial No. 288,408. (No model.)

Claim.—1. A bearing for the armature-shaft, in combination with a collar loosely mounted upon the same and provided with an inwardly-extending annular flange surrounding the armature-shaft, and forming an annular space between itself and the edge of the bearing, and having a transverse aperture through the lower portion of the collar in communication with the space, and a brush-holder support carried by the collar, substantially as described.

2. In a dynamo or motor, an armature-shaft bearing having a reduced portion around its inner end, in combination with a collar loosely mounted upon the reduced portion and provided with an inwardly-extending annular flange embracing the armature-shaft a distance from the edge of the reduced portion, and a brush-holder carried by the collar, substantially as described.

3. In a dynamo or motor, the combination, with a journal-box for the armature-shaft, of a collar loosely and adjustably mounted on the same, a brush-holder support detachably secured to the collar, and a handle provided with a screw extending through the support and collar, substantially as described.

4. An armature-shaft bearing, in combination with a collar loosely embracing the same, a brush-holder support partially embracing the collar and removably secured to the same, and a handle to adjustably clamp the parts in position, substantially as described.

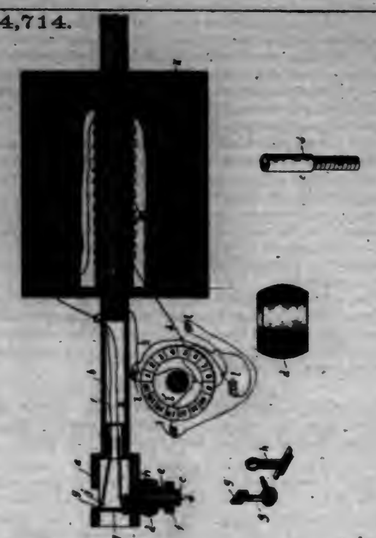
5. In a dynamo or motor, the combination of a shaft-bearing, a collar embracing and adjustable around the same, and provided with an inwardly-extending annular flange at the inner edge of the bearing and surrounding the shaft, a brush-holder support carried by the collar, and a handle provided with a screw-stud to extend through the collar and engage the bearing, substantially as described.

6. In a dynamo or motor, the combination, with an armature-shaft bearing, of a collar embracing and adjustable around the same, a brush-holder support provided with a recess in its under side fitting upon the upper side of the collar, set-screws securing the support to the collar, and a handle to adjustably clamp the collar to the bearing, substantially as described.

404,718. ARMATURE-CORE FOR DYNAMOS. JESSE F. KNEPER, Terre Haute, Ind., assignor of three-fourths to Joseph H. Briggs, same place. Filed Oct. 20, 1888. Serial No. 288,409. (No model.)

Claim.—1. As an article of manufacture, a removable interchangeable armature for dynamo-electric machines or motors, comprising a cylinder open at the ends, a series of rings embracing and clamped together upon the periphery of the cylinder, and end pieces provided with aligned central openings to removably receive the armature-shaft, and with radial arms engaging the ends of the cylinder, substantially as described.

2. In a dynamo or motor, the combination, with the armature-shaft having screw-threads, of an armature having a hollow core open at the ends removably located on the shaft, end pieces for the same provided with radial arms removably engaging the armature to hold the same to the shaft, and with central apertures to receive the shaft, one of said apertures being screw-threaded to screw upon the shaft and the other aperture of a size to slip over the screw-threads, and a nut on the shaft to hold the loose end piece.



3. In a dynamo or motor, an armature-shaft provided with screw-threads, in combination with an armature removably mounted on the shaft and comprising a hollow cylinder open at the ends, end pieces provided with central apertures to receive the shaft and with arms holding the cylinder, one of said apertures being screw-threaded to screw upon the shaft, and a nut screwed upon the shaft to clamp the other end piece to the shaft, substantially as described.

4. As a new article of manufacture, an armature consisting of a hollow core open at the ends and upon the outer periphery of which the coils are adapted to be placed, the ends of said core being notched, and end pieces consisting of central aligned hubs to fit upon the armature-shaft, and radial arms to fit in said notches and hold the armature to the shaft.

404,714. REGULATOR FOR DYNAMO-ELECTRIC MACHINES OR MOTORS. JESSE F. KNEPER, Terre Haute, Ind., assignor of three-fourths to Joseph H. Briggs, same place. Filed Oct. 20, 1888. Serial No. 288,410. (No model.)

Claim.—1. A regulator for a dynamo or motor, comprising a regulating-circuit, a speed-governor mounted upon a rotating part of the machine, and a circuit-controller included in the circuit and comprising a stationary contact-point and a bell-crank lever pivoted to the rotating part of the machine, one arm of which is connected with the governor and the other arm forms the shifting contact movable to or from the stationary point, substantially as described.

404,714.

2. A dynamo or motor regulator comprising a speed-governor rotating with the armature-shaft, a normally-open short circuit, and a circuit-controller included within the same and comprising a stationary contact-point and a lever pivoted to the armature-shaft and connected with and operated by the governor, and provided with a movable contact to engage the stationary point and close the short circuit when a determined speed is attained.

3. In a dynamo or motor regulator, the hollow portion of an armature-shaft, in combination with a stationary contact therein, and a bell-crank lever pivoted therein at its elbow to allow one arm a swinging movement into or out of engagement with the contact, substantially as described.

4. A dynamo or motor regulator comprising a hollow extension of a shaft, a centrifugal governor rotating with the same, and a circuit-controller located in the hollow extension and comprising a stationary contact and a pivoted lever connected with the governor, and provided with a contact movable to or from the stationary contact in a plane parallel with the axis of the shaft.

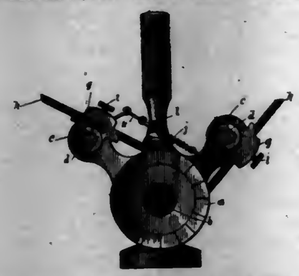
5. A centrifugal governor for dynamo-electric machinery, comprising a hollow slotted guide externally screw-threaded upon its outer end, a sliding weight embracing the guide, an adjustable nut upon the screw-threaded portion of the guide, a coiled spring embracing the guide between the weight and nut, and a rod within the guide and connected to move with the weight, substantially as described.

6. In a dynamo or motor, a hollow extension of the armature-shaft and a bent lever pivoted in the same, in combination with a guide screwed into and extending radially from the hollow extension, a sliding weight embracing the guide, a spring to yieldingly hold the guide against centrifugal force, and a rod connecting the weight and one arm of said lever, substantially as described.

7. A dynamo or motor regulator comprising a normally-open short circuit, including one or more armature-coils, and a circuit-controller and speed-governor to close the circuit when a predetermined speed is reached.

8. A dynamo or motor regulator comprising a normally-open regulating or short circuit, including one or more armature-coils, a resistance within the same, a circuit-controller within the circuit, and a speed-governor carried by a rotating part of the machine and connected with the controller to close the circuit when a predetermined speed is reached, for the purpose set forth.

9. In a dynamo or motor, the combination of a circuit, a hollow guide extending radially from a rotating part of the machine, a governor-weight sliding on the same, a spring and adjustable nut to regulate the tension of the spring on the weight, a T-bar located in said guide and engaging the weight and operated by the same, and a circuit-controller comprising a stationary contact, and a contact-lever pivoted at its elbow and having a horizontally-movable contact, and an arm connected with the inner end of said T-bar, substantially as described.



10. In a dynamo or motor, the combination of an armature-shaft, a regulating-circuit, a non-conducting hollow extension secured to said shaft, a centrifugal governor mounted upon and rotating with the same, and a circuit-controller located within said extension and comprising a stationary contact and a contact operated by the governor and movable to or from the stationary contact in a plane parallel with the axis of the shaft, substantially as described.

11. In a dynamo or motor, the combination, with an armature, of a normally-open short circuit including one or more armature-coils, a speed-governor, a circuit-controller, and a resistance-coil included in said circuit, for the purpose set forth.

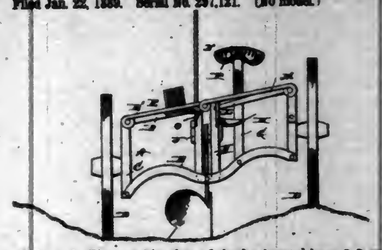
12. In a dynamo or motor, the combination of an armature, a commutator for the same, a normally-open short circuit including two commutator-segments, a resistance included in said circuit, and a circuit-controller, and a speed-governor to operate the same, substantially as described.

13. A dynamo or motor regulator comprising a normally-open regulating-circuit, a circuit-controller included within the same, and a resistance-coil located within the armature, and also included within the circuit, to reduce sparking and equalize the abrupt effect when the circuit is closed, substantially as described.

404,715. BRUSH-SPRING FOR DYNAMOS. JESSE F. KESNER, Terre Haute, Ind., assignor of three-fourths to Joseph H. Briggs, same place. Filed Oct. 29, 1888. Serial No. 289,411. (No model.)

Claim.—1. In a dynamo or motor, a brush-holder support provided with spindles extending from the same parallel with the commutator, brush-holders loosely mounted upon the same to swing transversely to the axis of the commutator, and brushes carried by the holders to bear upon the commutator, in combination with arms extending from opposite sides of the holders, links of insulating material loosely secured to the arms, and a retractive spring and adjusting rod and nut connecting the links, for the purpose set forth.

2. In a dynamo or motor, a brush-holder support, two sets of brush-holders loosely carried by the same, and commutator-brushes carried by the holders, in combination with arms extending from the holders, a pair of insulating-links connecting the arms of each set of holders, and a retractive spring and tension-regulating rod connecting the two links, for the purpose set forth.



3. In a dynamo or motor, the combination of a brush-holder support provided with spindles extending parallel with the periphery of the commutator, brush-holders loosely mounted upon said spindles and provided with transverse sockets, brushes secured in said sockets to bear upon the commutator and swing to or away from the same in planes transverse to its axis, and a retractive spring connecting the holders to yieldingly hold the brushes engaging the commutator, substantially as described.

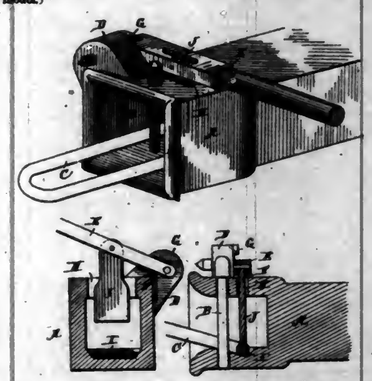
4. In a dynamo or motor, the combination of a brush-holder support, the loosely-mounted brush-holders, the brushes carried by the same and adapted to swing to or away from the commutator, links of insulating material loosely secured to the holders, and a retractive spring connecting the links to hold the brushes yieldingly in contact with the commutator, as set forth.

5. In a dynamo or motor, the combination of a brush-holder support extending in a plane above the commutator, brush-holders loosely supported by the same parallel with and over and above the commutator to swing in planes transverse to the axis of the same, commutator-brushes carried by the holders, and a retractive spring connecting the holders to yieldingly hold the brushes in engagement with the commutator, as set forth.

6. In a dynamo or motor, the combination of a brush-holder support provided with a pair of spindles extending parallel with and over the commutator, brush-holders, each having a longitudinal bearing loosely embracing a spindle and a transverse socket, brushes secured in the sockets to swing with the holders to or from the commutator, and a retractive spring connecting the holders to yieldingly hold the brushes in engagement with the commutator, substantially as described.

404,716. WHEEL-PLOW. GEORGE KIMBALL, Lawrence, Kans. Filed Jan. 22, 1889. Serial No. 297,121. (No model.)

Claim.—1. The combination of the horizontal bars B B, the vertical end bars C C, having their ends pivoted to the ends of the horizontal bars, the spindles projecting from the end bars, and the seat-supporting standard pivoted at its lower end to the lower horizontal bar B and at an intermediate point of its height to the upper horizontal bar B, as set forth.

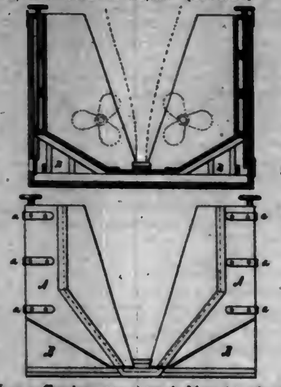


2. The combination of the horizontal bars B B and the vertical bars C C, having their ends pivoted together, the slotted supporting-arm H, pivoted to the horizontal bars B, and the yoke J, pivoted to the said arm H, the plow-beam being secured to the yoke J and projecting through the arm H, as set forth.

3. The combination of the horizontal bars B and the vertical bars C, having their ends pivoted together, the yoke E, pivoted to the bars C and supporting the tongue, the slotted supporting-arm H, pivoted to the bars B and having a forwardly-projecting branch I, pivoted to the yoke E, and the yoke J, pivoted to the arm H, the plow-beam being secured to the yoke J and projecting through the arm H, as set forth.

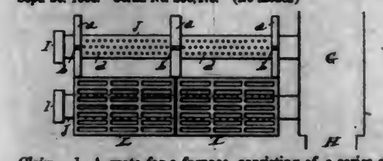
4. The combination of the horizontal bars B and the vertical bars C, having their ends pivoted together, the slotted arm H, pivoted to the bars B, the yoke J, pivoted to said arm H, the arm M, secured rigidly to one of the bars C, and the link L, connecting said arm with the yoke J, as set forth.

5. The combination of the bars B C, having their ends pivoted together, the arm H, pivoted to the bars B and having a forwardly-projecting branch I, the yoke J, pivoted to the arm H, the bent lever N, pivoted on the branch I of the arm H, and the link O, connecting said lever with the yoke J, as set forth.



404,717. CAR-COUPLING. JONATHAN H. KING and BENJAMIN F. REED, Swan Creek, Ill. Filed Mar. 5, 1889. Serial No. 301,907. (No model.)

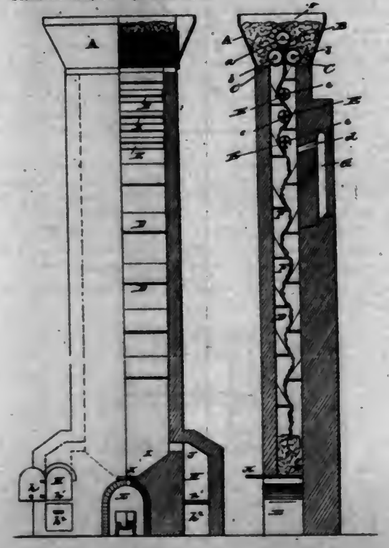
Claim.—1. The combination of the draw-head having a recess in its floor, the fulcrum-block on the draw-head, the lever fulcrumed on said block, the presser-plate pivoted to the lever and adapted to push the inner end of the link into the recess in the draw-head, and the spring secured to the draw-head and bearing on the lever to hold it normally elevated, as set forth.



2. The combination of the draw-head having a recess in its floor and a transverse slot in its top, the fulcrum-block on the draw-head, the lever fulcrumed to said block and extending over the draw-head, the presser-plate pivoted to said lever and depending therefrom through the slot in the draw-head and having its lower end arranged over the recess in the floor of the draw-head, the spring secured to the draw-head and bearing against the lever, and the stop projecting laterally from the fulcrum-block above the lever, as set forth.

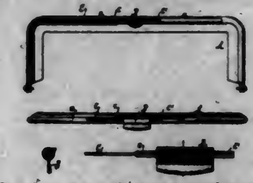
404,718. COFFER-DAM. HENRY P. KIRKHAM, Brooklyn, N. Y. Filed May 15, 1888. Serial No. 273,900. (No model.)

Claim.—In a coffer-dam, the gates A, hinged to the sides of the dam and extending from the top to the bottom of the dam, said gates having oblique bottom edges, as and for the purpose described.



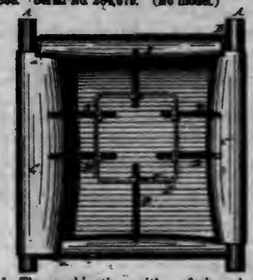
404,719. GRATE-BAR. GEORGE M. KNIGHT, Adrian, Mich. Filed Sept. 26, 1888. Serial No. 286,473. (No model.)

Claim.—1. A grate for a furnace, consisting of a series of pipes extending underneath and adjacent to a series of grate-sections and provided on their upper surfaces with perforations, of bearings on said pipes formed integral therewith for supporting said grate-sections, substantially as described.



2. The combination, in a furnace-grate, of the grate-sections L, pipes J, having perforations *d*, bearing-plates *a*, formed integral with said pipes and provided with lugs *b*, and a chamber G, into which said pipes extend and from which a current of air is supplied to the pipes, substantially as described.

404,720. CALCINING-FURNACE. DAVID LEWIS, JOHN H. WILLIAMS, and MAGGIE MATTHEWS, Anaconda, Mont. Filed Aug. 2, 1887. Serial No. 245,986. (No model.)



Claim.—In a furnace for calcining ores, the combination of a stack provided with oppositely-inclined internal projections and alternate fan-wheels located horizontally between said projections, a hopper upon the top of the stack provided with feed-rollers, a chamber at the bottom of the stack provided with an inclined bottom and a discharge-door at the lower part thereof, an open archway directly under said door, one or more furnaces near the bottom of said stack, having exit-flues communicating with said chamber, and a downcomer into which the stack opens near its upper end, substantially as described.

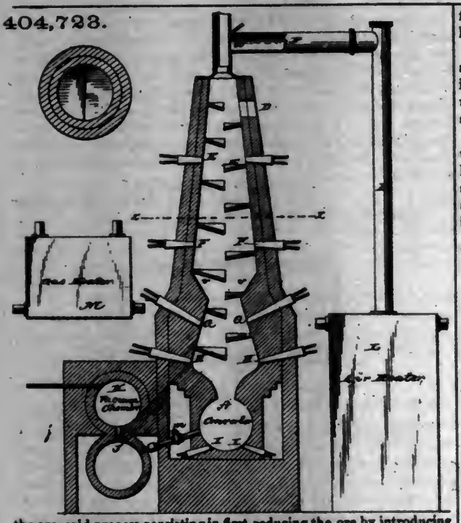
404,721. FRAME FOR POCKET-BOOKS OR OTHER ARTICLES. LOUIS MEMER, New York, N. Y. Filed Apr. 25, 1889. Serial No. 308,500. (No model.)

Claim.—In a frame for pocket-books or other articles, the combination, with the catch-carrying jaw of the frame and with the catch, of a spring-wire housed in the bead *a* of the jaw and extending through the catch along one side of the interior of the jaw and a certain distance down in the side of the jaw, the outer end of said spring-wire being bent back upon itself to form gudgeons *c c'* on both ends of the catch, substantially as described.

404,722. BED-BOTTOM AND MEANS FOR TIGHTENING AND SUPPORTING THE SAME. JOSEPH R. MOORE, Warwick, Mass. Filed Sept. 5, 1888. Serial No. 284,679. (No model.)

Claim.—1. The combination, with a chair or bedstead frame, a covering fabric and reeds enseamed within said fabric, substantially as described, of the clamping device composed of an endless ring, screw-threaded hooks taking hold of said fabric, and reeds and nuts run upon said hooks and bearing within said band to hold said fabric to a suitable tension, substantially as set forth.

2. The combination, with a chair or bedstead frame, two pieces of woven fabric (the one overlapping the other with their warp-threads crossing) folded over the ends and sides of said frame, and the strengthing-reeds for the said fabric held in fold by the hooks D, of the adjusting device composed of the metallic ring and screw-threaded hooks and nuts, said hooks taking hold of the said fabric and reeds, and the said nuts engaging the screw-threaded ends of the said hooks and bearing against the inner face of the said ring, as and for the purpose set forth.

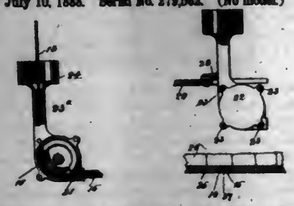


404,723. METHOD OF PRODUCING STEEL DIRECT FROM ORE. WILLIAM P. M. MCCARTY, Hagerstown, Md., assignor, by direct and mesne assignments, of part to Jane Logan, same place, Catherine Barton, Philadelphia, Pa., and Herman D. Wallbridge. Filed Feb. 26, 1888. Serial No. 301,297. (No model.)

Claim.—1. The process which consists in introducing into a highly-heated charge of iron ore and flux hydrogen gas, and subsequently at different points into the charge hydrogen and carbonaceous matter in a state of combustion in order to melt and subsequently carbonize the metal, substantially as set forth.

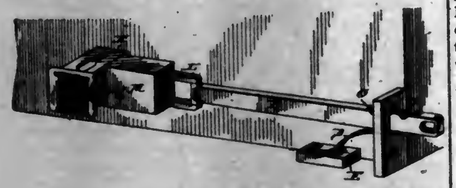
2. The process consisting in introducing into the highly-heated charge of iron ore and flux hydrogen gas to reduce the ore, subsequently introducing hydrogen and carbonaceous matter with air at different points into the same charge to melt the metal, and finally introducing hydrogen and atmospheric air with or without carbon into the molten metal to convert it into steel, substantially as set forth.

3. The process herein described of producing steel direct from



404,723.

the ore, said process consisting in first reducing the ore by introducing pure hydrogen into the charge of highly-heated ore and flux, then introducing hydrogen and carbonaceous matter with air to melt the metal, and subjecting the molten metal in its passage from the stack to the converter to the action of hydrogen and carbonaceous matter, substantially as described.

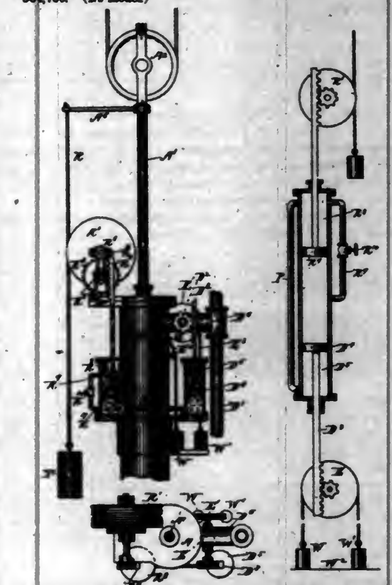


4. The herein-described continuous process of producing steel direct from the ore, said process consisting in first introducing hydrogen in the charge of highly-heated ore and flux to reduce the ore, then subjecting the charge to the action of hydrogen and carbonaceous material with air to melt the metal, then subjecting the molten metal to the action of purifying gases and air, and finally subjecting the molten steel thus produced to the action of a vacuum, substantially as set forth.

404,724. RAILWAY-GATE. ALEXANDER J. MCDONALD, Chicago, Ill. Filed July 10, 1888. Serial No. 279,562. (No model.)

Claim.—In a railway-gate, the combination, with a fixed part of the gate structure, of a cable guard or covering hinged thereto and adapted to support a sheave for the cable, and a conduit-pipe connected rigidly to said guard or covering, substantially as described.

404,725. CAR-COUPLING. SAMPSON S. MCKEAND, Ceredo, W. Va. Filed Mar. 28, 1888. Serial No. 305,162. (No model.)



Claim.—1. The combination, with the draw-head and the bracket A, of the transverse sliding frame adapted to hold the link in the draw-head, the lever pivoted to said sliding frame and provided with notches in its edge adapted to engage the said bracket, and the spring bearing on the said lever to hold the notches in engagement with the bracket, as set forth.

2. The combination, with the draw-head having the longitudinal rib on its floor, of the link adapted to engage said rib, and the sliding frame passing transversely through the draw-head and adapted to hold the link in engagement with said rib, as set forth.

3. The combination of the draw-head having the rib G, the link adapted to engage said rib, the lifting-plate arranged longitudinally in the draw-head in rear of said rib, and the sliding frame having its upper arm adapted to pass over the end of the link and its lower arm adapted to raise the lifting-plate to release the link, as set forth.

4. The combination, with the draw-head having the lateral extension M and the rib G, of the link adapted to engage said rib, the lifting-plate arranged in the draw-head in rear of said rib, and the sliding frame moving in the extension M and having its upper arm adapted to enter the draw-head and its lower arm provided with an inclined surface N, adapted to act on the lifting-plate, as set forth.

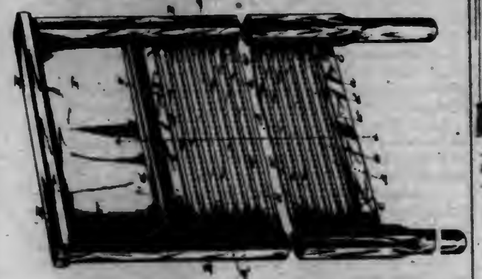
404,726. SELF-REGULATING HYDRAULIC ELEVATOR. WILLIAM E. NICKERSON, Cambridge, Mass. Filed Mar. 26, 1889. Serial No. 304,700. (No model.)

Claim.—1. In a hydraulic elevator, the combination of the main hoisting-piston and its cylinder, and a port for inlet and outlet having a throttle-valve held normally open by a retractor device, with a piston located in a fluid-cylinder and adapted to close said throttle-valve (when the hoisting mechanism of the elevator attains undue speed) by impulse generated by the motion of a secondary piston adapted to move with a fixed ratio to the hoisting mechanism, said secondary piston being located in a secondary cylinder having a restricted passage from one side of its piston to the other, and a fluid connection with the cylinder containing the valve-moving piston, substantially as described, and for the purpose set forth.

2. In a hydraulic elevator, the combination of the main cylinder A and its piston and piston-rod, port D^6, for inlet and outlet, having a throttle-valve E, and valve-retractor device consisting of the pulley E', rope E^3 E^5, and weights W W', with the piston-rack D^3, piston D^4, cylinder D^5, pipe P, cylinder R^4, having a restriction-pipe R^5, and piston R^7, adapted to move in a fixed ratio to the movement of the elevator-carriage, substantially as and for the purpose set forth.

404,727. FLY-TRAP. JUSTIN E. PACKARD, Mendocino, Cal. Filed Jan. 26, 1889. Serial No. 297,632. (No model.)

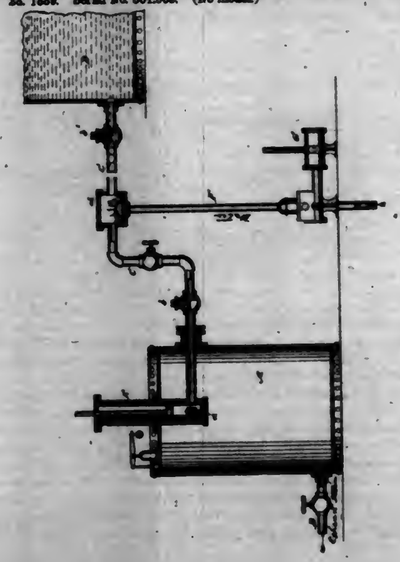
Claim.—In a fly-trap, the combination, with the casing, of the detachable cage, and the revolving drum provided with a shaft having a shoulder *d*, the gear-wheel mounted loosely on the shaft and connected to suitable clock mechanism, and the spring O, coiled on the shaft and bearing against the said gear-wheel to press it against the shoulder *d*, substantially as and for the purpose specified.



404,728. BOX-FASTENER. LUDWIG PETTERSON, Chicago, Ill. Filed Sept. 29, 1888. Serial No. 286,808. (No model.)

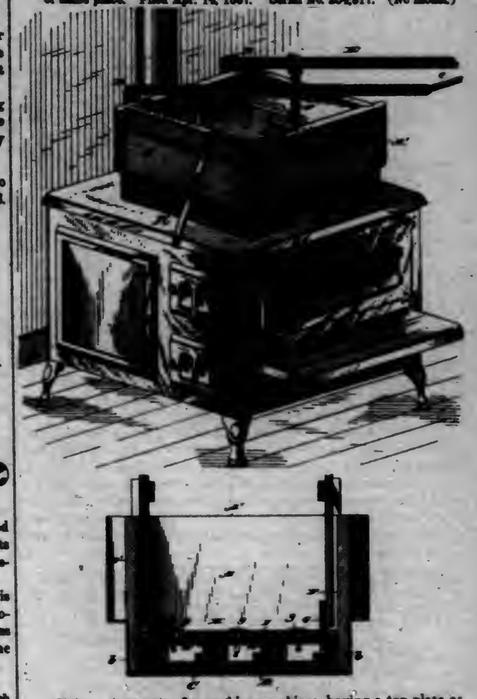
Claim.—1. As a new article of manufacture, a metallic fastener consisting of a center strip having a row of teeth along each edge with parallel sides and bent out of the plane of the strip on a line at an angle to the axis of the center strip, substantially as described.

2. As a new article of manufacture, a metallic fastener consisting of a center strip, a row of teeth along each side of and bent at an angle to this strip, a portion of said strip being left without teeth, whereby it is adapted to be bent around a corner, substantially as described.



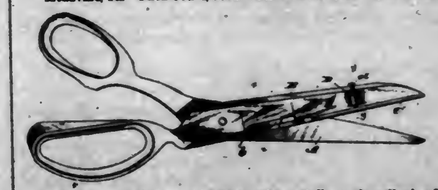
404,729. WASH-BOARD. ISAAC H. POE, Toledo, Ohio, assignor to the Union Manufacturing Company, same place. Filed Dec. 4, 1886. Serial No. 220,716. (No model.)

Claim.—1. A wash-board which is provided with a corrugated metal body that upon one face has plain smooth ribs, and upon its opposite face has its ribs divided into short sections by small cross-grooves, substantially as and for the purpose shown.



2. A wash-board which has a metal body that upon one face is provided with plain transverse ribs and grooves, and upon its opposite face has transverse ribs and grooves and small cross-grooves which pass through the tops of said ribs, substantially as and for the purpose set forth.

404,730. BOILER-FEED. JULIO H. RAE, Milford, Del. Filed Feb 23, 1889. Serial No. 301,503. (No model.)

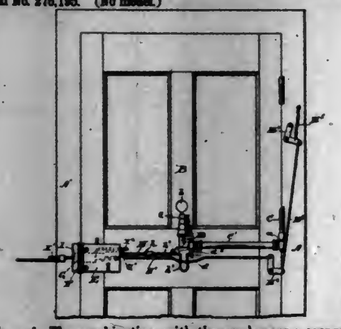


Claim.—The combination, with a steam-boiler and a tank for the reception of exhaust-steam from an engine, of a pump communicating with said tank, a valved feed-pipe leading from said pump to the boiler, and a water-spraying pipe discharging into the feed-pipe between the tank and the boiler, whereby the exhaust-steam is drawn from the tank, forced into the feed-pipe, condensed therein, and forced into the boiler, substantially as described.

404,731. WASHING-MACHINE. ZADOCK RANDEL, De Kalb, Mo., assignor of two-thirds to Harison B. Gardner and Henry R. Jones, both of same place. Filed Apr. 14, 1887. Serial No. 234,817. (No model.)

Claim.—A pounder for washing-machines, having a top plate or sheathing with elongated slots in two opposite sides thereof, and links to which operating-levers are adapted to be secured, projecting downward through said slots and attached to the inner surfaces of the side bars of the pounder above the lower edges of said strips, whereby obstructing projections are avoided on the sides and bottom of the pounder and permit the same to cover more space and fit snugly within the tub or receptacle, substantially as described.

404,732. ADDRESSING-MACHINE. JAMES W. H. REDMOND, Meadville, Pa. Filed Oct. 4, 1888. Serial No. 287,246. (No model.)

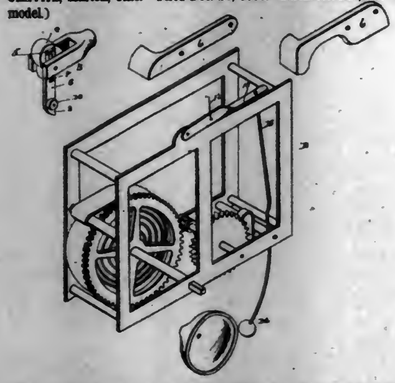


Claim.—1. The combination, substantially as described, of the blade A, the blade B, pivoted thereto and provided near its point with a threaded boss, a horizontal pressure-plate secured at its inner end to blade B near the pivot, and a vertical set-screw adjustably seated in the threaded boss to bear upon said plate near its outer end.

2. The combination, with the blades A and B, pivoted to each other and provided with operating-handles, of a plate C, carried by one of the blades, and a set-screw, also carried by the same blade, against which the plate will abut, substantially as shown, and for the purpose set forth.

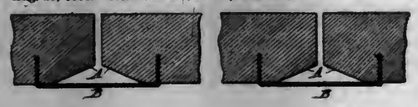
3. The combination, with the blade A, of a blade B, having a pro-

jection *b*, to which a plate C is removably attached, and a lug secured to said blade between the point and projection *b*, said lug having a screw-threaded perforation for the reception of a set-screw *d*, against which the plate will abut, substantially as shown, and for the purpose set forth.



404,733. DEVICE FOR AUTOMATICALLY OPERATING THE STOP-COCK OF A GAS-BURNER. CHARLES M. RIDER, Newark, Ohio, assignor of one-half to William Baker, same place. Filed June 6, 1888. Serial No. 276,195. (No model.)

Claim.—1. The combination, with the gas-burner *c*, secured to a door and having the stop-cock D, provided with the lever-arm *d*, of the lock E, having the sliding locking-bolt G, and the rod H, connecting the locking-bolt and lever-arm and formed in two sections *h h'*, having a screw-threaded connection and provided with the loop h^3, all constructed, arranged, and operating substantially as shown and described, as and for the purpose set forth.

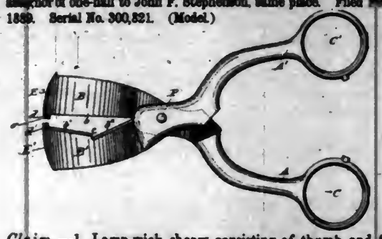


2. The combination, with the gas-burner *c*, having the stop-cock D, provided with the lever-arm *d*, the bearing d^2, set-screw d^3, mounted in said bearing and having a tapered end, and the stop d^5 on the portion of the gas-pipe in which the stop-cock is located, with which the end of the set-screw engages, of the lock E, having the locking-bolt G, and rod H, connecting said locking-bolt G and lever-arm *d*, all constructed, arranged, and operating substantially as shown and described, as and for the purpose set forth.

404,734. BURGLAR-ALARM. JOSEPH W. ROADS and THOMAS J. GRIFFITH, Marion, Ohio. Filed Dec. 22, 1888. Serial No. 294,364. (No model.)

Claim.—In a burglar-alarm, the combination of a bracket adapted to be secured over a window or door, a cam-shaped trigger pivoted in the bracket having a recess in one side, an adjustable arm moving in the said recess designed to rest against the window or door, ringing mechanism, a trigger for releasing the same, and a wire connecting the cam-shaped trigger and the trigger of the ringing mechanism, whereby, when the said adjustable arm is moved, the ringing mechanism will be released, substantially as described.

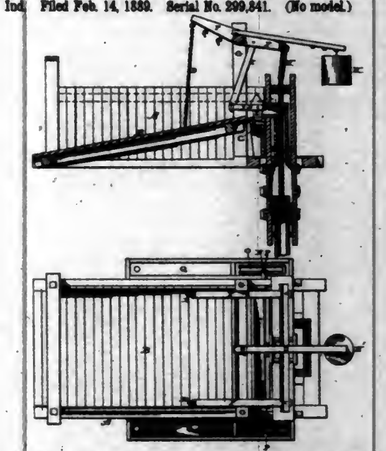
404,735. CAR-ROOF. GEORGE A. ROBERTS, Paducah, Ky. Filed Aug. 25, 1888. Serial No. 283,807. (No model.)



404,735.

Claim.—In a roof, the combination of the boards having their lower edges beveled away so as to form a chamber, with the pans B, having their edges turned up at right angles and made to fit in grooves formed in the under side of the boards, substantially as shown.

404,736. WICK-TRIMMER. JOHN L. SANFORD, Albany, N. Y., assignor of one-half to John F. Stephenson, same place. Filed Feb. 23, 1889. Serial No. 300,821. (Model.)

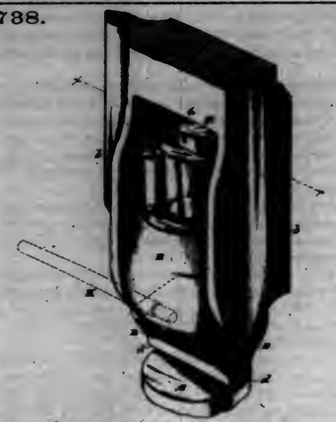


Claim.—1. Lamp-wick shears consisting of thumb and finger pieces C and C', handles A and A', and the curved blades B and B', said blades being unequally curved and furnished with the spurs *d* and *d'*, beveled on their opposing faces, substantially as set forth.

2. In lamp-wick shears, substantially such as described, one of the blades having a straight cutting-edge *b*, and the other blade formed with the angular cutting-edge *b'* and b^2, and the recess *c*, as hereinbefore set forth.

3. Lamp-wick shears consisting of thumb and finger pieces C and C', handles A and A', and blades B and B', said blades being unequally curved and furnished with the spurs *d* and *d'*, beveled on their opposing faces, the blade B having a straight cutting-edge *b*, and the blade B' formed with the angular cutting-edges *b'* and b^2 and the recess *c*, substantially as set forth.

404,737. STOCK-PUMP. GOTTLIEB W. SCHROEDER, Huntington, Ind. Filed Feb. 14, 1889. Serial No. 299,841. (No model.)



Claim.—1. In a stock-pump, the combination of the pivoted platform, the uprights G, the frame F, the weight H, connected to the frame, the chains D, for connecting the frame to the platform, the connecting-rod I, the pivoted lever J, operated by the rod I, the valve L, pivoted to the lever, and the trough C, having an opening through one end, substantially as shown.

2. The combination of the trough C, the platform, the pump, and the pivoted frame placed above the pump and connected both to it and the platform, with the trough Q, placed at the end of the one C, so as to receive water therefrom, the partition P, placed in one end of the trough, and the pivoted guide O, placed above the partition and having a float R secured to its inner end, substantially as described.

404,738. APPARATUS FOR STRAIGHTENING SAWS. DANIEL SIMONDS, Fitchburg, Mass. Filed July 23, 1888. Serial No. 281,221. (No model.)

404,738.

Claim.—1. In combination with a hammer-head, a rotatable die adapted to be rotated in a plane at right angles to the hammer-head, and the pivot-stem thereon connecting it with the head, substantially as and for the purpose shown.

2. In combination with a hammer-head, the rotatable die pivotally attached thereto having a narrow elongated striking-surface extending in a plane parallel to the plane of rotation of the die on the hammer, substantially as and for the purpose described.

3. In combination with a hammer-head, the rotatable die connected with the hammer-head by means of a pivot-stem and having an elongated striking-surface at right angles to the pivot-stem, substantially as and for the purpose described.

4. In combination with a hammer-head and the rotatable die, a handle for rotating the die, substantially as and for the purpose described.

5. In an apparatus for straightening saws, in combination with an anvil or support for a saw and the hammer-head, the rotatable die pivotally attached to the head, so as to be rotatable in a plane at right angles to the travel of the hammer, provided with an elongated striking-surface whose direction with reference to the anvil-surface is changed by the rotation of the die on the hammer-head, substantially as and for the purpose described.

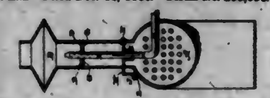
6. In combination with the hammer-head and the rotatable die carried thereby, a movable pawl carried with the die, and a recess in the hammer-head to be engaged by the pawl to lock the die from accidental rotation, substantially as and for the purpose described.

7. In combination with the hammer-head and the rotatable die connected with the head by a stem, a spring acting upon such stem to hold the die up against the hammer-face, substantially as and for the purpose specified.

8. In combination with the hammer-head, the rotatable die having a stem engaging an opening in the head, the cap on the stem, and the spring around the stem within the cap, substantially as and for the purpose described.

9. In combination with the hammer-head, the rotatable die thereon provided with a stem extending up through an opening in the head, the cap rigidly connected with the stem, and the spring-actuated pin carried by the cap and adapted to engage suitable depressions in the head, substantially as and for the purpose specified.

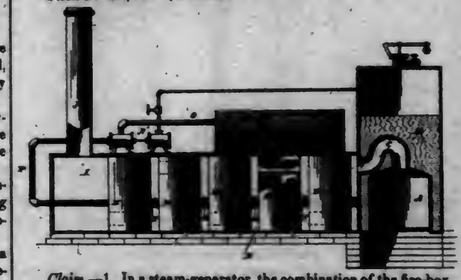
10. In combination with the hammer-head and the rotatable die, a spring-actuated pin connected with the die, so as to be moved as the die rotates, and suitable depressions on the hammer-head to be engaged by the pin, substantially as and for the purpose shown.



11. In combination with the hammer-head provided with one or more depressions, the rotatable die having the stem for connecting it with the head, the cap on the stem, the spring-pin carried by the cap, and the spring around the stem within the cap, substantially as and for the purpose set forth.

12. In combination with the hammer-head provided with a stop-pin, the rotatable die with its stem, and suitable stops rigidly connected with the stem for limiting the rotation of the die, substantially as and for the purpose described.

13. In combination with the hammer-head and the rotatable die carried thereby, a movable pawl carried with the die in its rotation, and suitable depressions in the hammer-head to be engaged by the pawl when the die has been rotated to different positions with reference to the hammer-head, substantially as and for the purpose shown.



14. In combination with the hammer-head and the rotatable die carried thereby, suitable stop devices for limiting the rotation of the die in opposite directions, a pawl on the die, and the two pawl-engaging recesses or depressions on the hammer so situated as to engage the pawl and lock the die at opposite ends of its movement, substantially as and for the purpose set forth.

404,739. EXHAUST MECHANISM. JOHN D. SMITH, Murfreesborough, Tenn. Filed Dec. 18, 1888. Serial No. 293,993. (No model.)

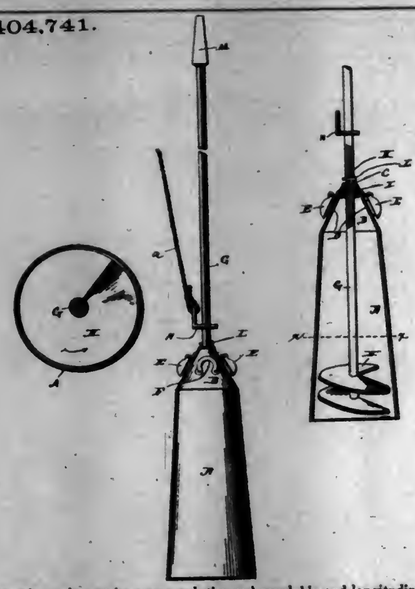
Claim.—The combination of the stack, the exhaust-pipe, a pipe pivoted in the stack and having its lower end movable in relation to the exhaust-pipe, and a mechanism for adjusting the lower end of the movable pipe, the upper end of the movable pipe being contracted and perforated and thereby partially closed, substantially as described.

404,740. STEAM-GENERATOR. WILLIAM SMITH, Pittsburg, Pa., assignor of part to William Smith, same place, and Charles T. Russell, Allegheny, and William Guckert, Pittsburg, Pa. Filed Feb. 26, 1889. Serial No. 301,334. (No model.)

Claim.—1. In a steam-generator, the combination of the fire-box, the upright boiler within which the same is located, the curved flue in the top of the fire-box, the oblong heating-chamber communicating at one end with said flue and at the other end with the smoke-chamber, a series of heaters located within said chamber communicating with one another by pipes and provided with diametrical flues located alternately in the top and bottom part of said heaters, and the side walls or partitions built up between the sides of the several heaters and the adjacent sides of the chamber within which they are placed, substantially as and for the purpose shown and set forth.

2. In a steam-generator, the combination of the fire-box, the upright boiler within which the same is located, the curved flue in the top of the fire-box, the oblong heating-chamber communicating at one end with said flue and at the other end with the smoke-chamber, a series of heaters located within said chamber communicating with one another by pipes and provided with diametrical flues located alternately in the top and bottom part of said heaters, the side walls or partitions built up between the sides of the several heaters and the adjacent sides of the chamber within which they are located, the feed-water tank on top of the heating-chamber, the feed-water pump, and the pipe connecting said pump with that one of the heaters which is located farthest from the fire-box, substantially as and for the purpose shown and set forth.

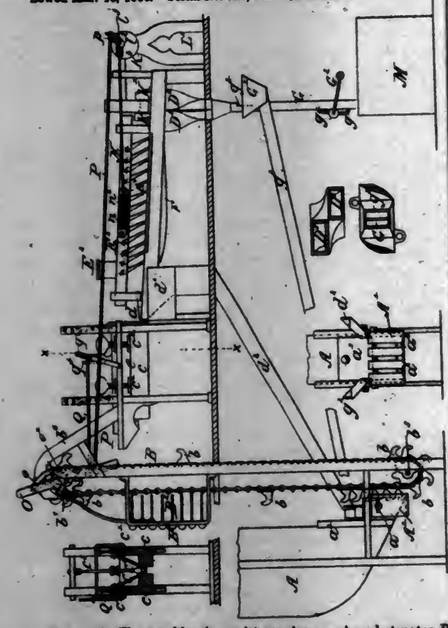
404,741. APPARATUS FOR RAISING QUICKSAND. HENRY STOLTEN, Sr., Manitowoc, Wis. Filed Feb. 6, 1889. Serial No. 298,830. (No model.)



Claim.—1. The combination of the tapered case having the outwardly-opening valves at its upper end, the rod revoluble in the case, and the boring-bit attached to the said rod and arranged in the lower end of the case, substantially as described.

2. The combination of the tapered case having the valves at its upper end, the rod revoluble in the case and having the boring-bit at its lower end, means, substantially as set forth, to rotate the said rod, the plate N, pivotally connected to the said rod, and the elevating-rod attached to said plate, substantially as described.

3. The combination, in apparatus for raising quicksand, of the case having the valves at its upper end, the rod G, extending through an opening in the upper end of said case and revoluble therein, said rod having the collar I, adapted to bear under the top of the case, and the opening K above said collar, the boring-bit attached to the lower end of the rod and arranged in the bottom of the case, and the pin or key, adapted to be inserted in the opening K, substantially as described.



4. The combination of the tapered case having the outwardly-

404,741.

opening valves at its upper end, the rod revoluble and longitudinally movable in the case, and the boring-bit attached to the rod and arranged in the lower end of the case, substantially as described.

404,742. FEED MECHANISM FOR CHAIN-LINK MACHINES. JAMES D. STORIE, Oshawa, Ontario, Canada. Filed Nov. 14, 1887. Renewed Mar. 18, 1889. Serial No. 303,821. (No model.)

Claim.—1. The combination, with the hopper A and elevator B, having fingers or hooks thereupon, of the well or chamber A', having a slotted front through which said fingers project, for the purpose described.

2. The combination, with the hopper A and elevator B, having fingers or hooks thereupon, of the well or chamber A', adjustable horizontally and having a slotted front, substantially as and for the purpose specified.

3. The combination, with the frame and an elevator having hooks or fingers for carrying drive-chain links, of a brush adapted to adjust the links upon said hooks, substantially as and for the purpose specified.

4. The combination, with the elevator having hooks or fingers for carrying drive-chain links, of a comb arranged at the upper end of said elevator and adapted to remove such links from said hooks or fingers, substantially as and for the purpose set forth.

5. The combination, with the elevator B, having fingers or hooks b b, of the comb b^3, chute b^4, and a trough or receptacle for the links, substantially as set forth.

6. In a drive-chain-link feeding-machine, the combination, with a feeding-chute, of the trough C, constructed with adjustable beveled blocks c c and adjustable sloping inner walls c^3 c^3, substantially as and for the purpose described.

7. In a drive-chain-link feeding-machine, the combination, with a track or way adapted to receive the loose links and suspend them by their heads or knuckles, or raking or pushing devices engaging with said heads or knuckles, so as to move said loose links toward the point of delivery, substantially as specified.

8. In a drive-chain-link feeding-machine, the combination, with a track or way along which the loose links travel while suspended by their heads or knuckles, of a reciprocating bar carrying pivoted raking or pushing bars or teeth adapted to engage with the heads of such loose links and advance the latter along said track or way, substantially as specified.

9. The combination, with the trough C, of the reciprocating rakers C', substantially as and for the purpose specified.

10. The combination, with the rails D' D^3, of the reciprocating rakers E, substantially as and for the purpose specified.

11. In a drive-chain-link feeding-machine, the combination, with a rail adapted to be embraced or straddled by the hook portions of the links and with means for causing said links to move upon said rail, of means for lubricating the rail, whereby the interior of the locking knuckles or hooks may also be lubricated, substantially in the manner set forth.

12. In a drive-chain-link feeding-machine, the combination, with the track or way along which the links travel, of a device for scraping and cleaning the insides of the hooks, substantially as described.

13. The combination, with the track upon which the links travel, of the comb W, for the purpose set forth.

14. The combination, with a rail for conveying the links, of the hollow raker-bar E', hollow perforated pivots e, and hollow rakers E, whereby a lubricant is conveyed from the raker-bar to the rail, substantially as and for the purpose described.

15. In a drive-chain-link feeding-machine, the combination, with a rail for conveying the links and rakers for moving same thereon, of the friction-plate d^6, for the purpose described.

16. In a drive-chain-link feeding-machine, the combination, with a guideway in which the links travel with their heads uppermost, of two rails diverging from said guideway and adapted to catch the links whose hooks are turned toward them, substantially as and for the purpose specified.

17. In a drive-chain-link feeding-machine, the combination, with a guideway in which the links travel with their heads uppermost, of two rails diverging from said guideway and adapted to catch the links whose hooks are turned toward them, and right and left twisted spouts arranged to turn two series of links and deliver them through a single spout with their hooks turned all in the same direction, substantially as and for the purpose specified.

18. In a drive-chain-link feeding-machine, the combination, with a delivery spout or conductor, of an overflow device whereby surplus links will be thrown out and only a regulated quantity delivered at the end of the spout, substantially as and for the purpose specified.

19. The combination, with the double-twist spouts D^4 D^5 of the single spout G, having the overflow-opening g', for the purpose specified.

20. In a spout or chute for delivering links, having a device for stopping its outlet end, the overflow-opening g', for the purpose described.

21. In combination with the spout G, having an overflow-opening, the hopper G', and return-spout g^3, for the purpose described.

22. In combination with a guideway for drive-chain links, the shield d, for throwing out misplaced links, arranged substantially as described.

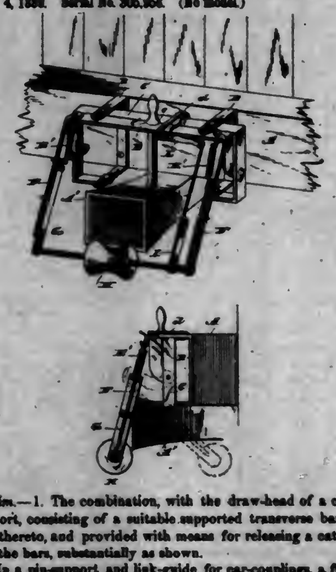
23. The combination, with the guideway D and shield d, of the hopper d' and return-spout d^3, for the purpose described.

24. The combination, with the rails for delivering and spouts for receiving the links, of the strikers K K' and means for operating same, substantially as and for the purpose described.

25. The combination, with the strikers K K', operating as described, the pivoted lever K^3, and driving shaft L, of the cam l, substantially as and for the purpose set forth.

26. In a drive-chain-link feeding-machine, the combination, with the rakers and means for driving same, of a spring adapted to compensate for the movement of said rakers when the latter are held stationary from any accidental cause, substantially in the manner described.

27. The combination, with the raker-bar E' and rakers connected thereto and with the rod N and means for working same, of the coiled spring n, substantially as and for the purpose specified.



28. The combination, with the driving-shaft L, having a crank wheel or disk thereon, of rod P, lever O, having a pawl, shaft b^4, having a ratchet thereon, elevator B, and shaft b^3, all combined substantially as and for the purpose described.

29. The combination, with the raker-bar C^3, carrying rakers and having the fork q', of the pivoted bridle q, rod Q, and lever O, operated as described, all substantially as and for the purpose described.

30. The combination, with the rails D' D^3, of the knife-edges d^5 d^5, for the purpose set forth.

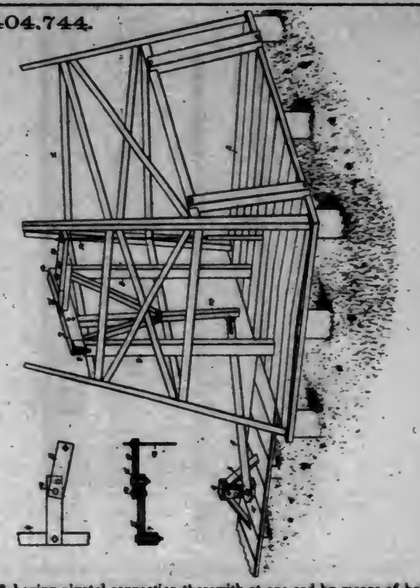
31. The oil-pan F, in combination with the rails D' D^3, rakers E, and hollow raker-bar E', as described.

404,743. CAR-COUPLING. ISAAC STOUT, Mackinaw, Ill. Filed Apr. 4, 1888. Serial No. 305,956. (No model.)

Claim.—1. The combination, with the draw-head of a car, of a pin-support, consisting of a suitable supported transverse bar, a bar pivoted thereto, and provided with means for releasing a catch connecting the bars, substantially as shown.

2. In a pin-support and link-guide for car-couplings, a frame C, adjustably secured to the car-body, the bar D, pivoted thereto and provided with rods F F, frame G, sliding upon said bars F, and carrying a roller on the cross-bar thereof, substantially as shown, and for the purpose set forth.

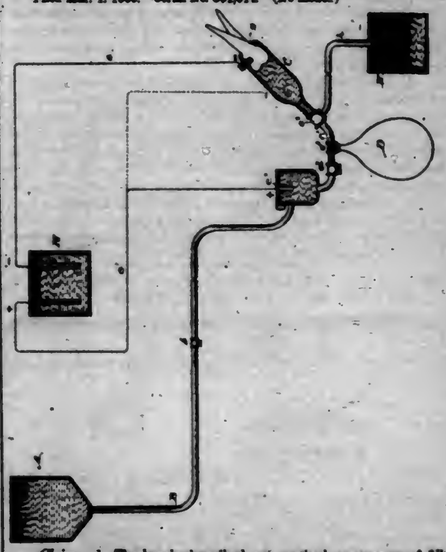
3. The combination, in a pin-support and link-guide for car-couplings, of brackets rigidly secured to the car-body above the draw-head, a rectangular frame supported thereby and carrying a frame D, which is pivotally attached thereto, the said frame D carrying depending bars, to which a sliding frame is connected, the cross-bar of the sliding frame carrying a roller, and an arm for operating a lever engaging with a spring-catch, whereby the pin-supporting bars are separated when the roller-carrying frame is depressed, substantially as shown, and for the purpose set forth.



4. The combination, in a pin-support and link-guide for car-couplings, of a rigid frame attached to the car-body, said frame having a spring-catch and a central recess, a swinging frame pivoted thereto having a corresponding recess, a pivoted lever for releasing the spring-catch, guide-rods for supporting a sliding frame, the said sliding frame being connected to the guide-rods and to the pivoted frame by coiled springs, and carrying a roller and an arm, which is connected by a rod to the pivoted lever, the parts being organized substantially as shown, and for the purpose set forth.

404,744. WELL PUMPING RIG. CORBAN C. STOVER, Bradford, Pa. Filed Oct. 31, 1888. Serial No. 289,632. (No model.)

Claim.—1. The combination of a pump-beam with a laterally-movable beam pivoted to the pump-beam, and to which the polish-rod of a well may be connected, substantially as described.

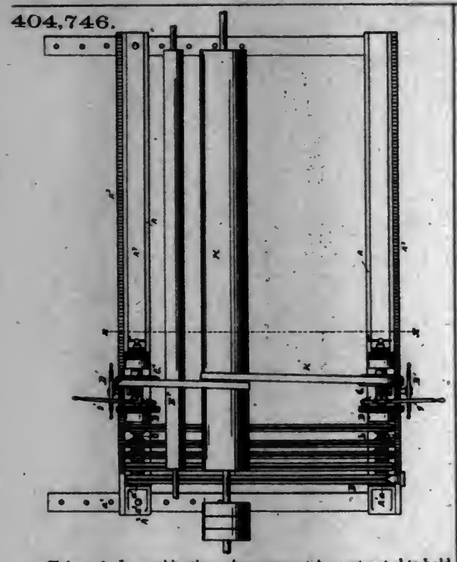


2. The combination of the pump-beam 11, laterally-movable beam

404,744.

13, having pivotal connection therewith at one end by means of bolt 14, and a removable bolt 15, substantially as shown and described.

404,745. METHOD OF FILLING TEETH. ELBERT C. TAYLOR, Humansville, assignor of three-fourths to Willis R. Humphreys and Frank H. Babbs, Stockton, and Alfred W. Mitchell, Humansville, Mo. Filed Mar. 1, 1889. Serial No. 301,614. (No model.)



Claim.—1. The herein-described art, method, or process of filling teeth, which consists in electroplating the cavity.

2. The herein-described art, method, or process of filling teeth, which consists in cleaning the cavity, electroplating the walls thereof, then inserting a plug in the cavity, and subsequently filling up the space between the walls of the cavity and the plug and the remainder of the cavity by electro-deposition.

404,746. MACHINE FOR ASSEMBLING RADIATOR-LOOPS. HARRISON H. TAYLOR, Detroit, Mich., assignor, by direct and mesne assignments, to the Michigan Radiator and Iron Manufacturing Company, same place. Filed Apr. 26, 1888. Serial No. 271,907. (No model.)

404,746.

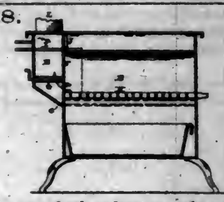
Claim.—1. In combination, a loop-support A, constructed to hold the loops in position, a head-block, a shaft mounted in said head-block carrying a chuck E, projecting beyond the face of the head-block, means for reciprocating the head-block, means to reciprocate the chuck-shaft independently of the head-block, and means to rotate the chuck-shaft, substantially as set forth.

2. In combination, a loop-support A, constructed to hold the loops in position, a sliding head-block D, a shaft mounted therein carrying an expansible chuck E, projecting beyond the face of the head-block, means for rotating said chuck-shaft, and means for reciprocating said chuck-shaft independently of the sliding movement of the head-block, substantially as set forth.

3. In combination, a loop-support consisting of two parallel arms constructed to hold the loops in position, and means for laterally adjusting one of said arms, a head-block having a sliding engagement on one of said arms, means for reciprocating the head-block, a shaft mounted therein carrying a chuck projecting beyond the face of the head-block, means to reciprocate the said chuck independently of the head-block, and means to rotate the chuck, substantially as set forth.

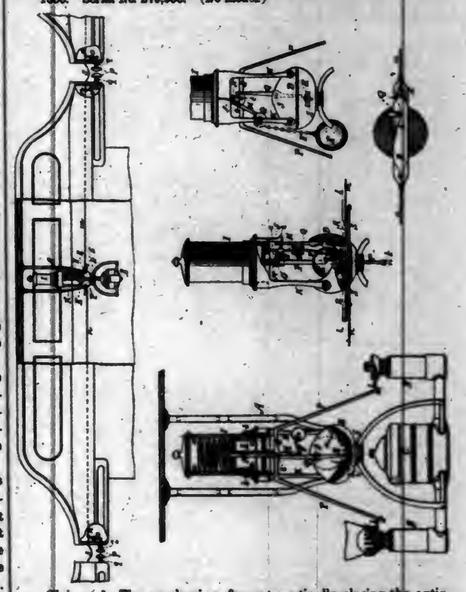
4. In combination, a loop-support A, constructed to hold the loops in position, a head-block D, a shaft mounted therein carrying a chuck E, projecting beyond the face of the head-block, and means to rotate the chuck, substantially as set forth.

404,747. FISH-HOOK GUARD. CHARLES W. TEED, Elmira, N. Y. Filed Oct. 16, 1888. Serial No. 288,199. (No model.)



Claim.—1. A fish-hook shield consisting of a concave attachment-plate adapted to be secured to the rod, and having connected thereto a spring top plate C, forming a shield, substantially as specified.

2. The combination, with a fishing-rod, of a hook-shield consisting of the lower plate secured to the rod, and having the integral posts, and the top plate of spring metal adapted to hold the hook between its lateral edge and the lateral edge of the lower plate, substantially as specified.



404,748. ATTACHMENT FOR STOVES OR RANGES. CHARLES B. TEFFT, Utica, N. Y. Filed Jan. 29, 1889. Serial No. 297,904. (No model.)

Claim.—In a stove or range, the fire-pot provided with the grate H in its bottom, the garbage-receptacle E, applied to one side of the stove at the end of the fire-pot, the partition F, placed between the fire-pot and receptacle, and provided with the opening *a* above the grate for the products of combustion to pass through and the opening *c* below the grate for the refuse to pass through, the damper I, the grate G, and the stove-pipe, substantially as shown.

404,748.

404,749. MECHANISM FOR EXTINGUISHING THE LIGHTS IN RAILWAY-CARS. ISAIAH N. TILLSON, Whitman, Mass. Filed July 14, 1888. Serial No. 279,963. (No model.)

Claim.—1. The mechanism for automatically closing the extinguishers of the lamp-burners of a railway-car, substantially as described, it consisting of the combination of the following elements: the spring-case secured to the lamp-supporting frame, its spring, and the sliding head, to which is connected by a rod the cross-head provided with arms having notches to receive the outer end of the levers of the extinguishers, said cross-head also having a stud *c*, the levers of the extinguishers, the lever Q, fulcrumed to the frame, the arm H, pivoted to the case and having the pin *e* and stud *d*, the spring *f*, for moving the arm H, and the slides R S, provided with inclines for moving the lever Q, the cords or wires *m n*, the former connecting the slides R of each lamp-supporting frame to each other and to a lever *o* at one end of the car, and the latter (the slide S) to each other and to a lever *o* at the other end of the car, the levers *o*, slides *p*, and springs *q*, all as set forth.

2. The mechanism for automatically closing the extinguishers of the lamp-burners of a railway-car, substantially as described, it consisting of the combination of the following elements: the spring-case secured to the lamp-supporting frame, its spring, and the sliding head, to which is connected by a rod the cross-head provided with arms having notches to receive the outer ends of the levers of the extinguishers, the levers of these extinguishers, the arm H, pivoted to the case and connected to the spring *f* for the purpose described, and having the stud *d* to operate with the stud *c* of the cross-head, the chain F, weight E, guide-wheel G, and the bearing for the weight, all as shown and set forth.

3. The mechanism for automatically closing the extinguishers of the lamp-burners of the cars of a railway-train, substantially as described, it consisting of the combination of the following elements: the spring-case secured to each lamp-supporting frame, its spring, and the sliding head to which is connected by a rod the cross-head provided with arms having notches to receive the outer end of the levers of the extinguishers, the levers of these extinguishers, the arm H, pivoted to the case and having the pin *e*, connected to the spring *f*, secured to the case, and also the stud *d* to operate with the stud *c* of the cross-head, the lever Q, pivoted to the frame, the slides R S, provided with inclines for moving said lever Q against the pin *e* of the arm H, cords or wires *m n*, connecting the slides, the lever *o*, and lines S, connecting the wire of one car with that of the other, all as shown and set forth.

404,750. APPARATUS FOR THE MANUFACTURE OF GAS. JOSÉ F. TORAYA, Havana, Cuba, assignor to the Toraya Patent Gas Company, Philadelphia, Pa. Filed Jan. 17, 1889. Serial No. 296,596. (No model.)

Claim.—1. An oil-vaporizing cartridge adapted to be removably located in a retort, said cartridge having its front end closed, a vertical longitudinal partition extending a portion of the length of the cartridge, forming two chambers in the same, communicating at their front ends only, a wall closing the portion of the rear end of the cartridge on one side of the partition, the remaining portion being open for the exit of vapor, and an oil-supply pipe extending through the front end of the cartridge and longitudinally through said cartridge almost to said rear end wall, substantially as described.

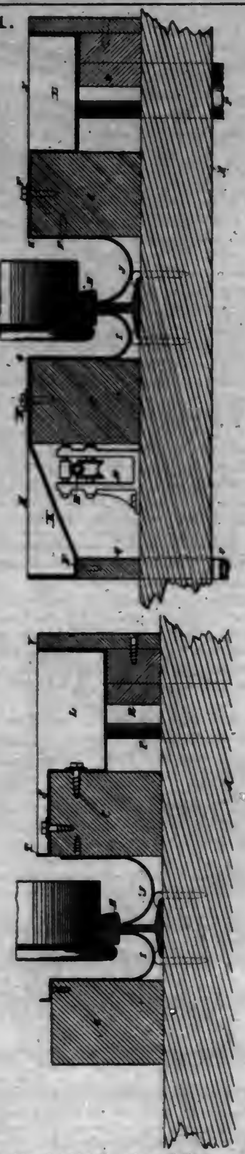
2. The combination, with a retort, of an oil-vaporizing cartridge removably located within the same and leaving heating spaces and passages between the ends and sides of the retort and cartridge, said cartridge having a partition extending from the rear end a portion of the distance to the front end thereof, the rear end of one of the chambers formed by the partition being closed and the other chamber having a vapor-escape into the retort, and an oil-supply pipe extending into the closed chamber on one side of the partition, substantially as described.

3. The combination, with a closed horizontal retort, of an oil-vaporizing cartridge removably located within the same and leaving heating spaces and passages within the retort for the vapor from the cartridge, said cartridge having an interior vertical partition extending a portion of the length thereof, an oil-supply pipe extending into a portion of the length of the cartridge, and a vapor-exit from the cartridge into the retort, substantially as described.

4. An oil-vaporizing cartridge adapted to be located in a retort, and formed of sheet metal with its front end closed, an interior partition extending from the rear end nearly to the front end of the cartridge, the rear end of the cartridge on one side of the partition being closed, an oil-supply pipe extending into the cartridge and provided with a union at the front end of the cartridge, whereby steam can be introduced into the pipe, and a man-hole in the front end of the cartridge, for the purpose set forth.

5. A normally-closed retort, in combination with an oil-vaporizing cartridge located therein, having a concaved bottom and of such size as to leave spaces between its sides and the walls of the retort for the passage and heating of the gas from the cartridge, the cartridge having a portion of its rear end open, a fluid-supply pipe extending into the cartridge, and a longitudinal partition in the cartridge extending from one end almost to the other end of the same and located between the discharge end of the fluid-pipe and the vapor-exit from the cartridge, substantially as described.

6. A cartridge for vaporizing oil adapted to be removably placed in a retort and formed of sheet metal with its head normally closed, a partition extending from the rear end of the cartridge a portion of the longitudinal length of the same, the rear end of the cartridge on one side of the partition being closed and the remaining portion open, and an oil-supply pipe extending through the front end of the cartridge and rearwardly within the same almost to the closed end of the cartridge, substantially as described.

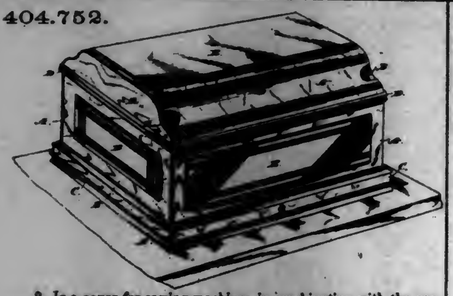


404,751. DRIP-PAN FOR ELEVATED RAILROADS. EDWARD A. TRAPP, Brooklyn, N. Y. Filed Mar. 11, 1889. Serial No. 302,850. (No model.)

Claim.—1. For elevated railroads, the guard-rails C upon opposite sides of the steel rails B, combined with drip-pans secured to said guard-rails, and forming gutters I J on each side of the steel rail, said drip-pans being formed of sheet metal, and at their contact with the guard-rails serving to cover the latter, substantially as and for the purpose set forth.

2. In the construction of elevated railroads, the guard-rails C at each side of the steel rail B, combined with sheet-metal drip-pans secured to said guard-rails, and forming receptacles to catch the drippings at each side of said rails, substantially as and for the purposes set forth.

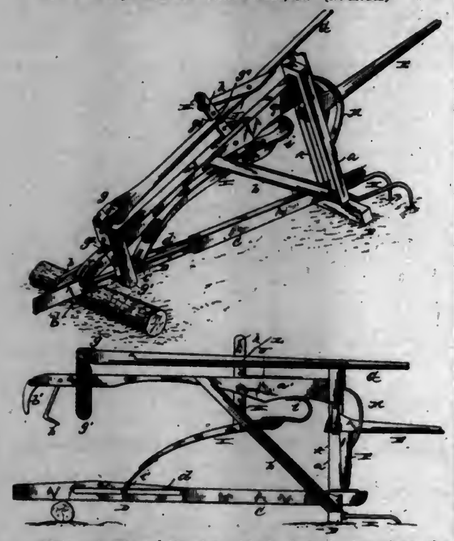
3. In the construction of elevated railroads, the guard-rails C at each side of the steel rails B, combined with sheet-metal drip-pans secured to said guard-rails and forming longitudinal receptacles for drippings from the engine, brakes, and heating appliances, substantially as and for the purposes set forth.



404,751.

404,752. COVER FOR SEWING-MACHINES. NATHANIEL R. VAN HORN, Toledo, Ohio, assignor to the Union Manufacturing Company, same place. Filed Aug. 17, 1887. Serial No. 247,163. (No model.)

Claim.—1. In a sewing-machine cover, in combination with the continuous piece of bent wood forming the top and the rear and front sides of the cover, the end pieces fastened to said bent piece, and reenforcing and strengthening panels superimposed upon the top, front sides, and ends of the cover, so as to aid in preserving the shape thereof, substantially as and for the purpose specified.

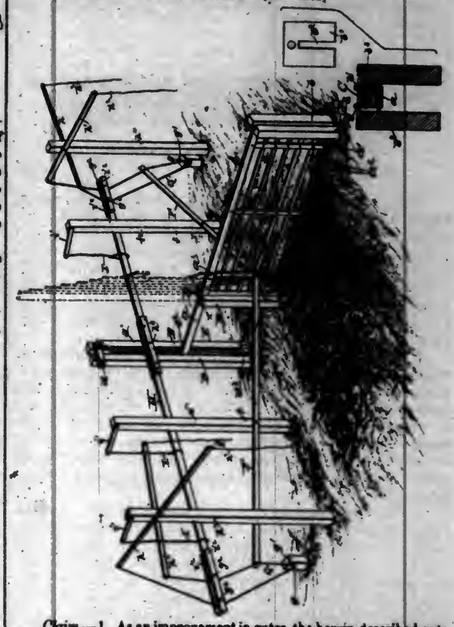


404,752.

2. In a cover for sewing-machines, in combination with the continuous piece of wood bent to form the top, front, and rear sides of the cover, with straight or plane surfaces, the end piece fastened to said bent piece, panels superimposed upon the end pieces and the straight or plane surfaces of the front and top of the cover, so as to strengthen and preserve the shape thereof, and a molding fastened to and extending around the lower portions of the cover, so as to define and preserve its shape, substantially as described.

3. The combination of the bent-wood piece which constitutes the front, top, and rear sides, the separately-formed end pieces, the re-enforcing and strengthening panels, the molding which extends horizontally around the lower part of said cover, and the horizontal molding that is secured to and extends around the upper part of the same, substantially as and for the purpose shown and described.

404,753. HAND-POWER SAW. JAMES M. VAUGHN, Water Valley, Ky. Filed Sept. 24, 1888. Serial No. 286,218. (No model.)



Claim.—1. The combination, with the frame having a lever pivoted thereto for operating the saw, of the arm I, the spring at its upper end connecting it with the arm a', and its lower end being provided with a movable pivot, and the saw provided with the slot d in the top of its blade, in which the movable pivot at the lower end of said arm I operates to permit the saw to be both reciprocated and raised when necessary, substantially as specified.

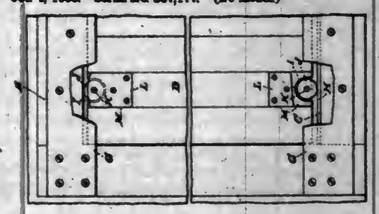
2. The combination, with the supporting-frame having the arm a', and the slotted saw-blade connected to the movable arm C, of the bar H, passing through a slot in the arm a', the arm I, connected to the lower end of the bar H, and connected to the arm a' by the curved spring i and to the slotted saw-blade by the movable pivot i', and the lever G, for imparting pressure to the saw, substantially as specified.

3. In a sawing-machine, the combination, with the arm a' and the lever G, having hook J secured thereto and adapted to engage the openings h in the bar H, of the bar I, connected with the arm a' and with the slotted saw-blade, and connected also with the perforated bar H above the arm a', substantially as specified.

4. In a sawing-machine, the combination, with the supporting-frame provided with the arm a', and the movable arm C, provided with the slotted saw-blade, of the connecting-arm having the spring i at its upper end and the pivot i' at its lower end, the guide M, and the lever E, provided at its inner end with the downwardly-extending arm F, having at its lower end a hinge, one leaf being attached to the arm F and the other leaf to the arm C, whereby, when the lever E is moved up and down, a reciprocating motion is imparted to the saw-blade, substantially as specified.

404,754. GATE. JOSEPH WALKER, near Manchester, Va. Filed Sept. 21, 1888. Serial No. 286,045. (No model.)

Claim.—1. As an improvement in gates, the herein-described gate having the upper pivoted right-angular beam, the posts between which said beam operates, and the gravity-latch pivotally secured to one of said posts and having grooves or recesses engaging said beam, substantially as set forth.



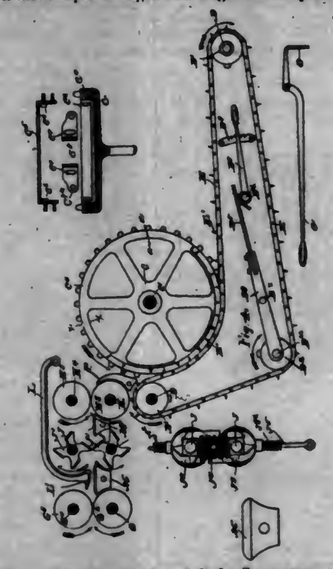
2. The gate having the upper pivoted beam, the posts D D, between which said beam operates, the pivoted gravity-latch secured to one of said posts, and the latch-operating bar pivotally secured to said latch and loosely supported in position, substantially as described.

3. The gate having the pivoted beam, the posts D D, between which said beam operates, the latch pivotally secured to one of said posts, the operating-bar pivotally secured thereto, and the ropes or chains for operating said bar, substantially as described.

4. The gate having the pivoted beam, the posts D D, between which said beam operates, the levers F F, secured to said gate at their inner ends, the gravity-latch pivoted to one of said posts, the operating-bar pivoted to said latch, the levers h h', and the ropes or chains connected to said latter levers and the levers F F, substantially as described.

5. The combination, with the gate having the pivoted beam and the posts D D, between which said beam operates, of the latch pivoted to one of said posts, the operating-bar pivoted to said latch, the guide-loops for supporting said bar, and the means for operating the latter at its outer ends, substantially as set forth.

404,755. CAR-DOOR. CHARLES L. WARD, Cavendish, Vt. Filed Oct. 4, 1888. Serial No. 287,177. (No model.)



404,755

Claim.—In a car-door, the combination, with the door, of bearing-plates seated in recesses in the door, rollers arranged in transverse recesses in the top and bottom edges of the door, journaled in the bearing-plates, and projecting beyond the edges of the door, the guideways applied to the car-body, having outer flanges projecting toward each other and lapping the outer roller bearing-plates, and a plate secured to the upper bearing-surface of the lower guideway, substantially as set forth.

404,756. MACHINE FOR SCRAPING THE PULP, &c., FROM FIBROUS PLANTS. RANDOLPH G. WARD, Baltimore, Md. Filed Feb. 15, 1888. Serial No. 264,061. (No model.)

Brief.—After being aligned by a gate at the lower end of the feed-trough, the leaves pass between crushing-rollers driven by eccentric gears upon their shafts, thence between separated rotary scrapers to holding-rolls, and thence between a scraping-cylinder and a scraping-chain. As soon as the forward ends of the leaves are seized by the holding-rolls the scraping-cylinders are brought together by rack-and-pinion gearing and a lever and scrape the leaves in a backward direction. The forward ends are scraped by the cylinder and chain. The material is thus scraped throughout its length at one operation.

Claim.—1. The combination of feed-rolls, scrapers, means for rotating said scrapers in a direction opposite to that in which material is fed to the same, feeding and holding rolls arranged beyond the scrapers in the line of feed, and rotating in a direction opposite to that of the scrapers, and scraping mechanism arranged beyond the feeding and holding rolls, substantially as specified.

2. Feeding-rolls, in combination with eccentrically-mounted gears connected with the rolls for operating the same.

3. Feeding-rolls, in combination with eccentrically-mounted gears connected with the rolls, and means for operating said gears, substantially as specified.

4. Rotary scrapers or cutters, means for rotating the said scrapers to scrape the material in a direction opposite to its travel in the machine and feeding and holding rolls, in combination with mechanism, substantially as described, for separating said scrapers at will, substantially as specified.

5. Feed-rolls having relatively variable surface speeds, in combination with rotary scrapers, and gearing, substantially as described, attached to said feed-rolls and scrapers for rotating the same in opposite directions.

6. Feed-rolls, eccentric gears operatively connected therewith, and mechanism, substantially as described, for driving said gears, in combination with rotary scrapers and gearing for driving said scrapers in a direction opposite to that of the travel of the material upon which they operate, and feeding and holding rolls, substantially as specified.

7. The combination of feeding-rolls, eccentric gearing attached to the same, as described, rotary scrapers, gearing to rotate the same in a direction opposite to that of the passage of the material, rolls arranged in advance of the scrapers in the direction of the movement of the material, scraping mechanism arranged in advance of said feeding and holding rolls, and mechanism for actuating the holding-rolls and the gearing of the feed-rolls, substantially as described.

8. Rotary scrapers or cutters, in combination with gearing for rotating the same continuously in a direction opposite to that of the material passing therebetween, feeding and crushing rolls arranged in advance of the cutters, holding-rolls arranged beyond said cutters, and a pivoted guard arranged over the cutters or scrapers and resting upon the material in advance of the cutters, substantially as described.

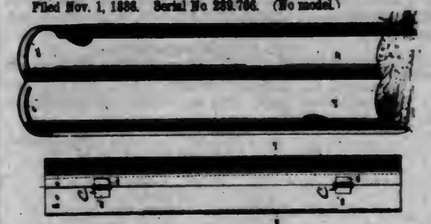
9. The scraping rolls or cutters J', working continuously in the direction specified, and provided with movable rack-bearings J^3, in combination with the pinion J^{3x}, springs J^5, rods J^6, lever J^4, and means for actuating said scraping rolls or cutters, substantially as specified.

10. The combination of the scraping-cylinder C, the scraping-chain E, the tightener D^2 D^3, the eccentric shaft D^4, the lever D^5, and the lever-holding device, substantially as described.

11. The combination, with the cylinder C, of the scraper C^3, slotted, as at C^4, and pivoted, as at C^{3x}, and with scraper-adjusting bolts C^4, substantially as specified.

12. The combination, with feeding and scraping rolls, means for operating the same, and the scraping-cylinder and scraping-chain, of intermediate gearing, and means, substantially as described, for adjusting the same, whereby the desired speed of motion is communicated from the cylinder to the gearing which operates said scraping-rolls and said feeding-rolls, substantially as specified.

13. Feeding-rolls and a system of gearing for driving the same, comprising a shaft and driving-pulley, and means for adjusting said pulley, in combination with a positively-driven shaft bearing a disk C^3, arranged adjacent to said adjustable pulley, whereby varied speeds with relation to that of the positively-operating shaft may be given to the feed-rolls, substantially as specified.



14. The combination of the disk C^3, the pulley F^4, nuts F^5, and the threaded and slotted shaft F, substantially as specified.

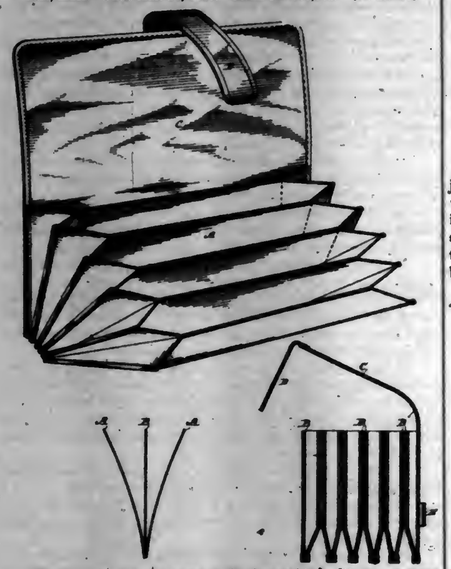
15. The guard L L', tables M M', the cutters J', feed-rolls H^2 H^3, rolls G^2 G^3, and the guard-piece, substantially as and for the purpose specified.

16. Separable scraping or cutting rolls, as J', the vertical shaft K, having wide-faced spiral gears K^2, intermeshing gears mounted on the cutter-shafts, and means, substantially as described, for effecting the separation of the scraping-rolls.

17. The combination of the spiral gears K^2, the shaft K, the gears J^3, and cutter-shafts J, substantially as specified.

404,757. TREE-PROTECTOR. HIRAM L. WEBBER, Stafford, Kans. Filed Nov. 1, 1888. Serial No. 289,706. (No model.)

Claim.—1. In a tree or plant protector, the combination of two metallic sections curved or bent from different centers, so that when the sections are placed edge to edge they will overlap and form tight joints, and hinges for connecting said sections, one series of the leaves thereof being located at the edge of one of the sections and the opposite leaves of the hinges being placed at a distance from the adjacent edge of the opposite section, substantially as shown, and for the purpose set forth.

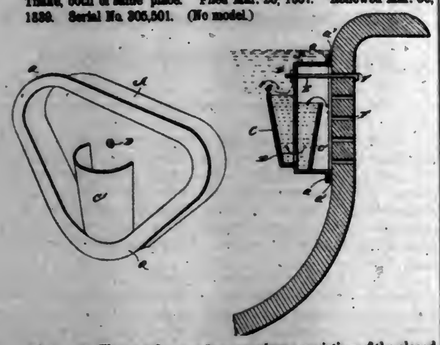


2. As an improved article of manufacture, a tree or plant protector made up of two longitudinal sheet-metal sections bent to form curved sections, one of said sections being of a greater curve than the other section, the sections being hinged to each other, the leaves of said hinges being secured to the outer edge of the larger curved section, the opposite leaves being secured at a distance from the edge of the smaller section, substantially as shown, whereby the sections may be opened to a greater distance than the diameter of the sections, and

when closed will form tight joints between the edges and will be retained in a closed position by the pressure of the free edges of the sections upon each other.

3. In a tree or plant protector, the combination of the sheet-metal sections A B, having struck-up metal prongs formed integral therewith for holding in place flexible tubes or packing, substantially as set forth.

4. In combination with a tree or plant protector having the body portion made up of sheet metal, flexible rubber tubes attached near the inner upper edges thereof and held removably in place by metal prongs formed integral with the body portion, substantially as shown, and for the purpose set forth.



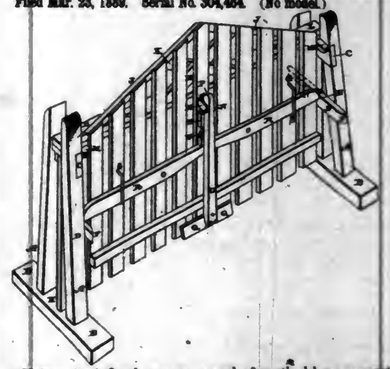
404,758. POCKET OR NOTE BOOK. EMIL WEHRROD, Greenfield, Mass. Filed Mar. 20, 1889. Serial No. 303,972. (No model.)

Claim.—1. A pocket or note book provided with one or more apartments made up of outside and dividing walls, said walls being composed of one or more thicknesses of combustible material and a sheet of asbestus or other non-combustible material, as and for the purpose specified.

2. The combination, with a pocket or note book provided with one or more apartments made up of outside and inside double walls, of the asbestus sheets inclosed within said walls, as and for the purpose set forth.

404,759. WATER-SEAL OVERFLOW-TRAP. EPHRAIM J. WHITLOCK, Brooklyn, N. Y., assignor of two-thirds to Ilas R. Byrnes and John Thake, both of same place. Filed Mar. 28, 1887. Renewed Mar. 30, 1889. Serial No. 305,501. (No model.)

Claim.—1. The trap for overflow-openings, consisting of the closed box A, secured directly to the side of the basin over the said openings, and the wells or receptacles C and C', arranged on reverse sides of the face-plate of the box A and connected by an opening B in said face-plate, the well C' being situated within and covered by the said box and the well C opening into the basin direct, substantially as described.



2. In a trap for overflow-openings, the combination of the closed box A, having the flanges *a*, the bolt E, secured in one of the overflow-openings at one end and to the box A at its other end, the receptacle or well C, arranged on the outer face of the box A and opening directly into the basin, the receptacle or well C', entirely inclosed by the box A and connected to the receptacle C by means of an opening B, formed in the lower portion of the face-plate of the box A, and the rubber gasket *a'*, substantially as described.

404,760. COUPLER FOR AIR-BRAKE MECHANISM ON RAILWAY-CARS. ANDREW J. WEBER, Philadelphia, Pa., assignor of one-half to Marcus P. Richardson, same place. Filed Jan. 12, 1886. Serial No. 188,343. (No model.)

Claim.—In an air-brake mechanism, the coupler having a single joint, substantially as described, with a longitudinally central dividing-wall L' L', with packing L^{IV} L^{VI} to maintain the integrity of the division, whereby two separate air-currents can be maintained through a single coupler and the branches O'' O'' from each air-division, whereby these currents may be carried through the intermediary of flexible hose to separate air-pipes beneath the cars, substantially as described.

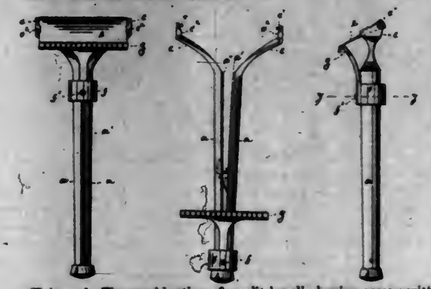
404,761. FLOOD-GATE. HENRY A. WRIGHT, Spring Garden, Mo. Filed Mar. 23, 1889. Serial No. 304,464. (No model.)

Claim.—1. A flood-gate composed of vertical bars connected at their lower ends by a cross-bar, and their upper ends secured to the edge of a flat supporting and pivotal timber, in combination with suitable supporting-posts, whereby the supporting-timber when the gate is open will be approximately upon its edge, for the purpose described.

2. The combination, with a flood-gate, of the flat supporting and pivotal beam I, the posts A, bars C, flat upon their upper surfaces, and the transverse guiding-bars M, secured to the under side of the beam I near its ends, for guiding the gate and preventing endwise movement thereof when the gate is open, substantially as shown.

3. In a flood-gate, the combination of the gate, the latches pivoted thereto, the supporting-posts upon which the gate is pivoted, the operating-lever provided with a block at its lower end and a projection or cam at its upper end, the bracket secured to the gate near its upper end, between which the upper end of the lever is pivoted, and a vertically-sliding rod having its upper end beveled away to coact with the upper end of the lever, and a guiding-loop passed around it and secured to the gate, the lower end of the vertical sliding rod engaging the inner ends of the latches, whereby, when the lower end of the lever is acted upon by the water, the outer ends of the latches are raised, substantially as specified.

404,762. VAGINAL SYRINGE. OTTO G. ESSER and SILAS T. YOUST, Lafayette, Ind. Filed Sept. 24, 1888. Serial No. 286,254. (No model.)

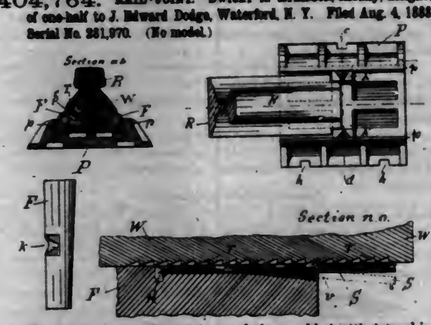


Claim.—The herein-described vaginal irrigator, consisting of a syringe, an injecting-tube A, enlarged and perforated in its front end, and having an enlarged screw-threaded flange *b* at its rear to connect with the syringe-tube, with the drainage-bulb B on said tube tightly

404,762.

fitting the same at its rear end, but having a large orifice in its front end, the hard grooved annulus *b*, fitting in and distending the front orifice of the bulb, and the drainage-tube C, connected to bulb B, all substantially as and for the purpose specified.

404,763. RAZOR. FRIEDRICH ASCHBURG, New York, N. Y., assignor to the Electric Cutlery Company, same place. Filed Feb. 12, 1888. Serial No. 263,577. (Model.)



Claim.—1. The combination of a split handle having arms *e* with a surrounding ring *f* and guard *g* secured thereto, and with a blade adapted to be engaged by arms *e*, substantially as specified.

2. The combination of a split handle having arms *e* and pins *e'* with spring *d*, ring *f*, guard *g*, and blade *c*, having holes *c'*, substantially as specified.

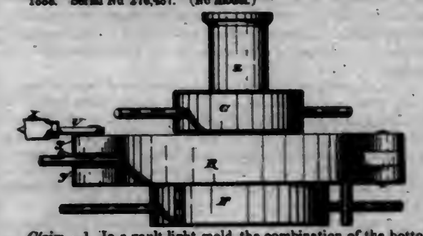
3. The combination of split handle having groove *d'* and arms *e* with spring *d*, blade *c*, ring *f*, and guard *g*, the ring *f* having pin *f'*, substantially as specified.

404,764. RAIL-JOINT. DWIGHT R. ATKINSON, Albany, assignor of one-half to J. Edward Dodge, Waterford, N. Y. Filed Aug. 4, 1888. Serial No. 281,970. (No model.)

Claim.—1. In a railway-joint, a chair provided with lateral inwardly-projecting flanges and bosses placed on each side of the upper surface of the chair, provided with a lower portion square in form and an upper portion V-shaped, substantially as described, and for the purpose set forth.

2. In a railway-joint, the combination of a triangular wedge-shaped bar provided with a groove and notch, into which is placed a key-bar provided with a latch-catch, with a wedge provided with a series of notches, with which the latch-catch engages, all substantially as described, and for the purpose set forth.

3. In a railway-joint, the combination, with a chair provided with lateral inwardly-projecting flanges, of triangular wedge-shaped bars placed in contact with the foot of the rails on both sides, and also in contact with the chair-flanges, and wedges in contact with the under sides of the rail-heads, and also in contact with said bars, substantially as described.



4. In a railway-joint, the combination, with a chair provided with lateral inwardly-projecting flanges, of triangular wedge-shaped bars placed in contact with the foot of the rails on both sides, and also in contact with the chair-flanges, and wedges located in contact with the rail-webs and under sides of the rail-heads, and also in contact with said bars, substantially as described.

5. In a railway-joint, the combination of a chair provided with an inwardly-projecting flange and a boss projecting inward from said flange, said boss having a lowered squared portion to fit recesses in the adjacent ends of the rails and provided with an upper inwardly-projecting V-shaped portion, a triangular wedge-shaped bar having a notch to fit the V-shaped portion of said boss, said bar being placed upon the foot of each rail and in contact with the chair-flange, and a wedge driven in contact with the under side of the head of each rail, and also in contact with said bar, substantially as described.

6. In a railway-joint, the combination of a chair provided with lateral inwardly-projecting flanges and bosses projecting inwardly from said flanges, said bosses each having a lower squared portion and an upper inwardly-projecting V-shaped portion, the rails having recessed ends to fit the squared portions of said bosses, triangular wedge-shaped bars notched to fit said bosses and placed upon the foot of each rail on both sides and in contact with the chair-flanges, and wedges driven in contact with said rails and bars on both sides, substantially as described.

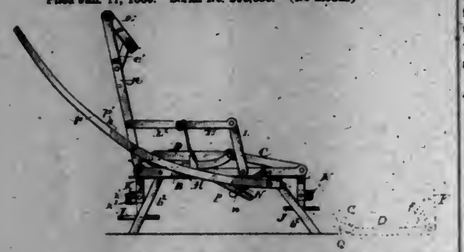
7. In a railway-joint, the combination of a chair provided on both sides with inwardly-projecting flanges, triangular wedge-shaped bars resting on the rail-feet in contact with the chair-flanges and provided on their inner sides with key-latches, and wedges driven in contact with said rails and bars on both sides of the rails, and provided with notches to engage the key-latches, substantially as described.

404,765. MOLD FOR VAULT-LIGHTS. DAVID BARKER, Canton, Ohio, assignor to the Canton Glass Company, same place. Filed June 8, 1888. Serial No. 276,487. (No model.)

Claim.—1. In a vault-light mold, the combination of the bottom part A, having a series of perforations B, an annular peripheral rib D, recess H, and a bottom plate I, having a series of plungers J secured thereto and adapted to enter the perforations B, said plungers cut away at the upper portion to a line of angularity of about forty-five degrees from a line drawn vertically through the center of the plungers, substantially as described, and for the purpose set forth.

2. In a vault-light mold, a top portion G, having a series of depressions K, a central fount, as O, and communicating sprues P, and an annular rib Q, substantially as described, and for the purpose set forth.

3. The combination of the bottom portion A, having a series of perforations B, recess H, plate I, plungers J, annular ring D, a top portion G, having depressions K, sprues P, fount O, annular peripheral rib Q, plungers Z, and locking-clasp R, substantially as described, and for the purpose set forth.



404,766. MOLD FOR MAKING GLASS PADS FOR HORSE-COLLARS. DAVID BARKER, Canton, Ohio. Filed Nov. 16, 1888. Serial No. 291,000. (No model.)

Claim.—1. The combination, with a mold for forming glass pads for horse-collars, as herein described, of the pins *n*, to form the apertures *m* in the pad, said pins having studs *p* secured therein, and drum C, pivotally secured to the body portion of said mold, having slots *l* to engage the studs *p*, whereby the pins *n* may be moved into and out of said mold, substantially as described, and for the purpose set forth.

2. The combination, with a mold for making glass pads for horse-collars, of pins having a sliding movement through the walls of said mold and through the said glass pad, and a rotatable drum having oblique guides which are engaged with said pins for the purpose of actuating the same, substantially as set forth.

404,767. CONVERTIBLE CHAIR. ABRAM BOTKIN, Wilmington, Del., assignor of one-tenth to Carpel Udelewitz, Washington, D. C. Filed Jan. 11, 1889. Serial No. 296,053. (No model.)

Claim.—1. In an article of furniture, the combination, with a main body composed of a series of four sections joined together by hinge-connections, of supports for one of the intermediate sections, and folding wheeled supports attached to said section and adapted be drawn out and made to engage and support the end sections, substantially as described.

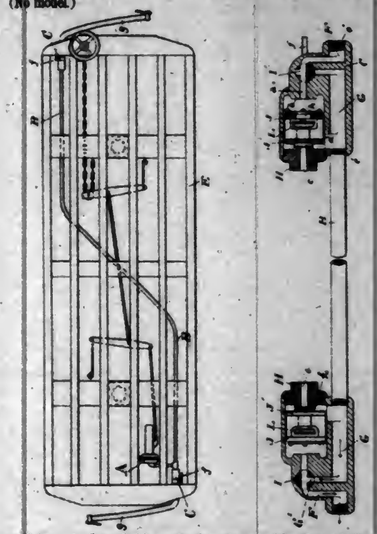
2. In an article of furniture, the combination, with a section corresponding to a chair-seat, a section corresponding to the back of a chair, and supports for said seat-section, of a section or sections pivoted to said seat-section and adapted to fold upon the same, arms attached to said seat and back sections, and braces for supporting said supplemental section or sections in a vertical position engaging said arms and forming a continuation of the same, substantially as described.

3. In an article of furniture, the combination, with a section answering to the seat of a chair, a section answering to the back of a chair, and a supplemental section or sections pivoted to said seat-section and adapted to fold upon the same, of folding supports for said seat-section, folding wheeled supports adapted to be unfolded and made to support said section, and a brace for maintaining said supplemental section or sections in an upright position when desired, substantially as described.

4. In an article of furniture, the combination, with a section corresponding to the seat of a chair, a section corresponding to the back of a chair, supports for said seat-section, and rockers connected to said seat-section and adapted to engage said supports, of a supplemental section or sections pivoted to said seat-section and adapted to fold upon the same, arms for said seat-section, and braces pivoted to said supplemental section or sections engaging said arms and forming continuations of the same for supporting said supplemental section or sections in a vertical position, substantially as described.

5. In an article of furniture, the combination, with a section answering to the seat of a chair, a section corresponding to the back of a chair, and a supplemental section or sections adapted to fold upon said seat-section and pivoted to the same, of supports for said seat-section, slides connected to said seat-section, and a folding support connected to said slides and adapted to be drawn out and made to support said supplemental section or sections, substantially as described.

6. An article of furniture consisting of a section answering to the seat of a chair, a section answering to the back of a chair, supports for said seat-section, and rockers each connected to said seat-section at two points by a slotted-link construction and adapted to receive the supports for the seat-section, substantially as described.



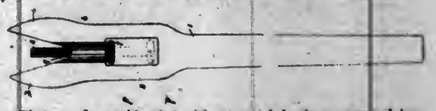
7. An article of furniture having a section corresponding to the seat of a chair and a section corresponding to the back of a chair, folding supports for said seat-section, and hinged standards connected to said seat-section and adapted to fold transversely thereof and provided with wheels, whereby said standards may be folded and the chair supported by the folding supports, or said standards and wheels may be unfolded and made to support the seat-section, substantially as described.

8. An article of furniture comprising four sections joined by hinge-connections, supports for one of the intermediate sections, slides connected to said supported section-wheels, and folding wheel-supports mounted on said slides, whereby said wheels can be extended, unfolded, and made to engage and support the outer sections, substantially as described.

9. In an article of furniture, the combination, with a section corresponding to the seat of a chair and a section corresponding to the back of a chair and pivoted to said seat-section, of a folding arm for said seat-section comprising a horizonal portion pivoted to the back-section and a vertical portion pivoted to the seat-section and to the horizontal portion, said horizontal portion consisting of two parts pivotally connected, and a brace pivoted to said seat-section and engaging the horizontal portion of said arm, substantially as described.

10. In an article of furniture, the combination, with the main body, which consists of four sections joined by hinge-connections and adapted to fold, as described, of the upholstering for said main body formed in sections and adapted to fold in a manner similar to that of the body-sections, one of the intermediate sections being provided with a supplemental portion on one or both sides of the same, substantially as described.

404,768. RELEASE-VALVE FOR AIR-BRAKES. GEORGE A. BOYDEN, Baltimore, Md., assignor to The Boyden Power Brake Company of Baltimore City, of Maryland. Filed Aug. 15, 1887. Serial No. 246,950 (No model.)



Claim.—1. In a fluid car-brake, the combination of the release-valve having passages F G for connection with the train-pipe, and a cock I', controlling said passages, whereby to make the valve operative or inoperative.

2. In a fluid car-brake, the combination of the train-pipe B on the car, an expansible chamber, two air-release valves, one on each side of the expansible chamber, and the cocks I', arranged to make either valve operative or inoperative.

3. In a fluid car-brake, the combination of the train-pipe having its terminals at opposite ends of the car, two air-release valves on the train-pipe between the said terminals, and the cocks, for the purpose set forth.

404,769. WRENCH. EDWARD S. BOYSTON, New York, N. Y., assignor to the Campbell Printing Press and Manufacturing Company, same place. Filed Nov. 26, 1888. Serial No. 291,872. (No model.)

Claim.—In combination with a wrench having a serrated jaw and an opposite plain jaw, forming a wedge-shaped opening between them, as 1, 3, and 4, an adjustable stop in the angle between the jaws, whereby said stop may be adjusted to any given diameter of object to be operated on, so as to permit of said object sliding on said smooth jaw until securely grasped by the teeth of the serrated jaw, and at that point to arrest the same from any further entrance into the angle of said jaws, thereby avoiding danger of the same being crushed, as set forth.

404,770. PIPE-WRENCH. EDWARD S. BOYSTON, New York, N. Y., assignor to the Campbell Printing Press and Manufacturing Company, same place. Filed Nov. 26, 1888. Serial No. 291,873. (No model.)

Claim.—In an adjustable wrench operating to rotate pipes or rods by means of a wedge-shaped opening on what is known as the "alligator" principle, the combination of a toothed or serrated jaw on one side of the angular opening, and a smooth jaw on the other side containing one or more steps or stops, as 2 3, whereby the opening between the jaws may be so adjusted that a firm hold is taken by the toothed jaw and flattening or crushing of the pipe or rod avoided, substantially as set forth.

404,771. BICYCLE. JOSEPH F. BIDEUX, Vineland, assignor of one-half to William H. Grosscup, Camden, N. J. Filed Feb. 18, 1888. Serial No. 300,334. (No model.)

Claim.—A bicycle having its backbone carved over and in the plane with the rim of the front wheel and having its lower end bent at substantially a right angle thereto, the rear wheel of substantially the same size as the front wheel and mounted on said bent end, and a saddle directly over the rim of the front wheel, said parts being combined substantially as and for the purpose set forth.

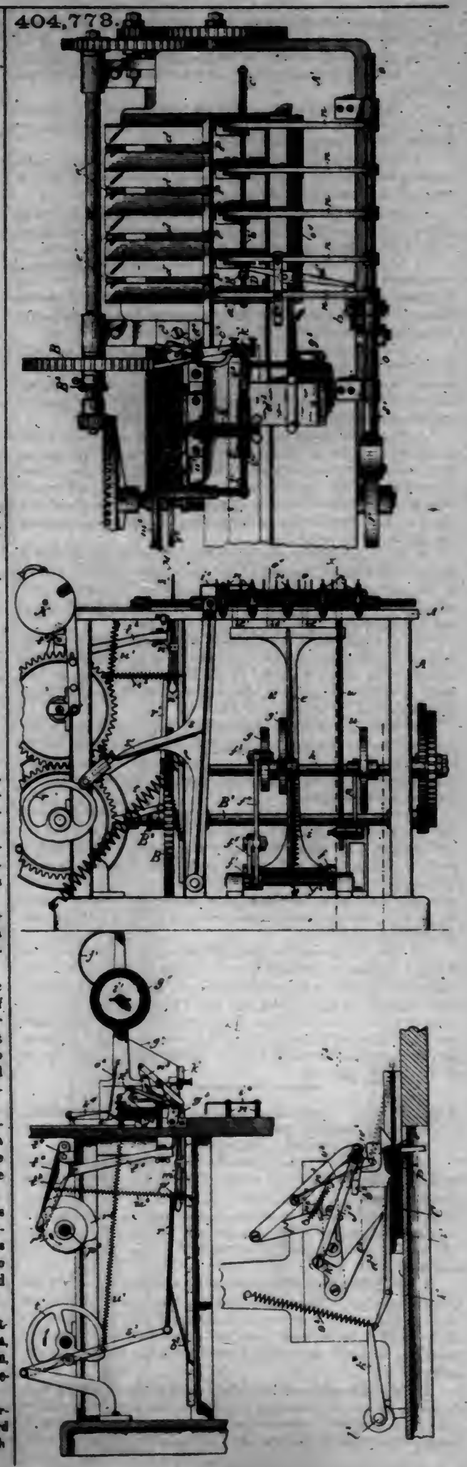
404,772. FILING-RECEPTACLE. AARON L. BROWN, Chicago, Ill. Filed Nov. 19, 1888. Serial No. 291,388. (No model.)

Claim.—1. The combination, with a filing-receptacle and a series of index-sheets, of a branched retaining post or rod having a part for detachable engagement with the index-sheets and laterally-projecting parts for engagement with the receptacle, substantially as described.

2. The combination, with a receptacle having a sectionally-T-shaped groove in its back wall, of a retaining-rod having laterally-extending parts engaging the wings of the T-groove, substantially as described.

3. The combination, with a receptacle having a sectionally-T-shaped groove in its back wall, of a retaining post or rod having a part engaged with the index-sheets and laterally-extending parts engaging the wings of the T-groove, substantially as described.

4. The combination, with the receptacle having a vertical groove or recess in its back wall and a recess *a* in its bottom and a series of apertured index-sheets, of a branched retaining-rod C, fitted at its rear side to rest against the walls of the groove, and provided with a part *e*, engaged with the aperture of the index-sheets, and constructed to engage the recess *a* at its lower and free end, and means constructed to retain the rod within the groove, substantially as and for the purpose set forth.



5. The combination, with a receptacle having a sectionally-T-shaped groove A^4, and provided with a recess *a* in its bottom, and a series of index-sheets, of a retaining-rod C, constructed to engage the wings of the T-groove and the said recess, and means for holding the rod in the groove, substantially as described.

6. The combination, with a receptacle having a T-groove in its back wall, and a series of index-sheets, of a rod C, having a part *e*, engaged with the index-sheets, and two laterally-separated parallel parts *e'*, connected with the part *e* at their upper ends and constructed to engage the recesses or wings of the T-groove, and means constructed to retain the said rod within the groove, substantially as described.

404,773. MACHINE FOR PACKAGING POSTAL-CARDS. WILLIAM H. BUNCE, Jersey City, N. J., and DWIGHT SLATE and JAMES RODDA, Hartford, Conn., assignors to Calvin C. Woolworth and Jno. S. Graham, New York, N. Y. Filed Mar. 13, 1886. Renewed Sept. 21, 1888. Serial No. 286,014. (No model.)

Claim.—1. In combination, the pockets *d* and the pocket-clearing device E, having the forward, downward, backward, and upward motions, all substantially as described, and for the purpose set forth

404,778.

2. The lateral feeding device composed of pivoted arms *n*, having the leftward, upward, rightward, and downward motions, as described, in combination with the independent pusher *a'*, actuated by lever *d'* and stop *b*, all substantially as described, and for the purpose set forth.

3. The pivotally-hung and vertically-reciprocating folding-finger p^3, in combination with its actuating-spring e^9, substantially as described, and for the purpose set forth.

4. In combination with the pivotally-hung and vertically-reciprocating folding-finger p^3, the reciprocating presser-lever w^5, all substantially as described, and for the purpose set forth.

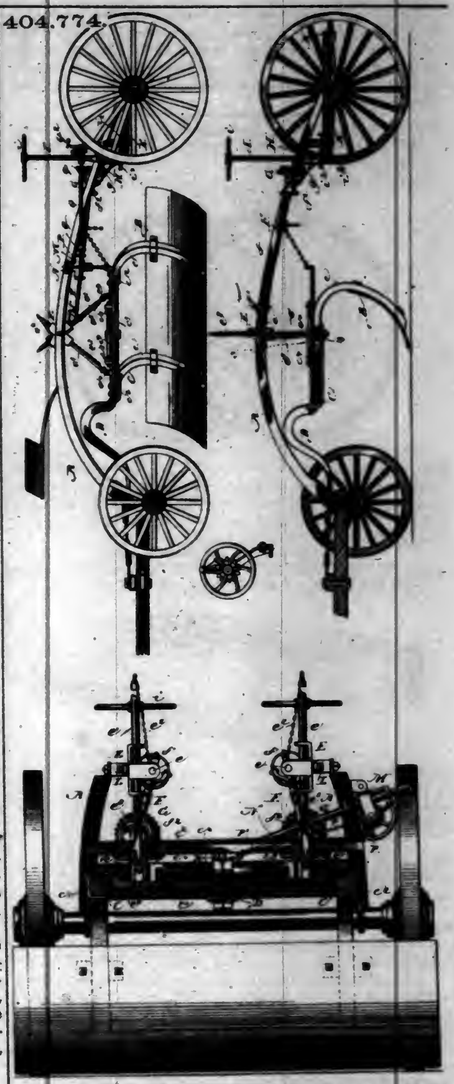
5. In combination, pockets *d*, clearing device *e*, lateral feeding device *n*, pusher *a'*, tape-guide *k'*, grasping-pinchers *m' m'*, and shears e^8 e^9, all substantially as described, and for the purpose set forth.

6. In combination, in a machine of the within-described class, a receiving-pocket with slotted bottom, the pocket-clearing lever, and the mechanism, substantially as described, whereby the said pocket-clearing lever is given an intermittent reciprocation along the pocket alternately in and out of it, all substantially as described.

7. In combination with package-holding mechanism, substantially as set forth, the lever bearing the folding-finger and pivotally supported on a second lever, and the mechanism whereby the folding-finger is lifted from the end of the tape after it has been gummed and the package bound, all substantially as described.

8. The herein-described tape-feed mechanism, comprising a pair of pinchers consisting of levers *m' m'*, pivoted upon a reciprocating slide, the said levers being provided with cam-surfaces *w'*, pins *v'*, and a spring to hold the clamping ends separated when they advance to feed the tape, combined with the actuating-rod *r'* and links *p'*, carrying the pin *z'*, said links connecting the said rod and slide *n'* and operating the pincher-levers, as set forth.

9. The combination, with the pusher *a'* and the tilting folding-finger k^3, for doubling one end of the paper tape upon the package, of the mechanism for folding the other end upon the package, consisting of the pivotally-hung vertically-reciprocating folding-finger p^3 and its actuating-spring, substantially as described.



10. In a machine of the class described, the combination of the pockets *d*, pocket-clearing devices, substantially as set forth, and the lateral feeding device composed of pivoted arms *n*, having the leftward, upward, rightward, and downward motions, substantially as described, and for the purpose set forth.

11. In a machine of the class described, the combination of the pockets *d*, pocket-clearing devices, substantially as described, the lateral feeding device composed of pivoted arms *n*, having the four motions set forth, and the independent pusher *a'*, actuated by lever *d'* and stop *b*, as explained.

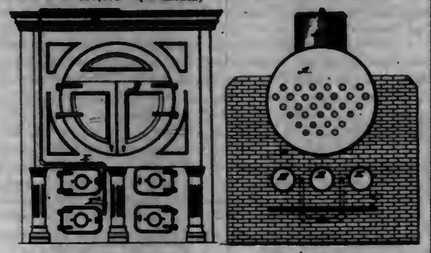
12. In a machine of the class described, the combination, with banding mechanism, substantially as herein described, in which the banding-tape is fed across the path of movement of the package of cards, of feeding mechanism, consisting of means, substantially as described, for imparting to a package of cards a main progressive movement, and a pusher *a'*, for imparting a supplementary movement to the package to move it into the place where it is bound with the tape, substantially as set forth.

13. In a machine of the class described, the combination, with the folding-finger p^3, pivotally hung to a lever l^6, and a lever l^5, pivoted to said lever l^3 and to the machine, of cams r^3 and r^3, substantially as shown, to operate the said levers in the manner described, whereby after the folding-finger has been operated to fold the tape upon a package its base is first lifted from contact with it and the finger drawn slightly backward before its downward movement begins, for the purpose set forth.

404,774. ROAD-SCRAPING MACHINE. MORTON G. BUNNELL, Chicago, Ill., assignor to Frederick C. Austin, same place. Filed Jan. 2, 1889. Serial No. 295,243. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the scraper-blade and a pair of extensible swinging hangers therefor, each comprising a member hung by a universal joint upon a support on the body-frame of the machine and a member having a suitable connection with the scraper-blade and a sliding connection with the said member which is hung by a universal joint, for the purpose described.

2. The combination, substantially as hereinbefore set forth, of the scraper-blade and a pair of sliding rods having jointed connections with the scraper-blade, and brackets supported from the body-frame of the machine by universal joints and provided with bearings with which the slide-rods have sliding connections, for the purpose described.



3. The combination, substantially as hereinbefore set forth, with the scraper-blade, of a swinging hanger therefor, comprising a slide-rod having a suitable connection with the scraper-blade, a swinging bearing with which the said rod has a sliding connection, and a winding-shaft supported with the swinging bearing and connected with the slide-rod by chains respectively for raising and lowering the same.

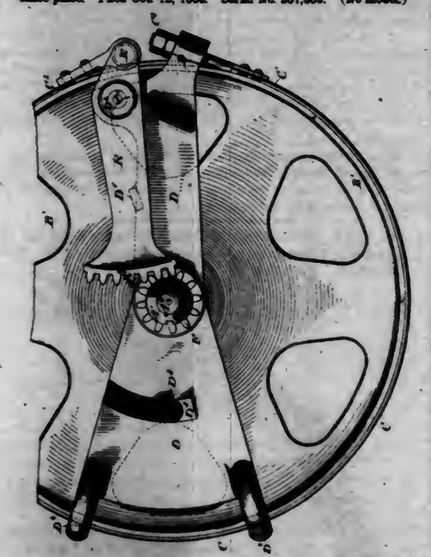
4. The combination, substantially as hereinbefore set forth, with the scraper-blade, of a swinging hanger therefor, comprising a slide-rod, a swinging bearing with which the said rod has a sliding connection, a winding-shaft connected with the slide-rod by chains, for the purpose specified, and a jointed rotary shaft connected with the rotary winding-shaft as a means for operating the same.

5. The combination of the scraper-blade and means for moving the scraper-blade toward either side of the machine, consisting of a slide-rod having a jointed connection with the scraper-blade and a sliding connection with a joint-supported bearing, and winding device, such as set forth, for operating the slide-rod.

6. The combination, substantially as hereinbefore set forth, of the scraper-blade, the segment C, consisting of a bar having its horizontal curved portion provided with notches and its bent ends secured to the scraper-blade, the draft-bar having a bearing for the horizontal portion of the segment, the locking-lever R, pivoted upon the draft-bar, a foot-lever *r'* below the driver's seat, and a rod *r*, connecting the foot-lever with the locking-lever, for the purpose described.

404,775. SMOKE-CONSUMER. JAMES C. BUTLER, Quincy, Ill., assignor of one-half to Hiram Best, same place. Filed Mar. 18, 1889. Serial No. 303,982. (No model.)

Claim.—1. The combination, with a boiler and the furnace and bridge-wall of the same, of flues leading through the bridge-wall, a main pipe passing through the bridge-wall below the furnace-grate, branch pipes leading from the main pipe up and forward through the bridge-wall above the furnace-grate, and a steam-pipe leading from the boiler-dome to the main pipe.



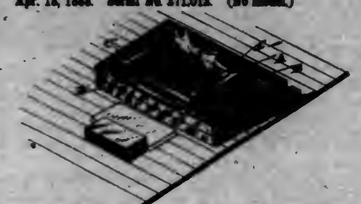
2. The combination, with a boiler and the furnace and bridge-wall of the same, of flues leading through the bridge-wall, the main pipe and the branch pipes, the apertured end cap, and the steam-pipe, substantially as set forth.

3. The combination, with a boiler and the furnace and bridge-wall of the same, of flues leading through the bridge-wall, the main pipe and the branch pipes, the apertured end cap, and the steam-pipe having the tapering lower end, substantially as set forth.

4. The combination, with a boiler and the furnace and bridge-wall of the same, of the tapering flues, the main pipe having the apertured end cap, the branch pipes, and the steam-pipe having the tapering lower end, substantially as set forth.

5. The combination, with a boiler and the furnace and bridge-wall of the same, of the tapering flues, the inclined floor, the main pipe having the apertured end cap, the branch pipes, and the steam-pipe, substantially as set forth.

404,776. FRICTION CLUTCH AND BRAKE. THOMAS W. CAPEN, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Oct. 12, 1888. Serial No. 287,889. (No model.)

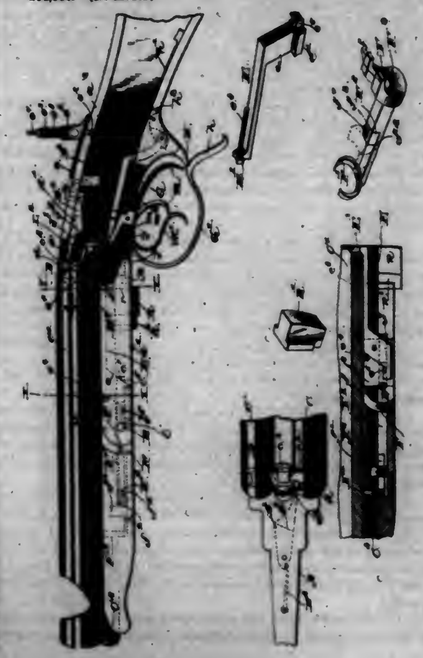


Claim.—The combination of a driving-shaft, a wheel provided with a friction-rim turning loosely on the shaft, a casting D, secured to the driving-shaft, a brake-lever pivoted to the casting, a strap secured at one end to the casting and at the other to the brake-lever, a pinion engaging with said lever to operate it, a handle secured to said pinion, and a locking device consisting of the socket D^2 in the casting, the bolt G', and the lever G^2, secured thereto in the handle, adapted to lock the handle in place, substantially as set forth.

404,777. FORK-GUARD. REGINALD R. B. CLAYTON, London, England. Filed Apr. 9, 1888. Serial No. 306,662. (No model.)

Claim.—A fork-guard having a plate adapted to lie along the top of the stem of the fork and whose end is bent downward and backward, passing between the prongs and holding beneath them, and which is provided with spring-jaws to clasp the stem of the fork, substantially as described.

404,778. DUPLICATING APPARATUS. GEORGE H. DAVIS, Washington, D. C., assignor to Augustus D. Kimber, New York, N. Y. Filed Apr. 18, 1888. Serial No. 271,012. (No model.)



Claim.—1. In a duplicating apparatus, a printing-stencil with one or more air-holes made therein for releasing a sheet adhering to the said stencil, substantially as described.

2. In a duplicating apparatus, the combination, with a stencil-frame, of a printing-board constructed with an inclined surface at its hinged side and cut away between the hinges, so as to leave a longitudinal opening, substantially as and for the purposes described.

3. In a duplicating apparatus, the combination of a stencil-frame the inner side A' of which is rounded off, and a printing-board constructed with an inclined surface at its hinged side and cut away between the hinges, so as to leave a longitudinal opening, substantially as and for the purposes described.

404,779. BREECH-LOADING FIRE-ARM. WILLIAM DICKE and CASSIUS M. BARKER, Albion, Mich. Filed Nov. 21, 1888. Serial No. 291,510. (No model.)

Claim.—1. The combination, with the breech-frame having the barrels pivoted thereto, of the adjustable guard engaging the front end of the breech-frame at its rear end and provided at its front end with a spring-catch engaging the barrel, the stationary block on the barrel and adjustable block on the guard bearing against the stationary block, and the compensating screw mounted in the guard and bearing against the adjustable block, substantially as and for the purpose specified.

2. The combination, with the breech-frame having the barrels pivoted thereto, of the adjustable guard provided at its front end with a spring-catch F' to engage the barrel, the stationary block f' on the barrel, the slotted adjustable block F^3, mounted on a guiding-screw on the guard and adapted to bear against the rear side of the stationary block, and the compensating screw F^5, mounted in a threaded bore F^6 in the guard and bearing at its front end against the rear side of the adjustable block, substantially as specified.

3. The combination, with the breech-frame having a transverse hinge-pin in its front end, of the depending notched tongue on the barrel engaging the said hinge-pin, the depending lug R on the heel of the barrel, fitting in a slot in the breech-frame, and the compensating key R', located in front of the said lug and bearing against its front side, substantially as specified.

4. The combination, with the breech-frame having a transverse hinge-pin, of the depending notched tongue on the barrel engaging the said pin, the compensating plug arranged in a longitudinal bore in the tongue and bearing against the hinge-pin, and the screw-fitting in a threaded portion of the said bore and bearing against the said plug, substantially as and for the purpose specified.

5. The combination, with the breech-frame provided at its front end with a longitudinal slot, of the depending tongue on the barrel fitting in the said slot and pivoted to the breech-frame, the compensating plug fitting in a longitudinal bore in the tongue, and the adjustable guard attached to the front end of the breech-frame, all constructed and arranged substantially as specified.

6. The combination, with the breech-frame and the barrels pivoted thereto and having a depending tongue c, of the extractor mounted on the barrel and provided with a depending web e, having an inclined front side, the stationary pin c^4 in the breech-frame adjacent to the said web and adapted to bear on the inclined front side, and provided with ribs engaging grooves in the tongue c thereof, and the head on the extractor fitting in a notch at the breech of the barrels, substantially as and for the purpose specified.

7. The combination, with the breech-frame and the barrels pivoted thereto, of the extractors mounted on the barrels and provided with heads fitting in notches at the rear ends of the barrels, the forwardly-extending guiding-pins c^2 on the heads, the depending webs e e, provided with inclined front sides operating in contact with a stationary pin c^4, and the extensions or stops e^5 at the lower ends of the said webs on the front sides of the same, which are adapted to bear against the said stationary pin to limit the movement of the barrels, substantially as specified.

8. The combination of the breech-block having a transverse perforation a^4, the barrels provided with a lug c^3, having a flattened perforation c^5, adapted to register with the perforation a^4, the locking-bolt mounted in said perforations and having a flattened lower side and provided with a notch d, the operating-lever D', pivoted on the breech-block and having its front end engaging the notch d, and the spring D^2, secured to the breech-block and bearing on the heel of the lever, as set forth.

9. The combination, with the breech-frame having the block a, provided with a transverse perforation a^4, and the barrels pivoted to the said frame and adapted to bear at their rear ends against the said block, of the lug c^3 on the rear end of the barrels, fitting in a vertical slot a^6 in the block a, and provided with a transverse perforation c^5, which is flattened at its lower side and registers with the perforation a^4, and the locking-bolt D, mounted in the perforation a^4 and provided with a tapered and flattened inner end to fit the perforation in the lug c^3, and the spring-actuated lever connected to the said bolt, substantially as specified.

10. The combination, with the barrel having an open breech and the hammer aligned with the breech, of the cocking-lever arranged adjacent to the trigger-guard, and the draw-bar or link having its rear end pivoted to the cocking-lever and its front end engaging the hammer, substantially as specified.

11. The combination, with the hammer arranged opposite the open breech of the barrel and provided with a shoulder, of the cocking-lever, the spring bearing at its free end on the said lever to hold it normally in the desired position, and the draw-bar or link pivoted at one end to the cocking-lever and provided at its front end with a transverse pin to engage the shoulder on the hammer, substantially as specified.

12. The combination, with the hammer provided with a shoulder, of the trigger-guard cut away at its rear end, the cocking-lever pivoted to the trigger-plate and fitting in the opening in the trigger-guard to complete the same when in its normal position, and the draw-bar or link connected to the cocking-lever and provided with a transverse pin engaging the shoulder on the hammer, substantially as specified.

13. The combination, with the breech-frame, the barrels pivoted thereto and provided with a rearwardly-extending perforated lug c^3, fitting in an opening in the breech-frame, and the locking-bolt mounted in the breech-frame and engaging the perforated lug, of the spring-actuated operating-lever connected at its front end to the locking-bolt and provided with an inclined shoulder d', the hammer mounted in the breech-frame and provided with a shoulder, the cocking-lever provided with an operating-spring, and the draw-bar or link pivoted at its rear end to the cocking-lever and provided at its front end with a transverse pin engaging the shoulder on the hammer, and a beveled projection which bears against the inclined shoulder d' when the draw-bar or link is drawn rearwardly, substantially as and for the purpose specified.

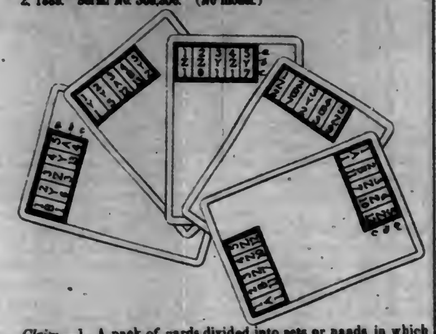
14. The combination, with the barrels C C' C^2, of the hammers J J, provided with the shanks j j, having rear notches J^3 and shoulders J^5, and the firing-pins J', connected to the shanks, the hammer K, provided with a firing-pin and having a shoulder K^2 and sear-notches K^3, the springs coiled on the said hammers, the triggers M M, provided at their front ends with sears m m to engage the rear notches in the hammers J J, the trigger M', provided with the sear n' to engage the sear-notches in the hammer K, the sear-springs bearing on the heels of the said triggers, the cocking-lever, and the draw-bar or link connected to the said lever and provided with a transverse pin engaging the shoulders J^5 J^5 and K^2 on the hammers, substantially as specified.

404,780. WATER-CONVEYER. Frank D. Down, Cortland, N. Y. Filed Sept. 29, 1888. Serial No. 286,812. (No model.)

Claim.—1. An apparatus for conveying water, consisting of a series of telescopic tubes, each tube made tapering, whereby, when extended, the larger end of one tube will fit tightly within the smaller end of the adjacent tube, and a head-section provided with a mouth-piece carrying a swiveled head adapted to receive the spout or mouth-piece of a hydrant or supply-pipe, substantially as specified.

2. An apparatus for conveying water, consisting of a series of telescopic tubes, each tube made tapering, so that when extended for use the larger end of each tube will fit tightly within the smaller end of each adjacent tube, a head-section provided with a mouth-piece carrying a swiveled head, and a foot-piece provided with a rest or holder for retaining said foot-piece in proper position, substantially as specified.

3. A water-conveyer consisting of a series of intermediate telescopic tubes a, the end sections B and C, the former provided with a plate b and standards b', and the latter with an elbow c and swiveled head c' c^2, substantially as specified.



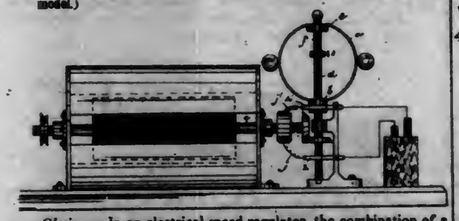
404,781. PIPE-WRENCH. Charles L. Dunham, Union City, Pa., assignor to William F. Rupp, Chicago, Ill. Filed Jan. 12, 1888. Serial No. 260,563. (No model.)

Claim.—1. The combination, with the handle, of two corresponding arms pivoted one at each side thereof and provided with lugs and curved springs having their free ends engaging said lugs, substantially as set forth.

2. The combination, with the handle, of two corresponding arms pivoted one at each side thereof and provided with lugs, lugs upon said handle, curved springs disposed one at each side the handle and engaging the lugs on the arms, said springs being secured between the lugs on the handle, a plate secured to the latter, an arm provided with teeth, and links connecting the same with the spring-actuated arms, substantially as set forth.

404,782. PLAYING-CARDS. Robert F. Fuerst, Baltimore, Md., assignor of one-half to Alexander J. Leith, New York, N. Y. Filed May 2, 1888. Serial No. 308,266. (No model.)

Claim.—1. A pack of cards divided into sets or nands, in which each card is provided with an indicator designating the order in which that card should be arranged in its hand, substantially as described.



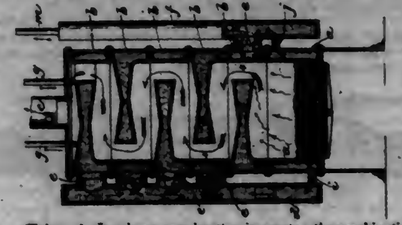
2. A pack of cards divided into hands, in which each card is provided with an indicator designating the order of playing in a prearranged game, substantially as described.

3. A pack of cards divided into hands, in which each card in each hand is provided with two indicators, one distinguishing the card from those of other players and the other designating the order in which the card should be played in a prearranged game, substantially as set forth.

4. A pack of cards divided into hands, and in which the cards are provided with two series of indicators, one series designating the cards of different players and the other the order of playing the cards in a series of prearranged games, substantially as set forth.

5. A pack of cards divided into hands, and in which each card is provided with indicators designating the hand to which it belongs and the order of its playing in prearranged games, and with a third series of indicators designating the order of the games, substantially as set forth.

404,783. REGULATOR FOR ELECTRIC MOTORS. Alfred Gartner, Newark, N. J. Filed June 7, 1888. Serial No. 276,371. (No model.)



Claim.—In an electrical speed-regulator, the combination of a rotary shaft, an insulated collar, conductors j j', a hoop fixed to said insulated collar and moving longitudinally on said shaft under the influence of centrifugal force, and a contact-bearing adapted to engage the hoop and complete an electrical circuit, substantially as and for the purposes set forth.

2. In an electrical speed-regulator, the combination of a shaft d, an insulated hoop a, and a collar k, arranged on said shaft and adapted to transmit the current from the said hoop to the shaft, substantially as and for the purposes set forth.

3. In an electrical speed-regulator, the combination of an insulating-sleeve b', arranged on a rotary shaft d, a collar b, arranged on said sleeve, a hoop fixed to said collar and to a sliding collar insulated, as at c', from said shaft, and a collar k, adapted to make a contact with said sliding collar, and conductors j j', connected with the shaft and collar b, respectively, said parts being arranged and combined substantially as and for the purposes set forth.

404,784. WATER-HEATER. Ebenezer H. Gayer, Fitchburg, Mass. Filed Mar. 16, 1888. Serial No. 303,637. (No model.)

Claim.—1. In a hot-water heating apparatus, the combination of a fire-pot section having an outlet for hot water at its upper portion, a series of superposed sections arranged to be heated by the fire within the fire-pot section, and a return or inflow stand-pipe connected, as described, with the upper and lower portions of said superposed sections and with the lower portion of the fire-pot section, as set forth.

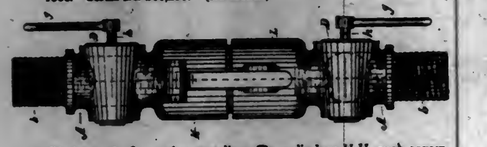
2. In a hot-water heating apparatus, the combination of a fire-pot section, a series of superposed sections arranged to be heated by the fire within the fire-pot section, a return or inflow stand-pipe connected, as described, with the upper and lower portions of said superposed sections and with the lower portion of the fire-pot section, and an outflow pipe or pipes connected with the upper portion of the fire-pot section, as set forth.

3. In a hot-water heating apparatus, the combination of a fire-pot section, a series of superposed sections arranged to be heated by the fire within the fire-pot section, an outflow-pipe connected with the upper portion of the fire-pot section and with the upper and lower portions of one or more of said superposed sections, and a return or inflow pipe connected with the upper and lower portions of the other superposed sections and with the lower portion of the fire-pot section, as set forth.

4. In a hot-water heating system, the combination of a fire-pot section and a series of superposed sections above the same, outflow-pipes communicating with the upper portion of the fire-pot section and conducting heated water therefrom, return-pipes conducting the return water to the highest of the superposed sections, and connections between said superposed sections and the fire-pot section, whereby the return water, the outflow of which is induced by the upward flow of heated water from the fire-pot section, is conducted from the upper superposed section successively through the other sections of said series and into the lower portion of the fire-pot section, as set forth.

5. In a hot-water heating apparatus, the combination of the fire-pot section a, the superposed sections b, relatively arranged, as described, and each composed of a hollow wall or water-leg, and a horizontal chamber located within the water-leg and above its lower portion, said chamber being separated from the water-leg at one side by an opening 4, the stand-pipe d, connected, as described, with the upper and lower portions of the sections b and with the lower portion of the fire-pot section, and an outflow pipe or pipes communicating with the upper portion of the fire-pot section, as set forth.

404,785. ORNAMENTAL VESSEL OR ARTICLE. Thomas R. Gibson, Glasgow, County of Lanark, Scotland. Filed June 8, 1888. Serial No. 276,526. (No model.)

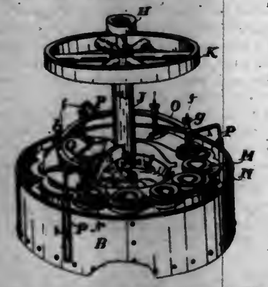


Claim.—1. An ornamental vessel or article consisting of the combination of a foundation or body substance with a woven-fabric covering of open-work stretched over the foundation and showing the color or ornamentation of the latter, substantially as and for the purpose herein set forth.

2. An ornamental vessel or article consisting of the combination of a foundation or body substance with a woven-fabric covering of

open-work carrying a design or ornamentation and stretched over the foundation, but showing through it the color of the latter, substantially as and for the purpose herein set forth.

404,786. STEAM-PIPE COUPLING. FREEMAN HARMON, Hollis, assignor of one-half to Charles B. Harmon, Biddeford, Me. Filed Jan. 7, 1888. Serial No. 260,253. (No model.)



Claim.—1. In a pipe-coupling, the cylinders H H, each screw-threaded at its outer end and connected thereby with the part A, and each having on opposite sides projecting lug W and latching-rod Y, hinged thereto, and an inclined plane V, and lugs *b'* and cam-lever L, pivoted thereto, substantially as described.

2. In a pipe-coupling, the two cylinders H H, each screw-threaded at the end and provided with locking-latches and levers, as described, for securing them together and internally with stop *s* and rim *p*, and movably within it a spring-actuated central valve-stem *j*, centrally surrounded by the beveled collar *k*, having radial arms *m* and the rim *q*, and centered in cross-piece *l*, substantially as described.

3. In a pipe-coupling, the combination of the part A, screw-threaded, as described, at each end, and having the cock or valve D, with the cylinder H, screw-threaded at one end to engage with the part A, and having within it a spring-actuated valve and externally on one side an incline and a cam-lever and on the other side a latching-rod, substantially as described.

4. A pipe-coupling each part of which is composed of the following elements, viz: a screw-threaded end for attachment to the pipe, a drip-valve in said end, a cylinder connected with said end by screw-threads and having externally means for locking it to the opposite part, said means consisting of an incline and cam-lever on one side and on the opposite side a latching-rod and internally a central spring-actuated stop-valve adapted to be opened when the two parts of the coupling are united, substantially as described.

404,787. GRINDING-MACHINE. CHARLES H. HENDERSON, Canton, Ohio, assignor to the Canton Glass Company, same place. Filed June 8, 1888. Serial No. 276,445. (No model.)

Claim.—1. In a grinding-machine for glass and other wares, the combination, with the shaft D and the grindstone secured thereto, of a hollow shaft J, sleeved upon shaft D, a frame O, a plate Q, having a yielding connection with the said frame, means for adjusting said plate and frame in unison, and a disk for holding the ware to be ground, said disk secured to the shaft J, substantially as set forth.

2. In a grinding-machine for glass and other wares, the combination, with the shaft D and a grindstone secured thereto, of a hollow shaft J, sleeved upon said shaft D, a disk for holding the ware to be ground, an adjustable frame O, a plate Q, having a yielding engagement with said frame, means for adjusting said plate and frame in unison, and means for adjusting said disk independently of said frame and plate, substantially as set forth.

3. In a grinding-machine for glass and other wares, the combination, with a vertical shaft D and a horizontal grinding-stone adjustably secured thereto, of a hollow shaft J, embracing and rotating about said shaft D, disk M, secured to the shaft J, and pulleys H and *k*, by which the stone G and disk M may be rotated at different speeds, substantially as set forth.

4. In a grinding-machine for glass and other wares, the combination of the supporting-frame A, inclosing-case B, vertical shaft D, a plate F, adjustably secured to said shaft, a grinding-stone G, secured to said plate, a collar *c*, adjustably secured to shaft D, a hollow shaft J, embracing shaft D, a disk M, secured to said hollow shaft, holders N, secured to said disk, frame O, adjustably secured to the case B, pressure-plate Q, and pulleys H and *k*, by which the grinding-stone and the plate F may be rotated at different rates of speed, substantially as set forth.

404,788. FENCE-POST. JOHN KELLY, Troy, Ohio, assignor to himself, George C. Kelly, Orrin Kelly, George S. Heiman, and W. A. Evans, all of same place. Filed Mar. 6, 1889. Serial No. 302,360. (No model.)

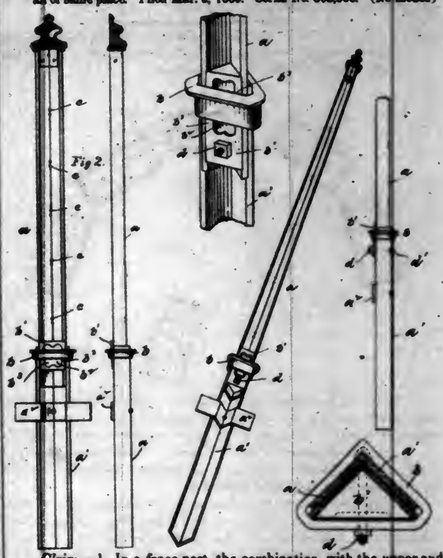


Fig 2.

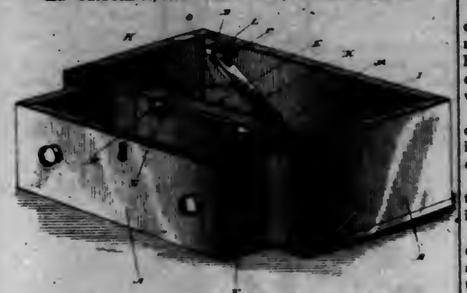
Claim.—1. In a fence-post, the combination, with the upper and lower parts formed of angle-iron, as described, one of the parts being adapted to lap the other, with the wings of the angle-iron parallel, of a triangular wedge-shaped key adapted to fit in the angle of said iron, and a clamping-ring extending around said angle iron and key and adapted to be driven on said wedge to draw the parts together, substantially as specified.

2. The combination, with the upper and lower angle-iron pieces adapted to lap each other, as described, of a triangular clamping-ring extending around said pieces, a triangular wedge-shaped key having a depression and side ways thereon adapted to be inserted in the angle of the parts under said ring, and a fastening-bolt for securing said parts and key in position, substantially as specified.

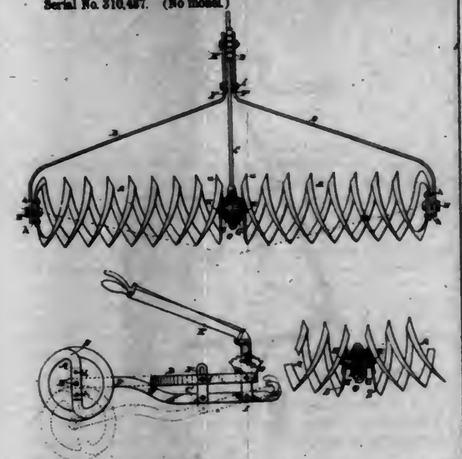
404,789. WHEELBARROW. WILBER E. KILBORN, Sidney, Ohio, assignor of one-half to William H. C. Goode, same place. Filed Feb. 27, 1889. Serial No. 301,357. (No model.)



Claim.—1. In a wheelbarrow-frame, a bar-metal yoke for the support of the front end of the tray, said yoke being so shaped that its middle portion will conform to the outline of the tray transversely and so that its end portions will extend down to the ends of the wheel-axle to form bearings for the same, substantially as described.

2. In a wheelbarrow-frame, metal trusses for supporting the middle portion of the tray, each of which is so constructed as to spring from the end of the wheel-axle, over which it is passed, to the bottom of the tray and thence to the leg near its bottom, it being bolted to each of said parts, substantially as set forth.

3. A wheelbarrow-frame comprising the trusses, the yoke, the legs, and the handles, each leg being formed integral with one of the handles, and the longitudinal and transverse braces, all constructed and combined substantially as described, and for the purpose stated.



404,790. FURNITURE-DRAWER. JOSEPH H. KRAUS, Fayette, Mo. Filed Jan. 17, 1889. Serial No. 296,582. (No model.)

Claim.—1. The combination, with the case and drawer, of the bar K, pivotally connected at one end to a fixed point in the case and having the pin or screw at its free end, the bar H, secured to the drawer and having the slot I at one end engaged by the pin or screw, and the link-rod connecting the opposite end of the bar H with the center of the bar K, substantially as described.

2. The combination, with the case and the drawer, of the cleats F, secured to the latter, the bar H, rabbeted in recesses in the upper edges of said cleats and having the slot I at one end, the bar K, pivotally connected at one end to a fixed point in the case and having the pin or screw at its outer end working in the slot I, and the link-rod connected to the end of bar H opposite said slot, and also connected to the center of bar K, substantially as described.

404,791. PULVERIZING-HARROW. CHARLES LA DOW, Albany, N. Y. Original application filed Oct. 26, 1886, Serial No. 217,133. Divided and this application filed June 8, 1887. Renewed May 11, 1889. Serial No. 310,457. (No model.)

Claim.—1. In a pulverizer, the double spirals A, mounted upon each other, in combination with a draft-frame.

2. In a pulverizer, a draft-frame, in combination with a gang of spiral cutters mounted upon each other so as to have spring motion or resilience.

3. In a pulveriser, two gangs of opposing cutters, buffers having flattened abutting surfaces between the gangs, a box which loosely envelops the buffers, so they can roll upon each other, and a draw-bar for the box, in combination with a draft-frame.

4. In a pulverizer, two gangs of opposing cutters, buffers having flattened coavex abutting surfaces working against each other between the gangs, and a box which loosely envelops the buffers, so they can roll upon each other, for maintaining both buffers in a uniform horizontal and vertical plane with each other, in combination with a draft-frame.

5. In a screw-pulverizer, the combination of the double spiral cutters having the end pieces or bars S, for attaching the spirals to each other.

6. In a pulverizer, two gangs of horizontally-adjustable cutters and a draft-frame, in combination with a lever for operating the bar C, said lever being bent rearward, so as to be reached from the rear of the gangs.

7. In a pulverizer, a draft-frame, two gangs of cutters, and two opposing buffers having flattened abutting heads, each head being mounted on a stem smaller than the head, in combination with a coupling-box loosely enveloping the buffers, so they can roll upon each other, and having flanges which coact with the buffer-heads to prevent the gangs from spreading apart.

8. In a pulverizer, a cylindrical gang of spiral cutters composed of two or more strips of metal mounted upon each other by means of intermediate fastenings, which are attached to the strips at two points only at or near the ends of the gang.

9. In a pulverizer, a cylindrical gang of spiral cutters adapted to revolve upon hubs or pins attached to the ends of the spirals only, in combination with a draft-frame connected with said hubs or pins.

10. In a pulverizer, a draft-frame, in combination with a cylindrical gang of spiral cutters adapted to thrust part of the soil laterally and to permit part thereof to pass through the gang without encountering other obstruction than presented by the spirals.

11. In a harrow or pulverizer, the combination, substantially as set forth, of two gangs of cutters set at right angles to the line of draft and adapted to create end-thrust by contact with the soil, a draft-frame, connections between the extreme outer ends of the gangs, and said frame located in the axial line of the gangs, and a hinge-connection between the extreme inner ends of the gangs and frame on which each gang independently vibrates, also located in the axial line of the gangs, whereby the end-thrust of the gangs is counteracted from a point directly in line with the center of revolution of the gangs.

12. In a pulverizer, a cylindrical spiral cutter without an interior frame or axle, adapted to revolve in bearings at its ends, in combination with a draft-frame in which it is mounted.

13. In a pulverizer, two opposing gangs of right and left spiral cutters adapted to counteract the inward side-thrust of each other by contact between their inner ends, in combination with a draft-frame in which the gangs are mounted.

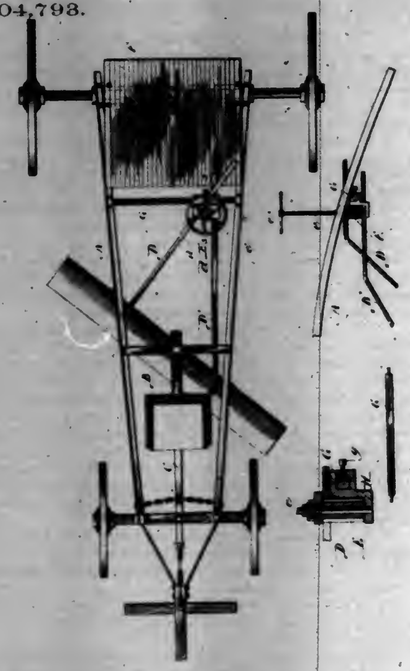
14. A spiral cutter formed of a continuous strip of metal coiled into a cylindrical spiral without an interior frame or axle shape, and supported at its ends only.

15. A cutter formed of a continuous strip of spring metal coiled into a cylindrical spiral the convolutions of which are capable of springing or vibrating, for the purpose described, in combination with a frame in which it is mounted.

16. The combination of the frame and draft devices and spiral cutters which throw the earth from each other and are so constructed as to permit part of the earth cut up to pass inwardly endwise through the cutters to fill the furrow formed at their inner ends.

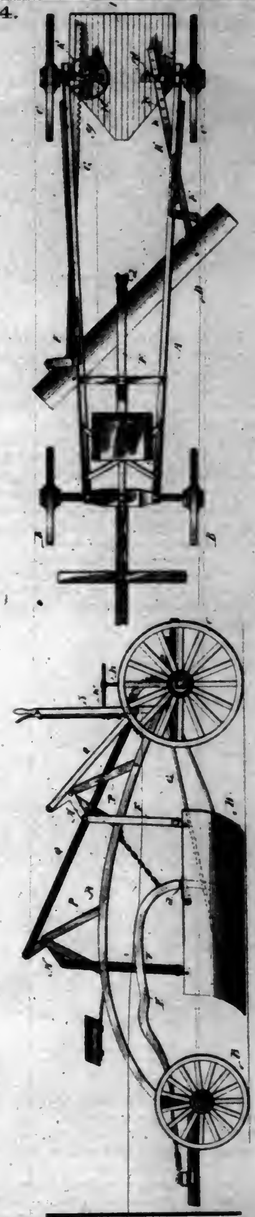
404,792. WINDOW. HENRY MABURER, Brooklyn, N. Y., assignor of one-half to William Heinemann, same place. Filed Oct. 16, 1888. Serial No. 288,237. (No model.)

Claim.—1. The combination of a glass-holding frame pivoted at opposite sides to sliding sash-rabbet strips, said strips being provided with cord-receiving recesses extending from the upper rear edge thereof through to the front edge thereof, substantially as set forth.



2. The combination of a glass-holding frame pivoted at opposite sides to sliding sash-rabbet strips, said strips being provided with cord-receiving recesses extending from the upper rear edge thereof through to the front edge thereof, and a cord-fastening pin, substantially as set forth.

3. The combination of a glass-holding frame pivoted at opposite sides to sliding sash-rabbet strips, said strips being provided with cord-receiving recesses extending from the upper rear edge thereof through to the front edge thereof, and a spring which presses the sliding strip to the glass-frame, substantially as set forth.



404,793. ROAD-SCRAPER. GEORGE H. MILLER, Ashton, assignor to Frederick C. Austin, Chicago, Ill. Filed Jan. 26, 1889. Serial No. 297,867. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the scraper-blade and a reversing device consisting of a couple of longitudinally-movable reversing-rods, and a reversing device com-

404,793.

404,794.

mon to both rods and adapted for shifting the rods longitudinally in opposite directions.

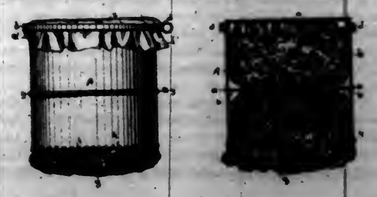
2. The combination, substantially as hereinbefore set forth, with the scraper-blade, of the two reversing-rods and the reversing-gear common to both rods, for the purpose described.

3. The combination, substantially as hereinbefore described, with the scraper-blade, of the reversing-rods and a gear common to both rods and supported upon a rocking bearing.

4. The combination, substantially as hereinbefore set forth, with the scraper-blade, of the reversing-rods and the reversing-gear common to both rods and adjustable transversely to the line of progression.

5. The combination, substantially as hereinbefore set forth, with the scraper-blade, of the reversing-rods connected therewith, and the reversing-gear common to both rods and mounted upon a rocking bearing which is adjustable transversely to the line of progression.

6. The combination, substantially as hereinbefore set forth, with the scraper-blade, of the reversing-rods D and D', the reversing-gear common to both rods, the bearing H, carrying the reversing-gear, and the rocking shaft upon which said bearing is adjustably secured.

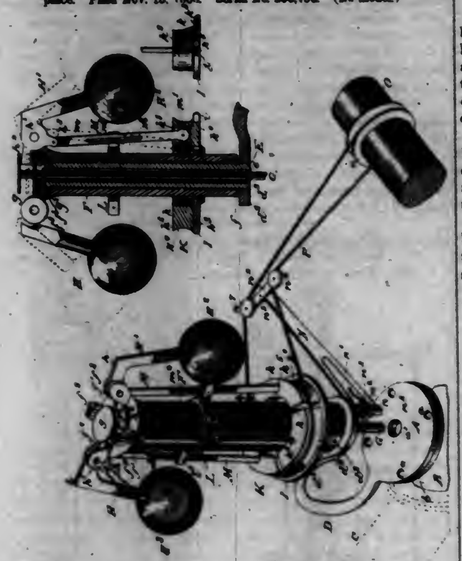


404,794. ROAD-SCRAPER. ORTUS E. MOATS, Chicago, Ill., assignor to Frederick C. Austin, same place. Filed Jan. 18, 1889. Serial No. 296,760. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, in a wheeled road-scraper, of the scraper-blade pivotally connected midway of its ends with a draft-bar, and a pair of adjusting-bars extending rearwardly from the scraper-blade and pivotally connected therewith at opposite sides of the pivotal connection between the scraper-blade and the draft-bar, said adjusting-bars being both adjustably held at the rear of the machine, for the purpose set forth.

2. The combination, substantially as hereinbefore set forth, with the scraper-blade arranged to swing or vibrate horizontally about a vertical line midway of its ends, of a pair of adjusting-bars extending rearwardly from the scraper-blade and connected therewith respectively at opposite sides of its longitudinal middle, one of said adjusting-bars being provided with a line of teeth, and a gear for operating said adjusting-bar, for the purpose described.

3. The combination of a draft-bar E, the scraper-blade D, pivotally connected with the draft-bar the, adjusting-bars G and K, the gear for adjusting one of said bars, and the device—such as set forth—for locking the other one of said bars, for the purpose described.



404,795. SLATE-CLEANER. JAMES M. MCFARLAND, Columbus, Ohio. Filed Aug. 30, 1888. Serial No. 284,156. (No model.)

Claim.—1. The combination, with the case A, having perforated partition *b*, of the supply and erasing sponges *h* and *g*, located, as described, within said case, and follower *c*, substantially as and for the purpose specified.

2. The combination, with the case A, having perforated partition *b* and hinged bail *d*, of the supply and erasing sponges *h* and *g*, located within the case, as described, follower *c*, and drying-cloth *i*, the latter held by bail *d*, described, substantially as and for the purpose specified.

404,796. STEAM-VALVE GOVERNOR. FREDERICK R. PETTENGILL, Rosedale, Kans., assignor of one-half to Edward Nicholson, same place. Filed Nov. 13, 1888. Serial No. 290,758. (No model.)

Claim.—1. In a centrifugal governor having fly-weights and a rotating sleeve, the combination, with said sleeve and weights, of a fixed plate, and an alternately expanding and contracting pulley having its sections movably keyed on said plate, and levers connected with said fly-weights and the sections of said pulley, substantially as described.

2. In a centrifugal governor having fly-weights and alternately expanding and contracting pulley, and oscillating bars connected with said pulley and said weights, for the purpose described.

3. In a centrifugal governor having fly weights and arms, the combination, with said arms, of a pulley consisting of movable sections, and oscillating bars connected with said arms and said sections and radially adjustable, as and for the purpose described.

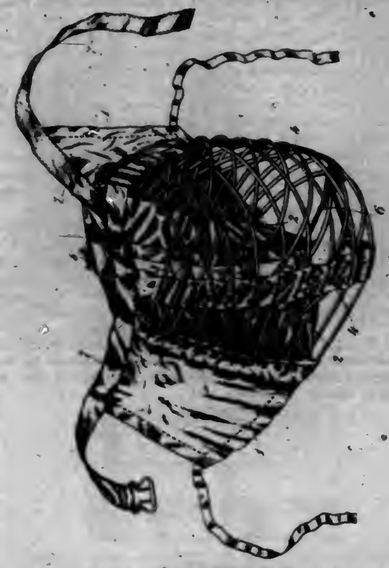
4. In a centrifugal governor having a rotary sleeve and fly-arms on said sleeve adapted to support the fly-weights, the combination, with said arms and sleeve, of a pulley consisting of movable sections, oscillating bars connected with said arms and said sections, and an adjustable collar upon said sleeve having lugs pivotally connected with said bars, for the purpose described.

5. In a centrifugal governor, the combination, with the rotating sleeve, of fly-weights, a radial supporting-plate, and a pulley having alternately expanding and contracting sections, and a recess in each section, radial lugs on said sleeve, and oscillating bars connected with said fly-weights and pivotally connected with said lugs, having an anti-friction end portion adapted to enter said recess in said section, for the purpose described.

6. In speed-regulating mechanism for engines, a governor having fly-weights, an alternately expanding and contracting pulley on said governor having movable sections, a driven shaft, a power-conveying belt connected with the sections of said pulley and said shaft, and levers connected with the sections of said pulley and said fly-weights, for the purpose described.

7. In speed-regulating mechanism for engines, the combination of a governor having fly-weights, and an alternately expanding and contracting pulley having movable sections, levers connected with said sections and said fly-weights, a driven shaft, a power-conveying belt connected with the sections of said pulley and said shaft, and a self-acting belt-adjusting arm adapted to adjust the alignment of and tension of said belt, as described.

404,797. BOTTLE-STOPPER. GEORGE RENFUSS, JOHN G. RENFUSS, and MARTIN G. RENFUSS, Philadelphia, Pa., assignors to the Joly Stopper Company, same place. Filed Feb. 8, 1889. Serial No. 299,133. (No model.)



Claim.—1. The combination of the bottle, the stopper-carrying bail, and external tightening devices for the latter, with a stopper having a sealing-washer and a depression-stud connected to the bail and having a thin disk located above the washer and of such diameter that it can be drawn down through the mouth of the bottle, the disk on depression indenting the washer and causing the same to bind over its upper edge, substantially as specified.

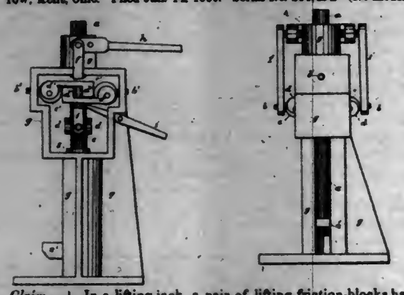
2. The combination of the shouldered bottle, the stopper, and its bail, with the operating-lever hung to the bail and having arms engaging with the shoulder of the bottle, and a neck-wire free to move vertically on the bottle-neck and preventing lateral displacement of the lever thereon, substantially as specified.

3. The combination of the shouldered bottle, the stopper, and its bail, the vertically-sliding neck-wire, and the operating-lever hung to the bail and having arms with rounded ends which engage with the shoulder of the bottle, as set forth.

404,798. BUSTLE. HOMER R. RHEUBOTTOM, Woodsport, N. Y., assignor to the Rheubottom & Teall Manufacturing Company, same place. Filed Feb. 25, 1889. Serial No. 301,016. (Model.)

Claim.—A bustle comprising side supports, arched wires springing therefrom, a waistband, tapes secured to and extending vertically across the sides of the arched wires, and flies extending inwardly from the side supports, the inner side edges of the flies being connected by elastic tapes, in combination with the elastic tapes connecting the upper ends of the flies and the waistband and the elastic tapes connecting the lower end of said flies and the lower ends of the vertical tapes, as set forth.

404,799. BOTTLE-STOPPER. JONAS J. SANDS, Merton, Wis. Filed Dec. 10, 1888. Serial No. 293,125. (No model.)



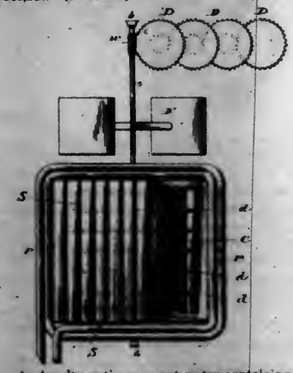
Claim.—1. The combination, with the walls of a vessel-orifice having internal shoulders and with a stopper in the orifice, of a flexible metal holding-bar inserted over the stopper and engaged at its ends with the said shoulders, the said metal bar being adapted to be withdrawn by outward flexure thereof between its ends and provided with a central prominence by which it may be engaged by a suitable instrument for its extraction.

2. The combination, with the walls of a vessel-orifice having internal shoulders and with a stopper therein, of a flexible metal holding-bar having a central arch or U-shaped bend, substantially as described.

404,800. LIFTING-JACK.

GEORGE H. SHAFFER and JOHN SAIRSTOW, Kent, Ohio. Filed Jan. 14, 1889. Serial No. 296,454. (No model.)

Claim.—1. In a lifting-jack, a pair of lifting friction-blocks having bearings opposite each other and on opposite sides of the lifting-bar, in combination with said bar, a cam pivoted to each of said blocks and having a bearing against the other and having a trunnion or suppert connected with the casing of the lifting-jack, and retaining friction-blocks, substantially as described.



2. In a lifting-jack, a pair of lifting friction blocks and cams, the blocks having bearings on the lifting-bar opposite each other and the cams being pivoted to the blocks and each having a bearing against the end of the block of the other cam, substantially as described.

3. In a lifting-jack, the combination of a pair of lifting-cams and friction-blocks, connected by links, retaining-blocks, a lever to operate the retaining-blocks, and a lever and link to operate the friction-blocks, substantially as described.

4. In a lifting-jack, the combination of a pair of lifting friction-blocks having bearings on opposite sides of the lifting-bar, each of said blocks being provided with a cam supported in the frame of the lifting-jack and having bearing against the other block, retaining friction-blocks, a lever to operate the same, and a lever and links to operate the lifting friction-block, substantially as described.

404,801. ELECTRIC METER FOR ALTERNATE CURRENTS.

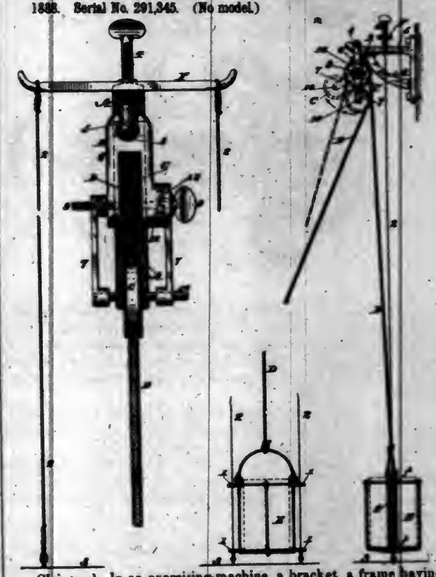
MARMADUKE M. M. SLATTERY, Fort Wayne, Ind., assignor to the Fort Wayne Electric Light Company, same place. Filed Mar. 14, 1889. Serial No. 303,217. (No model.)

Claim.—1. An alternating-current meter containing, in combination, a fixed primary coil conveying the current to be measured, a secondary closed coil of low resistance fixed relatively to the primary coil, so that its central plane shall cut the central plane of the primary coil, a cylinder of electrical conducting material organized to revolve in inductive relation with said primary and secondary coils, and carrying-disks of magnetic material cutting the magnetic field of force of each of said coils, with a retarding device and devices for counting and indicating the revolutions of the cylinder.

2. In an alternating-current meter having a fixed primary coil conveying the current to be measured and a secondary closed coil in inductive relation therewith, a moving part consisting of a copper cylinder carrying soft-iron disks and revolving in inductive relation to both said coils.

3. The combination, for use in an alternating-current meter, of a copper cylinder and soft-iron disks placed normal to its axis rotating in the inductive field.

4. In an alternating-current meter, a secondary coil or conductor consisting of successively-narrowing rectangles of copper laterally joined together and enveloping that member of the mechanism to which motion is communicated by induction, substantially as shown.



5. In an alternating-current meter, a secondary coil or closed conductor consisting of copper circuits of low resistance, all in electrical multiple connection with each other, substantially as shown.

6. In an alternating-current meter, a secondary coil consisting of copper circuits of low resistance integrally joined together by a mid-rib, substantially as described.

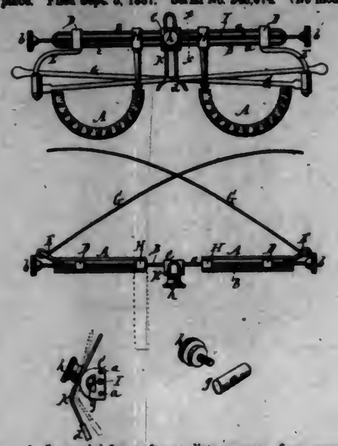
7. In an alternating-current meter, a secondary coil made from a continuous shell of conducting material sawed into ribs and enveloping that member of the mechanism to which motion is communicated by induction, substantially as shown.

404,802. EXERCISING-MACHINE.

JOSEPH J. SLEEPER, Camden, N. J., assignor to Ernest Y. Loomis, New York, N. Y. Filed Nov. 20, 1888. Serial No. 291,345. (No model.)

Claim.—1. In an exercising-machine, a bracket, a frame having pulleys thereon and depending from said bracket, a cord around said pulleys having a weighted cage on the end thereof, a cross-bar having a screw passing through the same with its point bearing against the top of the bracket, and wires secured to the ends of the cross-bar and serving as guides for said cage, said parts being combined substantially as described.

2. In an exercising-machine, a pulley-frame consisting of the two parts 6 and 7, the part 6 having a ratchet on its side, and the part 7 having a ratchet adapted to form a clutch with the ratchet of part 6, a connecting screw-bolt 9, and a pulley journaled on said bolt, a pin or shaft uniting the lower extremities of the part 7, and a pulley mounted on said pin or shaft, said parts being combined substantially as described.



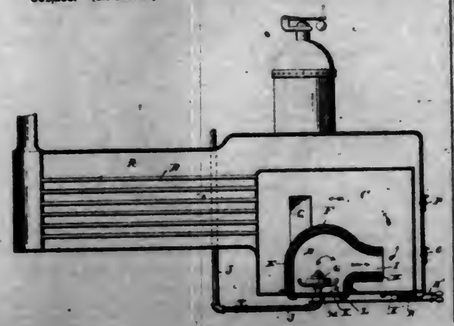
3. In an exercising-machine, a bracket with groove therein, a cross-bar with adjusting-screws, a two-part adjustable sectional frame depending from said bracket, pulleys mounted in said frame, a cord around said pulleys and carrying at one end a weighted cage, and wires secured to the ends of said cross-bars forming guides for said cage, said parts being combined substantially as described.

4. In an exercising-machine, a bracket, in combination with a two-part frame consisting of parts 6 and 7, part 6 having a side ratchet, and part 7 having a side arm with a ratchet adapted to engage with the ratchet of part 6 and form a clutch, a pulley carried by part 7, a cord on said pulley carrying a weighted cage, and guides for said cage, said parts being combined substantially as described.

5. The guides for the weight, in combination with a bar attached thereto, a bracket supporting said bar, and a screw connecting said bar and bracket, whereby the guides may be adjusted in tension and position, substantially as described.

404,808. TRIAL-FRAME FOR OCULISTS AND OPTICIANS.

ANDREW L. SMITH, Geneva, N. Y., assignor to the Geneva Optical Company, same place. Filed Sept. 3, 1887. Serial No. 248,674. (No model.)



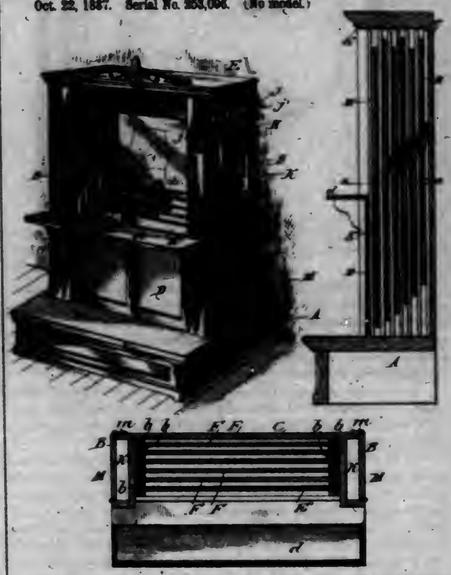
Claim.—1. In a trial-frame for oculists, an open frame consisting of two parallel rods, in combination with a central bearing-block through which said parallel rods pass, lens-frame bearing-nuts on each side of said central bearing-block, said nuts sliding on said parallel rods, and a right and left screw-rod parallel with and between said parallel rods and having its bearing in said central bearing-block and engaging with said sliding nuts to operate the same, substantially as set forth.

2. In a trial-frame for oculists, an open frame consisting of two parallel rods, in combination with a central bearing-block C, through which said parallel rods pass, lens-frame bearing-nuts H H on each side of said central bearing-block, and additional end nuts D D on each side of said central bearing-block, all of said nuts sliding on said parallel rods, and a right and left screw-rod parallel with and between said parallel rods having its bearing in said central bearing-block and engaging with said nuts H H and D D, substantially as set forth.

3. In a trial-frame for oculists, the frame-work thereof and the lens-holders adjustable thereon, in combination with the central bearing-block of said frame-work having its front face circular or segmental in shape, an adjustable nose bridge-piece resting against said circular or segmental face of the central block, an oscillating shaft mounted in said central block, and a clamping screw and nut engaging with the said shaft and clamping said nose bridge-piece against the face of said central block, substantially as set forth.

404,804. HYDROCARBON-BURNER.

WILLIAM SHER, Pittsburg, assignor to Charles T. Russell, Allegheny, and William Guckert and William Smith, both of Pittsburg, Pa. Filed Feb. 28, 1888. Serial No. 301,235. (No model.)



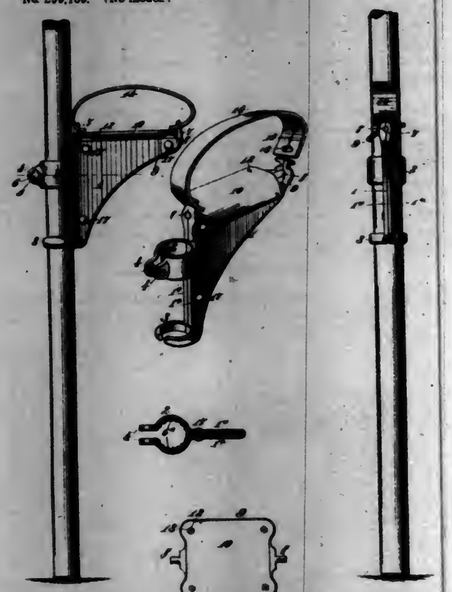
Claim.—1. In a boiler-furnace provided with a fire-box, the combination of the fire-box, the dome-shaped hood within the same bent downwardly and forwardly at its front side, the deflector arranged below the forward part of the hood, and the burner located below the arched top and within the hood, substantially as and for the purpose shown and set forth.

2. In a boiler-furnace provided with a fire-box, the combination of the exterior fire-box communicating with the flues of the steam-generator, the combustion-chamber located within the fire-box having an arched or dome-shaped top and narrow mouth or outlet facing the front end of the fire-box, the burner located within the combustion-chamber below its arched top and back of its outlet, the air-valve in the bottom of the combustion-chamber encircling the burner, and the bottom valve in the fire-chamber outside of the combustion-chamber, but below the outlet of the same, substantially as and for the purpose shown and set forth.

404,805. MAP-EXHIBITOR.

WILLIAM A. TAYLOR, Washington, D. C., assignor of one-half to George W. Loesintser, same place. Filed Oct. 22, 1887. Serial No. 253,096. (No model.)

Claim.—1. In a map-exhibitor, the combination of the sides having guides, the weights arranged outside of such guides, cords for connecting the weights with the maps, the short front piece, and the shelf provided thereon, all substantially as and for the purposes specified.



2. The map-exhibitor herein described, comprising the sides, the short front piece terminating below the upper ends of the sides, the shelf *d* at the upper end of said front piece, the maps movable in guides in said sides, the weights supported in wells in the sides, and the cords connecting the maps and weights, substantially as set forth.

3. In an exhibitor, substantially as described, the combination, with the framing having guides for the maps, &c., of the guide-pulleys arranged in two series—an inner series and an outer series—the pulleys of one series being arranged in line between those of the other series, substantially as and for the purposes specified.

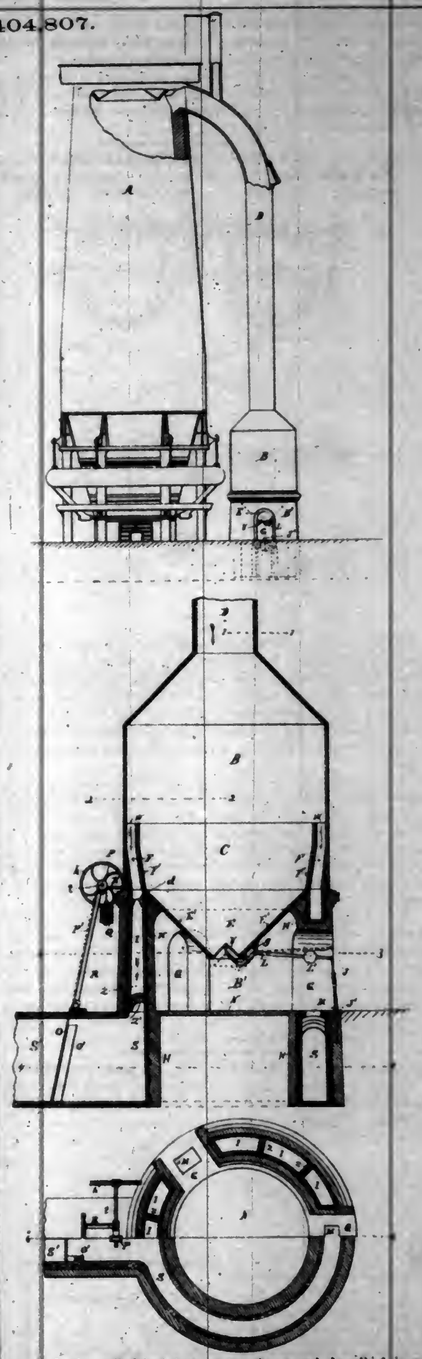
4. The exhibitor, substantially as herein described and shown, consisting of the base, the sides having guides which terminate at their lower ends in different horizontal planes, and extend at their upper ends to the upper ends of the sides, the front piece and the top hinged, whereby it may be moved from over the guides of the side pieces, substantially as set forth.

5. As an article of office-furniture, a map-chest constructed and arranged to hold a series of maps sliding in vertical grooves and being kept in position for easy inspection in parts by counterbalance-weights alone, the said chest having right and left double sides, forming two accessible lateral receptacles for the hanging and handling of the maps, and provided with a sliding front door or slide, substantially as set forth.

404,806. STILT. HENRY TEMPLE, Grand Rapids, Mich., assignor of one-half to William Harrison, same place. Filed Feb. 8, 1889. Serial No. 299,189. (No model.)

Claim.—1. The combination, in a stilt, of the step-bracket divided vertically into two separate and similar sections, each of which is provided with the semicircular part, of a clasp for embracing a staff, and an oscillating step-plate having end journals arranged and held between divided upwardly-projecting lugs of the two sections of the bracket, substantially as described.

2. In a stilt, an adjustable step-bracket provided with lugs which receive the journals of an oscillating step-plate, said lugs being provided with cross-heads forming fastenings for a detachable strap, substantially as described.

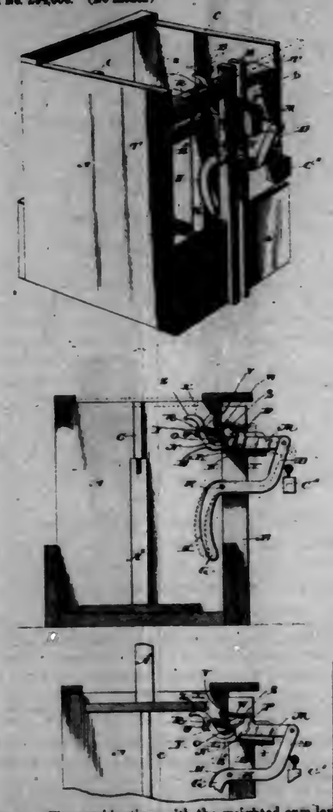


3. In a stilt, an adjustable step-bracket formed in two separate similar sections, each section having one member of the clasps, one part of each of the bearings for the oscillating step-plate and part of the cross-heads forming fastenings for a strap, each section being formed in a single integral piece and the two being united after the step-plate is inserted by suitable fastenings, substantially as described.

4. In a stilt, the combination, with the staff, of an adjustable foot-plate having two-part clasps engaging said staff, one of said clasps being provided with engaging-points and having lugs receiving a headed bolt having a tightening-nut, an oscillating step-plate having journals lying in lugs formed on said step-bracket, said step-plate being provided with a covering of suitable material, and a strap having slitted ends which engage T-shaped cross-heads formed upon the lugs which support the journals of the step-plate, substantially as described.

404,807. DUST-CATCHER FOR BLAST-FURNACES. FRANCIS H. TREAT, Joliet, Ill., assignor of two-thirds to Horace S. Smith and Charles Pettigrew, both of same place. Filed Apr. 6, 1888. Serial No. 269,809. (No model.)

Claim.—1. In the cylindrical dust-catcher shown and described, in combination with its outer wall, the inner wall arranged concentrically therein, and the space between said walls divided by cross-partitions forming vertical flues between said walls, the dust-receptacle supported concentrically within said inner wall and having vertical sides, and a funnel-shaped bottom provided with a discharge-opening controlled by a valve, substantially as and for the purpose set forth.



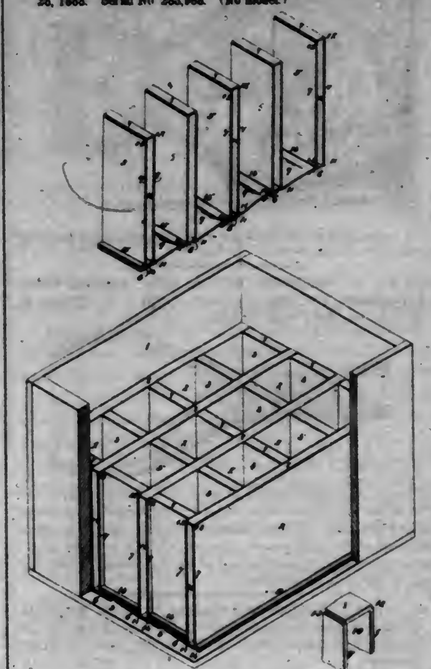
404,807.

2. In the cylindrical dust-catcher shown and described, in combination with the outer wall, the inner wall arranged concentrically therein and the space between said walls divided by cross-walls forming a series of vertical exit-flues between said walls, the dust-receptacle supported concentrically within said inner wall and having vertical sides and a funnel-shaped bottom, and the annular cover or shield secured to the inner side of said outer wall and immediately above said flues, substantially as and for the purpose set forth.

3. In the cylindrical dust-catcher shown and described, the combination, with the outer walls, and the dust-receptacle supported concentrically therein, said receptacle having vertical sides and a funnel-shaped bottom, of the vertical flues surrounding said receptacle, said flues being formed of two rows of vertical partitions, the upper row containing twice as many partitions as the lower, substantially as and for the purpose set forth.

404,808. ELEVATOR. ALEXANDER R. WALL, Colchester, Ill., assignor of one-half to Fred P. Blount, same place. Filed Dec. 18, 1888. Serial No. 294,009. (No model.)

Claim.—1. The combination, with the weighted cam-lever D, of the link M, the swinging support connected to the link, and the trigger X, pivoted in said swinging support, substantially as described.



2. The combination, of the weighted cam-lever D, the saddle or support I, the link M, connected to lever D and adapted to engage the saddle, the pivoted board or support R, connected to the link, and the trigger X, pivoted to said board or support and having the arms Z and B', for the purpose set forth, substantially as described.

3. The combination of the weighted lever D, having the cam-arm G, the saddle or support I, the link M, connected to lever D and having the shoulder adapted to engage the saddle or support, the rocking board or support R, the chain or connection between the same and the link, the trigger X, having the arms Z and B', for the purpose set forth, and the ear adapted to engage and operate the cam G and trigger X, substantially as described.

4. The combination, with the pivoted board or support R and the trigger X, swinging therein, of the weighted lever, and the link M and the chain connecting the weighted lever to the pivoted board or support R, to raise said swinging board or support R, substantially as described.

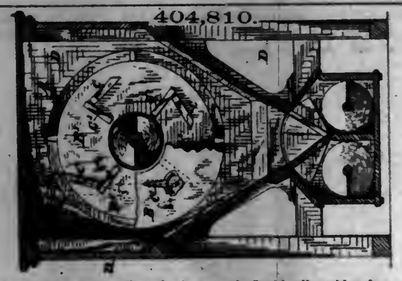
5. The pivoted support or board R, combined with the weighted lever D, having cam-arm G, the link M, and the chain connecting the board R and the lever D, and the trigger X on the board R, to engage the lever D, as set forth.

404,809. FOLDING BOTTLE-CASE. ENOS L. WALKER, St. Louis, Mo., assignor of one-half to Gabriel Hoyt, Brooklyn, N. Y. Filed Aug. 28, 1888. Serial No. 283,968. (No model.)

Claim.—1. A cellular packing for bottle-cases, comprising partitions of flexible material, each having parallel walls and a top and bottom, forming between them an inclosed air-space, substantially as and for the purpose set forth.

2. In cellular packing for bottle-cases, the combination of the partitions of flexible material, each having parallel walls and a top and bottom, forming between them an inclosed air-space, and a series of cross-partitions of the same construction placed at a right angle to the aforesaid partitions in the spaces between them, the two series of partitions constituting the cells to inclose the bottles, substantially as and for the purpose set forth.

3. In cellular packing for bottle-cases, the combination of the parallel-wall incasement-partitions constructed from an integral blank of flexible material which is cross-scored at 11, 12, 13, and 14 and folded at said cross-scores to form the foot-sections 6, double partition-incasement 7, surmounting-cap 8, and bottom section 9 of said partitions, and a series of interdivisional partitions of the same construction and placed at right angles to the aforesaid partitions in the spaces between the same, and together therewith constituting the cells that inclose the bottles, substantially as and for the purpose set forth.



4. In cellular packing for bottle-cases, the combination of the parallel-wall incasement-partitions 2 of flexible material, cross-partitions 5 of the same construction, which partitions together constitute the bottle-cells, and elastic bottom cushions that are formed by the foot, and bottom sections that extend from the bottom of the partition and form a multiple elastic layer at the bottom of the cells beneath the bottles, substantially as and for the purpose set forth.

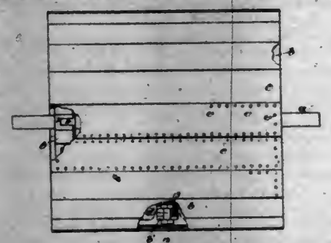
5. In cellular packing for bottle-cases, the combination of the parallel-wall incasement-partitions of flexible material, cross-partitions of the same construction, the partitions jointly constituting the bottle-cells, elastic bottom cushions formed by the foot, and bottom sections which extend from the bottom of the partitions and which cushion the bottom of the cells, and the line of stitches 15, that form flexible hinged connections of the sectional partitions, by which to erect the partitions for the package of bottles and fold them down for shipping empty, substantially as and for the purpose set forth.

404,810. BOLTING-REEL. JESSE WARRINGTON, Indianapolis, Ind., assignor to the Nordyke & Marmon Company, same place. Filed May 31, 1887. Serial No. 239,760. (No model.)

Claim.—The combination, with a bolting-reel, of one or more adjustable wings mounted in the head of its discharging end and sta-

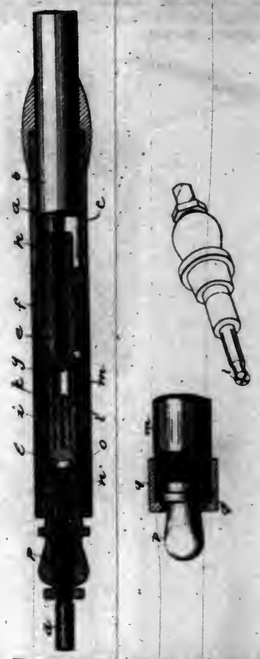
404,810.

tionary wings arranged at the inner end of said adjustable wings and extending toward the center of the reel.



404,811. CARTRIDGE-CRIMPING TOOL. FRIEDRICK WICHELHAUS, Newark, N. J., assignor to Bailey, Farrell & Co., Pittsburg, Pa. Filed Jan. 31, 1889. Serial No. 298,211. (No model.)

Claim.—As a device for indenting cartridge-shells, pivoted jaws, one of which is provided at its end with a pyramidal or equivalent projection having its base outermost, and which is adapted to engage the exterior of the shell, and the other of which is provided with a recess or indentation the counterpart of said projection, substantially as and for the purposes described.



404,812. CYLINDER FOR CARDING OR OTHER MACHINES. GEORGE O. WICKERS, Lawrence, assignor to the Davis & Furber Machine Company, North Andover, Mass. Filed July 30, 1888. Serial No. 281,395. (No model.)

Brief.—The invention consists in the improved construction of cylinders for carding-machines, &c., relating particularly to the formation of the surface on which rests the card-clothing.

Claim.—The herein-described cylinder, consisting, essentially, of a shaft, spiders thereon, and a series of metallic lags convexed at their outer faces and placed side by side to form the periphery of the cylinder, the said lags having longitudinal ribs at their inner sides provided with projections 8, forming pockets for the reception of the heads of fastening-bolts, whereby the said lags are confined to the spider, and being provided with a series of nail-receiving plugs along their edges to receive the nails employed to hold the card-clothing in place, substantially as described.

404,813. ELECTRIC-CABLE TERMINAL. ROBERT H. WIDDICOMBE, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Apr. 1, 1889. Serial No. 305,619. (No model.)

Claim.—1. The combination, with the lead pipe of a telegraph-cable, of a sleeve *h*, secured thereto by a wipe-joint, a metal sleeve *c* over the end of the conductor *a* and soldered thereto at *g*, a rubber coupling *f* between the sleeve *h* and the sleeve *c*, the tube *i*, adapted to receive a plug screwed over the end of sleeve *c*, and the rubber coupling *m*, placed over the same, substantially as and for the purpose specified.

2. The combination, with the insulated conductor *d*, of the terminal plug, said plug being provided with a handle *p*, through which the conductor *d* is inserted, packing being provided between the plug-handle and the insulating-covering of conductor *d*, said plug being inserted in a socket or tube *i*, substantially as and for the purpose specified.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

CORNELY *v.* MARCKWALD.

Decided May 13, 1889.

MEASURE OF DAMAGES.

The payment of a sum in settlement of a claim for an alleged infringement of a patent cannot be taken as a standard to measure the value of the improvements patented in determining the damages sustained by the owner of the patent in other cases of infringement.

APPEAL from the Circuit Court of the United States for the Southern District of New York.

Mr. B. F. Lee for the appellant.

Mr. W. A. Coursen for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity brought by Emile Cornely against Freeman D. Marckwald, for the alleged infringement of Letters Patent No. 83,010, granted to Cornely, as assignee of Antoine Bonnaz, the inventor, for an "improvement in sewing-machines for embroidering." There was an interlocutory decree for the plaintiff, establishing the validity of the patent and its infringement, and ordering a reference to a master to take an account of profits and damages.

The master reported that the defendant had made a profit of $142.92, by the sale of 26 infringing machines; and that he was not a willful and deliberate infringer. As to damages, he reported that the plaintiff had instituted 10 suits against other infringers on the patent, all of which, with one exception, were settled on the basis of $50 for each infringing machine; that the plaintiff claimed that that afforded a proper measure of damages, on the basis of an established license-fee; that there was a deviation in one instance because, as was stated by a witness, the case presented "circumstances of exceptional hardship," but what the circumstances were did not appear; that it did not appear that licenses were issued to any one other than in the settlement of a suit, or that the plaintiff had adopted the sum of $50 as a sum on the payment of which he was prepared to grant a license to any and all who wished to use the invention; and that the facts did not warrant the measurement of the damages by a fixed and established license-fee.

The master also reported that the plaintiff claimed that he had been forced to lower his prices to compete with the defendant; that the evidence did not show that any reduction in prices by the plaintiff was solely due to the acts of the defendant, or to what extent it was due to such acts; that as to damage to the plaintiff from the loss of the sale of machines which the defendant had sold, it did not appear what profits the plaintiff made on his machines, or what it cost to make them; and that, therefore, such damage could not be computed and could not be reported as exceeding the nominal sum of 6 cents.

The plaintiff excepted to the report, and, on a hearing, the court made a decree, (23 Blatchford, 163,) overruling the exceptions, and confirming the report, and awarding to the plaintiff the $142.92, with interest and costs, except the costs on the accounting subsequent to the master's draft report and the costs on the exceptions, which two items of cost it awarded to the defendant. The plaintiff has appealed from so much of the decree as awards to him no damages beyond the 6 cents.

The circuit court, in its opinion, held, that evidence of payments made for infringements was incompetent to establish a price as for a fixed royalty; that, as to loss by the plaintiff from the diversion of sales, he had failed to give any evidence showing the cost of his machines, or what his profits would have been; that, as there was no basis for a computation of the loss of profits, the determination of the master was correct; and that his conclusion was proper as to the alleged loss of the plaintiff by reason of the enforced reduction of his prices.

We concur in these views. As to the question of an established license-fee, the case is governed by the recent decision of this Court in *Rude* v. *Westcott*, (130 U. S., 152,) where it was held that the payment of a sum in settlement of a claim for an alleged infringement of a patent—

cannot be taken as a standard to measure the value of the improvements patented, in determining the damages sustained by the owner of the patent in other cases of infringement.

Decree affirmed.

U. S. Circuit Court—Southern District of New York.

YOUNG *et al. v.* FOERSTER.

Decided January 8, 1889.

1. INFRINGEMENT—RIGHT TO USE AND IMPROVE A PATENTED MACHINE.

A machine purchased of the complainant, the patentee, by the employer of the defendant was repaired and its construction somewhat changed by the defendant in his capacity as an employé of the purchaser. *Held* that the purchaser was at liberty to repair and improve it within the limits of his contract, and that so long as the identity of the machine was not destroyed its owner had the right to discard useless parts and add new ones which might improve its action.

2. SAME—PARTIAL USE.

One who has a license to use the whole of a machine does not become an infringer by the use of a part only.

Mr. Edwin H. Brown for the complainants.
Mr. Arthur v. Briesen for the defendant.

COXE, *J.:*

This is an action of infringement based upon Letters Patent No. 224,760, granted to Hugh Young February 17, 1880, for an improvement in machines for sawing stones.

In August, 1879, John R. Smith purchased of Young for $4,700 a machine embodying the patented features, and received a license to operate it under patents then owned by Young and under all patents for improvements on the same which thereafter might be owned by him. On the 8th of July, 1882, Smith entered into another agreement whereby, for the additional sum of $300, he received a license to use the machine according to the patent in suit, which had been granted since the purchase, and to embody any improvement covered by that patent or any other patent owned or controlled by Young. During the period in controversy Smith was the owner of the machine. The defendant was in Smith's employ, receiving $3.50 daily wages. He never used the machine except as an employé of Smith. He had no interest in or control over it. Soon after it was purchased it broke down, and since that time has been frequently repaired. No machine similarly constructed can run for more than a month without undergoing repair, which involves putting in new parts and changing old ones. In the spring and summer of 1886, on account of the removal of Smith's place of business, a more thorough overhauling was necessary. At that time new feed-screws, fly-wheels, and sash-heads were put in, the old ones being worn out. The crank-shaft and some little bolts, pins, and nuts were worn out also, and new ones were substituted. The slides on which the saw-sash runs were lowered about two feet, and all the attachments for imparting a lift or push motion to the blade were left off. Lift-motion is now imparted to the sash by an incline at each end of the guide-bars. The defendant had supervision of this work as employé of Smith. The complainants contend that what was done in 1886 constitutes an infringement. Many of the parts just mentioned—namely, "the large screws at the sides, the nuts thereon, the sash, and the crank-shaft"—had been renewed from time to time prior to 1886 with the knowledge of the patentee.

The defenses are, first, that in doing the acts of which infringement is predicated the defendant acted merely as the agent of John R. Smith; second, that Smith had a right to use and repair the machine, and that the work done by the defendant was necessary to put it in order; third, that the patent is void for lack of novelty.

The defendant did not use or vend the patented machine, and it can hardly be said upon this evidence that he made it, assuming now that an entirely new machine was constructed. The defendant acted solely as agent for Smith. He received his daily wages only. He made nothing by the transaction. The complainants expressly waive an accounting. The parts renewed were purchased of outside dealers, and put into the machine by their workmen. Very little of the manual labor was done by the defendant. He acted simply as superintendent. All that he did was done for Smith's benefit and under Smith's directions. He was there to protect Smith's interests and see that the work was properly done. This was all. The proof fails to establish infringement and brings the case within the following authorities: *Hussey* v. *McCormick*, (1 Fish., 509;) *Estes* v. *Worthington*, (30 Fed. Rep., 465;) *United Nickel Co.* v. *Worthington*, (13 Fed. Rep., 393;) *Delano* v. *Scott*, (Gilp., 498.) But is any one responsible as an infringer? Had not the owner a right to repair and improve the machine in the manner stated? The machine had a capacity to saw a stone 12 feet long and 5 feet high. It was bulky and expensive. Smith paid the patentee $5,000 for it and the right to operate it, with all the improvements covered by all the patents controlled by the complainants. When the machine broke down, as it frequently did, Smith was not required to abandon it and procure a new one. He was at liberty to repair and improve it within the limits of his contracts. These repairs were often necessary—were made with the consent of the patentee. The repairs complained of consisted, principally, in restoring portions which were worn out. True, other portions were taken off or their use discontinued. But one who has a license to use the whole of a machine does not become an infringer because he uses a part only. So long as the identity of the machine is not destroyed its owner has a right to repair it—to discard useless parts and add new ones which may improve its action. These alterations, though they changed somewhat the mode of operation, were rendered necessary, because equivalent parts had become worn out. Their addition did not make it a new machine. By putting the old machine in working order its owner did what he had a right to do. (*Gottfried* v. *Conrad Seipp Brewing Co.*, 8 Fed. Rep., 322; *Chaffee* v. *Boston Belting Co.*, 22 How., 217, 223; *Wilson* v. *Simpson*, 9 How., 109; *Union M. Cartridge Co.* v. *U. S. Cartridge Co.*, 2 Ban. and Ard., 595; *Syracuse Plow Co.* v. *Robinson*, 35 Fed. Rep., 502; *Singer Mfg. Co.* v. *Springfield Foundry Co.*, 34 Fed. Rep., 393; *Aiken* v. *Manchester Print Works*, 2 Cliff., 435.)

It is of course unnecessary to pass upon the defense, which disputes the validity of the patent.

The bill is dismissed.

U. S. Circuit Court—Southern District of New York.

AM ENDE *v.* SEABURY & JOHNSON.

Decided November 15, 1888.

1. AM ENDE—COMPOSITION OF BORATED COTTON.

Letters Patent No. 181,024, granted August 15, 1876, to Charles G. Am Ende, for an improvement in borated cotton, *Held* valid and not anticipated by such preparations as "lint steeped in a hot saturated solution of boracic acid" or "wadding saturated with a certain quantity of glycerine" or boracic acid dissolved in glycerine.

2. DESCRIPTION.

The description in the specification of the patent, which, it should be remembered, is addressed to persons skilled in the particular art to which the invention relates, is sufficiently explicit to enable a person skilled in the art to practice the invention.

Mr. Arthur v. Briesen for the complainant.
Mr. Norman T. M. Melliss for the defendants.

COXE, *J.:*

The complainant is the owner of Letters Patent No. 181,024, granted to him August 15, 1876, for an improvement in borated cotton. The object of the inventor was to produce a simple and inexpensive antiseptic dressing by combining the various advantages of cotton fiber with those possessed by boracic acid and glycerine. The specification asserts that prior to the invention boracic acid had been used as a preservative agent only in a fluid state or as a powder; and that it was necessary to immerse the matter to be preserved in the fluid or cover it completely with the powder, requiring in either case large quantities of the acid. The inventor accomplishes a better and more permanent result in a much simpler and more convenient way by saturating the cotton with the acid and glycerine in small proportions, thus adding to their preservative properties the germ-filtering quality and elasticity of the cotton. The manner of producing the borated cotton is described in the specification as follows:

> * * * I first prepare a solution of boracic acid in the usual manner, and add thereto a small proportion of glycerine. For the preservation of tender substances, such as veal, I may also add from ten to forty per cent. of soda or potash, never sufficient, however, to reach neutrality. The cotton, either in bulk or wadding, is next immersed in the solution until well impregnated therewith, and then pressed, to discharge all surplus solution, or so much thereof as may be required. The cotton is then dried and ready for use.

The claim is for—

> The borated cotton, being cotton fiber which is saturated with boracic acid and glycerine, substantially as herein shown and described.

The defenses are that the specification is not so clear and explicit as to enable a person skilled in the art to practice the invention, and that the patent is void for lack of novelty and invention. Infringement is clearly established, and is not denied in the brief submitted for the defendants.

In considering the question presented by the first defense it should be remembered that the language criticized by the defendants is addressed to persons skilled in the particular art to which it relates. To a lawyer or a banker the specification might seem vague and, perhaps, meaningless; but a pharmacist, a chemist, or even an educated physician would have little difficulty in understanding it. When the patentee says he prepares "a solution of boracic acid in the usual manner" he means as it has formerly been prepared. He speaks of it as he would speak of a solution of camphor or alum. Every druggist knows what he means. He certainly might have been more definite when he says that he adds to this solution "a small proportion of glycerine;" but it is thought that the intelligent chemist, setting out properly to combine the enumerated ingredients into which the cotton is to be immersed, and with which it is to be impregnated, could hardly go astray. Indeed, in examining the extracts introduced by the defendants to establish lack of novelty, copied from pharmaceutical journals of conceded reputation and authority, we find similar language used. Thus, in the *Druggists' Circular and Chemical Gazette* it is stated that Dr. Edmunds had used "a solution of boracic acid," and in the *Journal de Pharmacie* it appears that Prof. Gubler saturated his wadding with "a certain quantity of glycerine." The formula for preparing this dressing is then given. "It is only necessary," says the writer, "to pour a small quantity of glycerine over the square sheet," &c. Such expressions would seem to belong to the nomenclature of the art. The expression "well impregnated" means thoroughly, completely impregnated, the word "well" being used in the sense that a housewife might use it when telling her domestic to keep the bread or the joint in the oven until well done. Tested by the rule of *Loom Co.* v. *Higgins*, (105 U. S., 580,) the specification would seem to be sufficient.

The article translated from the *Journal de Pharmacie et de Chimie* is not an anticipation. It is entitled "Glycerized Cotton for Dressing Wounds." There is no reference to boracic acid. Two of the elements of Am Ende's combination—boracic acid and water, the acid in solution—are wanting. True, it is stated that Prof. Gubler found this wadding permeable to all medicinal liquids; but there is no hint that he knew that with it could be combined the preservative properties of boracic acid in an uncrystallized condition as a convenient, effective, and permanent antiseptic composition.

The article in the *American Journal of Pharmacy* of March, 1867, shows great familiarity with the characteristics and uses of glycerine on the part of the writer. He knew its excipient, hygroscopic, and penetrating properties. He knew that it was a solvent for boracic acid; but he certainly did not know—at least, he did not divulge the knowledge—that it could be combined with dissolved boracid acid, and thus held in cotton fiber for antiseptic purposes.

The quotation from the *Druggists' Circular* of June, 1875, is entitled "Boracic Acid," and describes a case of amputation in which the surgeon employed a "dressing of lint steeped in a hot saturated solution of boracic acid." This dressing was probably applied in a moist condition to the wound. No glycerine was used.

It cannot be demonstrated from the proofs that any one prior to Am Ende accomplished what he has described and claimed. Even though there be a doubt, it should be resolved in favor of the patent. The fact that others had done something quite similar—that they had used separately, or in different combinations, the ingredients of his claim—should not affect his patent. All that is described in the prior publications the defendants may use with perfect impunity. They may use "lint steeped in a hot saturated solution of boracic acid," or "wadding saturated with a certain quantity of glycerine," or boracic acid dissolved in glycerine; but they should not be permitted to use cotton saturated with a solution of boracic acid and glycerine in the manner described in the specification, for that belongs to Am Ende.

The complainant is entitled to the usual decree.

U. S. Circuit Court—Eastern Judicial District of Missouri, Eastern Division.

TAFT *v.* THE STEPHENS LITHOGRAPHING AND ENGRAVING COMPANY.

Decided March 26, 1889.

1. COPYRIGHT—SECTION 4963 CONSTRUED—PENALTY.

The language of section 4963 Revised Statutes, providing a penalty for falsely marking articles "Copyrighted," is not "for

each copy," and while it may be true that if upon different days, under different circumstances, separate copies are printed, each transaction thus separate would constitute a separate offense, yet when the printing of many copies is a single continuous act only one offense is committed thereby.

2. SAME—SAME—ARTICLES NOT COPYRIGHTABLE.

The law is clear that no offense is committed when the word "Copyrighted" is placed upon an article that is not the subject-matter of copyright—that cannot be copyrighted.

3. DEMURRER.

It being alleged in the petition that the print is not the subject of copyright, the demurrer sustained.

ON demurrer to the petition.

Mr. W. E. Fisse for the plaintiff.
Mr. Paul Bakewell for the defendant.

BREWER, *J.*:

This is a demurrer to the petition. The action is a *qui tam* action brought by the plaintiff as informer under section 4963 of the Revised Statutes of the United States to recover the penalty therein named.

The petition alleges that the defendant printed and circulated 10,000 copies of a chromo, which is described, putting on each the word "Copyrighted" or some equivalent word.

The section provides that—

every person who shall insert or impress such notice, or words of the same purport, in or upon any book, map, chart, musical composition, print, cut, engraving, or photograph, or other article for which he has not obtained a copyright, shall be liable to a penalty of $100, recoverable one-half for the person who shall sue for such penalty and one-half to the use of the United States.

The petition alleges that the defendant thus printed and issued 10,000 copies, and plaintiff asks judgment for $100 penalty for each copy, or $1,000,000 in gross. All this is stated in one count. And one ground of challenge is that either there are 10,000 different causes of action which should each be stated in a separate count, or if there is but one cause of action, a single penalty of $100 only is recoverable and the amount prayed for is excessive. The plaintiff pleads the great trouble and inconvenience there would be in setting out 10,000 causes of action.

We think that the rule is unquestioned, and see no reason why it should be deviated from in a case like this.

Plaintiff is not suing for the value of his services or for injury to his property, but simply to make profit to himself out of the wrongs of others, and when a man comes in as an informer and in that attitude alone asks to have a half million dollars put into his pocket, the courts will never strain a point to make his labors light or his recovery easy. So that if each separate imprint is a separate cause of action, we have no doubt that the petition is demurrable as joining 10,000 causes of action in a single count. But we think that, fairly construed, there is only one cause of action stated.

The petition alleges—

that heretofore, to wit, on the 2d day of November, A. D. 1888, and at divers times between said day and the commencement of this action, the said defendant did engrave, print, publish, and sell to the number of 10,000 copies a certain print, &c.

Now, the language of the statute is not "for each copy," and while it may be true that if upon different days, under different circumstances, the defendant printed separate copies, each transaction thus separate would constitute a separate offense, yet when the printing of many copies is a single continuous act only one offense is committed thereby. We had a similar question under the election statutes a year or two since, where false registrations were charged. We held there that where several names were falsely registered and all done at one time and as a single continuous act, it constituted but one offense, although if registered on different days and under different circumstances they might constitute separate offenses. Here the allegation is that "on the 2d of November and at divers times thereafter." This of course suggests a separation at least in the matter of time. Yet if the pleader claims that there were separate and distinct offenses there should be a clear divergence of each transaction both as to time and circumstances, and the court in a quasi criminal action like this ought to hold the pleader to language free from doubt, and hold as to a pleading like this that it simply alleges a continuous action in the printing and issuing of these 10,000 copies, and as such states but a single offense.

Another ground of demurrer is that the chromo upon which the word "copyrighted" was placed was not the subject of copyright.

The law is clear that no offense is committed when the word "copyrighted" is placed upon an article that is not the subject-matter of copyright—that cannot be copyrighted. The law is designed to guard against deception, and no one is deceived when the word "copyrighted" is placed upon an article that cannot be copyrighted, such as a kitchen-stove or a railroad-car.

Now, the plaintiff in this case describes the chromo, and the description discloses an article which could be copyrighted, and if the petition stopped with this description it would doubtless be sufficient. But it goes further and alleges that—

said printing and chromo has not been copyrighted by the defendant or any other person, nor was the same subject to copyright under said laws.

Thus it appears that the averment of disability is not limited to the person, but is cast upon the print. It was not the subject of copyright. There is in this an apparent contradiction to that which might be inferred from the language of description. Counsel suggests that the thought he had was that under the particular circumstances this print could not be copyrighted, and it is possible that there might be circumstances which would thus at the time exclude this print from copyright, although in its nature it was the subject-matter of copyright. But in a criminal or quasi criminal action the pleading should be clear and consistent. The court is not called upon to strain any language to remove doubt or secure consistency. There should be no labored effort at reconciliation of apparently contradictory averments, at least when the pleading is challenged before trial. So, because it is alleged that the print was not the subject of copyright, we think the demurrer should be sustained, and it is so ordered.

Subsequent pleading may be prepared with reference to the views of the offense as above expressed.

Plaintiff will be granted 30 days in which to file an amended petition, and defendant 30 days thereafter to plead thereto.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., May 24, 1889.

SIR: The Secretary of the Interior has ordered that Roderick McDonald, of Gardiner, Kennebec county, Me., be not recognized after this date as agent or attorney in the prosecution of any claim or other matter before this Department or any bureau thereof.

Very respectfully,

E. M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1887, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Issue of June 11, 1889.

DESIGNS.

19,146.—WALL-POCKET.—*Magnus Benas*, New York, N. Y. Application filed May 14, 1889. Serial No. 310,715. Term of patent 7 years.

19,147.—PORTABLE FIRE-PLACE GRATE.—*Edward L. Cately*, Philadelphia, Pa., assignor to *Gilbert Combs*, *John Bawden*, and *John H. Bawden*, Freehold, N. J. Application filed January 9, 1889. Serial No. 295,886. Term of patent 7 years.

19,148 and 19,149.—PORTABLE FIRE-PLACE GRATE.—*Edward L. Cately* and *Joseph A. Read*, Philadelphia, Pa., assignors to *Gilbert Combs*, *John Bawden*, and *John H. Bawden*, Freehold, N. J. Applications filed January 9, 1889. Serial Nos. 295,889, and 295,890. Term of patents 7 years.

19,150.—PORTABLE FIRE-PLACE GRATE.—*Edward L. Cately*, Philadelphia, Pa., assignor to *Gilbert Combs*, *John Bawden*, and *John H. Bawden*, Freehold, N. J. Application filed January 9, 1889. Serial No. 295,882. Term of patent 7 years.

19,151.—HARNESS-TERRET.—*Eugene L. Howe*, Cleveland, Ohio, assignor to *The Eberhard Manufacturing Company*, same place. Application filed May 10, 1889. Serial No. 310,321. Term of patent 7 years.

19,152.—DECORATIVE FABRIC.—*Charles H. Koster*, Brooklyn, N.Y., assignor to *The Unexcelled Fireworks Company*, same place. Application filed June 12, 1888. Serial No. 276,881. Term of patent 7 years.

19,153.—GEM-SETTING.—*James W. Lawson*, East Providence, assignor to *Hancock, Becker & Co.*, Providence, R. I. Application filed April 26, 1889. Serial No. 308,759. Term of patent 7 years.

19,154.—SHIRT-BOSOM.—*Victor Henry Rothschild*, New York, N.Y. Application filed May 13, 1889. Serial No. 310,647. Term of patent 3½ years.

19,155.—METALLIC CEILING.—*Longley Lewis Sagendorph*, Cincinnati, Ohio, assignor of one-half to *Harlan P. Lloyd*, same place. Application filed February 4, 1889. Serial No. 298,674. Term of patent 14 years.

19,156.—HANDLE FOR STOVE-LID LIFTERS, &c.—*William W. Sly*, Cleveland, Ohio. Application filed April 23, 1889. Serial No. 308,338. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,703.—BOOTS, SHOES, GAITERS, AND SLIPPERS.—*Acme Staple and Machine Company*, Philadelphia, Pa. Application filed May 15, 1889. Used since December 24, 1884.
"The word 'ACME.'"

16,704.—COMPRESSED COOKED BEEF.—*Armour Packing Co.*, Kansas City, Kans. Application filed October 18, 1888. Used since July 19, 1888.
"The representation of a block of beef upon a plate."

16,705.—PURE WHITE BALL SOLID NAPHTHALINE.—*Henry M. Black*, Pittsburg, Pa. Application filed May 8, 1889. Used since February 10, 1888.
"The words 'MOTH MARBLES.'"

16,706.—REVOLVERS, SHOTGUNS, AND RIFLES.—*Hermann Boker & Co.*, New York, N. Y. Application filed March 20, 1889. Used since July 1, 1888.
"The word 'CLIMAX.'"

16,707.—MEDICAL COMPOUNDS FOR EXTERNAL APPLICATION.—*Evelina de La Forest Kelly*, New Brighton, N. Y. Application filed April 19, 1889. Used since March 1, 1889.
"The word 'SOCORRO.'"

16,708.—VETERINARY MEDICINES OR SPECIFICS.—*Humphreys Homeopathic Medicine Company*, New York, N. Y. Application filed December 18, 1888. Used since 1873.
"The representation of a horse's head."

16,709.—DRESS-SHIELDS.—*A. Hutchinson & Co.*, Paris, France. Application filed April 3, 1889. Used since May 15, 1888.
"The words 'LA COLLERETTE.'"

16,710.—PERFUMED SOAP, SACHET-POWDER, AND THE LIKE.—*Ladd & Coffin*, New York, N. Y. Application filed April 19, 1889. Used since March 15, 1889.
"The word 'EDENIA.'"

16,711.—METALS AND MANUFACTURES THEREFROM.—*The Low Moor Company*, (*Limited*,) Low Moor, near Bradford, county of York, England. Application filed May 1, 1889. Used since March 7, 1782.
"The words 'LOW MOOR.'"

16,712.—WAISTS MADE FROM KNITTED GOODS.—*James McCreery & Co.*, New York, N. Y. Application filed May 8, 1889. Used since January 1, 1889.
"The word 'MATELOT.'"

16,713.—LADIES' AND CHILDREN'S SUITS.—*James McCreery & Co.*, New York, N. Y. Application filed May 8, 1889. Used since January 1, 1889.
"The word 'HOLLYWOOD.'"

16,714.—HYDRAULIC HOSE.—*New Jersey Car Spring and Rubber Company*, Jersey City, N. J. Application filed May 2, 1889. Used since January, 1889.
"The word 'EMERALD.'"

16,715.—GRAFTING COMPOUNDS AND PREPARATIONS FOR DESTROYING INSECTS.—*Ongerth Grafting Compound Company*, San Francisco, Cal. Application filed May 15, 1889. Used since June 1, 1888.
"The representation of a man and woman engaged in the operation of applying the preparation in the two forms of liquid and powder and the cans or packages in the foreground."

16,716.—CANNED FRUITS, VEGETABLES, AND SHELL-FISH.—*Piper Packing Co.*, Rockport and Union, Me. Application filed April 16, 1889. Used since September, 1888.
"The words 'MORNING GLORY.'"

16,717.—NEWSPAPER.—*Charles M. Palmer*, Minneapolis, Minn. Application filed March 25, 1889. Used since 1873.
"The words 'NORTHWESTERN MILLER.'"

16,718.—LINIMENTS AND BLOOD-PURIFIERS.—*Philibert François Perrin*, Columbus, Ga. Application filed March 15, 1889. Used since December, 1888.
"The letters 'P. F. P.' associated with a representation of a mortar and pestle."

16,719.—IRON AND STEEL AND MANUFACTURES OF IRON AND STEEL.—*Sandvikens Jernverks Aktie Bolag*, Sandviken, Sweden. Application filed November 30, 1888. Used since 1868.
"The representation of a fish and fish-hook."

16,720.—ARTICLES OF IRON AND STEEL.—*Sandvikens Jernverks Aktie Bolag*, Sandviken, Sweden. Application filed November 30, 1888. Used since 1868.
"The word 'SANDVIK.'"

16,721.—COTTON LININGS, SILESIAS, SATEENS, CAMBRICS, AND TWILLS.—*Frank L. St. John*, New York, N. Y. Application filed February 18, 1889. Used since January 2, 1889.
"The word 'OXFORD.'"

16,722.—PORTABLE STOVES, HEATERS, RANGES, AND FURNACES.—*Samuel A. Suydam*, New York, N. Y. Application filed March 27, 1889. Used since July 1, 1887.
"The words 'OUR CROWN.'"

16,723.—INFANTS' PREPARED FOOD.—*William C. Wagner*, Brooklyn, N. Y. Application filed May 7, 1889. Used since March 11, 1889.
"The arbitrary word 'NUTRITIVUM.'"

16,724.—MIXED PAINTS.—*The Wadsworth Paint and Oil Manufacturing Company*, Brooklyn, N. Y. Application filed May 16, 1889. Used since March 1, 1886.
"A representation of the Bartholdi statue of Liberty Enlightening the World, erected in the harbor of New York."

16,725.—SUGAR-CURED HAMS.—*Moses Walton, Jr.*, Spring Valley, Ohio. Application filed March 27, 1889. Used since December, 1876.
"The representation of a packing-house on the banks of a stream flowing through a valley, and across the stream is a bridge, near which is a train of cars, associated with the words 'SPRING VALLEY SUGAR CURED HAMS, SPRING VALLEY, OHIO.'"

16,726.—TRIMMINGS FOR DRESSES AND CLOAKS.—*Samuel Weil*, New York, N. Y. Application filed March 28, 1889. Used since January 2, 1889.
"The word 'STERLING' in script letters within a circle."

16,727.—GUANO.—*R. A. Wooldridge & Co.*, Baltimore, Md. Application filed May 14, 1889. Used since June 1, 1887.
"The word 'QUICK-STEP.'"

LABELS.

5,932.—Title: "EMULSION OF COD LIVER OIL WITH PEPTONATE OF IRON AND QUININE."—*Boeddike & Waller*, New York, N. Y. Application filed May 15, 1889.

5,934.—Title: "FRENCH'S ESSENCE OF CRUSHED VIOLETS" (FOR SODA WATER SIRUP.)—*French, Richards & Co.*, Philadelphia, Pa. Application filed May 14, 1889.

5,935.—Title: "GOSSER'S CREAM GLYCERINE."—*J. J. Gosser*, Emlenton, Pa. Application filed February 13, 1889.

5,936.—Title: "JOHNSTON'S CELEBRATED EAST INDIAN MALARIA CURE."—*Joseph B. Johnston*, Providence, R. I. Application filed August 23, 1889.

5,937.—Title: "KRAUSE'S HEADACHE CAPSULES."—*Norman Lichty*, Des Moines, Iowa. Application filed April 20, 1889.

5,938.—Title: "MUCILAGE."—*Pomeroy & Sons*, Newark, N. J. Application filed April 29, 1889.

5,939.—Title: "PURE FRUIT PEACH JUICE."—*S. Richards & Sons*, Mobile, Ala. Application filed April 1, 1889.

5,940.—Title: "DELATOUR" (FOR SODA WATER.)—*Ackley C. Schuyler*, New York, N.Y. Application filed March 29, 1889. (Trade-Mark Registered.)

5,941.—Title: "DR. STRASSMAN'S EMMENAGOGUE."—*Mrs. Dr. Strassman*, San Francisco, Cal. Application filed May 20, 1889.

5,942.—Title: "WAGNER'S INFANT FOOD."—*William C. Wagner*, Brooklyn, N. Y. Application filed April 15, 1889.

PATENTS

GRANTED JUNE 11, 1889.

404,814. PHOTOGRAPH-PRINT MOUNTER. JOHN W. ALLDERICE, Waterbury, Conn. Filed Aug. 30, 1888. Serial No. 284,161. (No model.)

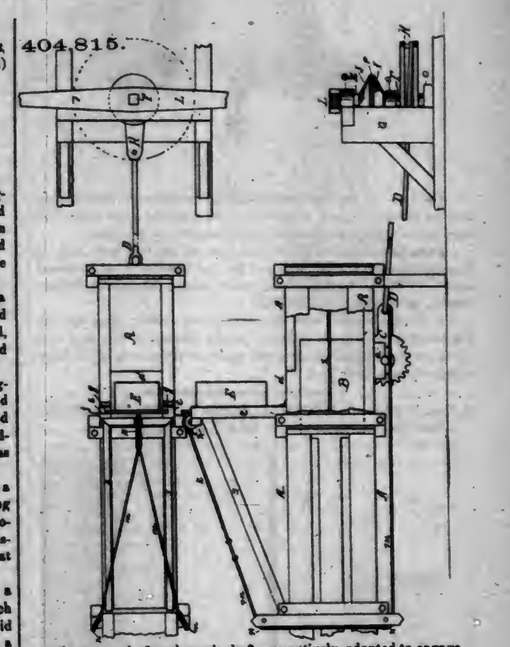
Claim.—1. A photographic-print mounter consisting of a spring-roller, a frame in which said roller is mounted, a textile strip carried by said roller, the outer end being secured in a fixed position, and an operating-roller partially inclosed by the textile strip and provided with a handle, whereby the strip may be laid over the surface of the print with pressure and without friction.

2. A photographic-print mounter consisting of a spring-roller, a frame in which the roller is journaled, a textile strip carried by said roller, a winding-roller to which the outer end of the strip is attached, and an operating-roller partially inclosed by the strip and provided with a handle, as and for the purpose set forth.

3. The frame-work, a spring-roller journaled therein, a winding-roller engaging slots in the frame, and a locking-pin, whereby said roller is locked in position, in combination with a textile strip wound upon the spring-roller and having its outer end secured to the winding-roller, and an operating-roller having a handle, substantially as described.

4. In a device of the class described, the combination, with a spring-roller and a textile strip wound thereon, its outer end being secured in a fixed position, of a winding-roller journaled in a two-part carrier, the parts of said carrier having half-screws which register with each other, and a handle engaging the half-screws so that the parts are held together and the roller retained in position.

5. The frame, a spring-roller journaled therein and carrying a textile strip, a winding-roller also journaled in the frame-work to which the outer end of the strip is attached, and a locking device for said winding-roller, in combination with an operating-roller journaled in a two-part carrier, the parts of the carrier having half-screws which match each other, and a handle engaging said half-screws, as and for the purpose set forth.



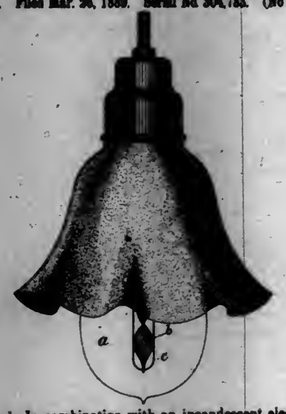
404,815. BALING-PRESS. FRED W. ADDEMAN, Maple Plain, Minn. Filed May 19, 1888. Serial No. 274,441. (No model.)

Claim.—1. The combination, with a horizontally-movable follower and a vertically-movable gravity-actuated condenser, of a segment-gear lever operating upon a corresponding rack upon the follower, means for operating said lever in one direction, and a cable or cables attached to said condenser passing over pulley-sheaves and connected with said lever, substantially as described, whereby the weight of the condenser operates the segment-gear lever in the other direction.

2. In a baling-press, a horizontally-movable follower, a gravity-actuated vertically-movable condenser, a longitudinally-extending rack upon said follower, a segment-gear lever adapted to mesh with said rack, a pitman connected with suitable power for oscillating said segment-gear lever in one direction, and a cord passing over sheaves *i* and *n* and connecting said segment-gear lever and condenser, whereby the drawing back of the segment-lever to move forward the follower raises the condenser, and the falling of the condenser draws back the follower, substantially as specified.

3. The combination, with the horizontally-movable follower and segment-gear lever for actuating the same, and a condenser connected with said segment-lever by cords and sheaves in such a manner that the weight of the condenser operates to cause the return movement of the follower, of a horse-power consisting of an upright crank-shaft, a pitman-rod connecting said crank and segment-gear lever, a sweep-shaft mounted above and in the axis of the crank-shaft, clutch members

404,815.

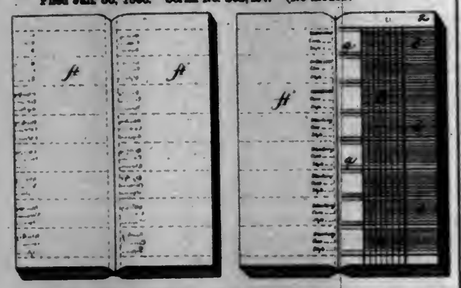


upon the sweep-shaft and crank-shaft, respectively, adapted to engage with each other when power is applied to the sweep-shaft and to become disengaged when power is applied to the crank-shaft, substantially as specified, whereby one-half a revolution of the crank-shaft from the inner to the outer dead-center is caused by the power applied by means of the sweep and the balance of the revolution by the downward movement of the condenser through its connection with the segment-lever and pitman independently of the movement of the sweep.

4. The clutch member I, mounted upon the crank-shaft, the gravity clutch member J, mounted and vertically movable upon the sweep-shaft and adapted to interlock with the clutch member I, when resistance is offered to the revolution thereof, and to ride over the same when clutch member I is caused to move independently in the same direction, in combination with the horizontally-movable follower, a segment-gear lever for operating the same, a pitman-rod connecting said lever and crank upon the crank-shaft, and means for drawing back said lever when the follower has finished its forward stroke, substantially as and for the purpose herein specified.

5. The combination, with a horizontally-movable follower, a segment-gear lever for actuating said follower, and a gravity-actuated condenser connected with said segment-gear lever in such a manner that the movement of the lever to move forward the follower raises the condenser, and the falling of the condenser draws back the follower, of a horse-power consisting of a vertically-mounted crank-shaft, a sweep-shaft mounted above the crank-shaft in the same axis, a pitman-rod connecting the crank upon the crank-shaft and the segment-gear lever, and clutch mechanism adapted to couple said shafts until the follower has completed its forward stroke and then to be released, substantially as and for the purpose herein specified.

404,816. INCANDESCENT LAMP. CHARLES A. BACKERTON, New York, N. Y. Filed Mar. 26, 1889. Serial No. 304,732. (No model.)



Claim.—1. In combination with an incandescent electric lamp and the filament thereof, a spiral standard attached to the base of the lamp and axially disposed therein, substantially as described.

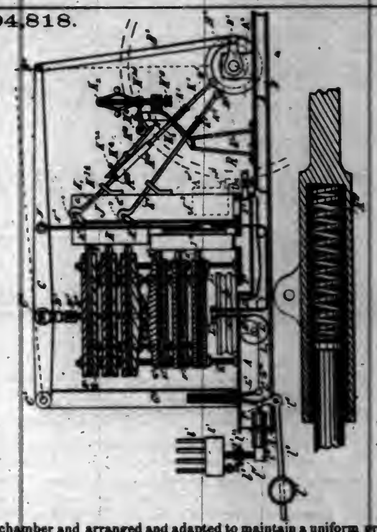
2. In combination with an incandescent electric lamp and the filament thereof, a spiral standard for the support of said filament attached to the base of said lamp, made of glass and axially disposed therein, substantially as described.

3. In combination with an incandescent electric lamp and the filament thereof, a spiral standard axially disposed within said lamp for the support of said filament and made ont of the body of the lamp, substantially as described.

404,817. BLANK BOOK. NATHAN H. BAKER, Providence, R. I. Filed Jan. 30, 1883. Serial No. 262,457. (No model.)

Claim.—The described blank book having permanent leaves with spaces on both sides for the matter of which a record is to be kept, and a detachable leaf on each side of the permanent leaf, the printing on each detachable leaf conforming in position to the corresponding space on the opposite side of the permanent leaf, whereby the record from two sides of a permanent leaf may be transferred by carbon-paper to the detachable leaves on either side thereof, substantially as described.

404,818. AIR-ENGINE. JAMES S. BALDWIN, Newark, N. J. Filed May 19, 1888. Serial No. 274,453. (No model.)



Claim.—1. In an air-engine, the combination of a hot-air chamber and a cold-air chamber exposed to the pressure of the outer air and each having flexible walls, a regenerator, and a heating apparatus heated by steam or hot water for the development of power, substantially as set forth.

2. In an air-engine, an operative chamber having flexible walls and arranged and adapted to have a suitable heating medium applied to warm a portion of the internal surface thereof independent of the heat supplied to the air employed therein, substantially as described.

3. In an air-engine, the combination of a series of automatically-movable plates and a series of hot-air chambers having flexible walls and flexible necks or outlets, said plates being arranged and adapted by their simultaneous action to transmit power from said chambers to the working parts of said engine, substantially as and for the purposes set forth.

4. In an air-engine, an accumulator, in combination with a hot-air chamber and arranged and adapted to maintain a uniform pressure in said hot-air chamber during the whole time the hot air is entering therein, as set forth.

404,818.

5. In an air-engine, an accumulator arranged and adapted to supply heated air to the hot chamber or chambers at the beginning of each inflation thereof before the cold-air chambers commence the delivery of their air, substantially as described.

6. In an air-engine, in combination, an accumulator, a spring, and an intermediate cam or equivalent graduating apparatus, said cam being arranged and adapted to change the varying strain of the spring into a practically uniform pressure on the accumulator, as set forth.

7. In an air-engine, in combination, an accumulator having flexible walls and a spring arranged and adapted to maintain a constant strain upon the movable head of said accumulator, as described.

8. In an air-engine, in combination, an accumulator having flexible walls and a cold-air chamber, said accumulator being arranged and adapted to receive cold air from the cold-air chamber and to supply said air under tension to the hot-air chamber, as set forth.

9. In an air-engine, an accumulator, in combination with a hot-air chamber, and adapted, as described, to maintain a uniform tension in said chamber during nearly the whole of the operative stroke of the engine, substantially as set forth.

10. In an air-engine, an accumulator, in combination with a regenerator, and adapted to transmit air through said regenerator into the hot-air chamber of said engine, substantially as set forth.

11. In an air-engine, in combination, an accumulator, a regenerator, a heater, and means, as described, for supplying said accumulator with cold air under pressure, as and for the purposes set forth.

12. In an air-engine, in combination, an accumulator, a hot-air chamber, and a governor, substantially as and for the purposes set forth.

13. In an air-engine, the combination of hot and cold air chambers having flexible walls and an accumulator, substantially as set forth.

14. In an air-engine, in combination, a cold-air pump and an automatic regulating device arranged to adapt the quantity of air delivered by said pump to that required by the engine, substantially as set forth.

15. In an air-engine, in combination, a cold-air chamber or pump and an automatic regulating device adapted to regulate the amount of air delivered by said pump by controlling the action of the inlet-valve of the said pump or chamber, substantially as and for the purposes set forth.

16. In an air-engine, in combination with a hot-air chamber, a relief-valve opening inwardly and arranged and adapted to admit warm air to the said hot-air chamber when a partial vacuum is formed therein, substantially as set forth.

17. In an air-engine, the combination of hot and cold air chambers having flexible walls, an accumulator, and a thermal apparatus, the whole constructed and operated substantially as and for the purposes set forth.

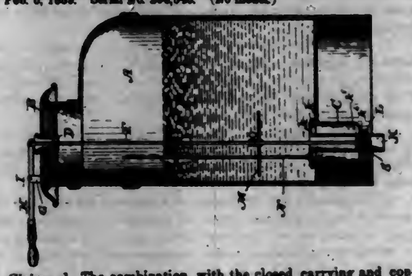
18. In an air-engine, in combination, a thermal apparatus, an accumulator, and a hot-air chamber or chambers, said thermal apparatus being arranged and adapted to control the tension of the air employed in said hot-air chamber or chambers by the action of the temperature of the external atmosphere, as set forth.

19. In an air-engine, a thermal apparatus actuated by the temperature of the external atmosphere, and a hot-air chamber or chambers, said thermal apparatus being adapted and arranged, as described, to cause an increase of the pressure of the air supplied to said hot-air chamber or chambers by the decrease of the temperature of said atmosphere, substantially as set forth.

20. In an air-engine, in combination with a hot-air chamber or chambers thereof, a thermal apparatus actuated by the temperature of the external atmosphere, and arranged and adapted, as described, to cause a decrease in the pressure of the air supplied to the hot-air chamber or chambers by the increase of the temperature of the atmosphere, substantially as set forth.

21. In an air-engine, the combination of a series of parallel movable plates connected by suitable rods or bars, a corresponding series of fixed parallel plates, and a series of cells or chambers having flexible walls interposed between said series of plates for receiving heated air under pressure, substantially as described, and for the purposes set forth.

22. In an air-engine, the combination of a series of parallel movable plates, a corresponding series of fixed plates, said fixed and movable plates being also adjustable in their relation to each other, and a series of cells or chambers interposed between said series of plates and having flexible wall for receiving cold air, substantially as and for the purposes set forth.



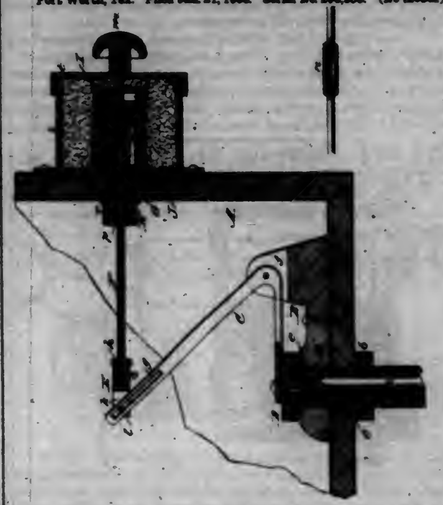
23. In an air-engine, the combination of the fixed plates F and F', movable plates G and G', chambers H and H', heater J, and regenerator J', constructed and operated substantially as described.

24. In an air-engine employing the heat of hot water or steam, the combination of a hot-air chamber, a cold-air chamber, each having flexible walls and exposed to the pressure of the outer atmosphere, and a valve adapted to cut off communication between said chambers, substantially as and for the purposes set forth.

25. In an air-engine employing the heat of steam or hot water, the combination of a series of hot-air chambers, a series of cold-air chambers, each having flexible walls and each exposed to the pressure of the outer air, a corresponding series of fixed and movable plates, a heater, and a regenerator, substantially as described, and for the purposes set forth.

26. In an air-engine employing the heat of steam or hot water, the combination of a series of hot-air chambers, a series of cold-air chambers, each having flexible walls, fixed and movable plates, as described, and a valve adapted to automatically cut off the supply of air under pressure from the hot-air chambers before their inflation is complete, substantially as described.

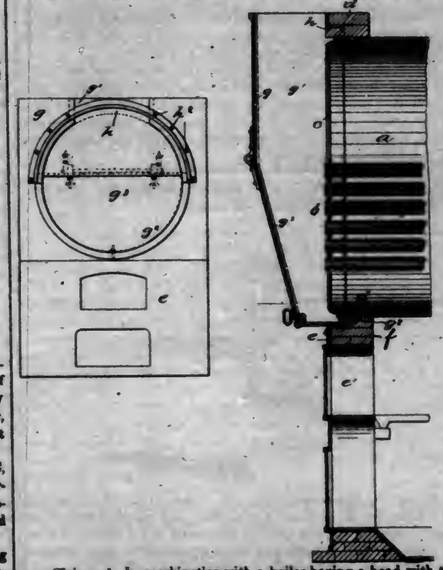
404,819. LIQUID TRANSPORTING AND MEASURING VESSEL. HARVEY P. BARNHART and SAMUEL L. BARNHART, Potsdam, N. Y. Filed Feb. 6, 1889. Serial No. 298,948. (No model.)



Claim.—1. The combination, with the closed carrying and containing vessel A, having the open-bottomed measuring-chamber C, of the piston S, the detachable cylinder K, and means for operatively closing the joints between the cylinder and the measuring-chamber, whereby the said chamber is adapted to be filled and emptied, as set forth.

2. The cylinder K, in combination with the measuring-vessel C, the latter open at top and bottom and the former having the covering-cap *k* at its upper extremity, the contracted lower end thereof being provided with a thumb-nut, and means for packing the top and bottom openings of the measuring-chambers, as set forth.

3. The carrying and containing vessel A, having the measuring devices described, comprising the cylinder K, the piston S, and chamber C, in combination with the agitator M, fixed to the piston-rod, whereby the operation of discharging the contents of the vessel simultaneously agitates and thoroughly incorporates the constituent parts of the same, as set forth.

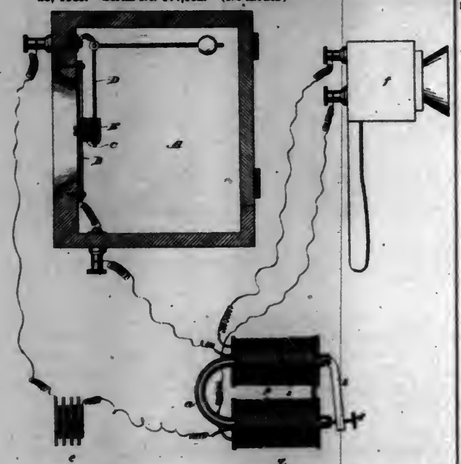


4. The closed vessel A, having the open-bottomed measuring-chamber C, the cylinder K, seated therein and provided with perforations k^4, and the sliding piston S, in combination with the air-inlet pipe N and float-valve *n*, connecting the said measure-chamber with the air-space in the top of the said closed vessel, as set forth.

404,820. ANTI-FREEZING TANK-VALVE. WILLIAM H. BARRETT, Fort Worth, Tex. Filed Jan. 21, 1889. Serial No. 296,953. (No model.)

Claim.—The combination, with the tank, its valve and lever, and the valve-rod F, of the frost-chamber having an annular space to receive the non-freezing compound, the stuffing-box G around the rod F and screw-threaded at the ends, and the screw-threaded caps H and I, having necks *p* and flanges *r*, all arranged and operating substantially as shown and described.

404,821. BOILER FRONT AND SETTING. HENRY L. BEACH, Hartford, Conn. Filed Jan. 24, 1889. Serial No. 297,336. (No model.)



Claim.—1. In combination with a boiler having a head with the internal flange secured thereto, the boiler-front composed of a section *e* and the section *g*, the latter box-like in form and constituting the smoke-chamber *g'*, and having in its rear wall the socket g^2 for the end of the boiler, all substantially as described.

2. In combination with a tubular boiler having the shell *a*, the head *c*, with inturned flange *d'*, secured to said shell by rivets *d*, the section *e* of the boiler-front, and the hollow section *g*, with the boiler-socket g^3 in the rear wall, the edge of said socket lying back of the line of rivets *d*, all substantially as described.

3. In combination with a boiler having a flanged head secured therein, the lower front section *e* and the hollow upper front section *g*, having the boiler-socket g^3, the edge of which lies back of the front line of rivets, all substantially as described.

4. In combination with a boiler-front and setting composed of the lower section *e* and the hollow upper section *g*, forming smoke-chamber *g'*, and having a boiler-socket g^3 greater in vertical diameter than the boiler, the boiler having the flanged head secured therein by a line of rivets, the socket adjacent to the lower half of the boiler lying back of the front line of rivets, all substantially as described.

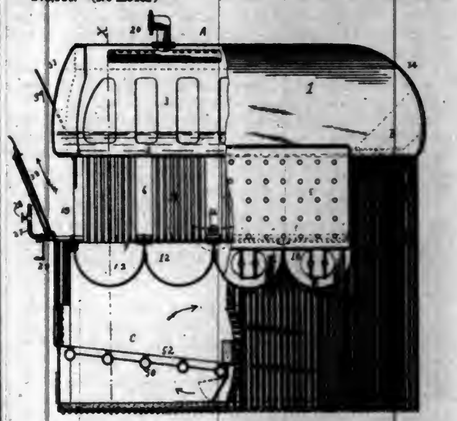
404,822. INDUCTION-COIL. FRED. H. BROWN, Fort Worth, Tex., assignor to the Magnetic Telegraph Company, of New York. Filed Sept. 23, 1885. Serial No. 177,932. (No model.)

Claim.—1. The combination of the core, the primary and secondary coils wound thereon, and means for bringing the poles of the core toward or from each other, substantially as described.

2. The combination of the bent core, the primary and secondary coils wound thereon, the adjustable armature connected to one pole (to form an extension thereof) and extending over the opposite pole, and the set-screw for moving the free end of the armature toward or from the disconnected pole to establish or break the magnetic circuit, substantially as described.

404,828. PLOW. CARL G. BUSCHNER, Webster, Dak. Filed Nov. 30, 1888. Serial No. 292,283. (No model.)

Claim.—1. The combination, with a plow, a hinged stub-axle, a seat mounted on the axle, and a land-wheel, of a supplementary beam loosely secured to the axle and the main beam of the plow, and a device to adjustably secure the axle to the handles of the plow, substantially as set forth.



2. The combination, with a plow-beam, a mold-board, landside, and plow-handles, of a stub-axle hinged to one of the handles, a seat mounted on the stub-axle, a supplementary plow-beam removably attached to the front end of the main plow-beam and also pivoted on the stub-axle, and a connecting-rod that is loosely secured to the axle and adjustably attached to a bar which is fastened to the plow-handles, substantially as set forth.

404,824. BUSHING FOR PULLEYS. CHESTER W. CLARK and THERON D. KEASEY, Mishawaka, Ind., assignors to the Keasey Pulley Company, same place. Filed Feb. 28, 1888. Serial No. 265,542. (No model.)

Claim.—A pulley-bushing made of paper and an abrading material, substantially as set forth.

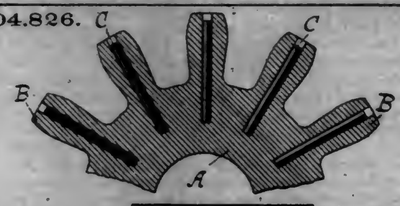
404,825. STEAM-BOILER. NATHAN B. CLARK, Washington, D. C., and FRANK B. KIRK, Baltimore, Md. Filed June 27, 1888. Serial No. 278,381. (No model.)

Claim.—1. A steam-boiler consisting, essentially, of a number of connected segments running longitudinally, a number of reversed segments running transversely thereof, and a series of water-tubes connecting these segments.

2. A steam-boiler consisting, essentially, of a number of connected top segments running in one direction, a number of reversed bottom segments running in a direction at a right angle thereto, but of less width than the length of the top segments, and tubes connecting the flat sides of the segments.

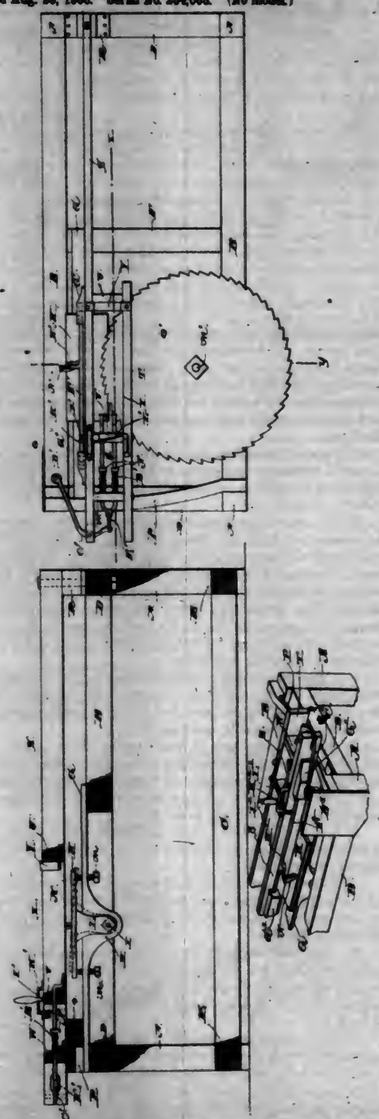
3. The combination, in a steam-boiler, of a water-tube box serving as a flue for the products of combustion, a pair of arched sections connected together at their edges, and a stay connecting these edges to the tube-box, substantially as described.

4. The combination, in a boiler, of a series of top segments and a series of bottom segments connected therewith, as described, each bottom segment having a depressed pocket, and a pipe extending into the interior of and opening inside the segment in proximity to the pocket.



5. The combination, in a steam-boiler, of a series of water-tubes connecting the larger members and a movable perforated pipe extending between said tubes, said pipe having connections, substantially as described, whereby a jet of steam, air, or water may be conveyed to spaces between the tubes to clean the same, substantially as described.

6. The combination, with a boiler consisting of top section and bottom section and connecting-tubes, of a rotary perforated pipe between said tubes, a connecting-pipe leading to the same, and a handle whereby said perforated pipe may be rotated, substantially as described.



404,826. COGGED GEARING. WILLIAM COURTENAY, New York, N. Y. Filed Feb. 13, 1888. Serial No. 299,696. (No model.)

Claim.—Cogged gearing composed of vulcanized fiber, having strengthening-pins extending from the body of the gear into each tooth, said body and teeth being integral, substantially as described.

404,826.

404,827. MACHINE FOR SAWING SHINGLES. GEORGE J. DAVIS, Mill Bay, assignor of one-half to William D. Davis, Statesborough, Ga. Filed Aug. 20, 1888. Serial No. 284,063. (No model.)

Claim.—1. The combination of the frame, the saw, the carriage guided on the frame and adapted to be moved across and from the saw, the longitudinally-movable rod sliding in guides on the carriage, the tappet-arm, and the tilt-table having the cam or arm M, adapted to be engaged by the tappet-arm, for the purpose set forth, substantially as described.

2. The combination, in a machine for sawing shingles, of the frame having the stop O, the pivoted carriage movable toward and from the saw, the dogs Z in the said carriage, for the purpose set forth, the springs B' on the shanks of the dogs to normally move the said dogs in one direction, and the lever C', pivoted to the carriage and connected to the said dogs, and having the roller D', adapted to engage the stop O as the carriage is withdrawn from the saw, whereby the dogs will become disengaged, substantially as described.

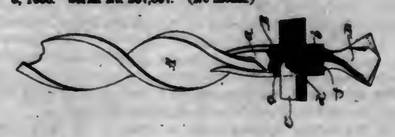
3. The combination, in a machine for sawing shingles, of the frame, the tilting table supported thereon and having the arm N, the screws M, to limit the movement of the tilting table, the carriage, and the longitudinally-movable rod F, guided thereon and having the tappet-arm to engage the arm N, substantially as described.

4. The combination, in a machine for sawing shingles, of the frame, the tilt-table thereon having the arm N, the carriage, the longitudinally-movable rod F on the carriage, having the tappet-arm H', the handle to move the rod in one direction, and the spring L', to move the rod normally in the opposite direction, substantially as described.

404,828. LETTER-BOX. WILLARD D. DURRIN, Washington, D. C. Filed Jan. 31, 1889. Serial No. 298,173. (No model.)

Claim.—1. In a letter-box, the combination, with the body having an opening in one side thereof, of a plate pivoted to the body adjacent to one edge of the opening and adapted to close the same, said plate having a curved flange on one edge, and a curved guard-plate projecting into the body of the box diametrically opposite the curved flange on the pivoted plate, substantially as set forth.

2. In a letter-box, the combination, with the body and a restricted chamber on top of the latter, said chamber having an open side, of a plate pivoted in the body at the lower edge of the opening, a curved flange on one edge of the pivoted plate concentric with the axis of the latter, tapering segments at the end of the pivoted plate, and a curved plate projecting from the body diametrically opposite the curved plate on the pivoted plate, and concentric also with the axis of the latter, substantially as set forth.



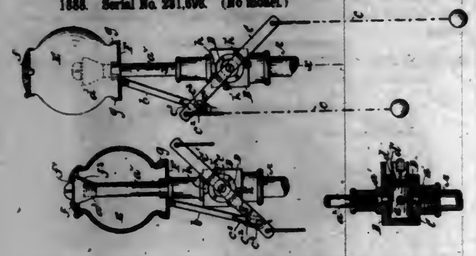
3. In a letter-box, the combination, with the body having an opening in its side, of a lid pivoted in the body, said lid having flanges at its ends adapted to lap over the adjacent edges of the body, substantially as set forth.

4. In a letter-box, the combination, with the body of the box and a restricted chamber at the top having an opening in its side, of a lid having a counterpoise at one edge, flanges at the ends to lap over the edges of the body, and an angle-plate projecting laterally from the lid and adapted to act as a stop to abut against the body, and thereby prevent the lid from being opened too far, substantially as set forth.

5. In a letter-box, the combination, with the body of the box and a restricted chamber at the top having an opening in its side, of a lid pivoted in the body at the lower edge of the opening and provided at its upper end with an inwardly-projecting flange, an angle-plate projecting out at right angles from the outer face of said lid, and adapted to abut against the adjacent surface of the body of the box and serve as a stop to prevent the lid from being opened too far, substantially as set forth.

6. In a letter-box, the combination, with the body having an opening therein and the lower door, of a dial supported on a pivot within the body, with its edge projecting over the lower opening, said dial having characters to be exhibited through the opening, and a flange located between the dial and the body and projecting over the crack formed between the meeting edges of the body and door, substantially as set forth.

404,829. DRILL-BIT. JAMES EAGEN, Wyoming, Pa. Filed Oct. 3, 1888. Serial No. 287,067. (No model.)



Claim.—1. In a drill-bit, the combination, with a stem having a transverse opening therein, of a removable knife located within said opening and having cutting ends and a notched side edge, and a leader secured to the stem below the knife and locking the latter in position.

2. In a drill-bit, the combination, with a stem having a screw-threaded bore at one end and a transverse slot through this bore, of a knife having a notch therein and adapted to enter this slot, and a leader having a screw-stem designed to enter the bore and the notch in the knife, whereby the knife is locked in place, substantially as set forth.

3. In a drill-bit, the combination, with a twist-stem and an integral tip having a screw-threaded bore and a transverse slot through the latter, of a knife having a notch in one edge and oppositely beveled or sharpened edges, and a twisted leader adapted to enter the bore of the tip and be seated in the notch of the knife, substantially as set forth.

404,830. GAS-BURNER. WILLIAM F. FOLMER, New York, N. Y., assignor of one-half to Walter R. Schwing, same place. Filed Aug. 1, 1888. Serial No. 281,696. (No model.)

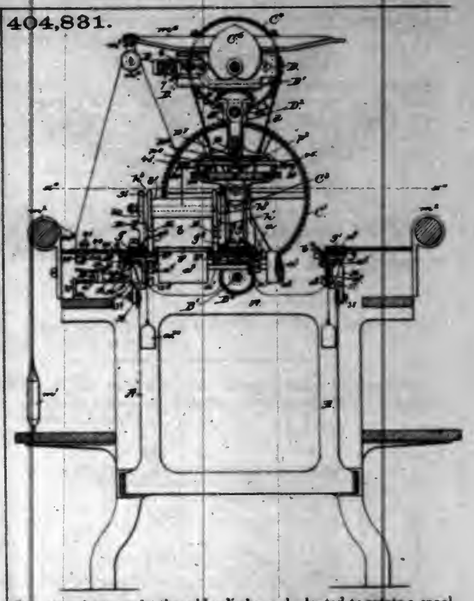
Claim.—1. The combination, with a cock having a rotary plug, a burner, a globe, a rocking piece connected to the plug, and a link connected near one end to the globe and having a slotted connection near the other end, with a pin on said rocking piece, said slot having a notch and a spring, substantially as specified.

2. The combination, with a supply-pipe, of a cock having a rotary plug, a globe, a gas-burner, a swinging connection between the globe and the plug of the cock, a rocking bar on the plug, stops for varying the degree of rotation of the plug comprising a projection on the cock, and adjustable stops engaging the rocking bar on each side of the projection, substantially as specified.

3. The combination, with a gas-cock having a rotary plug, a gas-burner, a globe for the gas-burner, a swinging connection between the globe and the plug, and hinged covers for the globe provided with a central opening and adapted to contact with the burner-tip when the globe is moved in one direction, substantially as specified.

404,831. SPOOLING-MACHINE. JOHN W. FOSTER, Pawtucket, R. I., assignor of one-half to George B. Manning, Taunton, Mass. Filed Jan. 30, 1888. Serial No. 262,315. (No model.)

Brief.—The object of the invention is to produce an improved machine for doubling or winding yarn from cops or bobbins upon spools, effective in its operation and requiring little floor-space.



Claim.—1. The series of horizontally-placed driving-cylinders having their axes of rotation substantially at right angles to the frame, means to rotate them, and the series of drums resting thereon and adapted to rotate a series of spools by frictional contact, combined with a series of open-centered brakes, as b^3, interposed directly between the said driving-cylinders and drums, each brake having bars, as shown, extended in the direction of the length of the drum and at opposite sides of the axis of rotation of the said drum to thereby engage and instantly lift the drum above it from contact with the cylinder driving the said drum, the contact of the brake with the drum to lift the same from the cylinder acting instantly to check the rotation of the drum, substantially as described.

2. The cylinder a^3, the drum resting thereon, the slotted spool-stands to receive the journals of the said drum, and bearing means for the spool, also guided between and held by the said spool-stands, combined with the brake b^3, having an open center and interposed directly between the cylinder and drum, the bars or projections 400 400 of the brake acting upon the drum at the opposite sides of a vertical line drawn from the journals of the drum, whereby the drum is lifted vertically and is supported by the brake at each side, the said line thus instantly stopping the rotation of the spool, substantially as described.

3. The driving-cylinder, means to rotate it, the drum resting on and rotated by the said cylinder, the slotted spool-stands, and cheek-pieces to hold frictionally between them and clamp the spools, and having journals free to enter and rotate and slide vertically in the slots in the said spool-stands, substantially as described.

4. The driving-cylinder, means to rotate it, the drum resting

404,831.

thereon and rotated by the said cylinder and adapted to rotate a spool lying thereon, and spool-stands provided with slots and overhanging flanges 51 to form pockets, as 18, combined with bearing means, substantially as described, for the spools, the said bearing means consisting of independent cheek-pieces and journals, the latter entering the said pockets automatically when the spool has been filled, substantially as described.

5. The driving-cylinder, combined with slotted spool-stand adapted to receive between them the spool to be rotated, one of the said stands being made movable in a direction from and toward the other, substantially as described.

6. The series of driving-cylinders arranged across the machine in the direction of its length, drums resting on the said cylinders, and spool-stands slotted, as at 17 18, to leave flanges 51 overhanging the slots 17, combined with independent cheek-forming bearing means for both ends of the spools, the said bearing means, as the spools fill, rising and rotating in the said slots 17 until the bearing means meet the said flanges, the latter, as the yarn on the spool increases in diameter, acting on the bearing means to force the same into the slots 18 to stop the spool, substantially as described.

7. The driving-cylinder, means to rotate it, the spool-stands, the drum resting thereon, and the brake, combined with the brake-actuating lever, the spring-actuated bolt of the stop-motion, and means to actuate it, substantially as described.

8. The driving-cylinder, the intermediate drum adapted to support the spool, and the slotted spool-stands, one of which is movable upon a pivot in a direction from and toward the other, combined with a spring adapted to hold in operative position the pivoted portion of the spool-stand, substantially as described.

9. In combination, the revolving ratchet-wheel 33, the spring-operated bolt f, the lever pivoted thereon, and the drop-wires, substantially as described.

10. The driving-cylinder, means to rotate it, the drum, the brake, and the brake-actuating lever provided with the shelf, combined with the starting-lever to move the brake-actuating lever, to operate substantially as described.

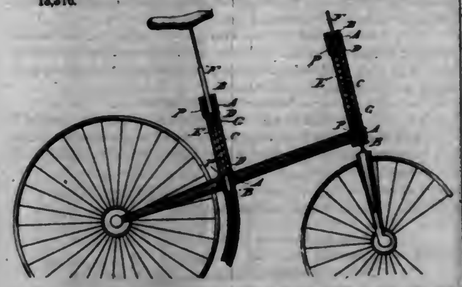
11. The heart-cam shaft, the heart-cam thereon, the horizontally-sliding carriage D, and the wave-motion carriage, combined with the sector-lever actuated by the said carriage and connections, substantially as described, between it and the said wave-motion carriage, as set forth.

12. In a spooling-machine, two series of driving-cylinders arranged transversely of the machine and having their axes substantially in line, two series of drums parallel therewith and resting thereon, and two series of spool-stands, combined with bearing means, substantially as described, for the said spools, and with the open-center brakes interposed directly between the said cylinder and drum and having parallel bars acting upon opposite sides of the axis of the drum to lift each drum from each cylinder, and with means to actuate the said brakes, substantially as described.

13. In a spooling-machine, two sets of driving-cylinders at opposite sides of the frame, with their axes at right angles to the length of the frame, two sets of spool-stands, stand-rails to which they are bolted, rails on which the stand-rails rest, and means to adjustably connect the stand-rails with the said rails, combined with two sets of drums b, for rotating the spools b', and bearing means for the spools, whereby the spool-stands may be simultaneously adjusted to adapt the frame for the reception of spools of different lengths, substantially as described.

14. Two sets of driving-cylinders, one at each side of the frame, the axes of the said cylinders being arranged transversely of the frame, two sets of slotted spool-stands, and bearing means for the said spools between the said stands and above the said cylinders, combined with the wave-motion carriage located above the spools and having arms p^3, and thread-guides, as 24, for the yarns going to both sets of spools, and with means to rotate the said cylinders and actuate the wave-motion carriage, to operate substantially as described.

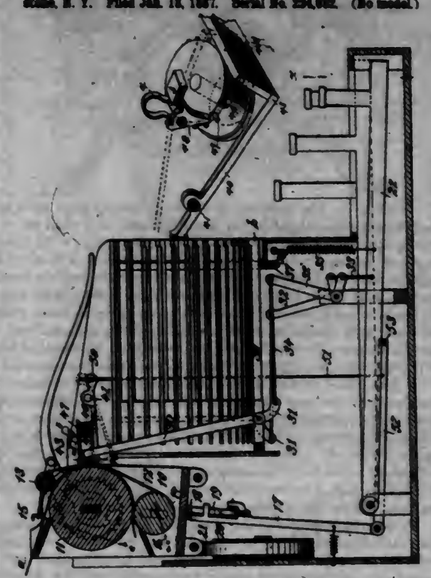
15. The slotted spool-stands, driving-cylinder, and drum, combined with metallic cheek-pieces, shaped substantially as described, at their inner side for engagement with the spool and provided at their outer side with journals entering the slots of the said stands, substantially as described.



16. The cylinder a^3, the drum, the brake, and the brake-actuating lever having a toe and a shoulder 8 and weight to move the said lever, combined with the spring-actuated bolt, its attached lever, drop-wire, and ratchet, and means to move it, substantially as described.

17. In a spooling-machine, two sets of driving-cylinders at opposite sides of the frame, the said cylinders having their axes coincident, or substantially so, two sets of slotted spool-stands having flanges, as 51, to leave pockets 18 below them, two sets of drums having their axes parallel to the axes of and resting on the said cylinders, and bearing means for the spools, combined with the wave-motion carriage, and means, substantially as described, to reciprocate it transversely of the frame, the said wave-motion carriage and its actuating cam-shaft being located above the said drums and spools thereon, substantially as described.

18. In a spooling-machine, two series of driving-cylinders, one at each side of the frame, the said cylinders having their shafts or axes of rotation arranged transversely of the frame, means to rotate the said cylinders at uniform speed, two sets of slotted spool-stands, bearing means for the spools to be held by the said slotted stands and to be rotated between the said stands, a wave-motion carriage having yarn-guiding eyes to guide the yarn going to the said spools, and means for actuating the said wave-motion carriage, substantially as described.



19. In a spooling-machine, two sets of driving-cylinders at opposite sides of the frame, the said cylinders having their axes coincident, or substantially so, two sets of slotted spool-stands having flanges, as 51, to leave pockets 18 below them, two sets of drums having their axes parallel to the axes of and resting on the said cylinders, and bearing means for the spools, combined with the wave-motion carriage, means, substantially as described, to reciprocate it transversely of the frame, the said wave-motion carriage and its actuating cam-shaft being located above the said drums and spools thereon, a series of brakes, brake-actuating levers, stop-motion devices, and with means for moving the said stop-motion devices on the breaking of a yarn, substantially as described.

404,832. VELOCIPEDE. WILLIAM GOULDEN, No. 1 Donegal Place, Clapton, London, County of Middlesex, England. Filed Nov. 8, 1887. Serial No. 254,652. (No model.) Patented in England Oct. 1, 1887, No. 13,316.

Claim.—The combination, in velocipedes and other wheeled vehicles, substantially as described, of a cylinder with stuffing-box attached at each or either end, the cylinder being dust-proof and containing a long coil spring or springs with piston-rod working through the center of coil spring or springs and stuffing-box or stuffing-boxes and extending through the box or boxes any convenient distance each way for the purpose of attachment at each or either end, substantially as set forth.

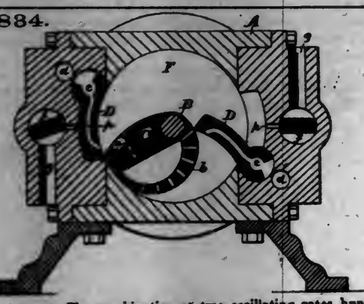
404,833. TYPE-WRITING MACHINE. ARTHUR GRANDY, White Plains, N. Y. Filed Jan. 18, 1887. Serial No. 224,662. (No model.)

Claim.—1. In a type-writing machine, the combination, with the type-arms and their operating-levers, of a tilting frame, ribbon-spools mounted on said tilting frame, and intermediate mechanism, substantially as described, for operating the tilting frame from the type-operating levers, as and for the purpose specified.

2. In a type-writing machine, the combination, with the type-arms and their operating-levers, of a tilting frame operated by the type-operating levers, ribbon-spools mounted on the tilting frame, and means, substantially as described, for turning the ribbon-spools at each throw of the said tilting frame, as specified.

3. In a type-writing machine, the combination, with the carriage and means for operating the same, of pivoted type-arms, a tilting frame, ribbon-spools mounted on said tilting frame, and a connection, substantially as described, between the said tilting frame and the carriage-operating mechanism, as set forth.

4. In a type-writing machine, the combination, with the main frame, of a tilting frame pivoted thereto, a ribbon-spool mounted on the said tilting frame, and a pawl on the main frame engaging the ribbon-spool to turn it at each throw of the said tilting frame, substantially as described.



5. In a type-writing machine, the combination, with the main frame, of pivoted key-levers, pivoted type-arms, a tilting frame, ribbon-spools on the said tilting frame, toothed wheels carried by the spools, a spring-pressed pawl arranged in connection with one of the toothed wheels, and means, substantially as described, for operating the type-arms and tilting frame from the key-levers, substantially as specified.

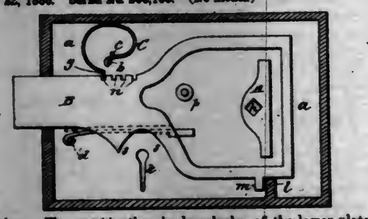
6. In a type-writing machine, the combination, with the levers 22, of the type-arms 30, arranged in front of the carriage in a curve about a common center and pivoted a short distance from one end, the crank-levers 32, the rods 34, connected to long arms of the crank-levers and to the short arms of the type-arms, the rods 33, connecting the short arms of the crank-levers to the levers 22, and the springs 35 for returning the type-arms to their normal positions, substantially as described.

7. In a type-writing machine, the combination, with the carriage and its operating-frames 52 and 53, of the type-arms 30, the key-levers 22, intermediate mechanism, substantially as described, between said levers and type-arms, the pivoted ribbon-carrying frame 40, and the connection 51 between the ribbon-frame and the frames 52 and 53, substantially as described.

404,834. ROTARY ENGINE. HENRY HAAR, Bristol, Conn., assignor of one-half to J. B. Holley, same place. Filed Mar. 3, 1888. Serial No. 266,496. (No model.)

404,884.

Claim.—1. The combination of two oscillating gates hung at diametrically-opposite points, the piston mounted on a shaft for revolving in a given direction and having a concentric face at its outer edge and one pressure-face on its convex rear side that extends at an angle to said concentric face from the rear corner thereof to a point near the shaft on the arc of a circle whose radius is not greater than the length of each gate, the case having a cylindrical chamber with live-steam ports located at the back of said oscillating gates, and alternately-acting cut-off valves for said live-steam ports on opposite sides of said case, substantially as described, and for the purpose specified.

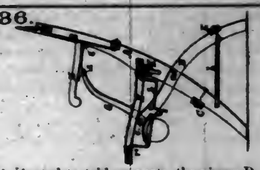


2. In a rotary engine having a case provided with a cylindrical chamber and inlet-ports and having a revolving piston within said chamber, the oscillating gate having an inclosed exhaust passage-way extending lengthwise through said gate, the induction of which passage opens into the cylindrical chamber on the inner concave face of said gate at a point near the swinging end thereof, and the eduction of which passage is at the pivotal end of said gate, substantially as described, and for the purpose specified.

3. In a rotary engine having a revolving piston, the combination of the oscillating gate having an inclosed exhaust passage-way through it that opens on the inner concave face of said gate at a point near the swinging end thereof and extends backward through said gate to its pivotal end, and a case having a cylindrical chamber for said piston with an inlet-port located at the back of said gate, substantially as described, and for the purpose specified.

4. The combination of a case having a cylindrical chamber and inlet-ports, the revolving piston mounted on a shaft within said chamber, the oscillating gates both having a bearing-contact with said piston when it is moving in a forward direction and having an inclosed exhaust passage-way through them that opens on the inner concave face of said gates at a point near the swinging ends thereof, and alternately-acting cut-off valves on opposite sides of said case, substantially as described, and for the purpose specified.

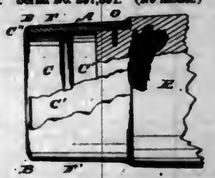
5. The combination of the case having a cylindrical chamber, the oscillating gates hung in the case, each having a concave inner face on the same arc as the wall of said cylinder, and the revolving piston having the cam *b* for actiug against the concave inner faces of said gates and provided with perforations for the passage of steam through said cam from one side to the other of the point where the gate bears against it and thereby prevent the gate from being forced out of contact with said cam, substantially as specified.



404,885. LOCK. SAMUEL C. HARLAN, Lake City, Minn. Filed Mar. 22, 1888. Serial No. 268,109. (No model.)

Claim.—The combination, in door-locks, of the lower plate or casing *a a a*, having a center-post *p* and lugs *l*, *b*, *c*, *d*, and *e*, a bolt B, for a latch and lock, provided with notches *n*, a lug *m*, a shoulder *f*, and two shoulders *e e*, with a spring C, having lug *y*, and a spring D, with its shoulder *g*, all substantially as set forth.

404,886. FOLDING CHAIR OR SETTEE. HERBERT J. HARWOOD, Littleton, assignor to the Harwood Manufacturing Company, Boston, Mass. Filed Jan. 12, 1889. Serial No. 295,963. (No model.)



Claim.—1. The combination of the supports A, constituting the sides of the back frame and also the front legs, the seat arranged between and pivoted to said supports, the pieces D, constituting the rear legs and also supports for the seat, connected to each other by the bar E and pivoted to the supports A, the bar E, the links G, pivoted to the seat-supports and to arms H, the arms H, hinged to the supports A, and the connection *b*, secured to the legs, all substantially as shown and set forth.

2. The combination of the supports A, constituting the sides of the back frame and also the front legs, the seat arranged between and pivoted to said supports, the friction-hinges K at the pivots, the pieces D, connected by the bar E and constituting the rear legs and also supports for the seat and pivoted to the supports A, the bar E, and the connection *b*, secured to the legs, all substantially as shown and described.

3. The friction-hinge consisting of the bracket provided with the rests *g*, pin *h*, and hole *k*, the nut-lock having the prong and nut-socket, the bolt and nut and washer *l*, combined with the seat and supports A, all essentially as shown and set forth

404,887. HUB-BAND. WILLIAM LE B. HAWES, Cincinnati, Ohio, assignor of one-half to the Standard Wagon Company, same place. Filed Jan. 28, 1889. Serial No. 297,891. (No model.)

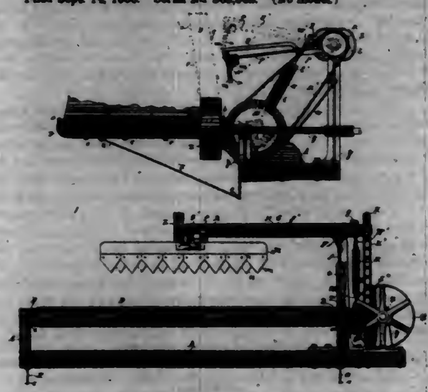
Claim.—1. An iron hub-band covered with a sheet-metal ornamental band locked in place by the lining C, substantially as and for the purpose described.

2. An iron hub-band countersunk to receive the screws for attaching it to the hubs and the whole covered by a sheet-metal ornamental band locked in place by the lining C, substantially as and for the purpose described.

404,888. VEHICLE-WHEEL HUB. WILLIAM LE B. HAWES, Cincinnati, Ohio, assignor of one-half to the Standard Wagon Company, same place. Filed Feb. 13, 1889. Serial No. 300,341. (No model.)

Claim.—1. A vehicle-wheel hub consisting of a wooden hub incased in a metallic shell made in two or more parts, locked to the wooden hub, one shell being provided with an external bead at its inner edge to hide the joint and resemble a plain wooden hub, substantially as and for the purpose described.

2. A vehicle-wheel hub consisting of a wooden center incased within a metallic shell made in two or more pieces, one piece being locked to the hub by means of teeth embedded in the wood, substantially as and for the purpose described.



404,889. POINT-BAND FOR VEHICLE-HUBS. WILLIAM LE B. HAWES, Cincinnati, Ohio, assignor of one-half to the Standard Wagon Company, same place. Filed Mar. 6, 1889. Serial No. 302,090. (No model.)

Claim.—1. A point-band for vehicle-wheels, consisting of an iron band provided with an ornamental metal band expanded around it in the manner and for the purpose described.

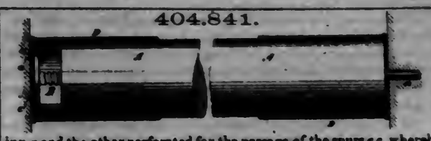
2. A compound point-band for vehicle-hubs, consisting of an ornamental metal band expanded around an iron band, with the outer edge curved and locking in place an interior lining-band, substantially as and for the purpose described.

404,840. HAND-CUTTER. CHAUNCY H. HILL, Minneapolis, Minn. Filed Sept. 14, 1888. Serial No. 285,262. (No model.)

Claim.—1. In band-cutters, the combination, with an endless carrier, of a rock-shaft having a rigid arm overhanging said carrier transverse to the plane of its movement, a cutter on the outer end of said arm, a driving-shaft provided with an eccentric or crank, an extensible connecting-rod from said eccentric to said rock-shaft, and a resistance-spring acting on said rock-shaft in opposition to the pressure of the bundles, substantially as described.

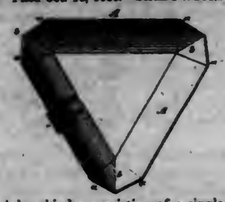
2. In band-cutters, the combination, with an endless carrier, of a rock-shaft provided with a crank and a rigid arm overhanging said carrier transverse to the plane of its movement, a cutter on the outer end of said arm, a driving-shaft provided with an eccentric, a telescopic eccentric-rod connecting said eccentric and the crank of the rock-shaft, and a spring connecting and tending to draw together the telescoping parts of said eccentric-rod, substantially as described.

3. In band-cutters, the combination, with an endless carrier, of a hollow rock-shaft having a cutter-supporting arm overhanging said carrier transverse to the plane of its movement, a constantly-revolving shaft within said rock-shaft provided with a cam, fixed and movable cutters on said supporting-arm, and a connection from said cam to said movable cutters for operating the same, substantially as described.



4. In band-cutters, the combination, with an endless carrier and a driving-shaft having an eccentric, of a hollow rock-shaft having a crank and a rigid cutter-supporting arm overhanging said carrier, an extensible eccentric-rod coupling together said crank and eccentric, a fixed and a movable cutter-bar provided with knives mounted on said supporting-arm, a constantly-revolving shaft located within said rock-shaft and provided with a cam, and a connection from said cam to said movable cutter-bar, substantially as described.

5. In band-cutters, the combination, with an endless carrier and a driving-shaft having an eccentric, of a shaft frame or support overhanging the path of the bundles, a hollow rock-shaft having a crank-arm and a rigid cutter-supporting arm overhanging said carrier transverse to the plane of its movement, fixed and movable cutter-bars having knives mounted on said arm, an automatically-extensible eccentric-rod coupling said eccentric and crank, a revolving cam-shaft within said rock-shaft provided with a cam, a bell-crank lever pivoted to said rock-shaft, having one arm in engagement with said cam and the other connected to said movable cutter-bar, and a connection from said cam-shaft to said driving-shaft, as and for the purpose set forth.



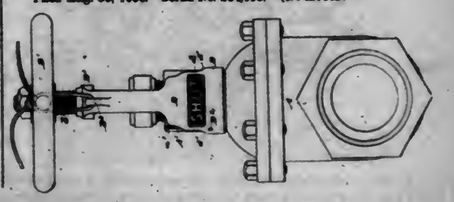
6. In band-cutters, the combination, with an endless carrier, of a rock-shaft having a crank and a cutter-supporting arm overhanging said carrier, a fixed and a reciprocating cutter mounted on said arm, a driving-shaft provided with an eccentric, and an automatically-extensible eccentric-rod coupling said eccentric and the crank of said rock-shaft, substantially as described.

404,841. CURTAIN-POLE. FRANK G. JOHNSON, New York, N. Y. Filed Feb. 7, 1888. Serial No. 263,363. (No model.)

Claim.—In combination with a curtain-pole A, the supporting-fixture consisting of the screw B, screwed into said pole and having the disk C attached to its outer end, the said disk being provided with two or more spurs *c c*, located near the periphery, the caps D, covering the ends of the pole, one of which is provided with a bearing *a* and the other perforated for the passage of the spurs *c c*, whereby the said screw is held from turning as the curtain-pole is turned to extend the same, as and for the purpose set forth.

404,842. METALLIC BOX-BINDER. FRANK G. JOHNSON, New York, N. Y. Filed Oct. 16, 1888. Serial No. 288,255. (Model.)

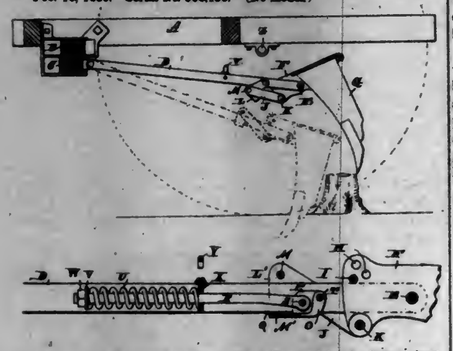
Claim.—A box-binder consisting of a single flat strip of sheet-metal A, bent on the three diagonal lines *a a*, *a a*, and *a a* and on the three cross-lines *b b b*, having three sides at right angles to and inclined toward each other, and having the two ends of the said strip fastened together, as and for the purpose set forth.



404,843. FLEXIBLE RECEPTACLE FOR LIGATURES. ROBERT W. JOHNSON, New Brunswick, N. J. Filed May 3, 1889. Serial No. 310,011. (No model.)

Claim.—1. A receptacle for ligatures for surgical purposes, consisting of a flexible tube in which said ligatures can be retained side by side in an unbent condition, with an antiseptic liquid therein, the whole hermetically closed, substantially as described.

2. A receptacle for ligatures for surgical purposes, consisting of a flexible tube of gelatasolve, in combination with ligatures retained side by side therein in an unbent condition and projecting beyond one of the ends of the tube, and an antiseptic liquid hermetically closed with flexible gelatine, substantially as described.

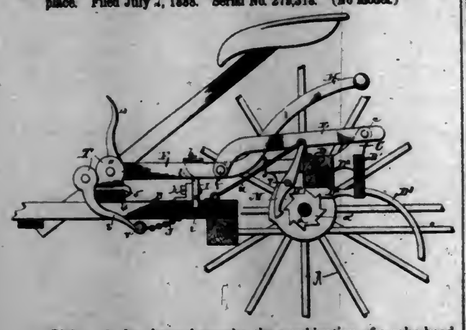


404,844. VALVE-INDICATOR. DANIEL KENNEDY, Brooklyn, N. Y. Filed Aug. 30, 1888. Serial No. 284,153. (No model.)

Claim.—1. In a valve having a casing A and boss A', with operating-shaft B, having a screw-thread *b*, the combination therewith of a sleeve D, surrounding such boss and connected therewith by the longitudinal groove *a'* and pin D^2, so as to allow longitudinal motion, and the yoke D', connecting such sleeve with the thread *b*, all arranged for joint operation, as herein specified.

2. The easily-destroyed fastening M, in combination with the casing A A', stem B, having hand-wheel B', and screw-thread *b*, and with the sleeve D, yoke D', and lug D^2, and with the groove *a'* and pin D^2, for holding the sleeve against rotation, all substantially as herein specified.

404,845. HOE FOR GRAIN-DRILLS. MARTIN L. KIBBELL, Springfield, Ohio, assignor to the P. P. Mast & Company, same place. Filed Feb. 16, 1889. Serial No. 300,136. (No model.)



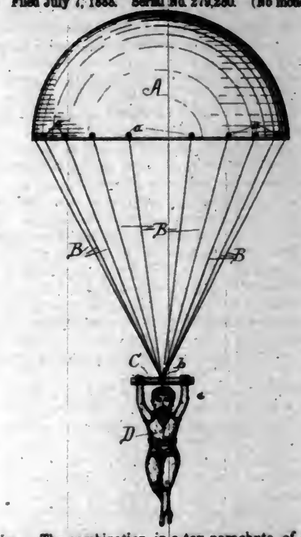
Claim.—1. The combination, with a hoe and its draft-bar pivotally connected to it, of a spring-rod carried by the draft-bar, a lever pivoted to the draft-bar at one end, links pivoted to the hoe and to the other end of said lever, a stop constituted by said lever between said last pivots, and a pivotal connection between the lever and the spring-rod.

2. The combination, with a hoe and its draft-bar pivotally connected thereto, of a spring-rod carried by the draft-bar, a lever composed of an upwardly-turned rear portion pivoted to the draft-bar, a body locked under and across the said bar and side pieces at the sides of said bar, and an arm within the draft-bar, a pivotal connection between the said arm and the spring-rod, and links pivotally connected with the hoe and with the said side pieces of the lever.

3. The combination, with a hoe, its draft-bar composed of two pieces pivoted to the hoe, a plate and rod between said pieces, a spring between the plate and an enlargement on the forward end of the rod, a stop-lever composed of a rear upwardly-extending portion pivoted to said draft-pieces, an arm extending from said portion and pivoted to said rod, a body beneath and across said draft-pieces and side pieces, and links pivoted to the upper forward ends of the side pieces and to the hoe below its pivotal connection with the draft-pieces.

4. A stop-lever composed of a horizontal body portion, side pieces extending above said portion, a rear upwardly-extended part, and a short arm projecting forward from said part, all of said parts being integral.

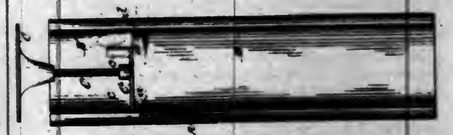
404,846. HORSE HAY-RAKE. LEONARD KIMMER, Lancaster, Ohio, assignor to the Hocking Valley Manufacturing Company, same place. Filed July 7, 1888. Serial No. 279,318. (No model.)



Claim.—1. In a horse hay-rake, the combination of a rake-head, automatic dumping mechanism, a bracket mounted on the frame, two levers pivoted thereon in the same vertical plane, intermeshing gears carried by the levers to cause them to vibrate in the same direction when pressure is applied to one of said levers, and connections between the other lever and dumping mechanism, substantially as set forth.

2. In a horse hay-rake, the combination of a rake-head, an automatic dumping mechanism, a bracket mounted on the frame, an upstanding treadle-lever and a depending lever, both pivoted on the bracket in the same vertical plane and provided with intermeshing teeth, a spring engaging one of said levers to restore them to their normal position, and connections between one of said levers and the dumping mechanism.

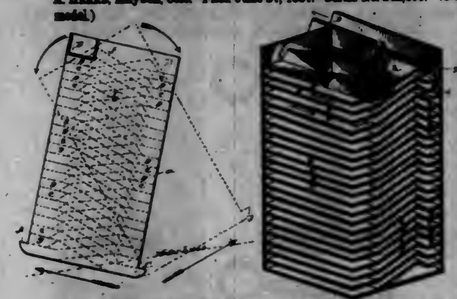
3. In a horse hay-rake, the combination of a rake-head, dumping mechanism, a bracket mounted on the frame and provided with recesses, intermeshing pinions mounted in said recesses and provided with projecting levers, connections between one of said levers and the dumping mechanism, and a spring engaging one of said levers for holding both levers in their normal positions, substantially as set forth.



4. The combination, in a horse hay-rake, of the axle, two draft-wheels affixed thereto, a ratchet-wheel secured on the axle, a rake-head pivoted on the axle, and a dog pivoted on the rake-head and adapted to interlock with the teeth of the ratchet-wheel, of a depending lever pivoted on the frame and connected to the pivoted dog, an upwardly-projecting treadle-lever, also pivoted on the frame and geared to the first-named lever, and a spring engaged with the treadle-lever to restore it to its normal position, substantially as set forth.

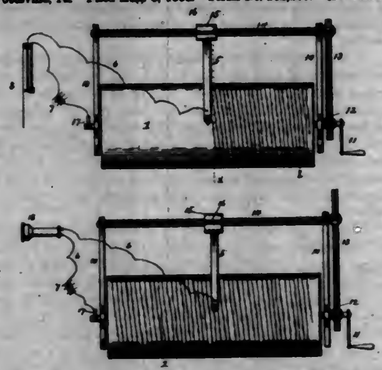
404,847. TOY PARACHUTE. WILLIAM J. KUNTZEN, Syracuse, N. Y. Filed July 7, 1888. Serial No. 279,280. (No model.)

Claim.—The combination, in a toy parachute, of the umbrella portion A, having the attached cords B, converging downwardly to a common meeting-point and suitably secured to the horizontal bar C in an annular groove *b*, formed centrally thereon, and a weight, configurated as desired, pendent from said bar, said bar and weight being integral and formed of cast metal, substantially as described, and for the purposes specified.



404,848. WICK-TUBE FOR LAMPS. THOMAS LAWSTON, Meriden, Conn., assignor to Edward H. Fessenden and Kate E. Jacobus, both of Brooklyn, N. Y. Filed Mar. 29, 1889. Serial No. 265,845. (No model.)

Claim.—1. In an annular wick-tube, the combination, with the outer wall and the upper inner section having the perforations, of the section having the reduced conoidal upper end seated in the upper section, forming the annular spaces, substantially as specified



2. The combination, with an annular wick-tube consisting of an outer wall and the inner wall comprising the upper section having perforations and the lower section having the reduced conoidal portion forming a support, of the spreader having the spider base adapted to rest upon said support, substantially as specified.

404,849. WATER-ELEVATOR. ANDREWS LATHROP and LUCAS A. HEARD, Mayfield, Ohio. Filed June 27, 1887. Serial No. 242,699. (No model.)

Claim.—The water-elevator comprising the oscillating case having the vertical partition *i*, the inclines *f h* on opposite sides of said partition and extending in opposite directions, and provided at their ends with horizontal extensions *e g*, constituting receivers, the receiver at the higher end of each inclined plane being arranged at the lower end of the communicating inclined plane on the opposite side of the partition, whereby said inclined planes and receivers constitute a pair of channels running around the four sides of the case and ascending the same by a series of successive gradations, one of said channels having a scoop A at its lower end on one side of the case, and the other having the scoop C at its lower end on the opposite side of the case, and the discharge-spouts at the upper ends of said channels, substantially as described.

404,850. METHOD OF RECORDING AND REPRODUCING ARTICULATE SPEECH OR OTHER SOUNDS. GEORGE W. LITTLEHALES, Pottsville, Pa. Filed Aug. 6, 1888. Serial No. 282,260. (No model.)

Claim.—1. The method of producing a record of articulate speech or other sounds, which consists in producing permanent changes in the resistance of a conductor or partial conductor by and in accordance with a current of electricity varied by said speech or other sounds, substantially as described.

2. The method of producing a record of articulate speech or other sounds, which consists in producing permanent changes in the resistance of a conductor or partial conductor through the agency of an electrolyte decomposed and deposited thereon by and in accordance with a current of electricity undulated by the voice or by other sounds.

3. The method of producing a record of articulate speech or other sounds, which consists in changing the resistance of a conductor or partial conductor through the agency of an electrolyte decomposed and deposited thereon and acting chemically thereon by and in accordance with a current of electricity undulated by the voice or by other sounds.

4. The method of producing a record of articulate speech, which consists in causing a current of electricity undulated and controlled by the voice to decompose an electrolyte and to deposit the products of the decomposition of the same upon a conductor or partial conductor.

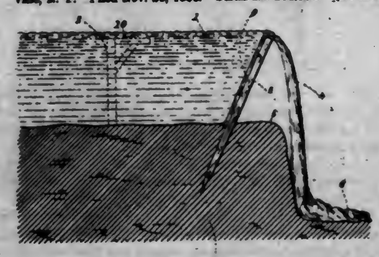
5. The method of producing a record of articulate speech, which consists in causing a current of electricity undulated and controlled by the voice to decompose an electrolyte and to deposit the products of the decomposition of the same upon a conductor or partial conductor, the components of said electrolyte forming two or more compounds, one or more with said conductor or partial conductor to change the resistance of the same, and one or more of the remaining components of said electrolyte forming a drier to fix said record more permanently, substantially as described.

6. The method of producing a record of articulate speech, which consists in causing a current of electricity undulated and controlled by the voice to decompose an electrolyte and to deposit the products of the decomposition of the same upon a conductor or partial conductor, one or more components of said electrolyte forming a resisting compound and one or more forming a drying compound, substantially as described.

7. The method of recording and reproducing articulate speech, which consists in undulating a current of electricity by and in accordance with sound-waves, causing said current to change the resistance of a conductor or partial conductor in accordance with its undulations, and then causing the record so formed to undulate a telephonic current by and in accordance with its varying resistance, substantially as described.

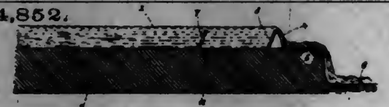
8. The method of recording and reproducing articulate speech, which consists in producing a record consisting of a line of varying conductivity by undulating a current of electricity by and in accordance with sound-waves, and then causing said record to change the resistance of an electric circuit.

9. The method of producing a record of articulate speech, which consists in undulating a current of electricity by and in accordance with sound-waves, causing said current more or less permanently to change, in accordance with its undulations, the resistance of a moving electric conductor or partial conductor.



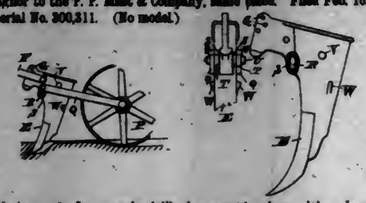
10. The method of recording and reproducing articulate speech, which consists in undulating a current of electricity by and in accordance with sound-waves, causing said current to decompose an electrolyte, the components of which will act chemically upon a conductor or partial conductor to change its resistance, and then causing a telephonic current to be undulated by and in accordance with the varying resistance of said conductor.

404,851. MEANS FOR OBTAINING WATER-POWER. DAVID H. LOUD, Williamsville, N. Y. Filed Sept. 20, 1888. Serial No. 285,857. (No model.)



Claim.—The herein-described mode of obtaining water-power along the river above the river-falls, consisting in combining therewith an auxiliary canal located along the river above the river-falls, having its bed below the bed of the main stream or river and having its head or upper end closed and the foot or lower end open at some point near the surface of the river below the river-falls, in combination with a series of cross-cuts from said upper river to the canal, and a means located at suitable points for receiving and transmitting the power, substantially as described.

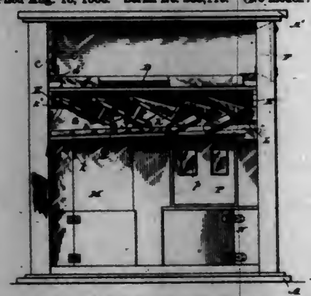
404,852. HYDRAULIC EXCAVATING. DAVID H. LOUD, Williamsville, N. Y. Filed Nov. 26, 1888. Serial No. 291,886. (No model.)



404,852.

Claim.—The herein-described method of excavating for ditches, canals, or other purposes, consisting in excavating the soil by hydraulic erosion by causing the water to flow over a dam upon and over a portion of the soil until removed, and then moving the dam upstream and securing it until another similar portion of soil is removed, which operation is repeated until the desired excavation is made, substantially as described.

404,853. GRAIN-DRILL. PHINEAS P. MAST, Springfield, Ohio, assignor to the P. P. Mast & Company, same place. Filed Feb. 16, 1889. Serial No. 300,311. (No model.)



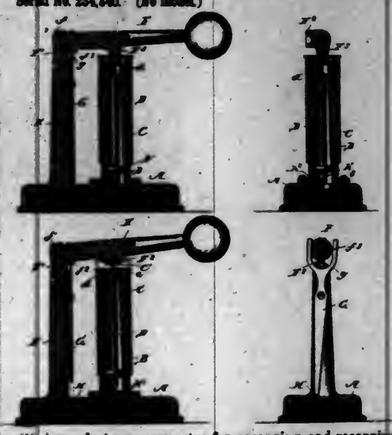
Claim.—1. In a grain-drill, the combination, with a hoe connected to the frame and devices to depress the hoe into the ground, of a grain and soil packing wheel, and its connecting-bars pivotally attached to the hoe, and a lateral projection on the hoe above and below said bars, the one to transfer the pressure on the hoe to the wheel and the other to lift the wheel with the hoe.

2. In a grain-drill, the combination, with a hoe, the frame, and devices to depress the hoe into the soil, of a grain and soil packing wheel, and its connecting-bars attached to the hoe by a vertically-adjustable pivot, and projections on the hoe near said pivot, and arranged to engage with the wheel-connecting bars when the hoe is adjusted to different depths, according to the adjustment of said pivot.

3. The combination, with a hoe having a substantially vertical slot and serrated surfaces about the slot and a lug or projection in proximity to the said slot, of a soil and grain packing wheel and its connecting-bars, serrated washers engaging said serrated surfaces, and a bolt which passes through said slot and binds said bars, washer, and serrated surfaces together.

4. The combination, with a hoe having a slot substantially in a vertical direction, serrated surfaces about said slot, a projection at each side in proximity to the said slot, and projections below the slot and near the rear edge of the hoe, of a soil and grain covering wheel, its connecting-bars, serrated washers fitted to said surfaces, and a bolt which passes through said slot and binds the bars, washers, and serrated surfaces together, whereby the wheel may be lifted and depressed by lifting and depressing the hoe.

404,854. REFRIGERATOR. MARTIN S. MILLARD, Kansas City, Mo. Filed Aug. 18, 1888. Serial No. 283,110. (No model.)



Claim.—1. In a refrigerator, the combination, with a suitable support provided with inclined seats and laterally-extending projections, of a series of drip-pans seated upon the support and provided with lugs adapted to catch under said lateral projections on the support and lock the pans in position, pivoted arms for tilting said pans, and a rod connected to said arms for operating them, substantially as set forth.

2. In a refrigerator, the combination, with a suitable support provided with inclined seats and with laterally-extending projections, of a series of drip-pans seated upon the support and provided with lugs or projections adapted to catch under the said lateral projections on the support and lock the pans in position, substantially as set forth.

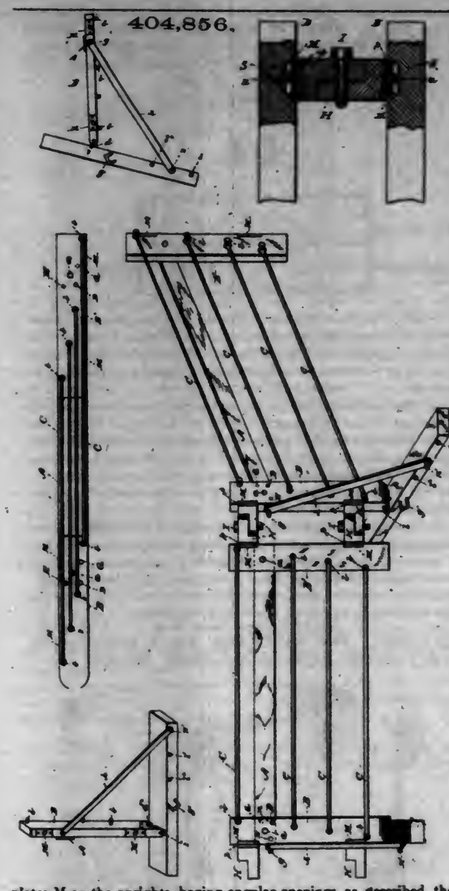
3. In a refrigerator, the combination, with a series of overlapping and contacting drip-pans forming a closed roof or ceiling for the cooling-chamber, of a valve at one end of the series to open or close communication between the ice and cooling chambers, substantially as set forth.

404,855. DEVICE FOR UNCAPPING AND RECAPPING CARTRIDGE-SHELLS. NATHAN M. MUNT, Chicago, Ill. Filed Apr. 14, 1887. Serial No. 234,840. (No model.)

Claim.—1. In an apparatus for uncapping and recapping cartridge-shells, the combination, with the shell-support and the vertically-movable plunger therein, of the pivoted pressure-lever capable of rotation around its longitudinal axis, and provided with the uncapping and recapping projections at different points of its circumference above the shell-support, the cam-lever for actuating the plunger, and the intermediate lever connected to said cam-lever and actuated by the rotation of the pressure-lever, substantially as and for the purposes specified.

2. In an apparatus for uncapping and recapping cartridge-shells, the combination, with the shell-support and the vertically-movable plunger therein, of the pivoted pressure-lever capable of rotation around its longitudinal axis, and provided with the uncapping and recapping projections arranged at different points of its circumference above the shell-support, and the cam projection or projections on said pressure-lever, the cam-lever for operating the plunger, and the intermediate lever connected to said cam-lever and having a yoke to embrace the said cam projections, substantially as and for the purposes specified.

3. In an apparatus for uncapping and recapping cartridge-shells, the combination, with the shell-support and the vertically-movable plunger therein, of the pivoted pressure-lever capable of rotation around its longitudinal axis and provided with stops to limit said rotation, the uncapping and recapping projections arranged at different points on the circumference of said lever above the shell-support, and suitable connecting mechanism, actuated by the rotation of the pressure-lever, to operate the plunger, substantially as and for the purposes specified.

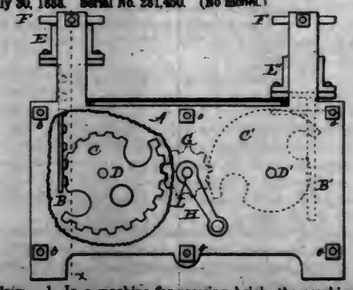


4. In an apparatus for uncapping and recapping cartridge-shells, the combination, with the shell-support and the vertically-movable plunger therein, of the cam-lever H, for operating said plunger, said cam-lever being arranged below the lower end of said plunger, and being provided with cam H', having inclined surface h' and flat top surface h^2, substantially as and for the purposes specified.

404,856. FOLDING ADJUSTABLE FENCE-PANEL. JAMES J. OSILVIE, Roscoe, Ohio. Filed Feb. 6, 1889. Serial No. 298,890. (No model.)

Claim.—1. The combination of the uprights B and B' of two adjacent fence-panels, one B having its foot beveled, pierced, and hollowed out for the purposes described, with the connecting-bars H, having plate p attached, said plate having a hooked projection, the-

404,856.

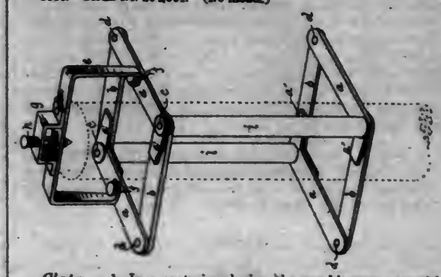


plates M on the uprights, having angular openings, as described, the sill provided with a connecting-link d, arranged to enter the opening d^2 in the foot of the upright, the pin i, and the brace k, all constructed, arranged, and operating substantially as described.

2. The combination of the bar H, having plate p attached, said plate being provided with a hooked projection, with the plate M, having an angular or L-shaped opening therein to receive hook u, the connecting-pin I, and the uprights B and B', all substantially as described.

3. The combination of two adjacent fence-panels provided with the plates M, having openings, as described, with the connecting-bars H, plates p, having hook u, and the connecting-pin I, all constructed, arranged, and operating substantially as described.

404,857. BRICK-MACHINE. BENJAMIN OWEN, Dayton, Ohio. Filed July 30, 1888. Serial No. 281,450. (No model.)

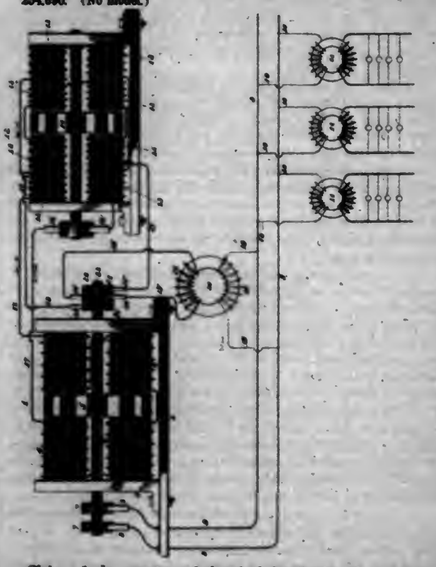


Claim.—1. In a machine for pressing brick, the combination of the frame A, with vertical grooves, cap-plate F, the rock-frame B, with mold E attached, discharging-plate I, with arm J on stem thereof, double sectors C, pivotally held in said frame and having the operating-arm K attached thereto, and the pinions G, attached to the crank-shaft L, substantially as shown and described.

2. In a brick-machine, the discharging device comprising the plate I, held in the rack-frame, and mold normally resting on said rack-frame, and the operating-arm of the double sectors to hold said plate at a fixed elevation during a partial descent of the mold, substantially as set forth.

3. In a machine for pressing brick, the combination of the frame A, with vertical grooves, cap-plate F, with plate to center the mold, the rack-frame B, with mold E attached, discharging-plate I, double sectors pivotally held in said frame, and pinions G, attached to the crank-shaft L, substantially as shown and described.

404,858. CENTERING DEVICE. JACOB A. PAINTER, Decatur, Ill., assignor of one-half to Charles M. Allison, same place. Filed Dec. 19, 1888. Serial No. 294,061. (No model.)



Claim.—1. In a centering device, the combination comprising a hinge-jointed quadrilateral frame and a punch-guide hinged to the frame, as set forth.

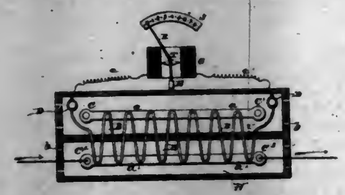
2. A centering device comprising two or more hinge-jointed quadrilateral frames held parallel by strut-bolts, and a punch-guide hinged to one of the frames, as set forth.

3. In a centering device, in combination, hinge-jointed bars a a and b b, having the angular extensions a' a' and b' b', and punch-guide frame c, pivotally connected with opposite bars, as set forth.

4. In a centering device, in combination, the hinged frames comprising the bars a a and b b, having angular extensions a' a' b' b', strut-bolts i i, holding the frames parallel, and punch-guide c g, hinged to opposite bars, as set forth.

404,859. REGULATION OF ALTERNATING ELECTRIC-CURRENT GENERATORS. GUSTAV FRANKENCHE, Cleveland, Ohio, assignor to the Brush Electric Company, same place. Filed Nov. 9, 1887. Serial No. 254,690. (No model.)

Claim.—1. In a system of electrical distribution, the combina-



tion of one or more alternating-current dynamos and a separate exciting-dynamo having two sets of field-magnet coils, one set being included in circuit with the field-coils of the alternating-current generator and the other set included in the secondary circuit of an inductorium, the primary of which is in a multiple-arc branch of the main line, substantially as set forth.

2. The combination, with an alternating-current generator (one or more) and an exciting-dynamo for energizing the field-magnets of the alternating-current generator, said exciting-dynamo having differential field-magnet coils, the main coils of which are energized by current generated by the exciter, of an induction apparatus having its primary coil in a shunt across the brush-terminals of the alternating-current generator, the secondary coil having a commutator included in its circuit for straightening the current therein, and conductors for supplying the straightened current to the regulating field-magnet coils of the exciting-dynamo, substantially as set forth.

3. The combination, with an alternating-current generator (one or more) and an exciting-dynamo having two sets of field-coils, one set being included in circuit with the field-coils of the alternating-current generator, of an inductorium the primary coil of which is of fine wire and included in a multiple-arc branch of the main line, while the secondary coil is of coarse wire and has a commutator included therein for straightening the current flowing therein, and conductors for supplying the straightened current to the regulating field-magnet coils of the exciting-dynamo, substantially as set forth.

404,860. APPARATUS FOR INDICATING THE STRENGTH OF THE CURRENT IN AN ELECTRIC CIRCUIT.

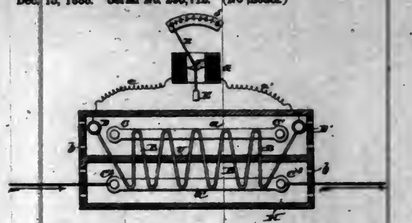
GUSTAV PFANHUCHER, Cleveland, Ohio, assignor to the Brush Electric Company, same place. Filed Dec. 15, 1888. Serial No. 293,711. (No model.)

Claim.—1. In a current-indicator, the combination, with a thermo-pile or thermo-spiral, of an electric conductor combined therewith, said conductor constructed and adapted to be included in an electric circuit and be heated by the current flowing therein, whereby the heat thus generated will be transmitted to the alternate joints of the thermo-pile, substantially as set forth.

2. In a current-indicator, the combination, with a conductor adapted to be included in the circuit of a current to be measured, of a thermo-pile or thermo-spiral having its alternate joints connected with said conductor so as to be heated thereby, the other joints of the thermo-pile or thermo-spiral being exposed to the atmosphere, substantially as set forth.

3. In a current-indicator, the combination, with a conductor adapted to be included in the circuit of a current to be measured, of a thermo-pile or thermo-spiral arranged with part of its joints exposed to the heat of said conductor and another portion of its joints located in a separate compartment, substantially as set forth.

4. In a current-indicator, the combination, with a thermo-pile or thermo-spiral and a conductor arranged to transmit heat to the alternate joints of the thermo-pile or thermo-spiral, said conductor adapted to be included in the circuit of the current to be measured, of a galvanometer included in the circuit of the thermo-pile or thermo-spiral, substantially as set forth.



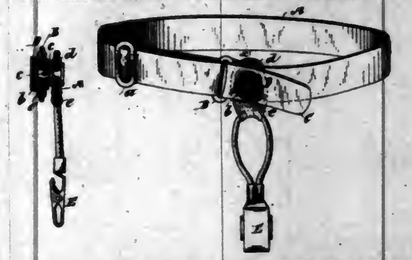
5. In a current-indicator, the combination, with a suitable box or receptacle and a partition dividing the box or receptacle into two compartments, of a thermo-pile arranged within the box with part of the joints in one compartment and a part in the other comparment and a conductor adapted to be included in the circuit of a current to be measured, said conductor being located within one of said compartments and arranged to transmit heat to the thermo-pile joints located in the same compartment therewith, substantially as set forth.

6. In a current-indicator, the combination, with a ventilated box or receptacle and a thermo-pile located therein, of a conductor arranged to transmit heat to the alternate joints only of said thermo-pile, said conductor being adapted to be included in the circuit of the current to be measured, and a galvanometer electrically connected to the terminals of the thermo-pile, substantially as set forth.

7. In a current-indicator, the combination, with the thermo-spiral, of the conducting-bars secured to the alternate joints of the thermo-spiral and insulated therefrom, and a galvanometer electrically connected to the terminals of the thermo-spiral, substantially as set forth.

404,861. METHOD OF INDICATING THE STRENGTH OF THE CURRENT IN AN ELECTRIC CIRCUIT.

GUSTAV PFANHUCHER, Cleveland, Ohio, assignor to the Brush Electric Company, same place. Filed Dec. 15, 1888. Serial No. 293,712. (No model.)



Claim.—1. The method of indicating the strength of an electric current of constant or varying strength, consisting in converting such current or a portion of it into a thermo-electric current and utilizing the latter to operate a current-indicating apparatus, substantially as set forth.

2. The method of indicating the strength of an electric current of constant or varying strength, consisting in heating an electric conductor by the current or a portion of the current to be measured and transmitting the heat thus generated to the alternate joints of a thermo-pile or thermo-spiral, and thereby generating an electric current and utilizing the latter in actuating a current-indicating apparatus, substantially as set forth.

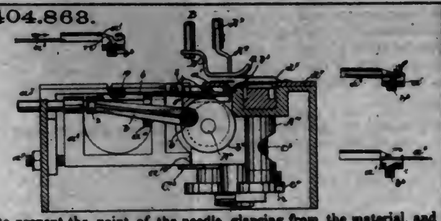
3. The method of indicating the strength of an electric current, consisting in heating a conductor by passing through it the current to be measured, or a portion of it, transmitting the heat so generated directly to the alternate joints of a thermo-pile, and thereby generating a thermo-electric current and utilizing the latter in actuating a current-indicating apparatus, substantially as set forth.

404,862. STOCKING-SUPPORTER.

JOHN M. RAMSEY, Roseville, N. Y. Filed Dec. 24, 1888. Serial No. 294,469. (No model.)

Claim.—1. A garment-support consisting of a band, a non-elastic flexible finger-strip secured to one end thereof, a portion of a clasp thereon, a non-elastic flexible stay-piece secured to the opposite end of the band and having a loop portion, a portion of a clasp on said stay-piece, and a spring-actuated clasp having a flexible connection with the loop of the stay-piece, substantially as specified.

2. A garment-supporter consisting of an elastic band having a ring at one end, a non-elastic flexible finger-strip secured to said ring, a clasp portion on said finger-piece, a non-elastic flexible stay-piece secured to the opposite end of the elastic band and having a loop, a clasp portion on said stay-piece, a flexible connection in said loop, and a clasp at the lower end of the flexible connection, substantially as specified.



404,863. SEWING-MACHINE FOR FINISHING BUTTON-HOLE PIECES.

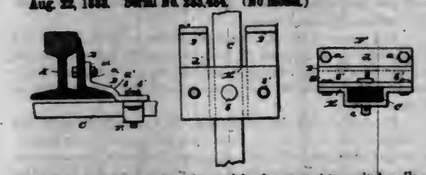
JOHN REECE, Boston, Mass. Filed Nov. 1, 1888. Serial No. 289,758. (No model.)

Claim.—1. In combination, the grooved or slotted throat-plate, a reciprocating bender to bend the material into the said groove or slot, an eye-pointed needle and complemental stitch-forming mechanism, devices to reciprocate the needle in the direction of its length and transversely to the said groove or slot, and devices to impart to the needle a lateral motion in opposite directions at each alternate thrust, or in a plane substantially at right angles to the bender-actuating plane, and a feeding mechanism acting in the direction of the needle's length, substantially as described.

2. In a sewing-machine, an eye-pointed reciprocating needle, complemental stitch-forming mechanism, a bender, and a throat-plate cooperating therewith to bend the material prior to the formation of each stitch, combined with a needle-guide and devices to vibrate it in a plane substantially at right angles to the needle-actuating plane

404,868.

to prevent the point of the needle glancing from the material, and feeding mechanism, substantially as described.



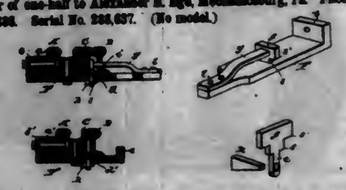
3. A grooved or slotted throat-plate, and a reciprocating bender to bend the material between it and the said throat-plate, combined with feeding mechanism, a needle-bar, and eye-pointed needle and complemental stitch-forming mechanism, and laterally-movable bearings in which said needle-bar reciprocates, whereby the needle of the stitch-forming mechanism at one thrust is enabled to penetrate a bent portion of the material held between the bender and throat-plate, and at another thrust to enter said material at a distance from the preceding stitch in the direction of the bend in the material, substantially as described.

4. The needle-bar, its eye-pointed needle, and complemental stitch-forming mechanism, the pivoted yoke in which the needle-bar has its bearings, devices to reciprocate the needle-bar, and devices to vibrate the said yoke, combined with a throat-plate grooved or slotted transversely to the path of reciprocation of the needle, a bender, and devices to actuate it, whereby the said bender forces the material into said groove or slot at right angles to the needle-actuating plane and feeding mechanism, substantially as described.

5. In a sewing-machine, a grooved or slotted throat-plate, a needle, and complemental stitch-forming mechanism, devices for moving the needle in a path transverse to said groove or slot, and devices to impart to it a lateral motion in opposite directions at each alternate thrust in a plane substantially at right angles to the bender-actuating plane, and a bender, and devices to reciprocate it to bend or press the material into the groove or slot of said throat-plate, combined with a spring-supported or yielding thrum-gatherer and feeding mechanism, substantially as described.

404,864. RAILWAY-SWITCH.

JOHN T. RICHARDSON, Harrisburg, assignor of one-half to Alexander H. Ege, Mechanicsburg, Pa. Filed Aug. 22, 1888. Serial No. 283,434. (No model.)

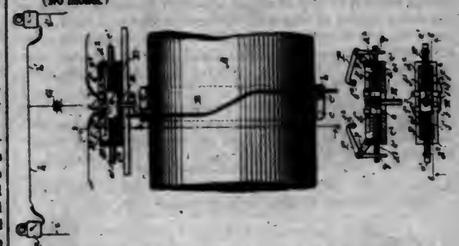


Claim.—1. The combination, with the movable switch-rails, of the connecting-bars and the brackets having the seats in which the connecting-bars are swiveled open at both ends, the said brackets consisting of the plates D, secured to the rails and bent to have longitudinal projecting portions, and other plates secured to the said horizontal portions of the plates D and forming the bottom of the said open-ended seats, substantially as set forth.

2. The combination, with the movable switch-rails, of the connecting-bars and the brackets in which they are swiveled, consisting of the plates D, secured to the rails and having the horizontal projecting portions d', and the stirrup-shaped plates E, secured to the portions d' of the plates D, and forming in connection therewith the seats for the bars, substantially as described.

404,865. RINDING-BAR.

JOHN T. RICHARDSON, Harrisburg, assignor of one-half to Alexander H. Ege, Mechanicsburg, Pa. Filed Oct 20, 1888. Serial No. 288,637. (No model.)



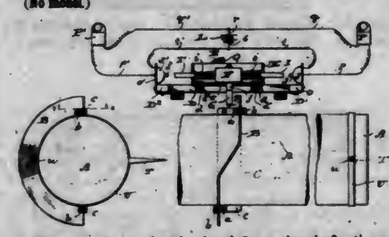
Claim.—1. In a railway-frog, the combination, with the tongue-rails, one of which has a notched flange, of the bearing-plate upon which the said rails rest, and the locking-leg having an expanded head resting upon the said rail-flange and also resting in the notch therein and secured to the said plate, substantially as set forth.

2. In a railway spring-frog, the combination of the tongue-rails, the fixed wing-rail secured to the tongue-rails, the movable wing-rail, the bearing-plate beneath the said rails, and a lug secured to the said plate situated between the movable wing-rail and the adjacent tongue-rail, and having an expanded head engaging with the flange of the tongue-rail, substantially as set forth.

3. The combination, with the tongue-rails and the wing-rails, of the bearing-plates below the said rails, and the locking-lugs *f*, having shouldered edges, seated in notches in the flange of the tongue-rail and passing through the said plates, to which they are secured by keys, substantially as set forth.

404,866. ELECTRIC SIGNAL FOR ENGINE-SHAFTS.

JAMES C. RICKETSON, Milwaukee, Wis. Filed Oct. 4, 1888. Serial No. 287,102. (No model.)



Claim.—1. The combination, with a revolving shaft having a two-sided or double cam attached thereto, of a pair of distant signals, a movable pin depending normally in the path of motion of said cam, a contact pin or pins connected or arranged in relation to said movable pin to move therewith, and a casing bearing metallic strips terminating in spring contact ends arranged in pairs in the paths of motion of said contact pin or pins and electrically connected to said distant signals, substantially as set forth.

2. The combination, with a revolving shaft having a two-sided or double cam attached thereto, of a pair of distant signals, a movable pin depending normally in the path of motion of said cam, a contact pin or pins connected or arranged in relation to said movable pin to move therewith, a casing bearing metallic strips terminating in spring contact ends arranged in pairs in the paths of motion of said contact pin or pins and electrically connected to said distant signals, and electric bells and switches located at points remote from the distant signals, one of said bells and switches being in the same circuit with one of the said distant signals and the other bell and switch in the same circuit with the other distant signal, substantially as set forth.

3. The combination, with a revolving shaft having a cam attached thereto, of a casing hinged to a suitable support and carrying a movable pin depending normally in the path of motion of said cam, a spring extending from said casing to a point above the same for raising said casing and withdrawing the movable pin from operative position, and another spring attached to said casing and to a cord for drawing down the casing against the force of the first-named spring and restoring the movable pin to operative position in the path of motion of the cam, substantially as set forth.

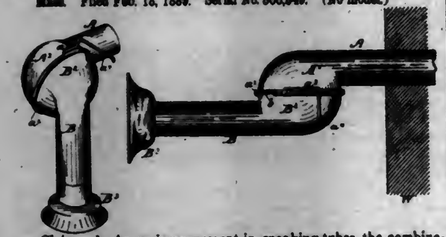
404,867. ELECTRIC INDICATOR FOR ENGINE-SHAFTS.

JAMES C. RICKETSON, Milwaukee, Wis. Filed Jan. 26, 1889. Serial No. 297,608. (No model.)

Claim.—1. In an electric signal for engine-shafts, the combination of a revolving shaft and a two-sided or double cam attached thereto, with a pair of push-buttons electrically connected to distant signals, and a pin adapted to be moved by said cam to actuate said push-buttons, substantially as set forth.

2. In an electric signal for engine-shafts, the combination of a revolving shaft, a two-sided or double cam attached thereto, and a movable pin depending in the path of motion of said cam, with a pair

of push-buttons electrically connected to distant signals and adapted to be actuated by said pin, substantially as set forth.



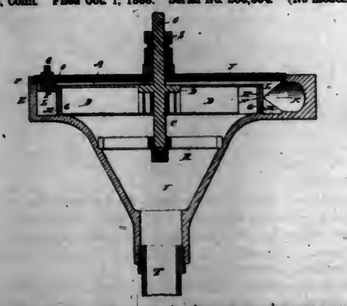
3. In an electric signal for engine-shafts, the combination of a revolving shaft, a two-sided or double cam attached thereto, a movable pin depending in the path of motion of said cam, and a slide connected to said pin, with a pair of push-buttons electrically connected to distant signals and adapted to be actuated by said pin, substantially as set forth.

4. In an electric signal for engine-shafts, the combination of a revolving shaft, a two-sided or double cam attached thereto, a movable pin depending in the path of motion of said cam, a slide connected to said pin, a contact pin or pins carried by said slide, and a pair of push-buttons electrically connected to distant signals and adapted to be actuated by said contact pin or pins, substantially as set forth.

5. The combination, with a revolving shaft, of a two-sided or double cam attached thereto, a pair of distant signals, push-buttons located adjacent to said shaft and connected by electric circuits to said distant signals, a horizontally-moving slide carrying a pin depending in the path of motion of said cam, and means, substantially as described, for closing one or the other of said electric circuits and actuating the signal in said circuit thereby closed, substantially as set forth.

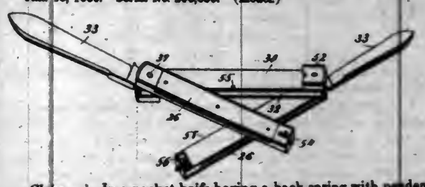
6. In an electric signal for engine-shafts, the combination of a revolving shaft with a cam partially encircling the same, and an indicator secured to said shaft at a point on a horizontal line between the horizontal lines of the ends of said cam, substantially as set forth.

404,868. SPEAKING TUBE, PIPE, &c. JAMES H. ROSE, Boston, Mass. Filed Feb. 18, 1889. Serial No. 300,249. (No model.)



Claim.—1. As an improvement in speaking-tubes, the combination of the horizontal stationary tube having a chambered enlarged end in the elbow thereof, with a rigid metal tube having a mouth-piece at one end and a chambered enlarged end in the elbow thereof and pivotally connected with the enlarged elbow end of the stationary tube, substantially as and for the purpose described.

2. As an improvement in speaking-tubes, the combination of the stationary tube having a chambered enlarged end, with a rigid metal tube having a mouth-piece at one end and a chambered enlargement at the other end pivotally connected to one side of the chambered end of the stationary tube, whereby the mouth-piece-carrying tube is adapted to swing up and down in a plane parallel with a vertical plane passing through the stationary tube, substantially as and for the purpose described.



3. The combination of a stationary tube having a chambered end and a rigid metal tube having a mouth-piece at one end, a chambered enlargement at the other end formed integral therewith and pivotally connected to the chambered end of the stationary tube, with a spring having one end connected to the stationary tube and the other end to the movable tube, substantially as and for the purpose described.

404,869. TURBINE WATER-MOTOR. PERRY T. SANFORD, New Haven, Conn. Filed Oct. 1, 1888. Serial No. 286,864. (No model.)

Claim.—A turbine water-motor having an annular raceway, the inner wall whereof is provided with ports, a cone-shaped efflux-chamber located below such raceway, and a wheel located above the said efflux-chamber and having its blades shaped to follow involutes struck from its shaft to its periphery, and arranged so that the water will strike the outer ends of their convex faces, whereby a swirling motion will be imparted to the water in passing through the motor, substantially as set forth.

404,870. POCKET-KNIFE. JOHN C. F. SCHEPOL, Moline, Ill. Filed Jan. 10, 1889. Serial No. 296,039. (Model.)

Claim.—1. In a pocket-knife having a back-spring with pendent side pieces attached thereto, a blade-rivet supported crosswise in such side pieces, and a knife-blade having a shank provided with shoulders, the combination of said blade supported upon a sleeve through its shank, such sleeve supported on said blade-rivet, an engaging surface upon said sleeve, and an arm pivotally attached to a side piece provided with an engaging surface in circumferential line with the engaging surface on said sleeve, substantially as described.

2. In a pocket-knife having a back-spring with pendent side pieces attached thereto, a blade-rivet supported crosswise in such side pieces, and a blade having a shank provided with shoulders, the combination of said blade supported upon a sleeve through its shank, such sleeve supported upon said blade-rivet, an engaging surface upon each end of said sleeve, and two parallel arms connected together at one end, the opposite ends of each pivotally attached to one of said side pieces, and said arms provided with engaging surfaces in circumferential line with the engaging surfaces on said sleeve, substantially as described.

3. In a pocket-knife having a back-spring with pendent side pieces attached thereto, a blade-rivet supported crosswise in said side pieces, and a blade having a shank provided with shoulders, the combination of said blade supported upon a sleeve through its shank, such sleeve supported upon said blade-rivet, an engaging surface upon said sleeve, and an arm pivotally attached to a side piece, such arm provided with an engaging surface in circumferential line with the engaging surface on said sleeve and with a spring-actuated bolt registering with a notch in said side piece when such arm and side piece are side by side lengthwise, substantially as described.

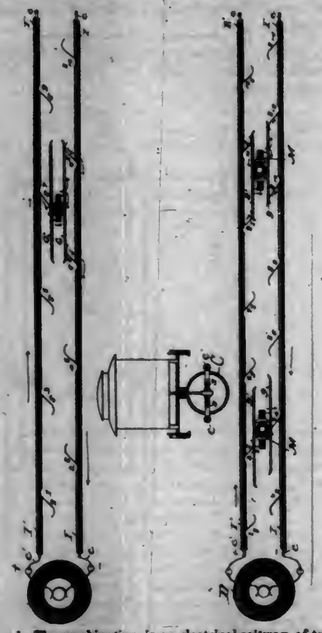
4. In a pocket-knife, the combination of the back-spring 32, the side pieces 30, the knife-blade 33, with its shank 34 and aperture 35, the blade-sleeve 37 and engaging surface 40, the set-screw 36, the blade-rivet 39, the arm 23, and engaging surface 41, substantially as described.

5. In a pocket-knife, the combination of the back-spring 32, the side pieces 30, the rivet 39, the knife-blade 33, its shank 34 and aperture 35, the blade-sleeve 37, with engaging surface 40, the set-screw 36, the arm 23, and end pieces 25, such arms provided with the engaging surface 41, substantially as described.

6. In a pocket-knife, the combination of the back-spring 32, side pieces 30, rivet 39, knife-blade 33, its shank 34 and aperture crosswise therein, blade-sleeve 37 and engaging surfaces thereon, arms 23 and connecting end piece 25, such arms provided with engaging surfaces in circumferential line with the engaging surfaces on said blade-sleeve, a spring-actuated bar attached to the end piece 25, and an engaging notch in the blade-carrier handle, substantially as described.

404,871. STEAM-COOKER. CHARLES O. SCHROYER, Dawson, and WILLIAM H. PENN, Waynesburg, Pa. Filed Nov. 6, 1888. Serial No. 290,061. (No model.)

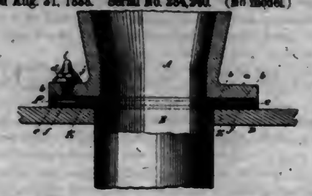
Claim.—1. In a steam-cooker, the combination, with a water-reservoir, upright supports projecting therefrom, and shelves attached to said upright supports, of a removable cap resting on the reservoir and inclosing the supports, a dome-shaped hood attached to the under surface of the top of the cap, and provided at its apex with an opening for the entrance of steam and at points near the side wall of the cap with openings for the escape of water of condensation, substantially as set forth.



2. In a steam-cooker, the combination, with a water-reservoir having a flaring rim, upright supports attached to said rim, and shelves resting on said supports, of a cap or cover inclosing the supports and resting on the flaring rim and a dome-shaped hood secured to the under side of the top of the cap or cover and forming a condensing-chamber, the said hood being provided at its apex with an opening for the entrance of steam, and at its edge near the side wall of the cap with drip-openings for the escape of water, substantially as set forth.

404,872. COFFIN-FASTENER. SILAS A. SCOFIELD, Morenci, Mich. Filed Mar. 1, 1889. Serial No. 301,713. (No model.)

Claim.—A spring locking-plate H, secured to the under face of the casket-lid, said plate having a wedge-shaped protruding tongue *a* and extended spring end 4, having the lip *s* and depending nose *c*, all of said parts being formed integral, in combination with the groove-cavity D in the top of the casket, and the plate C located over said cavity, the tongue *a* and nose *c* of the spring locking-plate adapted to engage with the plate C on the top of the casket and lock the lid to the top of the casket, as specified.

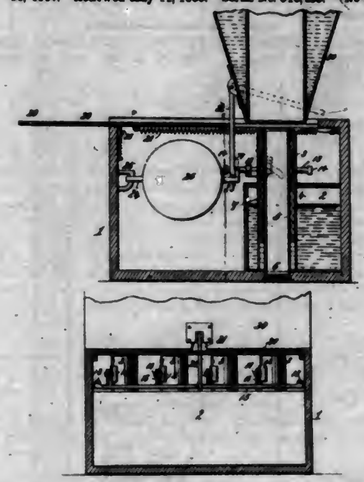


404,873. ELECTRIC RAILWAY. SIDNEY H. SHORT, Denver, Colo., assignor to the United States Electric Company, same place. Filed Feb. 16, 1887. Serial No. 227,796. (No model.)

Claim.—1. The combination, in an electrical railway, of two conductors in circuit with a current-generator insulated throughout their entire lengths, excepting at intervals, where contact-springs are permanently attached thereto, the said conductors being arranged parallel to each other, and the contact-points extending into a conduit toward each other, but separated therefrom, and a current-collector suitably connected to the car and with its sides insulated from each other but connected electrically to a motor carried on the car, the said collector being adapted to travel within the conduit and to come in contact with the contact-springs of the two conductors, substantially as described.

2. In an electrical railway in which the motors are run in multiple arc, the combination of a generator, a conduit, an underground conductor insulated throughout its entire length except at intervals, where it is provided with spring contact-arms permanently connected therewith, a current-collector traveling in the conduit and adapted for contact with the spring-arms, a car, a motor on the car, and means for moving the collector with the car, substantially as described.

404,874. FLOOR-FLANGE FOR WATER-CLOSETS, &c. BENJAMIN C. SMITH, Brooklyn, assignor to Fred Adee & Co., New York, N. Y. Filed Aug. 31, 1888. Serial No. 284,240. (No model.)



Claim.—1. The combination, with a water-closet A, having flange *a*, of the independent and separate ring E, having slots *b*, for the passage of bolts, and grooved below the slots to retain the heads of the bolts, and of bolts passing through said slots and through the flange *a* and nuts on the bolts, said nuts being on the upper side of the flange *a*, whereby said bolts may be adjusted in the slots to register with the holes in the flange *a*, substantially as described.

2. The floor-flange E, having the slots *b* and the grooves *c* beneath the slots, combined with the plates F and with bolts or screws for passing through said plates, substantially as described.

3. The combination, with a floor-flange having slots *b* and grooves *c*, of the plates F, having slots *i*, and of bolts or screws for passing through said plates, whereby the bolts may be adjusted around the flange and laterally thereon, substantially as described.

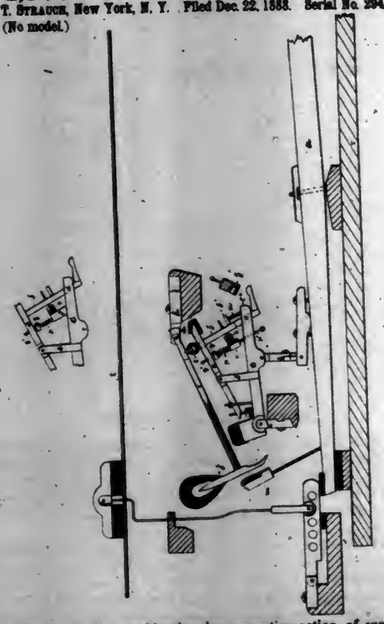
404,875. SAFETY EXTINGUISHING ATTACHMENT FOR HEATING AND ILLUMINATING APPARATUS FOR RAILWAY-CARS. ROSWELL T. SMITH, Nashua, N. H., assignor to himself and Nate W. Goddard, same place, and George H. Dunham, New York, N. Y. Filed Mar. 16, 1887. Renewed May 11, 1888. Serial No. 310,485. (No model.)

Claim.—1. In a safety extinguishing attachment for car heating and illuminating apparatus, a chest or casing adapted to contain material and devices for sustaining combustion, a cover normally impelled to close said casing, a swinging trigger-bar engaging said cover when open, and a gravity-catch sustaining the engagement between said cover and trigger-bar, substantially as specified.

2. In a safety extinguishing attachment for car heaters and lighters, the combination, with a chest or casing adapted to contain means and material for sustaining combustion, of a cover for said casing, which is normally impelled to close, a trigger-bar holding said cover open, a gravity-catch held in engagement with said trigger-bar by the pressure of the cover, and an automatic catch locking the cover as it closes, substantially as specified.

3. In a safety extinguishing attachment for car-heaters, the combination, with a chest or casing adapted to contain devices and material for sustaining combustion, of one or more wick-tubes rising to the

plane of the open top of the casing, a cover normally impelled to close the latter, a trigger-bar holding said cover open, and a gravity-catch engaging said trigger-bar, substantially as specified.

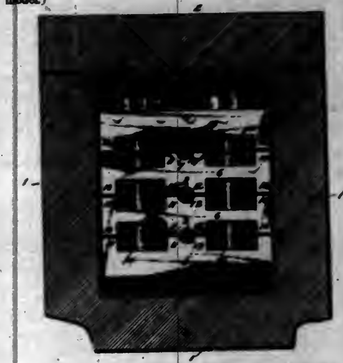


4. In heating or illuminating devices for railway-cars, a chest or casing, a cover constantly impelled to close the same, a closed oil-reservoir within said casing, one or more wick-tubes rising from said reservoir, a wick-adjuster engaging with each wick and a trigger-bar, and a gravity-catch holding said trigger-bar against the pressure of the cover, said trigger-bar being swept by the closing-cover against the bar connecting the wick-adjusters, whereby said wick-adjusters are operated automatically simultaneously with the closing of the cover, all combined substantially as specified.

5. In heating or illuminating devices for railway-cars, a chest or casing, one or more wick-tubes rising from a closed oil-reservoir within said casing, a wick-adjuster in each tube having a stud projecting through a slot cut spirally in the wick-tube, an actuating-slide engaging said stud or studs, a spring-impelled cover sliding over and practically closing the tops of said wick-tubes, and an automatically-released trigger-bar which holds and automatically releases said cover and by which the actuating-slide is operated to lower the wicks as the cover closes, all combined substantially as specified.

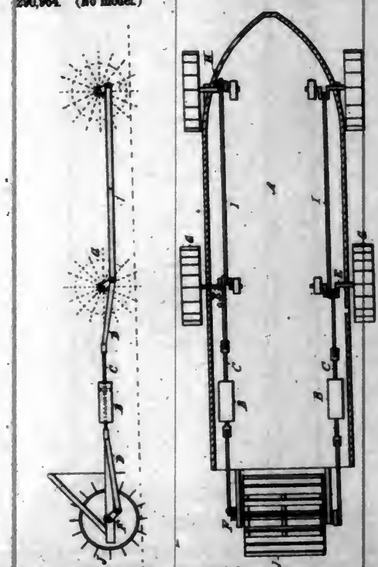
6. In heating or illuminating devices for railway-cars, a chest or casing, a spring-impelled slide closing the same, an oil-reservoir within said casing, one or more wick-tubes rising from said reservoir, a wick-adjuster in each having a stud projecting through a slot cut spirally in the wick-tube, a slide-bar having arms engaging said studs, a swinging trigger-bar holding the slide open, and a loaded latch holding said trigger, the latter when released swinging against and actuating the slide-bar to lower the wicks before the slide shoots over the tops of the wick-tubes and closes the same, all combined substantially as specified.

7. In heating or illuminating devices for railway-cars, a chest or casing, a reservoir containing material for sustaining combustion, burner-tubes rising from said reservoir, devices for raising and lowering the flame, a slide-bar actuating said devices, a spring-impelled slide closing said casing, means for holding and automatically releasing said cover, and an automatic locking-detent for retaining it in a closed position, the slide-bar being actuated by the releasing device as the slide closes over the tops of the burner-tubes, all combined substantially as specified.



404,876. REPEATING-ACTION FOR GRAND PIANOS. ALBERT T. STRAUCH, New York, N. Y. Filed Dec. 22, 1888. Serial No. 294,419. (No model.)

Claim.—1. The combination, in a repeating-action, of support *c* and whip *d* with the whip-spring *p*, and with a button for adjustably securing the spring to the support and whip, and with the jack *f*, having regulating-button *e*, that is adapted to come into contact with one of the whip-spring buttons, substantially as specified.

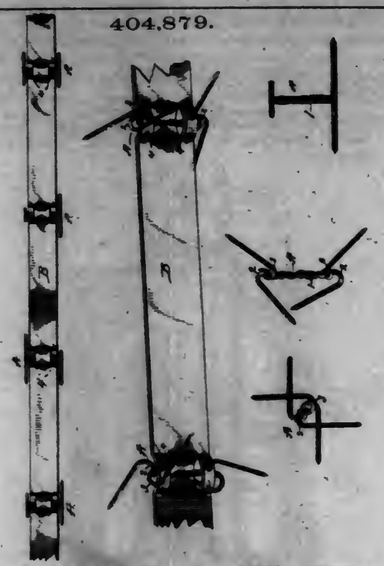


2. The combination, in a repeating-action, of support *c*, having forward extension c^2, with the jack *f*, having lug *f'*, and with the jack-spring *n* between the parts c^2 *f'*, substantially as specified.

404,877. UNDERGROUND CONDUCTOR. GEORGE E. TAILLEUR, Schenectady, N. Y. Filed Oct. 25, 1888. Serial No. 289,160. (No model.)

Claim.—A bracket for underground cables, formed of non-conducting material and consisting of end sections 4 and 5 and intermediate sections 6, each of the end sections being provided upon one of its faces with end projections 10 and central projections 11, grooved, as at 12, and the intermediate sections 6 being provided with similar projections and grooves upon each of their faces, and each of the sections being vertically perforated, as at 14, and binding-bolts 15, inserted through the opening and provided with nuts 16, substantially as specified.

404,878. SYSTEM OF APPLYING POWER TO STEAM-VESSELS. SAMUEL H. TIBBOTS, Evansville, Ind. Filed Nov. 15, 1888. Serial No. 290,964. (No model.)



Claim.—A vessel having the stern-wheel and along the sides one or more sets of wheels, the train of wheels on each side and the stern-wheel being operated in unison by an engine provided with a piston-rod in each end of the cylinder, and the connecting parallel rods, substantially as herein set forth.

404,879. BARBED FENCE. CONSTANT S. TREVITT and SOLOMON F. MOUCK, Lincoln, Nebr. Filed Jan. 23, 1889. Serial No. 297,797. (No model.)

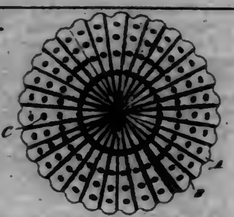
Claim.—1. The improved fence-barb herein described, formed with an axial bearing 1, curved surface bearings 2 3 at each end of the axis, arranged on planes at right angles to the axis, and terminating in barbs struck at right angles to each other, substantially as described.

404,879.

2. The improved fence-barb A, consisting of two wires twisted together to form an axial bearing 1, the four ends of the wires being formed into curved bearing-surfaces 2 3, arranged on planes at right angles to the axis and terminating in barbs arranged at right angles to each other, substantially as described.

3. The combination, with the strands formed with vertical bearings, of barbs composed of wires having a twisted shank constituting a bearing or axis, curved surface bearings at the end of the shank, and terminating in barbs arranged at right angles to each other, substantially as specified.

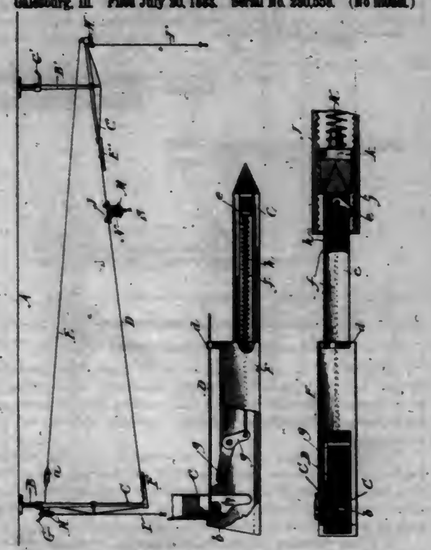
404,880. FRUIT-BOX. VANBUREN WHEAT, Orleans, N. Y. Filed Apr. 13, 1889. Serial No. 307,106. (No model.)



Claim.—1. A box having its ends grooved at their upper inward edges, which project above the sides of the box, a cover to slide in said grooves, and handles secured to the sides of the box adapted to to be turned over the ends of the box to release the cover, to be folded down upon the box-cover, and to be raised and used for carrying, and thus also locking the box, as herein set forth.

2. A box having its sides extended below its end pieces, a bottom fitted in between said sides and attached to the end pieces of the box, the said end pieces having grooves on the inner sides of their upper edges which extend above the sides of the box, a cover adapted to slide in said grooves, and handles so secured to the sides of the box that they may be turned outwardly to release the cover, upwardly to serve as handles, and that may be folded down upon the box-cover, substantially as and for the purposes herein set forth.

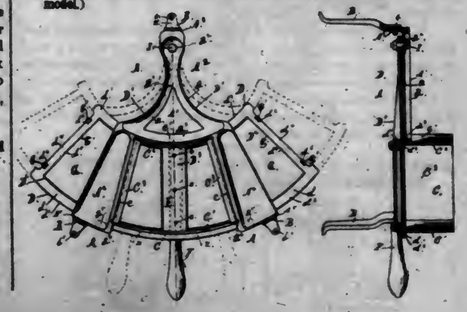
404,881. BOSOM-PAD. SETH WEBBLER, Albany, N. Y. Filed Mar. 7, 1888. Serial No. 266,433. (No model.)



404,881.

Claim.—As a new article of manufacture, a bosom-pad formed of a single unseamed piece of fabric corrugated and perforated, substantially as described.

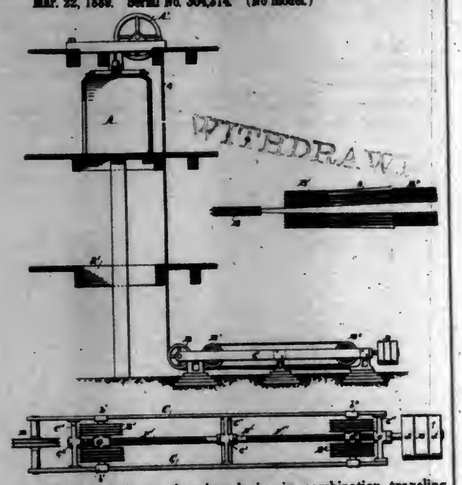
404,882. STORE-SERVICE APPARATUS. CHARLES A. WHIPPLE, Galesburg, Ill. Filed July 30, 1888. Serial No. 280,556. (No model.)



Claim.—1. The brackets B B', swinging arms C C', track D, and wire E, in combination with stops G G', catches H H', and ropes I I', substantially as and for the purpose specified.

2. The frame F, having a pointed stem e and a pawl *e*, in combination with a carrier-frame J, having teeth *j* and spring K, substantially as and for the purpose specified.

3. The toothed carrier-frame J and the frame F, having a stem *e*, a pawl *e*, rod *f*, and an elbow-lever *g*, in combination with a swinging arm C, adapted to engage with the lever *g*, substantially as and for the purpose specified.



4. The carrier-frame J and beveled ring M, supported therefrom, in combination with the cup N, spring-catches O, bell-crank levers R, conical stem Q, and handle S, substantially as and for the purpose specified.

404,883. VEGETABLE-SLICER. THEOPHILUS ABBOTT, Floria, Pa. Filed Oct. 18, 1887. Renewed Nov. 20, 1888. Serial No. 291,414. (No model.)

Claim.—In a vegetable-slicing machine, the combination of the frame A, having ribs a^4, the hopper C, having grooves *c*, and the turn-button *c'*, with the reciprocating sector D, provided with the two-edged cutter E, the bottom guide-plates G, vertically adjustable in said sector, and the handle F, said sector D being fulcrumed to the under side of the frame A at a^2 and adapted to reciprocate under the hopper C by means of the handle F, substantially as set forth.

404,884. ELEVATOR. LEONARD ATWOOD, Philadelphia, Pa. Filed Mar. 22, 1889. Serial No. 304,314. (No model.)

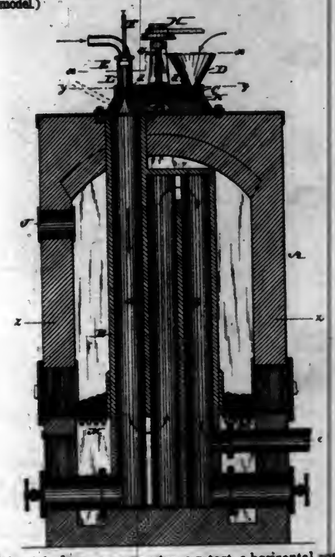
Claim.—1. In an elevating device, in combination, traveling sheaves, a shaft threaded in opposite directions and working in threaded bearings connected with said traveling sheaves, a car, and connections, substantially as described, between said car and the traveling sheaves.

2. In an elevating device, in combination, traveling sheaves bearings on said sheaves, guides on which said bearings rest, a shaft threaded in opposite directions and working in threaded bearings connected with said traveling sheaves, a car, and connections, substantially as described, between the traveling sheaves and the car.

3. In an elevating device, in combination, traveling sheaves, bearings on said sheaves, guides on which said bearings rest, a shaft threaded in opposite directions, internally-threaded bearings connected with said sheaves on which said threaded portions of the shaft work, a rope secured at both ends and passing around said traveling sheaves, and a car connected to said rope.

4. In an elevating device, in combination, traveling sheaves, bearings on said sheaves, guides on which said bearings travel, a shaft threaded in opposite directions, internally-threaded bearings connected with said sheaves in which said threaded portions of the shaft work, a pulley to operate said shaft, a car, and connections, substantially as described, between the sheaves and the car.

5. In an elevating device, in combination, traveling sheaves, bearings on said sheaves, guides on which said bearings rest, a shaft threaded in opposite directions, internally-threaded bearings connected with said sheaves in which said threaded portions of the shaft work, a stationary sheave, a rope secured at both ends and passing around the stationary and traveling sheaves, and a car connected to said rope.



6. In an elevating device, in combination, traveling sheaves, bearings on said sheaves, guides on which said bearings travel, a shaft threaded in opposite directions, internally-threaded bearings connected with said sheaves in which said threaded portions of the shaft work, a pulley to operate said shaft, a stationary sheave, a rope secured at both ends and passing around the stationary and traveling sheaves, and a car connected to said rope.

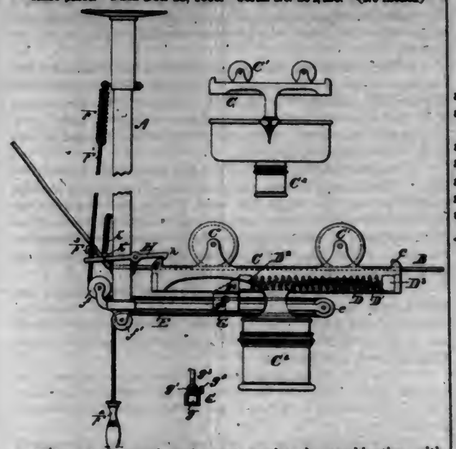
404,885. VALVE. WILLIAM A. BABCOCK, South Coventry, Conn. Filed June 24, 1884. Serial No. 135,852. (No model.)

Claim.—In an air-compressor of the character described, the deflecting balancing plate or disk adjustably attached to the movable plug or plunger of the valve and disposed before the discharge-orifice, whereby the reactionary force of the discharge is regulated, substantially as shown and described.

404,886. APPARATUS FOR GENERATING GAS. WILLIAM G. BEDFORD, Philadelphia, Pa. Filed Apr. 17, 1888. Serial No. 270,992. (No model.)

Claim.—1. In a gas-generator, a retort, a horizontal rotary feeding-wheel provided with openings, a hopper or chute communicating with the openings, and a vapor-pipe also communicating with the openings of the feeding-wheel at a different place from the hopper, whereby the hopper supplies the charge to an opening of the feeding-wheel, which carries the same around under the vapor-pipe and deposits it into the retort, thereby thoroughly commingling the charge with the vapor, substantially in the manner and for the purpose described.

2. In a gas-generator, a retort, in combination with a steam-pipe, an intermediate rotary supply-wheel with opening communicating between said pipe and retort, and a vertically-removable flanged sleeve in said pipe, substantially as and for the purpose set forth.



3. In a gas-generator, a furnace having a retort with tube located therein, a horizontal rotary feeding-wheel with openings mounted on a vertical shaft above said furnace, a hopper with an opening adapted to communicate with the openings of the feeding-wheel, a casting having its bottom adapted to close the lower end of said openings and cut away above the tube of the retort, a steam-pipe communicating with the tube of the retort by means of the openings in the feeding-wheel, and a hydrocarbon-vapor pipe leading into the steam-pipe, said parts being combined substantially as described.

4. In a gas-generator, a furnace with the retort having a tube, a horizontal feeding-wheel mounted above the furnace and having openings near its periphery adapted to communicate with the tube of the retort, the casting having its bottom adapted to close the lower end of the openings in the feeding-wheel, a steam-pipe communicating with the tube in the retort by means of the openings of the feeding-wheel, and a hydrocarbon-vapor pipe leading into the steam-pipe, said parts being combined substantially as described.

5. In a gas-generator, a furnace with a retort consisting of a series of vertical parallel tubes communicating alternately at opposite ends and having an inlet and outlet with an eduction-pipe, a housing or casing secured to the top of said furnace, a horizontal rotary wheel having openings within said casing, the said openings adapted to coincide with an opening leading to the retort, a steam-pipe leading into the retort through one of said openings, and a hydrocarbon-vapor pipe leading into the said steam-pipe above said wheel, said parts being combined substantially as described.

6. In a gas-generator, a furnace with a retort thereto, a casing above said furnace having the bottom cut away at an upper opening of the retort, a rotary wheel within said casing having openings coinciding with the upper opening of the retort, a steam-pipe leading into the retort through one of said openings in the rotary wheel, a hydrocarbon-pipe leading into the steam-pipe, and an expansible collar in said steam-pipe above the rotary wheel, said parts being combined substantially as and for the purpose set forth.

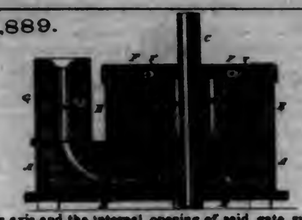
404,887. CASH-CARRIER. WILLIAM H. BILLING, East Saginaw, Mich., assignor of two-thirds to Arthur Caille and Edward A. Owen, same place. Filed Dec. 22, 1888. Serial No. 294,420. (No model.)

Claim.—1. In a cash and parcel carrier, the combination, with the taut wire, the hanger having an arm extending at right angles from the same and provided with pulleys, and a cord or strap passing over said pulleys and carrying a plunger-block, of a car adapted to travel on said wire and provided with a slotted cylinder, a coil-spring located in said cylinder and adapted to be compressed by the plunger-block entering the cylinder through the slot therein, means for holding the car at the station until the spring has been compressed, and means for releasing the car after the spring has been compressed, substantially as described.

2. In a cash and parcel carrier, the combination of the hanger A, having an arm E, provided with pulleys, the taut wire B, a car adapted to travel on said wire and provided with a slotted cylinder D, having a coil-spring D', and slides D^3 D^4, located therein, the cord F, having plunger-block G and nut F^6 attached thereto, and the trigger H, substantially as described.

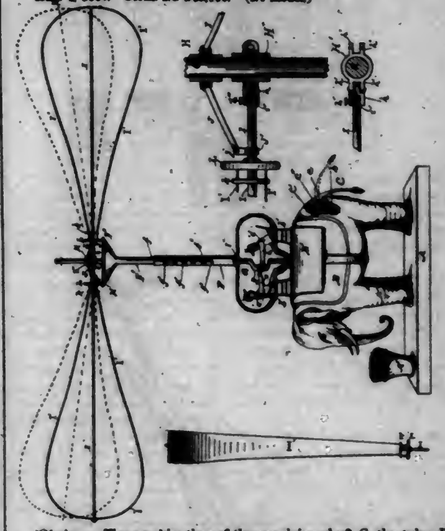
404,888. APPARATUS FOR CASTING CHILL-RINGS. HANS BERGHOLL, Milwaukee, Wis., assignor to Edward P. Allis, same place. Filed Apr. 22, 1884. Serial No. 128,693. (No model.)

Claim.—1. The combination, in a mold for casting chill-rings for corrugated rollers, of a corrugated master-roll or chill-core, a sand mold formed about the same and having an annular depression at the bottom below the exposed face of said master-roll or chill-core, and a gate or gates leading into the upper part of said mold, substantially as and for the purposes set forth.



2. The combination, in a mold for casting chill-rings for corrugated rollers, of a corrugated master-roll or chill-core, a sand mold formed about the same, an annular depression at the bottom of said mold extending below the exposed face of said master-roll or chill-core, a feeding-basin formed at the top of said mold, and a gate or gates connecting said basin above its bottom with the upper part of said mold, substantially as and for the purposes set forth.

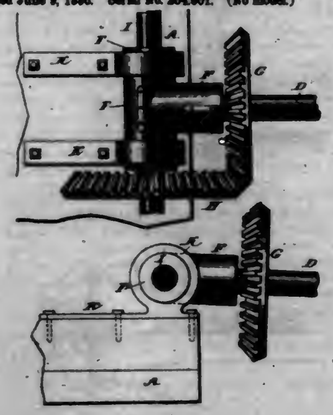
404,889. APPARATUS FOR CASTING CHILLED CORRUGATED ROLLERS. HANS BERGHOLL, Milwaukee, Wis., assignor to Edward P. Allis, same place. Filed Apr. 22, 1884. Serial No. 128,694. (No model.)



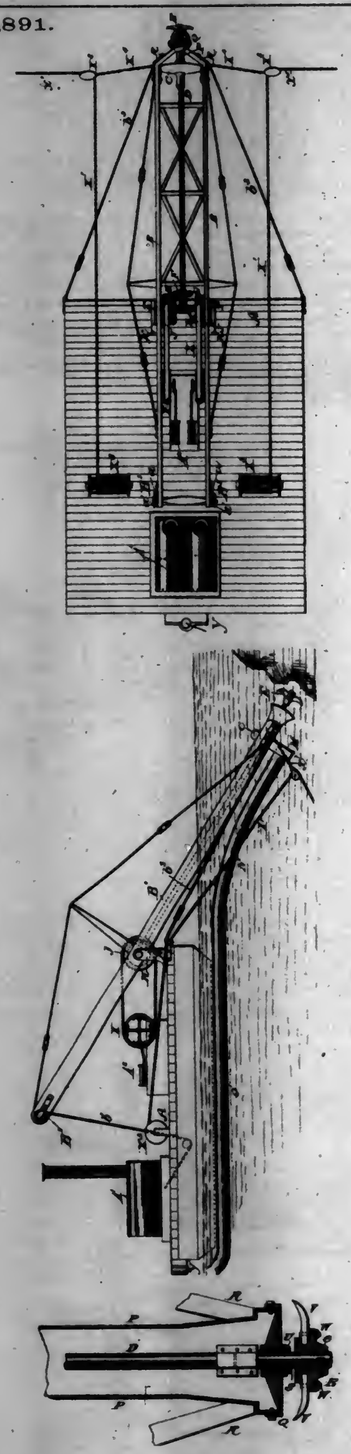
Claim.—1. In a mold for casting corrugated rollers, the combination of an internally-corrugated chill-ring, a gate opening on the outside above said mold and into the bottom of the same near the center, and a cylinder having oblique openings placed within said mold about its axis and the internal opening of said gate, substantially as and for the purposes set forth.

2. In a mold for casting corrugated rollers, the combination of an internally-corrugated chill-ring, a gate opening on the outside above said mold and into the bottom of the same near the center, and a fluted cylinder having oblique openings placed within said mold about its axes, and the internal opening of said gate, substantially as and for the purposes set forth.

404,889.



404,890. FLY-FAN. HENRY S. BERRINGTON, Baltimore, Md. Filed Aug. 4, 1887. Serial No. 246,166. (No model.)



Claim.—The combination of the revolving shaft G, the tubes F and F', the latter of which is adjustably supported within the former by the pin *f''* and notches *f' f'*, &c., and has on its upper end a friction-plate F'', the friction-wheels L L, shafts I I, sliding sleeves H H', and connecting-rods J J and sockets A A, substantially as described.

404,891. DREDGING-MACHINE. HORACE S. BROWN, Quincy, Ill. Filed June 9, 1886. Serial No. 204,601. (No model.)

404,891.

Claim.—1. The combination, with the sweep-beam B, the trunnions T T, supporting the same, and the bearings for said trunnions, of the box-bearing F, rotating in bearings on the boat and supporting the shaft of the digger-wheel, substantially as described.

2. The combination, with the pivoted sweep-beam B, the trunnions T, supporting the same, and the bearings for said trunnions, of the box-bearing F, rotating in bearings on the boat and supporting the shaft of the digger-wheel, and also the cross-shaft from which said digger-wheel shaft derives its motion, substantially as shown and described.

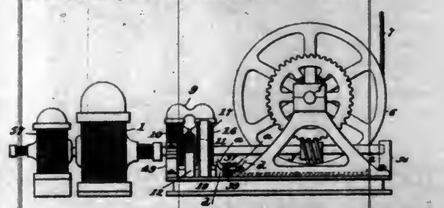
3. The combination, with the sweep-beam B, the trunnions T, the bearings therefor, the box-bearing F, rotating in bearings on the boat, and the longitudinal shaft D, supported at one end by the box-bearing F, of the cross-shaft I, also supported by said bearing F, the pump operated by said shaft D, and the digger-wheel, also operated by said shaft, substantially as described.

4. The combination, with the pivoted sweep-beam B, the trunnions T, the bearings therefor, the box-bearing F, rotating in bearings on the boat, and the longitudinal shaft D, supported at one end by the said bearing F, of the cross-shaft I, also supported by said bearing F, the pump operated by said shafts, the digger-wheel, the engine, the pulleys J J on the shaft I, and the belts X, all substantially as shown and described.

5. The combination, with the trussed beam B, the pump C, carried thereby, and the flexible pipe N, connected to the discharge-opening of said pump, of the pipe-line O, connected with the pipe N and passed alongside the hull of the boat to a pivot-spud Y, substantially as shown and described.

6. In a dredging-machine, the combination, with the shaft D, of the short shaft S, connected thereto by a clamp-coupling, as described, and the digger-wheel E, carried by the shaft S, substantially as shown and described.

7. In a dredging-machine, the combination, with the shaft D, strainer-head Q, the bushed bearing U therein, and the short shaft S, passed through said bushed bearing and connected to the shaft D by a clamp-coupling, of the digger-wheel carried by the outboard end of said short shaft, substantially as and for the purpose specified.



404,892. LATCH-CASE. CHARLES M. BURGESS, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed Mar. 26, 1888. Serial No. 304,814. (No model.)

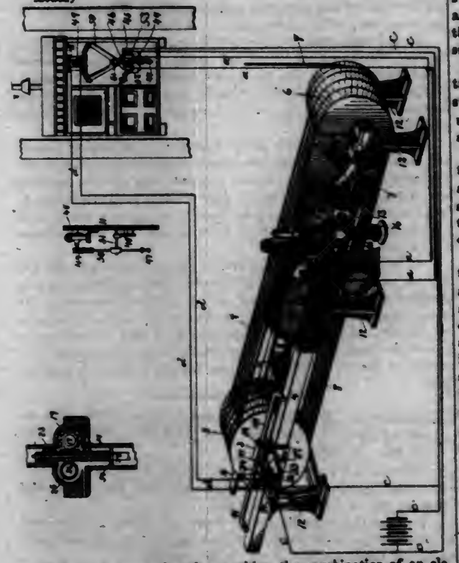
Claim.—1. The sheet-metal latch-case having the base 6 for the spring 11 formed integral with one of the latch-plates A, cut and bent from the body thereof, substantially as described, and for the purpose specified.

2. The herein-described sheet-metal latch-case having the rim or flange 10 swaged up from the plates A A and forming bearings for the latch-hub, substantially as described, and for the purpose specified.

404,893. ELEVATING-MACHINE. JAMES E. BYRNE, Brooklyn, N. Y. Filed Aug. 10, 1888. Serial No. 282,477. (No model.)

Claim.—1. The combination, in an elevating-machine, of a winding-drum and two electric motors, (one for hoisting and the other for lowering,) connected through a train of mechanism, consisting of a worm-shaft, a worm, a worm-wheel, and a drum-shaft, all substantially as set forth.

2. The combination, in an elevating-machine, of a winding-drum and two electric motors, (one for hoisting and the other for lowering,) connected through a train of mechanism, consisting of a worm-shaft, a worm, a worm-wheel, and a drum-shaft, the motors being in electrical connection with contact-points in the elevator-car, all substantially as set forth.

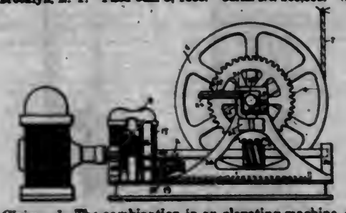


3. The combination, in an elevating-machine, of a band-brake having a slackening-spring and an electric motor, the band-brake and the motor being mechanically connected through a worm-shaft, a worm, a worm-wheel segment swinging about its shaft and fastened to the brake-band at two points, the slackening-spring being attached to segment at some point below its shaft and at some point without said segment, the motor being in electrical connection with a contact-point in the elevator-car, all substantially as set forth.

4. In an elevating-machine, the combination of a bracket having arms carrying electrical contact-points, the said electrical contact-points carried by the bracket-arms, a feather which prevents a traveling nut turning, a traveling nut carrying insulated arms which engage with the electrical contact-points carried by said bracket-arm, hoisting and lowering motors, contact-points in elevator-car, and a battery, the electrical contact-points carried by said bracket-arms being in the electrical circuit connecting the elevating-machine hoisting and lowering motors, the contact-points in elevator-car, and the battery, all substantially as set forth.

5. In an elevating-machine, the combination of a rocking lever having arms at one end upon which the hoisting-ropes fall when they unwind from the winding-drum, and at the other end an arm with an insulated tip, hoisting and lowering motors, contact-points with which the insulated tip on the end of the said rocking lever engages, contact-points in the elevator-car, and a battery, the contact-points with which the insulated tip on the end of the said rocking lever engages being in the electrical circuit connecting the hoisting and lowering motors, contact-points on the bracket-arms, contact-points in the elevator-car, and battery, all substantially as set forth.

6. The combination of two electric motors fastened to the same shaft, one for hoisting and the other for lowering, and a drum winding the hoisting-cables of an elevator-car connected through a train of mechanism, the motors being in electrical connection with a contact-point in the elevator-car, a brake operated by an auxiliary electric motor connected through a train of mechanism, the auxiliary motor being in electrical connection with a contact-point in the elevator-car, a nut traveling on the winding-drum shaft and carrying insulated arms which engage at the ends of the travel of the nut with contact-points mounted on the arms of a bracket which carries a feather for preventing the said nut from turning, said contact-points being in the electric circuit connecting the machine-motors with the contact-points in the car, a rocking lever which makes and breaks contact between the battery-wire and the machine-motor wires, and a switch connected with the battery-wire and extending through the side of the elevator-car and engaging with stops at the top and bottom of the elevator-hoistway, thereby altering the position of the switch in the car, all substantially as set forth.



404,894. ELECTRICALLY-CONTROLLED ENGINE. JAMES E. BYRNE, Brooklyn, N. Y. Filed Dec. 24, 1888. Serial No. 294,564. (No model.)

Claim.—1. In an elevating-machine, the combination of an elevator-car, an electric switch in said car for operating same, a reversible electric motor in said car, a bracket attached to the elevating-machine cross-head slides and carrying a switch and contact-points, insulated arms carried by the elevating-machine cross-head and which engage with the said bracket-switch, and a suitable source of electricity, the car-motor and the car-switch being connected through a train of mechanism, the car-motor being in electrical connection with the arms of the bracket-switch, and the bracket contact-points being in electrical connection with the source of electricity, all substantially as set forth.

2. In an elevating-machine, the combination of an elevator-car, an electric switch and contact-points in said car for operating same, a reversible electric motor in said car, a bracket attached to the elevating-machine cross-head slides and carrying a switch and contact-points, insulated arms carried by the elevating-machine cross-head and which engage with the said bracket-switch, a reversible electric motor in mechanical connection with the elevating-machine operating-valve, and a suitable source of electricity, the car-motor and car-switch being connected through a train of mechanism, the car-motor being in electrical connection with the arms of the bracket automatic switch, the machine valve-motor being in electrical connection with the arms of the car-switch, and both the car and bracket contact-points being in electrical connection with the source of electricity, all substantially as set forth.

404,895. ELECTRIC ELEVATING-MACHINE. JAMES E. BYRNE, Brooklyn, N. Y. Filed Jan. 5, 1889. Serial No. 295,563. (No model.)

Claim.—1. The combination, in an elevating-machine, of an electric motor and a winding-drum connected by a train of mechanism, a reversible switch in the elevator-car, top and bottom and intermediate automatic stop-switches on the machine, a battery, and suitable electric connections between the machine-motor, car-switch, automatic switches, and battery, all substantially as set forth.

2. The combination, in an elevating-machine, of an electric motor and a winding-drum connected by a train of mechanism, a reversible switch in the elevator-car, top and bottom and intermediate automatic stop-switches, springs to keep the automatic switches in mid-position, a traveling nut carrying arms which engage with the top and bottom switch-arm, a rocking lever which engages with the intermediate automatic switch, a battery, and suitable electric connections between the machine-motor, car-switch, automatic switches, and battery, all substantially as set forth.

3. The combination, in an elevating-machine, of a reversible electric motor and a brake connected through a train of mechanism, a switch in the elevator-car, contact-points, and a battery, the switch, motor, contact-points, and battery having suitable electric connections, all substantially as set forth.

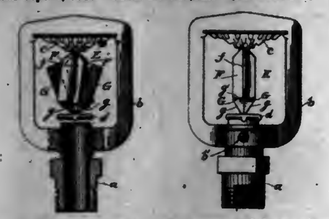
4. The combination, in an elevating-machine, of a reversible electric motor and a switch, both in the elevator-car, connected through a train of mechanism, top and bottom and intermediate automatic stop-switches on the machine and contact-points in the car, and a battery, the switches, battery, and contact-points having suitable electric connections, all substantially as described.

5. The combination, in an elevating-machine, of a reversible electric motor and a winding-drum connected through a train of mechanism, a reversible electric motor and a band-brake connected through a train of mechanism, a reversible electric motor and a switch in the elevator-car connected through a train of mechanism, top and bottom and intermediate stop-switches on the machine, a traveling nut carrying insulated arms which engage with the top and bottom automatic stop-switch, a rocking lever which operates in connection with the intermediate stop-switch, a lever which engages with projecting tappets on the sides of the elevator-hoistway, suitable contact-points, and a battery, the electric motors, switches, and contact-points having suitable electric connections, all substantially as described.

404,896. ADJUSTABLE CURVE FOR CASH-CARRIERS. FRANK S. CHURCH, Ovid, assignor to the Union Store Service Company, East Saginaw, Mich. Filed Jan. 26, 1888. Serial No. 267,500. (No model.)

Claim.—1. In a store-service apparatus, a curved track-section having arms for supporting the same, one or more of said arms being adjustable and adapted to vary the curvature of said section, substantially as described.

2. In a store-service apparatus, a curved track-section having arms for supporting the same, one or more of said arms being provided with a turn-buckle for lengthening or shortening the arms, substantially as described.



3. A curve for the track of a cash-carrier apparatus, consisting

404,896.

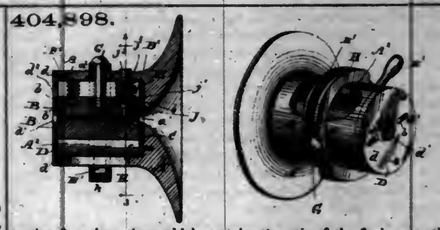
of a curved track-section supported midway between its ends by a fixed arm and adjustable arms located on each side of said fixed arm, the construction being such that the curvature may be varied by lengthening or shortening the adjustable arms, substantially as described.

404,897. AUTOMATIC SPRINKLER. JOSEPH CLAPP, Evanston, assignor to the Clapp Automatic Fire Extinguisher Company, Chicago, Ill. Filed Sept. 4, 1888. Serial No. 284,520. (No model.)

Claim.—1. The combination, with the cap and frame of an automatic sprinkler, of a separable intervening post having a member tapered to pivotally bear upon the axis of the cap, the body of which member is extended laterally from said axis, a secondary member having one end resting against the frame and the other provided with a positive eccentric point of bearing upon said first member, the main body of one of said members being inclosed within the other and having their contiguous surfaces united by means of fusible solder, whereby upon the yielding of the solder from heat said surfaces may slide laterally upon each other in the arc of a circle the center of which is said eccentric point of bearing, substantially as shown and described.

2. In an automatic sprinkler, a sectional sheet-metal post for normally holding the cap in position, consisting of independent members of less length than the entire length of the post, the body of the members forming one section of said post having radial flanges extending from the axis thereof, one of said members being partially inclosed within the other, fusible solder for uniting the contiguous surfaces of said members, and positive pivotal points of bearing therein eccentric to said axis, substantially as shown and described.

3. The combination, with the cap and frame of an automatic fire-extinguisher, of a sectional cap-holding post consisting of two independent sheet-metal members tapered to a point at and having a bearing upon the axis of the cap, one or more members soldered thereto to form the remainder of the post, which rests against the frame, and bearings or rests upon said tapered members eccentric to the axis thereof, substantially as shown and described.



4. In an automatic sprinkler, a sectional sheet-metal post for normally holding the cap in position, consisting of two independent members of less length than the entire length of the post, pointed to meet and bear in common upon the axis of the cap, the bodies of which members extend laterally from said axis, one or more secondary members attached thereto with fusible solder and having eccentric points of bearing thereon, substantially as shown and described.

404,898. NIPPER FOR SPINNING-MACHINES. CHARLES D. CLARK, Chicago, Ill., assignor to William Deering & Company, same place. Filed Sept. 29, 1888. Serial No. 286,741. (No model.)

Brief.—The object of the invention is to provide means for preventing the unevenness in twine sometimes caused by small lumps in the fiber, which lumps cause an enlargement of the mouth of the nipper during the entire time that they are passing through it, and consequently cause an enlargement in the twine of corresponding length.

Claim.—1. In a nipper for a twine-spinning machine, in combination with the tubular shell having a flaring mouth, a pair of nipper-jaws located within the shell and having opposed faces normally in contact, a pair of opposed springs located within the shell and reacting between the wall thereof and the jaws, respectively, at their forward part, and a pair of springs located within the shell and reacting between the wall thereof and the jaws, respectively, toward their rear end, the opposed springs of each pair being of substantially equal tension, whereby the jaws are held normally with their opposed and contacting faces in a plane which contains the axis of the flaring mouth and are made capable of separating at either end without separating at the other, substantially as set forth.

404,898.

2. In a nipper for twine-spinning machines, in combination with a tubular shell having a flaring mouth, a pair of nipper-jaws having faces opposed to each other, and provided with coinciding longitudinal grooves constituting together a longitudinal duct, a pair of opposed springs located within the tubular shell and reacting between the wall thereof and said jaws, respectively, toward the receiving end of the jaws, and a pair of opposed springs located within the shell and reacting between the wall thereof and the jaws, respectively, toward the delivery end of the jaws, the opposed springs of each pair being substantially of equal tension, substantially as and for the purpose set forth.

3. In combination with the chambered shell, the nipper-jaws located therein, and the springs which yieldingly hold them together, said jaws being provided with stems which protrude transversely through the wall of the shell, and the cam-ring encircling the shell and having the eccentric cams engaging the protruding portion of the stems, respectively, substantially as set forth.

4. In combination with the chambered shell, the jaws located in said chamber, opposed springs reacting between them, respectively, and the wall of the chamber, said jaws being provided, respectively, with stems G G, which protrude through the chamber-wall and are exteriorly headed, and the cams guided on the exterior of the shell and engaging the protruding portions of the stems, respectively, substantially as and for the purpose set forth.

5. In combination with the chambered shell, the jaws located in such chamber, springs which react against the forward ends of the jaws, and other springs which react against the rear end of the jaws to yieldingly hold the jaws together at said ends, respectively, the stems G G, projecting from said jaws midway between said springs, and the shell having elongated apertures a^3, in which said stems, respectively, are guided, substantially as set forth.

6. In combination with the shell having the receiving-mouth and the rear chamber entered from said mouth, the jaws located in said chamber and provided with gudgeons *b*, and the guide-plates C and D, provided with the parallel slots c^2 and d^2, which receive the gudgeons, respectively, and the springs which force the jaws together, substantially as set forth.

7. In combination with the shell and the jaws located therein and the springs which force them together, the plunger-pins J J, protruding through said jaws to their opposed faces near the receiving end, said pins having grooves *j'* in their abutting ends diminishing in depth toward the discharge side thereof, and springs which react against said plunger-pins to force them toward each other, substantially as set forth.

8. In combination with the shell having the receiving-mouth and the rear chamber entered through the same, the jaws located in said chamber, and springs which react against said jaws, respectively, the plunger-pins within and extending to the opposed faces of the jaws, respectively, and the springs which react upon said plunger-pins to force them toward each other longitudinally, said springs being independent of the springs which act upon the jaws substantially as set forth.

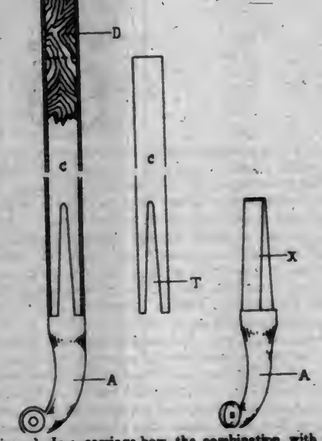
404,899. TOY RACKET. GEORGE D. COREY, Lowell, Mass., assignor to Harry W. Coburn, same place. Filed Feb. 2, 1889. Serial No. 298,424. (No model.)

Claim.—1. A toy racket having a wire frame and a face of interlaced wires, the ends of said interlaced wires being bent around said frame, as and for the purpose specified.

2. A toy racket having a wire frame and a face of interlaced wires, the ends of said interlaced wires being bent around said frame and tinned thereto, as and for the purpose specified.

3. A toy racket having a compound wire frame consisting of two or more wires twisted together and then bent into form of an oval loop, the end portions of said compound wire being twisted together to form a shank, and having a face consisting of interlaced wires, the ends of which are bent around said frame, as and for the purpose specified.

4. A toy racket having a compound wire frame consisting of two

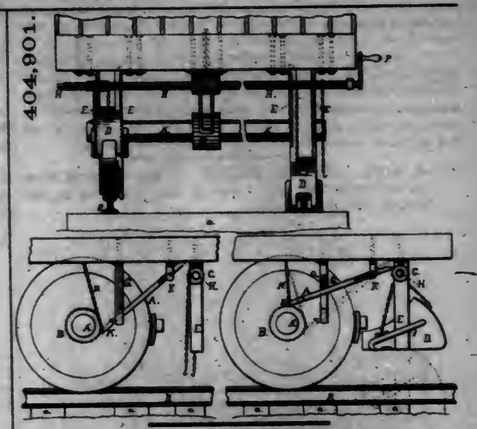


404,899.

or more wires twisted together and then bent into the form of an oval loop, the end portions of said compound wire being twisted together to form a shank, and having a face consisting of interlaced wires, the ends of which are bent around said frame and tinned thereto, as and for the purpose specified.

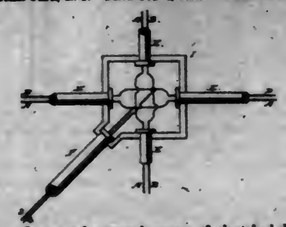
5. A toy racket having a wooden handle and having a frame of wire bent into an oval loop, the end portions of said frame-wire being twisted together to form a shank and inserted in said handle, as and for the purpose specified.

404,900. CARRIAGE-BOW. GEORGE L. CRANDAL, Binghamton, N. Y. Filed Mar. 18, 1889. Serial No. 303,810. (No model.)



Claim.—1. In a carriage-bow, the combination, with the metal tubular bow-socket B and wood bow or filler D, of the slat-iron A, having the projecting tang X, and the metal strengthening-strip C, made with its lower end cut away at T, so as to fit over and rest upon the projecting tang X of the slat-iron A, substantially as described.

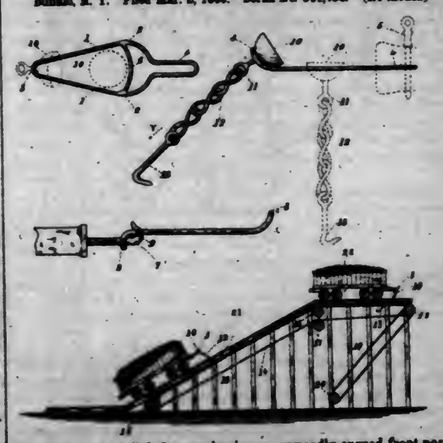
2. In a carriage-bow, the combination, with the metal tubular bow-socket B, of the slat-iron A, having the projecting tang X, and the metal strengthening-strip C, made with its lower end cut away at T, so as to fit over and rest upon the tang X, substantially as described.



404,901. CAR-CHECK. JAMES M. DU WITT, Rutherford, N. J. Filed Mar. 1, 1889. Serial No. 301,722. (No model.)

Claim.—The combination of the hinged pawl A with the ratchet-wheel B on axle A and the ratchet-wheel C on rod H, the latter being provided with a check-elevating chain, all substantially as described.

404,901.

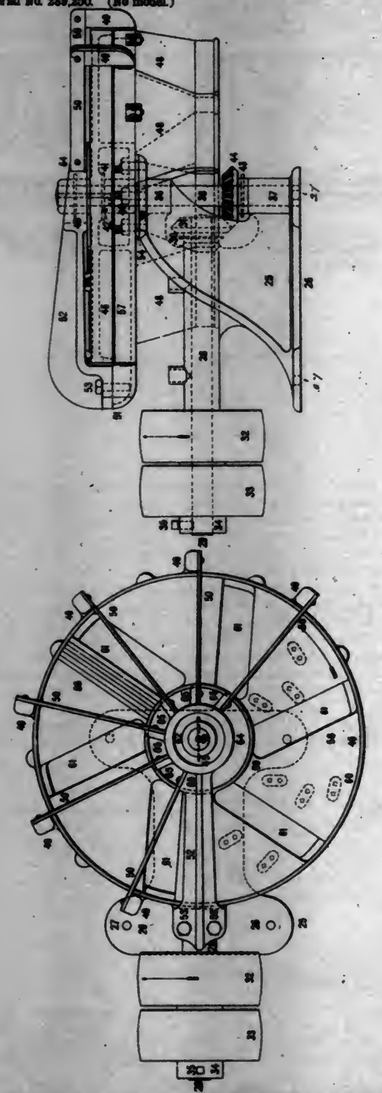


404,902. ELECTRICAL-DISTRIBUTION SYSTEM. THOMAS A. EDISON, Menlo Park, N. J. Filed Oct. 4, 1881. Serial No. 42,163. (No model.)

Claim.—1. In an underground system of electrical distribution, the combination, with a street-intersection box having pipe-openings in its sides, of two or more pairs of conductors, each pair forming the two sides of a circuit, pipes for the separate conductors entering the box, and connections within the box of conductors of the same polarity, substantially as set forth.

2. In an underground system of electrical distribution, the combination, with a street-intersection box having pipe-openings in its sides, of two or more pairs of conductors, each pair forming the two sides of a circuit, pipes for the separate conductors entering the box, connections within the box of conductors of the same polarity, and a line of conductors forming a feeding-circuit entering the box and connected to the intersecting conductors, substantially as set forth.

404,903. SELF-ACTING UNLOCKING-LINK. WILLIAM P. FISHER, Buffalo, N. Y. Filed Mar. 2, 1889. Serial No. 301,784. (No model.)

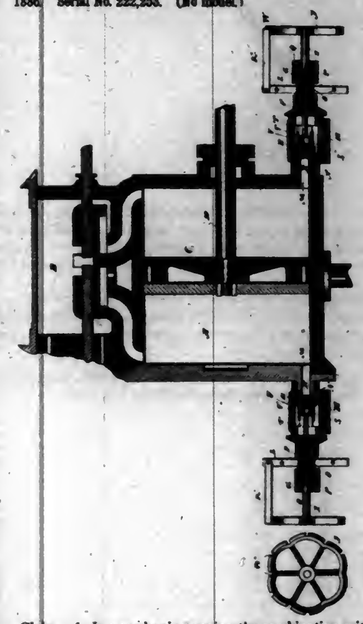


Claim.—1. A link for cars having an upwardly-curved front portion, with its sides spread outward, so that the opening between them is gradually enlarged from the front toward the rear, and having a

contracted portion at the rear adapted for connection with a car, substantially as and for the purposes described.

2. The combination of a connecting-link for cars having its sides spread outward so that the opening between them gradually enlarges from the front toward the rear, and a chain provided with a tapering or semi-spherical head at one end and a means at the opposite end for connecting with a movable cable or chain, the front portion of said link having an upward inclination, substantially as described.

404,904. ASSORTING-MACHINE. CHARLES S. GOODING, Brookline, and SHERMAN W. LADD, Somerville, Mass. Filed Oct. 26, 1888. Serial No. 289,250. (No model.)



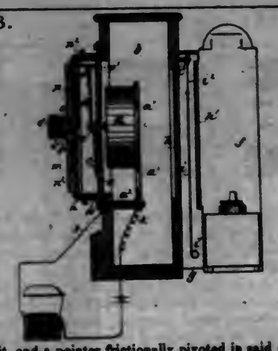
Claim.—1. In an assorting-machine for assorting articles of different thicknesses into several groups of uniform thicknesses, respectively, the combination of the following instrumentalities, to wit: a revolving perforated assorting feed-plate 46, revolving above a chute-plate 57, which is provided with chute-openings 47, said assorting feed-plate revolving below a series of assorting-fingers 50, which are fixed at graded distances above the upper surface of said feed-plate, and operative mechanism, substantially as and for the purposes set forth.

2. In an assorting-machine, the chute-plate 57, provided with chute-openings 47 and chutes 48, in combination with assorting feed-plate 46, assorting-fingers 50, and operative mechanism, substantially as described.

3. In an assorting-machine, the chute-plate 57, provided with assorting-finger lugs 49, arm 52, provided with lugs 65, and assorting-fingers 50, in combination with assorting feed-plate 46, provided with openings, and operative mechanism, substantially as described.

4. In an assorting-machine, the combination of the chute-plate 57 and assorting-fingers 50 with assorting feed-plate 46 and devices whereby the assorting feed-plate may be rotated, substantially as and for the purpose set forth.

404,905. LOW-PRESSURE ENGINE. HENRY HAAR, Bristol, Conn., assignor of one-half to Elisha S. Hollister, same place. Filed Dec. 22, 1886. Serial No. 222,253. (No model.)



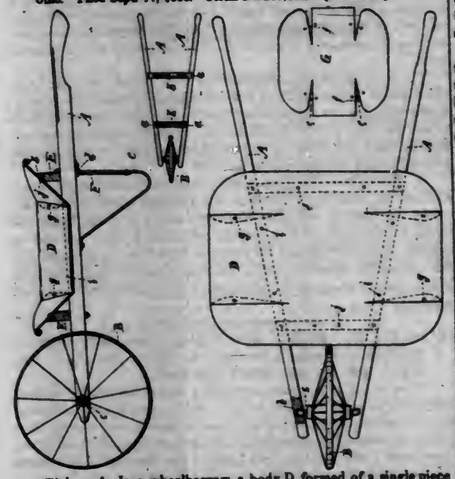
Claim.—1. In a condensing-engine, the combination, with a steam-cylinder in which a vacuum is produced by condensation in the normal operation of the engine, of a drip-discharge valve constructed and arranged to be opened by pressure within the cylinder, closed when a vacuum is formed therein solely by the pressure of the atmosphere, to which its outer end is directly exposed, and made adjustable in its opening to conform to the amount of water condensed, whereby the condensed water is freely and completely discharged without the expenditure of any power other than that required for moving the valve, and whereby the holding of water in the cylinder after the engine is stopped is avoided, substantially as set forth.

2. In a condensing-engine, the combination, with a steam-cylinder in which a vacuum is produced by condensation in the normal operation of the engine, of two automatic drip-discharge valves respectively located at the lower edges of the opposite ends of the cylinder, each of the said valves being constructed and arranged to be opened by pressure within the cylinder, closed when a vacuum is formed therein solely by the pressure of the atmosphere, to which its outer end is directly exposed, and made adjustable in its opening to conform to the amount of water condensed, whereby the condensed water is freely and completely discharged without the expenditure of any power other than that required for moving the valve, and whereby the holding of water in the cylinder is avoided, substantially as set forth.

404,906. ELECTRIC ALARM-CLOCK. WILLIAM R. HADLOCK, Wenham, Mass. Filed Feb. 3, 1888. Serial No. 263,416. (No model.)

Claim.—1. The combination of a clock-movement and hands thereof connected with an electric circuit, one of said hands being provided with an electric contact constituting one terminal of said circuit, with a crystal in front of said clock-hands provided with a circular metallic frame insulated from the clock-movement, but connected with and forming the other terminal of the before-mentioned

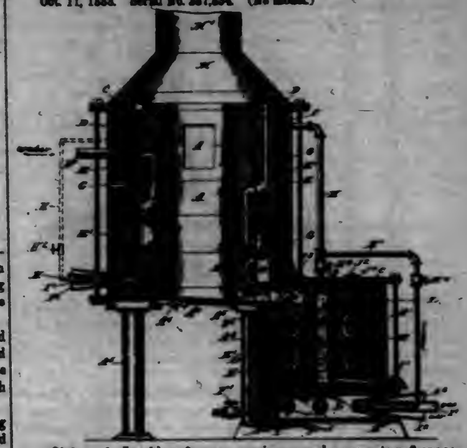
404,906.



electric circuit, and a pointer frictionally pivoted in said crystal concentrically with the clock-hands, the end of said pointer bearing with spring-pressure against the metallic frame of said crystal and being provided with a contact co-operating with the one carried by the clock-hand, substantially as and for the purpose described.

2. The combination of a clock-hand and electric contact fixed thereon with a yielding contact-carrier insulated from said clock-hand and provided with a spring-pressed contact normally engaging the said contact on the hand and a stationary contact co-operating with said yielding carrier, substantially as described.

3. An electric circuit closer and breaker for clocks, comprising two members, one carried by the clock-hand and the other located in the path thereof and completing the circuit when the member carried by the clock-hand engages the other member, combined with a contact-piece in the same circuit co-operating with one of said members, which is operated by the movement of the clock-hand, as described, whereby the circuit is broken, while the two members that originally closed it still remain in engagement, substantially as described.



404,907. WHEELBARROW. FRANK H. HARRIS, Auburndale, Ohio. Filed Sept. 17, 1888. Serial No. 285,604. (No model.)

Claim.—1. In a wheelbarrow, a body D, formed of a single piece of material provided with triangular-shaped openings c upon opposite sides and extending lengthwise of the blank, said openings being made flaring at their outer ends, and the outer portions formed with rounded corners, as shown, and the sides and ends bent up and secured and seamed, substantially as shown and described.

2. In a wheelbarrow, the combination of the handles A, the wheel B, non-detachably secured by a transverse shaft b, socketed into the front ends of the handles, the legs C, secured near the rear end of the handles and provided with the cross-braces F, the cross-bars E of the handles beveled at their upper edges, and the scoop D, secured to the handles and cross-bars and formed of a single metal plate provided with openings upon its opposite sides and secured together in the form of a scoop by means of rivets through the overlapping edges of the openings, and a seam around the outer edge, and a strengthening-wire concealed in the folds of said seam, all arranged substantially as and for the purpose described.

404,908. CUPOLA OR BLAST FURNACE. GEORGE M. HATHAWAY, New York, N. Y., and EDGAR R. STOCKING, Washington, D.C. Filed Oct. 11, 1883. Serial No. 287,834. (No model.)

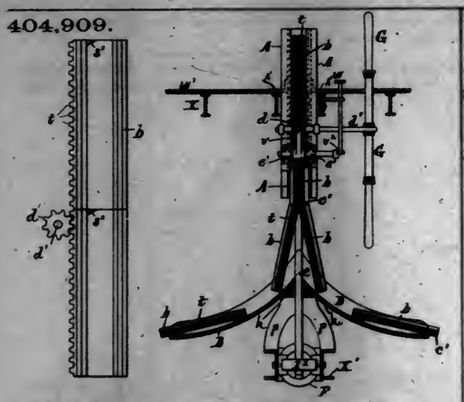
Claim.—1. In a blast-furnace, a primary and a secondary furnace communicating with each other by the throat of the former and each surrounded by a shell forming a gas-chamber, a communicating passage from the gas-chamber of one furnace to that of the other, and a burner or burners independent of the furnace arranged at the secondary furnace, substantially as specified.

2. In a blast-furnace, a primary and secondary furnace communicating with each other by means of the throat of the former, which furnace consists of a refractory lining, an annular shell forming a gas-chamber and an outer shell forming a non-conducting chamber, and burners independent of the furnace arranged at the secondary furnace, substantially as specified.

3. In a blast-furnace, a compound furnace comprising a primary furnace surrounded with gas and water chambers and having its throat communicating with a secondary furnace provided with annular gas and water spaces communicating with the gas and water spaces, respectively, of the primary furnace, and a fire-box communicating with the gas-spaces of the secondary furnace and provided with a burner or burners, and a steam-pipe extending from the non-conducting space of the primary furnace to the burners, substantially as specified.

4. In a blast-furnace, a compound furnace comprising a primary furnace arranged above and at one side of a secondary furnace and communicating therewith by its throat, said primary furnace being provided with a surrounding combustion or gas chamber, and a communicating passage leading from the gas-chamber of one furnace to that of the other, and a burner independent of the furnace arranged at the secondary furnace, substantially as specified.

5. A compound blast-furnace consisting of a primary furnace communicating by its throat with a secondary furnace, each provided with lining-brick and with surrounding communicating gas and water chambers, a communicating fire-box and a series of burners projected therein, and a burner communicating directly with the interior of the primary furnace, substantially as specified.



6. A blast-furnace consisting of a primary furnace arranged above and at one side of and communicating with a secondary furnace, and gas-burners independent of the furnace arranged against an outer wall of said secondary furnace, substantially as specified.

404,909. INGOT-CASTING MACHINE. WILLIAM R. RIDSDALE, Hoboken, N. J. Original application filed June 8, 1883, Serial No. 276,492. Divided and this application filed Mar. 13, 1889. Serial No. 303,146. (No model.)

Claim.—1. In an ingot-casting machine, the combination, with a series of molds provided each with rack-teeth upon one side, of a holder adapted to guide and to sustain the molds, as described, and a toothed pinion mounted adjacent to such rack-teeth and adapted to engage with the teeth upon the molds to move the same downward in the holder, as and for the purpose set forth.

2. In an ingot-casting machine, the combination, with a series of molds each divided longitudinally, of teeth formed upon the mold parts adjacent to the dividing-line, and adapted, when the molds are butted

404,909.

together, to form a continuous rack, and a holder adapted to guide and to sustain the molds, as described, and a toothed pinion mounted upon the holder and adapted to engage with the teeth upon both parts of each mold to move the same downward in the holder, as and for the purpose set forth.

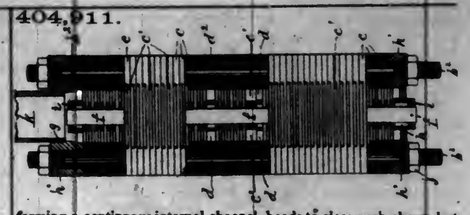
3. In an ingot-casting machine, the combination, with a series of molds provided each with rack-teeth upon one side, of a holder adapted to guide and to sustain the molds, as described, a toothed pinion mounted upon the holder and adapted to engage with the teeth upon the molds to move the same downward in the holder, and a pawl adapted to prevent the rotation of the pinion, as and for the purpose set forth.

4. In an ingot-casting machine, the combination, with a series of molds provided each with rack-teeth upon one side, of a holder adapted to guide and to sustain the molds, as described, a toothed pinion mounted upon the holder and adapted to engage with the teeth upon the molds to move the same downward in the holder, a pawl adapted to prevent the rotation of the pinion, and a weight or spring to hold the pawl in operation, and a presser to disengage the pawl, as and for the purpose set forth.

5. In an ingot-casting machine, the combination, with a series of molds each divided longitudinally and provided with rack-teeth, of a holder adapted to guide and sustain the molds, a separator below the holder for dividing the mold parts, and a toothed pinion mounted upon the holder and adapted to sustain the molds within the holder while being filled, and to force the molds downward upon the separator to divide the mold parts, substantially as herein set forth.

6. The means for preventing the slipping of the mold upon the ingot-bar, consisting in a projection and a groove formed in the two elements and operating to lock the mold and ingot together in the process of casting, substantially as herein set forth.

404,910. THIMBLE. CHARLES HORNER, Halifax, County of York, England. Filed June 21, 1886. Serial No. 205,634. (No model.) Patented in England June 14, 1884. No. 8,954.



Claim.—A thimble composed of an outer casing and an inner lining, both of precious metal, in combination with a steel core interposed between said casing and lining, substantially as set forth, whereby a thimble having the appearance of the precious metal and the durability of steel is formed.

404,911. STRAINER FOR GRANULAR FILTER-BEDS. JOHN W. HYATT, Newark, N. J. Filed June 15, 1888. Renewed Apr. 17, 1889. Serial No. 307,634. (No model.)

Claim.—1. A strainer composed of a series of fixed and movable perforated disks arranged alternately, as described, with intervening apertures for the passage of the fluid, the perforations in the disks

404,911.

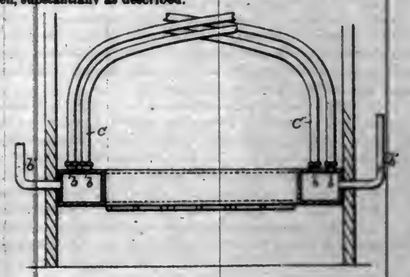
forming a continuous internal channel, heads to close such channel at the opposite ends of the series, an outlet from one of the heads, and means for rotating or oscillating the movable disks, as and for the purpose set forth.

2. In a strainer, the combination, with suitable tie-rods, of an outlet-socket, a series of perforated disks fixed to the tie-rods, a series of movable disks arranged alternately between the fixed disks, and means for rotating or oscillating the movable disks, as and for the purpose set forth.

3. In a strainer, the combination, with suitable tie-rods, of an outlet-socket, a series of fixed and movable perforated disks, a shaft fitted to the movable disks, and bearings secured to the tie-rods for such rock-shaft, substantially as set forth.

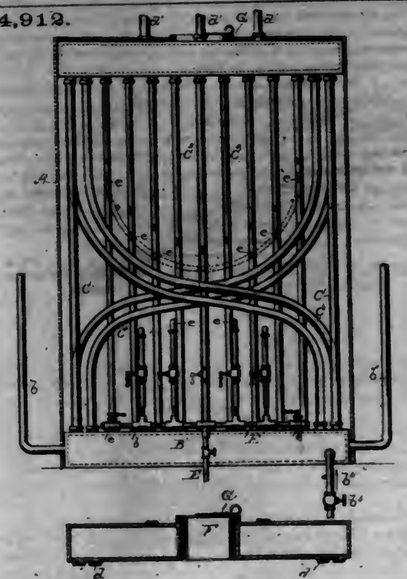
4. In a strainer, the combination, with suitable tie-rods, of an outlet-socket, a series of fixed and movable perforated disks, a square shaft fitted to square holes in the hubs of the movable disks, bearings secured to the tie-rods for such rock-shaft, and means for oscillating the rock-shaft, substantially as herein set forth.

5. In a strainer, the combination, with suitable tie-rods, of an outlet-socket, a series of fixed and movable perforated disks, an end bearing adjustable upon the tie-rods, a rock-shaft fitted to the end bearing and to the movable disks, and an intermediate bridge to support the rock-shaft, the outlet-socket, the fixed disks, the end bearing, and the bridge for supporting the rock-shaft being held in line at suitable distances apart by means of the tie-rods, substantially as herein set forth.



6. A strainer composed of a series of fixed and movable perforated disks arranged alternately, as described, and having seats upon their faces to separate the same, the perforations in the disks forming a continuous internal channel, heads to close such channel at the opposite ends of the series, an outlet from one of the heads, and means for rotating or oscillating the movable disks, as and for the purpose set forth.

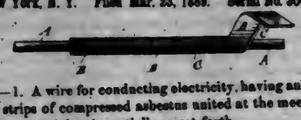
7. In a strainer, the combination, with suitable tie-rods, of an outlet-socket, a series of fixed and movable perforated disks, a rock-shaft connecting the movable disks, and an arm upon one of said disks to oscillate them all, the outlet-socket, the fixed disks, and the end bearing being held in line at suitable distances apart by means of the tie-rods, as and for the purpose set forth.



8. The combination, with a series of outlet-strainers constructed as described, with fixed disks and with alternate movable disks connected by a central rock-shaft, of a crank-arm *e*, projected from one of the movable disks in each strainer and adapted, when vibrated, to oscillate the rock-shaft and the movable disks in the same strainer, a link uniting the series of crank-arms, and means for oscillating such link to cleanse all the strainers simultaneously, substantially as herein set forth.

404,912. BOILER. MARK R. IRVING, Detroit, Mich., assignor of two-thirds to Cornelius S. Dyer and John Heffron, same place. Filed Sept. 8, 1888. Serial No. 284,931. (No model.)

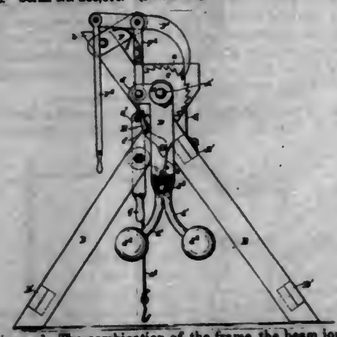
Claim.—1. A hot-water-circulating boiler consisting of top and bottom shells united by water-tubes C', which curve in alternate directions across the intervening space from side to side, and in connection therewith water-tubes extending in like manner from the front of the upper shell downward and backward to the rear end of the lower shell, substantially as described.



404,912.

2. A hot-water-circulating boiler consisting of horizontal top and bottom shells united by lateral tubes C' and longitudinal tubes C², both completely crossing the space between the shells, substantially as described.

404,913. INSULATED ELECTRICAL WIRE. HENRY W. JOHNS, Jr., New York, N. Y. Filed Mar. 23, 1889. Serial No. 304,555. (No model.)



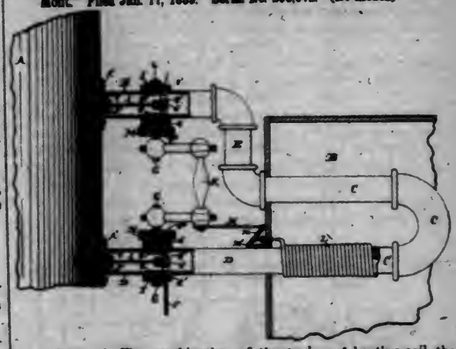
Claim.—1. A wire for conducting electricity, having an insulating covering of strips of compressed asbestus united at the meeting edges by cementing material, substantially as set forth.

2. A wire for conducting electricity, having an insulating covering of compressed vulcanized asbestus strips, the meeting edges whereof are joined by vulcanized cementing material, substantially as set forth.

3. A wire for conducting electricity, having an insulating covering of compressed asbestus strips underneath and an exterior layer of binding and waterproofing material, substantially as set forth.

4. A wire for conducting electricity, having an insulating covering of strips of compressed and vulcanized asbestus which overlap each other, and vulcanized cementing material at the overlapped joints, substantially as and for the purposes set forth.

404,914. WINDLASS. JOHN KNOCHE, Helena, Mont. Filed Oct. 1, 1888. Serial No. 286,960. (No model.)



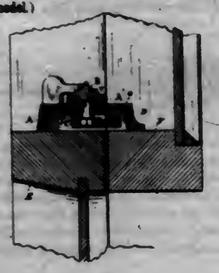
Claim.—1. The combination of the frame, the beam journaled therein, the ratchet C, secured upon the beam-shaft, the pendulous lever D, pivoted upon the beam-shaft in proximity to said ratchet, and the pawls E and F', connected to said lever upon arms at right angles to each other and engaging the teeth of the ratchet C, whereby a continuous rotary motion is imparted to the beam when the lever is vibrated, substantially as set forth.

2. The combination of the frame B B' *b*, the beam A, mounted therein, the ratchet C, secured upon the beam-shaft, the weighted angle-lever D *d*, pivoted upon said shaft, the pawl E, pivoted upon the lever, a spring to hold said pawl either in or out of engagement with the teeth of said ratchet, the pawl F', and links F F², connecting said pawl, respectively, with the frame and crank-arm *d* of said lever, the spring *f*, to hold the pawl in engagement with the ratchet, and the arm F², to disengage the pawl, substantially as set forth.

3. The combination, with a windlass frame and beam, of a ratchet secured upon the beam-shaft, a vibrating weighted lever pivoted upon said beam-shaft alongside the said ratchet, two pawls to engage the teeth of said ratchet and connected to the said lever upon arms at right angles to each other to impart a continuous rotary motion to the beam when the lever vibrates, and a brake, such as described, to arrest or regulate the movement of the beam, substantially as hereinbefore set forth.

4. An actuating mechanism for windlasses, consisting, substantially, of a ratchet secured upon the beam-shaft, a weighted angle-lever pivoted upon the same shaft, a pawl pivoted upon said lever to rotate the beam when the lever swings in one direction, and another pawl linked, respectively, to the frame of the machine and the angle-arm of the lever to continue the rotary movement of the beam when the lever swings in the opposite direction, and a spring to hold the ratchet in working position.

404,915. WATER-HEATING APPARATUS. JOHN KNOCHE, Helena, Mont. Filed Jan. 17, 1889. Serial No. 296,672. (No model.)

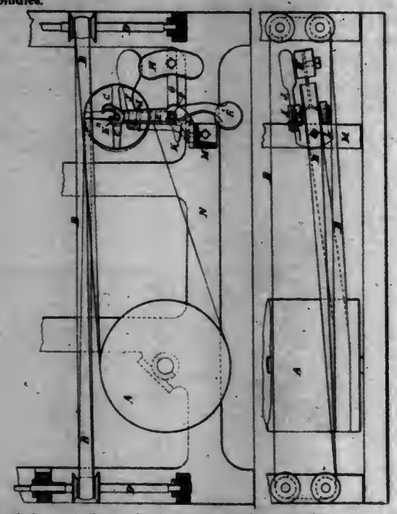


Claim.—1. The combination of the tank and heating-coil, the pipes D E, connecting the same and having branches *d d' e e'*, the crank-shafts G, fitted within said branches, the packing around the ends of said shafts, the valves F in the tank ends of said pipes D E, the rods *j*, connecting the valves and crank-shafts, and the crank-handle K, to simultaneously open and close said valves, substantially as specified.

2. The combination of the tank and heating-coil, the pipes D E, having branches *d d' e e'*, the crank-shafts G, fitted in said branches, the packing for the ends of said shafts, the vent-cock *i* and the waste-cock *i'*, and the crank-handle K, secured on the said shafts G, between the pipes D E, substantially as and for the purpose set forth.

3. The combination of the tank, the heating-coil, and pipes connecting them, with valves controlling the supply from the tank to the coil, crank-shafts for actuating said valves, a crank-handle connecting said shafts, and the rod M, link *m*, and coiled spring L, to automatically operate said handle by the expansion and contraction of the said spring, as set forth.

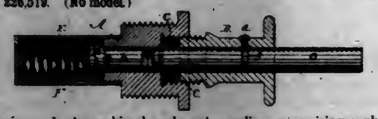
404,916. FASTENER FOR THE MEETING-RAILS OF SASHES. WILLIAM KOEHNE, Cleveland, Ohio. Filed Jan. 10, 1889. Serial No. 296,969. (No model.)



Claim.—1. In a sash-lock, the combination of the hub of the main casing having a recess with two or more inclined projections, and the pivotal lever carrying the locking-plate provided with corresponding depressions on the under side of the head thereof for lifting said plate, constructed and arranged substantially as shown and set forth.

2. In a sash-lock, the combination of the main casing-hub having a recess with one or more cam-faces, the pivotal lever, the locking-plate having a partly level and partly centrally-inclined face, and a lug depending from the casing of the upper sash, acting conjointly in the manner and for the purpose described.

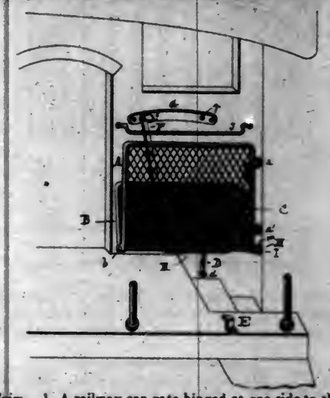
404,917. TENSION-REGULATING DEVICE FOR SPINDLE-DRIVING BANDS. ARTHUR T. LAWSON and SOMERVILLE DEAR, Leeds, County of York, England. Filed Dec. 13, 1887. Serial No. 257,779. (No model.) Patented in England May 26, 1887, No. 7,904; in France Nov. 26, 1887, No. 187,290, and in Germany Dec. 8, 1887, No. 44,353.



Brief.—The invention consists in the improved device for maintaining a uniform tension upon the band employed to drive a number of spindles.

Claim.—1. In mechanism for maintaining a uniform tension on the endless driving-tapes of spinning, twisting, and other machinery, the combination of the tension-pulley over which the endless tape is passed, the vertical frame mounted on pivots and carrying this pulley, said frame having the horizontal arm extending radially from the pivots and carrying a weight, and the curved segment fixed thereto and the weighted lever resting upon it to retard its movements.

2. In mechanism for maintaining a uniform tension on the endless driving-tapes of spinning, twisting, and other machinery, the combination of the tension-pulley over which the endless tape is passed, the vertical frame mounted on pivots and carrying this pulley, said frame having the horizontal arm extending radially from the pivots and carrying a weight, and the curved segment fixed to the arm, and the weighted lever resting upon it to retard its movements and serve as a catch to hold back the pulley from pressing against the band when the bracket has been moved to the end of its traverse away from the band.



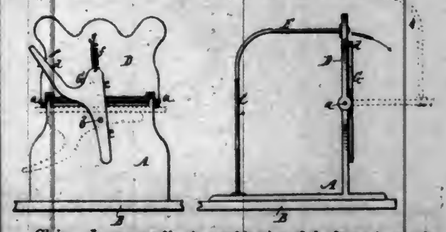
404,918. COMBINED COCK AND COUPLING FOR BARRELS, CASKS, &c. CHARLES C. LINDSLEY, Fort Edward, N. Y., assignor of one-half to H. Davis Northrup, same place. Filed Feb. 4, 1887. Serial No. 226,519. (No model.)

Claim.—1. A combined cock and coupling comprising a plug-section to be permanently secured in a barrel and provided with a longitudinal bore, a spring-seated valve having a tubular stem located in said bore, the detachable screw-plug provided with a longitudinal bore, a removable set-screw extending from the outer periphery into the bore of the screw-plug, and the herein-described connecting pipe-section uniform in diameter with said valve and extending completely through the bore of the screw-plug and provided with an annular groove in its outer periphery, into which the end of said set-screw removably extends, whereby the said pipe is held extending through the plug, for the purpose set forth.

2. The combination, with a plug-section that is permanently secured in a barrel and which is provided with a spring-seated valve B, having the perforated tubular stem *b*, of the screw-plug D, to screw into the plug-section and provided with a set-screw *d*, and the pipe G, passing completely through said screw-plug to enter the bore of section A and coact with the valve-stem to open the valve and form a continuous discharge through the valve-stem and pipe from the barrel, said pipe having an annular groove, into which the set-screw extends and by which the pipe is detachably held, extending through the screw-plug, substantially as described.

404,919. CAR-GATE. NATHAN F. MATHEWSON, Providence, R. I. Filed Apr. 13, 1889. Serial No. 307,186. (No model.)

Claim.—1. A railway-car gate hinged at one side to the car and having a lug extending from the bottom, and a folding platform hinged to said gate at its bottom, adapted to lie horizontally when the gate is closed and to fold up against said gate when the gate is open, in combination with a lever mounted pivotally on said car, and a link-bar connecting said lever and the lug of said gate, substantially as specified.



2. The combination of a gate hinged at one side to the car and having a lug extending from its bottom, a lever mounted pivotally on said car, and a link-bar connecting said lever and the lug of said gate, substantially as described.

3. The combination of the lever F, mounted pivotally on the car and having the handle *f* and the pin *n*, the locking-plate G, having slots *g*, the gate A, hinged at one side to the car and having the lug I, and the link-bar H, pivotally connected with said lever and lug, substantially as shown.

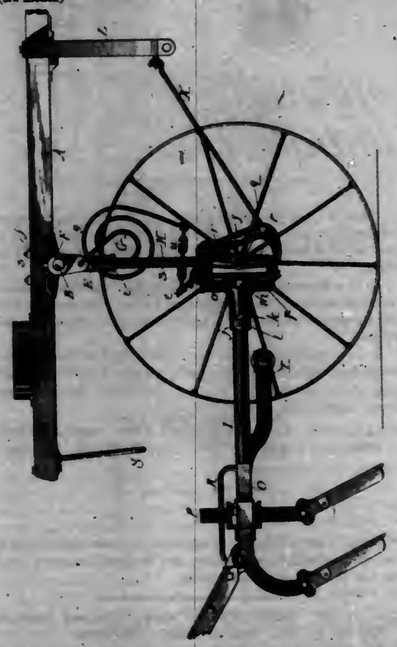
4. The combination of the lever F, mounted pivotally on the car and having the handle *f* and the pin *n*, the locking-plate G, having slots *g*, the gate A, hinged at one side to the car and having the lug I, the folding platform B, having the wheel C and hinged to the bottom of the gate A, the track D, and the link-bar H, pivotally connected with said lever and lug, substantially as described.

5. The combination of the gate A, hinged at one side to the car, the folding platform B, hinged to the gate A at its bottom, and the locking device E, located on the car-platform, substantially as and for the purpose specified.

404,920. FILE FOR LETTERS. LAWRENCE A. MERK, Rochester N. Y. Filed Jan. 22, 1889. Serial No. 297,213. (No model.)

Claim.—In a paper-file, the combination of the frame A, carrying the stationary wire C, the plate D, hinged to the back of the main frame and carrying the movable wire E, the lever G, pivoted to the back of the main frame and provided with arms *c d*, that shunt across the frame and plate and stiffen them in position, and the spring *f*, connecting the lever with the plate, as shown and described, and for the purpose specified.

404,921. MEANS FOR CHANGING THE CENTER OF GRAVITY OF GUNS. WILLIAM R. MILLER, Baltimore, Md. Filed Jan. 26, 1888. Serial No. 297,810. (No model.)



Claim.—1. A gun having a weight of constant gravity adjustable in position longitudinally of the stock and means for securing the weight in its adjusted positions, substantially as and for the purpose specified.

2. In a gun the stock thereof having therein a weight of constant gravity in two or more sections susceptible of independent movement, adjustable longitudinally of the stock, and means for securing the said weight in its adjusted positions, substantially as and for the purpose specified.

3. In a gun the stock thereof having a longitudinal cavity therein, combined with a threaded stem inserted in the said cavity and a weight of constant gravity screwed on the said stem, substantially as and for the purpose specified.

404,922. CULTIVATOR. GILPIN MOORE, Moline, Ill., assignor to Deere & Company, same place. Filed Nov. 19, 1888. Serial No. 291,300. (No model.)

Claim.—1. In a cultivator, a divided pipe-box, which forms a part of the coupling, the two parts of which *j k* are connected together and to the beam, the forward ends of said two parts being adjustably connected, each part carrying an arm or bracket, as *o* and *p*, substantially as and for the purpose specified.

2. A coupling for connecting the plow beam of a cultivator with the axle, consisting of a divided pipe-box, the two parts of which are connected together and to the beam, each part carrying an arm or bracket, as *o* and *p*, in combination with a pipe-box adapted to be placed on the axle and provided with two studs or pivots, as *r*, substantially as and for the purposes specified.

3. A coupling for connecting the plow-beam of a cultivator with the axle, consisting of a divided pipe-box, the two parts of which are connected together and to the beam, each part carrying an arm or bracket, as *o* and *p*, in combination with a pipe-box adapted to be placed on the axle and provided with two studs or pivots, as *r*, and an adjusting or tightening bolt, as *s*, substantially as and for the purpose specified.

4. The combination, with the axle and the laterally-swinging plow-beam, of a pipe-box on the axle, a bracket rigidly secured to the plow-beam and pivotally connected with parts of the pipe-box, and a draft-clevis extending back of the axle and pivoted to the bracket by a vertical pivot behind the axle and in rear of the pivotal point of connection of the bracket with the pipe-box, said draft-clevis being free to swing laterally on the bracket, substantially as described.

5. The combination, with the axle and the plow-beam, of a pipe-box mounted on the axle and having an upward and a downward projecting stud *r*, a bracket rigidly secured to the plow and having upper and lower portions pivoted, respectively, on the ends of said studs, and a draft-clevis having its ends extending under and over the axle and embracing and pivoted to the bracket by a vertical pivot *s* in the rear of the pivotal attachment of the said bracket to the ends of said studs, substantially as described.

6. A spring supported at its upper end by the shaft B, or by a projection thereon, and engaging at some distance from said fixed end with a projection on one of the swinging parts of the arch, whereby, when such swinging part of the arch swings either forward or backward, the lower end of the spring will be carried correspondingly forward or backward, while the beam retains its horizontal position, substantially as and for the purposes specified.

7. In combination with a plow-beam, a cross-head, as N, provided with two vertical holes and with two horizontal holes to receive the shovel-standards, substantially as specified.

8. In a cross-head, a socket adapted to receive a shovel-standard, a chamber by the side of and communicating with such socket and provided with an inclined wall, in combination with a key-bolt *l*, extending transversely to the standard through the socket and having an inclined head, substantially as and for the purposes specified.

9. In a cultivator, the combination of a handle and a plow-beam with the castings *a'* and *d'*, constructed and connected substantially as and for the purposes specified.

404,923. BACK-BAND PAD. GEORGE W. MOORE, New Orleans, La. Filed Dec. 5, 1883. Serial No. 292,763. (No model.)

Claim.—1. In combination with a back-band, bearing-pads having loops 3 3, and pivoted tongues 6 6, as described.

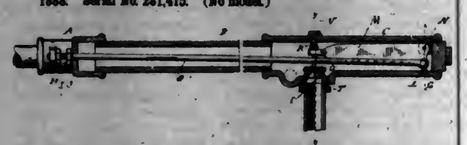
2. The combination of the back-band 1, the bearing-pads 2 2, the loops 3 3, having flat end portions 4 4, and longitudinal portion 5, and pivoted tongue 6.

404,924. RULE-HOLDER. MIKE MURPHY, Birmingham, Ala. Filed Jan. 3, 1889. Serial No. 295,257. (No model.)

Claim.—1. The rule-holder herein described, consisting of a bottom part A and a top part B, united as shown, and provided with prongs *c* and movable prongs *e*, and having the spring-clamps arranged substantially as specified.

2. In a rule-holder, the combination of the bottom A and open top B, united by wires C C and strip D, with the spring-clamps G H

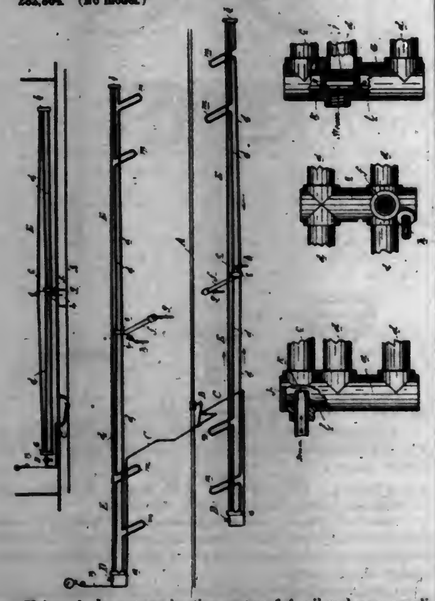
404,924.



H and prongs *c c* and *e e*, all substantially as and for the purpose set forth.

3. The combination of the bottom A and the top B, united as shown, with the spring-clamps H H, having ears *h h*, and the clamp G, fixed prongs *c c*, and movable prongs *e e* on the wire E, arranged and shown as specified.

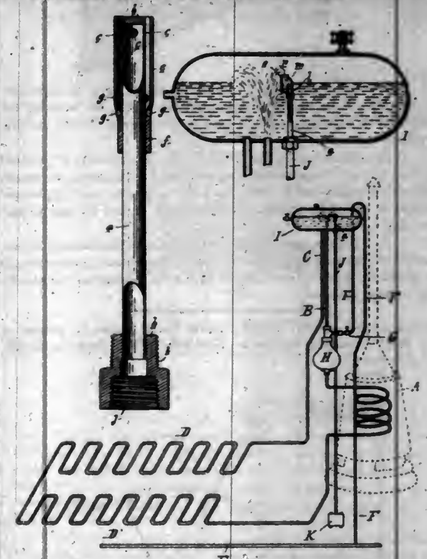
4. In the rule-holder described, the bottom A and the open top B, united by the wires C and strip D, with the spring-clamps G H H, the wire E, provided with lever F, and the prongs *c* and the prongs *e*, all constructed and arranged as and for the purpose herein set forth.



404,925. STEAM-TRAP. JAMES F. MCELROY, Lansing, assignor to the McElroy Car Heating Company, Detroit, Mich. Filed July 30, 1888. Serial No. 281,415. (No model.)

Claim.—1. The combination of the casing provided with a bend or offset E at one end, an expansion-rod inclosed within that casing and passing with its free end through the bent portion or offset of said casing to the outside, the lug H, into which the expansion-rod engages, and the lock-nuts I and J, substantially as described.

2. The combination of the casing consisting of the parts A, B, and C, the offset E of the part A, the expansion-rod G, within the casing and projecting through the offset E to the outside, the lug H, into which the expansion-rod engages, the adjusting-nuts I and J, the multiplying-lever M, fulcrumed at and pivotally secured with the short arm to the expansion-rod, the valve O, carried by the long arm of the lever and having the valve-stem P, the collar Q upon said valve-stem, the spring R, and the nipple T, secured in the walls of the casing, the parts being arranged and constructed to operate substantially as and for the purpose described.

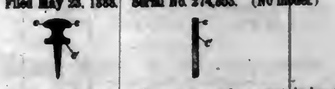


404,926. STEAM-HEATING SYSTEM FOR RAILWAY-CARS. JAMES F. MCELROY, Lansing, Mich. Filed Aug. 16, 1888. Serial No. 282,864. (No model.)

Claim.—1. In a steam-heating system for railroad cars, a radiator consisting of two or more courses of pipes extending longitudinally through the car and suitably inclined to conduct the water of condensation to an outlet in the center of the lower course, and connections at the ends of said courses of pipes, one of said connections being provided with a steam-supply pipe, and restricted ports proportioned in size to the capacity of the radiator-pipes with which they communicate, whereby they distribute the steam into the different courses of pipes in proper proportion, substantially as described.

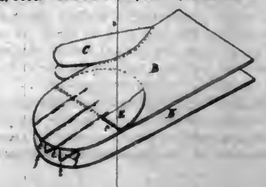
2. The combination of a radiator having multiplex pipes with a distributing-connection provided with means, as the restricted ports *k l*, proportioned to distribute the steam in proportion to the length or capacity of the radiating-pipes supplied from said connection, substantially as described.

404,927. CAR-HEATING APPARATUS. JAMES F. MCELROY, Lansing, assignor to the McElroy Car Heating Company, Detroit, Mich. Filed Mar. 25, 1889. Serial No. 304,719. (No model.)



Claim.—1. In combination with a car-heating apparatus of the kind described and the drum thereof, an overflow-pipe having its aperture shielded from the effects of the ebullition, substantially as described.

2. In a car-heating apparatus of the kind described and the expansion-drum thereof, an overflow-pipe having a covered top and side shields, such shields having top and bottom apertures, substantially as described.



3. In a car-heating apparatus of the kind described, and the expansion-drum thereof, a reducing-plug, the pipe *a*, secured therein and capped at the top, the aperture *c*, and the shield *e*, open at the top and bottom, substantially as described.

404,928. CARRIAGE-CURTAIN KNOB. FRED A. NEIDER, Augusta, Ky. Filed May 23, 1888. Serial No. 274,853. (No model.)

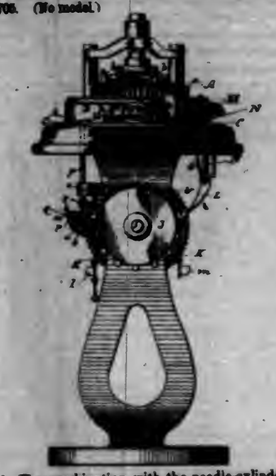
Claim.—As a new article of manufacture, a carriage-curtain knob of the form substantially as shown and described, stamped out from a flat bar or sheet of wrought metal.

404,929. BOXING-GLOVE. DENIS J. O'SULLIVAN, Detroit, Mich. Filed Apr. 11, 1888. Serial No. 270,287. (No model.)

404,929.

Claim.—1. In a boxing-glove, the combination, with the palm and back pieces, each consisting of a single part, of the fourchettes stitched to the inner face of the part B′ and to the doubled or folded-in portions *e* of the palm-piece, as and for the purposes specified.

2. The combination, in a boxing-glove, of the palm B and back B′ and the fourchettes stitched to the adjacent faces of said parts, so as to cause the forward ends of said fourchettes to stand on a line back of the joined or stitched edges of the parts B B′, as specified.



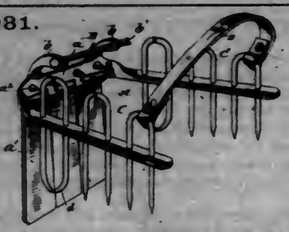
3. In an organized boxing-glove, the combination, with the palm and back pieces and the interposed fourchettes, of the finger-pad mounted on the palm-piece, substantially as and for the purposes specified.

4. In an organized boxing-globe, the combination of the palm and back pieces, the thumb, the buffer mounted on the back-piece, and the pocket or stall mounted on the buffer, so as to receive the thumb, substantially as specified.

5. In an organized boxing-glove, the combination of the parts B B′, the interposed fourchettes, the wristband, the buffer, and the elastic joining said buffer to the wristband, as and for the purposes specified.

6. In an organized boxing-glove, the combination of the parts B B′, the interposed fourchettes, the thumb, the buffer mounted on the part B′, the pocket D, mounted on the buffer, and the pad E, mounted on the part B, as and for the purposes specified.

404,930. CIRCULAR-KNITTING MACHINE. WILLIAM H. PEPPER and ALBERT T. L. DAVIS, Lake Village, N. H. Filed Dec. 12, 1887. Serial No. 257,709. (No model.)



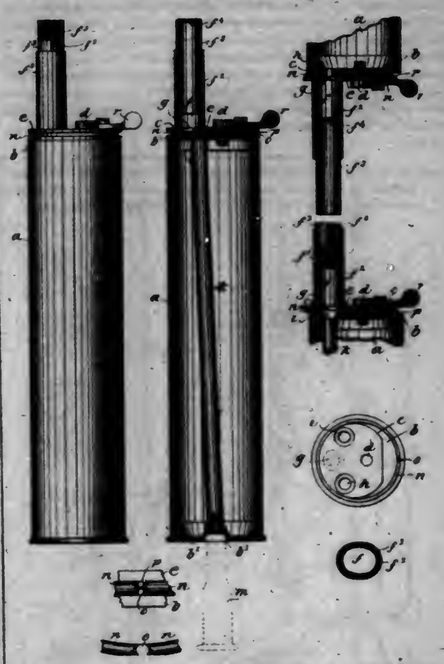
Claim.—1. The combination, with the needle-cylinder and needles, the cam-ring, and the needle-depressing cam, of a cam-bar having a series of depressing cam-faces, a pattern chain or wheel having a series of cam projections corresponding with the cam-faces on the cam-bar, and means, as the step-lever P, tappet R, and lever H, for connecting the movements of the said pattern chain-wheel and the cam-bar, substantially as and for the purpose herein set forth.

2. The combination, with the needle-cylinder and needles, the cam-ring, and the needle-depressing cam, of a cam-bar having a series of depressing cam-faces, a pattern chain or wheel having a series of cam projections, a step-lever having a series of steps thereon, a fixed tappet resting on one of the series of steps for adjusting its height, and a lever H, provided with a pin or projection *q*, arranged to strike the tappet as the cam-ring revolves, the said lever being attached to and adapted to move the cam-bar into its various positions as the cam-ring revolves, for the purpose herein specified.

404,931. CALF-WEANER. WILLIAM H. PRESMORE, Walworth, Nebr. Filed July 23, 1888. Renewed May 9, 1889. Serial No. 310,196. (No model.)

404,931.

Claim.—1. As an improvement in calf-weaners, the horizontally-disposed U-shaped frame having a series of vertical side bars projecting above and below the side arms thereof, substantially as described.



2. As an improvement in calf-weaners, the horizontally-disposed U-shaped frame and the series of vertical bars secured to and projecting above and below the side arms thereof, and having their upper ends bent or curved, as set forth.

3. As an improvement in calf-weaners, the U-shaped frame having the curved apertured arms, the cross-pin, the series of vertical side bars, and the strap, substantially as shown and described.

4. As an improvement in calf-weaners, the U-shaped frame having the vertical side bars, and the series of front barbs or teeth, substantially as shown and described.

5. The herein-described improved calf-weaner, comprising the U-shaped frame, the front cross bar or plate having a series of barbs or teeth, the hanger-plate secured to said bar or plate, the series of vertical side bars, the cross-pin, and the strap, substantially as shown and described.

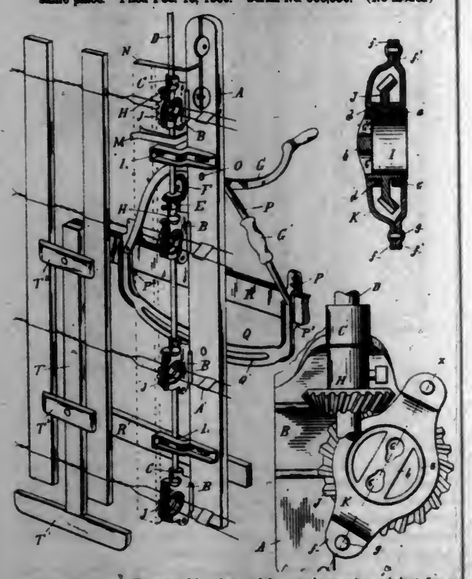
404,932. POWDER-FLASK. FRANCIS J. RABBETH, Boston, Mass. Filed Aug. 27, 1888. Serial No. 283,823. (No model.)

Claim.—1. A flask comprising a magazine or receptacle, combined with a measuring-chamber composed of an outer and inner tube, the said inner tube being permanently closed at one end and being detachable from the outer tube and adjustable longitudinally therein when either its closed or its open end is inserted in said outer tube, substantially as and for the purpose described.

2. The combination of the magazine provided with a port-opening and discharge-passage with a measuring-chamber provided with an opening constituting both inlet and outlet thereto, said measuring-chamber being movable with relation to the magazine, whereby its opening may be placed in communication with the port-opening of

the said magazine or with the said discharge-passage, substantially as described.

3. The combination of the magazine provided with a port-opening and discharge-passage with a measuring-chamber provided with an opening constituting both inlet and outlet thereto, said measuring-chamber being movable with relation to the magazine, whereby its opening may be placed in communication either with the port-opening of said magazine or with the discharge-passage, and a spring by which the measuring-chamber is normally retained with its opening out of coincidence with said port and discharge-passage, substantially as described.



4. The combination, with a magazine, of a measuring-chamber composed of an inner and outer tube movable longitudinally, one relative to the other, and slightly oval in cross-section, the longer external diameter of the inner tube being slightly greater than the shorter internal diameter of the outer tube, whereby a slight rotation of the inner tube fastens it within the outer tube, substantially as and for purpose described.

5. The combination of the magazine provided with a port communicating with the interior of the magazine and a discharge-passage, with a measuring-chamber movable with relation to said port and discharge-passage, and having an opening which may be placed in communication with either one of them, substantially as and for the purpose described.

6. The combination of the magazine having an end portion provided with a seat and passages therethrough, with a measuring-chamber and supporting-plate therefor pivoted on said seat and provided with an opening into the said measuring-chamber, said plate closing the passages in said seat except when moved to place the opening in the measuring-chamber in communication with one or the other of said passages, substantially as described.

7. The combination of the magazine having an end portion provided with a seat and passages therethrough, with a measuring-chamber and supporting-plate therefor pivoted on said seat and provided with an opening into the said measuring-chamber, said plate closing the passages in said seat except when moved to place the opening in the measuring-chamber in communication with one or the other of said passages, and a spring the ends of which engage projections, one connected with the magazine and the other with the supporting-plate for the measuring-chamber, as set forth, the said spring opposing the movement of the chamber in either direction, substantially as described.

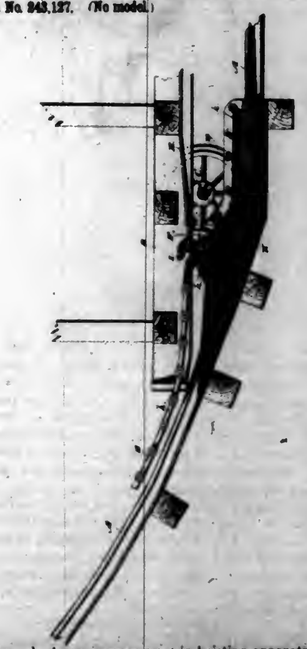
404,933. PICKET-FENCE MACHINE. BERA RAMSON, Flint, Mich., assignor, by direct and mesne assignments, of two-thirds to Oren Stone, same place. Filed Feb. 18, 1889. Serial No. 300,366. (No model.)

Claim.—1. The combination, with a twister of a picket-fence machine, of an independent spreader formed of two parts detachably secured together and slidingly engaging between the two wires of a strand in advance of the twister, substantially as described.

2. The combination, in a picket-fence machine, of the twister frame, a carriage pivotally secured thereto, and consisting of the frame P, pivotally secured at O the standard above its longitudinal center and provided below its longitudinal center with the circular slotted portion Q, the clamping-bolt and clamp-nut S, adjustably securing the same to the standard, and the travelers P', substantially as described.

3. The combination, in a picket-fence machine, of the twister-frame, a carriage pivotally secured thereto, and consisting of the frame P, pivotally secured at O to the standard above its longitudinal center and provided with the circular slotted portion Q, the clamping-bolt and clamping-nut S, adjustably securing the same to the standard, the travelers P', the guide-rail R, and the guide-flanges P², projecting underneath said guide-rail, substantially as described.

4. The herein-described tension mechanism, consisting of the frame, the shaft *k*, the sleeves *l*, having the ratchet-flanges *m*, the spools *n*, upon which the tension-cable is wound, and provided with a dog *o* and wrench-holds *n'*, the gear-wheel *r*, the pinion *s*, the brake-wheel *u*, the brake-shoe *v*, and the brake-lever *w*, adjustably secured to the tension-spring *y*, substantially as described.



404,934. DEVICE FOR TWISTING WIRE CABLES OF SUSPENSION-BRIDGES. EDWIN R. RUNYON, Mountain Spring, Tex. Filed Apr. 1, 1889. Serial No. 305,583. (No model.)

Claim.—1. The cable-twister consisting of the casting B, the two disks C C', the bolt F, and the arms H, substantially as described.

2. The combination, with the casting B, having grooves *b b'* and openings *b² b²* therein, of the semicircular disks C and C', having grooves *c c'* therein and openings D, extending through the same, the bolt F, for binding the several parts together, and the arms H, extending out from the disks, substantially as described.

404,935. HOISTING APPARATUS FOR MINES. SAMUEL SALMON, Drifton, Pa., assignor to Bobley B. Coxe, same place. Filed July 1, 1887. Serial No. 243,127. (No model.)

Claim.—1. As an improvement in hoisting apparatus for mines, the combination of a car which is provided with a pivoted pendent link, a hoisting-cable that has pivoted upon its lower end an engaging-hook, and a grooved guide which is located at the lower end of the mine-slope, and is adapted to cause the hook to move beneath the link at an inclination that is greater than the inclination of the track upon which the car rests, substantially as and for the purpose set forth.

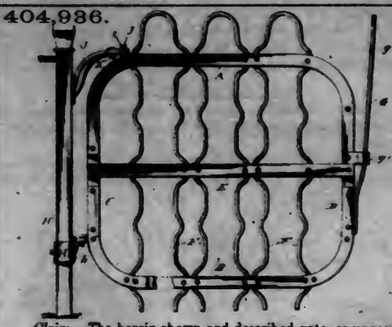
2. As an improvement in hoisting apparatus for mines, the combination of a mine-car having a pivoted link, a hoisting-cable, a hook which is pivoted upon the end of such cable, and a guide that engages with the hook as it reaches the lower end of the slope, and operates to move said hook in a plane which has an angle to the plane of the slope at such point, substantially as and for the purpose shown and described.

3. As an improvement in hoisting apparatus for mines, the combination of a hoisting-cable, a hook which is pivoted upon the end of such cable, a mine-car having a pivoted link that is secured upon it and is adapted to be engaged by the hook, and a guide which is located at or near the lower end of the slope and operates to move said hook at an angle to the plane of said car, and thereby cause it to be engaged with or to be disengaged from said link, substantially as and for the purpose specified.

4. As an improvement in hoisting apparatus for mines, the combination of an inclined track, a hoisting-cable, a hook which is pivoted to or upon the end of the same, a mine-car that is adapted to run upon or over such inclined track, and is provided with a pivoted link for engagement by the hook, and a guide which is located at or near the lower end of the slope, and is adapted to move said hook at an angle to the plane of said car to cause it to engage with or to be disengaged from said link, substantially as and for the purpose shown.

5. As an improvement in hoisting apparatus for mines, in combination with a mine-car having a pivoted link, the hoisting-cable provided with a hook, which is pivoted to or upon its lower end, is adapted for engagement with said car-link, and is provided at or near its outer end with laterally-projecting trunnions, and a guide which is located at the lower end of the slope, and is adapted to engage with said trunnions and move said hook out of engagement with the car-link when the car has reached the bottom of the slope, substantially as and for the purpose set forth.

6. As an improvement in hoisting apparatus for mines, in combination with a mine-car having a pivoted link, the hoisting-cable provided with a hook, which is pivoted to or upon its lower end, is adapted for engagement with said car-link, and is provided with laterally-projecting trunnions, and a guide which is located at the lower end of the slope, and is adapted to engage with the trunnions and move said hook into engagement with said link as said cable is drawn upward, substantially as and for the purpose shown and described.

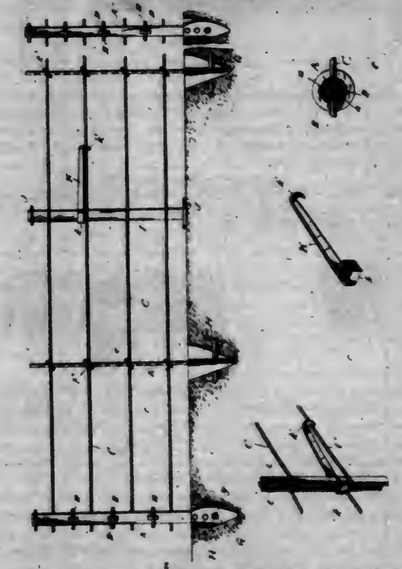


7. In combination with a mine-car having a pivoted link and with a hoisting-chain, the hook pivoted at its rear end upon the hoisting-chain and provided at its front end with laterally-projecting trunnions, the guide having a bearing for the pivoted end of said hook, a groove which is adapted to receive the body of the same, and grooves that engage with said trunnions, the arrangement being such that said hook is moved downward with relation to the plane of the inclined track when it passes downward over said guide, and is moved upward with relation to said inclined track when it is drawn upward over said guide, substantially as and for the purpose specified.

8. The hoisting-cable hook provided with laterally-projecting trunnions at or near its rear end, in combination with the hoisting-cable, the inclined guide-plate, which has a longitudinal T-shaped groove, and a mine-car having the pivoted hoisting-link upon it, substantially as and for the purpose shown.

9. In combination with the track of a mine-slope and with the hoisting-cable thereof, a hook pivoted at one end upon said cable and provided at its opposite end with laterally-projecting trunnions, a guide-plate which is located at the lower end of said slope and has cam-grooves for engagement with said trunnions, and a mine-car having a hoisting-link that is pivoted upon the lower side of it, and is adapted to be engaged with or disengaged from said hook as the latter is moved, respectively, upward or downward over and within said plate, substantially as and for the purpose set forth.

404,936. GATE. EDWARD F. SHILLABEER, Beaver Falls, Pa. Filed Feb. 28, 1889. Serial No. 301,462. (No model.)



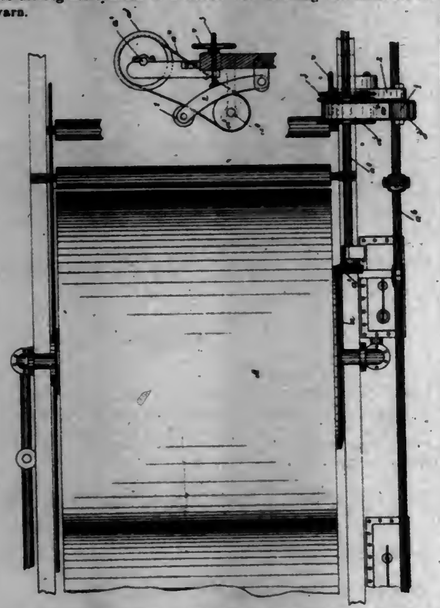
Claim.—The herein shown and described gate, composed of the end battens, the upper and the lower rails, each composed of two corresponding bars having their ends uniformly curved in opposite directions and embracing the ends of the end battens, and the vertical pickets secured between the bars of the said rails, substantially as described.

404,937. WATCH-MAKER'S TOOL. ALBERT F. THOMPSON, Adel, Iowa. Filed Aug. 23, 1888. Serial No. 283,547. (No model.)

Claim.—As an article of manufacture, a tool for watch-makers, consisting of two handles pivoted together, and provided beyond their connection with jaws bent upwardly, tapering toward their outer and upper ends and beveled on their adjacent side edges to form knife-edges, as and for the purpose set forth.

404,938. WIRE-FENCE TIGHTENER. REUBEN WARNER, Tomah, Wis. Filed Mar. 6, 1889. Serial No. 302,115. (No model.)

Claim.—1. The combination, with the wire-fence tightener, of the removable wrench having a hook to engage with a fence-wire, substantially as described.



2. The combination, with the wire-fence tightener, of the wrench adapted to embrace the said tightener on three sides, being open on the fourth side, and having a hook at its outer end for engaging with the fence-wire, substantially as described.

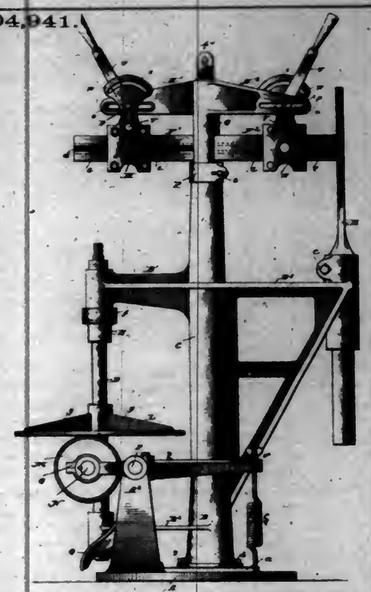
3. The herein shown and described fence-wire tightener, composed of two bars which are adapted to have the fence-wires passed between them, the plate J, for connecting the bars at their lower ends

and supporting them on the ground, the plate J', for connecting the upper ends of the bars, and the wrench for turning the bars to wind the fence-wires thereon, said wrench being constructed to engage with one of the wires to prevent the bars turning back, substantially as described.

404,939. SLASHER. JOHN WATT, Saccarappa, Me., assignor to Woodbury K. Dana, same place. Filed Mar. 27, 1889. Serial No. 305,027. (No model.)

Brief.—The object of the invention is to provide improved means for driving the cylinder of a slasher and relieving the strain on the yarn.

Claim.—In a slasher, the combination of cylinder A and side shaft a^2 with gear a, pinion a', jack-shaft a^3, belt a^6, side shaft a^2, and a device for regulating the tension of the belt a^4, running from a pulley a^5 on jack-shaft a^3 to a pulley a^6 on side shaft a^2, substantially as and for the purpose set forth.



404,940. MILLING-CUTTER. AMOS WHITNEY, Hartford, Conn., assignor to The Pratt & Whitney Company, same place. Filed Feb. 18, 1889. Serial No. 300,328. (No model.)

Claim.—1. In a milling-head, the combination of the central plate or body carrying one set of cutters and having a laterally-projecting threaded ring, the sliding ring thereon and carrying another set of cutters, and means, substantially as described, serving to adjust said sliding ring and cutters relative to the other set of cutters carried by said body, all substantially as described.

2. In a milling-head, the combination of the body 4, having threaded ring 5, cutters 6, adjustably fixed in said body, the sliding ring 10, carrying a second set of cutters, the ring-nut 12, and means, substantially as described, connecting said rings 10 and 12, the one to turn on the other, substantially as described.

404,941. POTTERY-JIGGER. PETER WILKIE, Trenton, N. J. Filed July 27, 1888. Serial No. 281,190. (No model.)

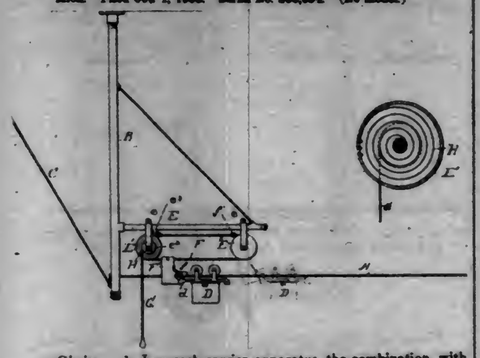
Claim.—1. The combination, of the horizontal shaft P, having attached thereto and forming a part of the same the bearings O O, and the horizontal shaft held in such bearings and carrying the friction-wheel, substantially as described.

2. The combination, with the vertical spindle and its upper bearing, of the metal collar K, faced out on its interior surface and having around its upper edge a flange to form a lubricating-chamber, substantially as described.

3. The combination, with the shaft P, of the foot-lever Q, the horizontal arm R, provided at its end with a jaw, and the spring S, having its upper end passed through said jaw and its lower end screwed into the base-plate, the said spring being provided with the adjusting thumb-nut m, substantially as described.

4. The frame B, cast with the upper sleeve-bearing B', the clamp B^2, and the sleeve B^3, the said clamp B^2 being bored out smooth on its interior and slotted and provided with a tightening bolt and nut, substantially as described.

5. The upright column G, having the eye G^4, and turned smooth to fit into frame B, and cast or formed with the planed arms F^2 F^3 and arms H' H^3, the first-mentioned arms being formed for their entire length with T-slots adapted to receive adjustable stop-bolts, and the second-named arms being formed with oblong slots o o, substantially as and for the purpose described.

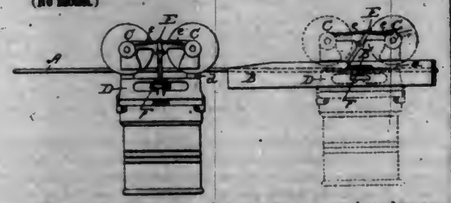


6. The combination, with the column G, having the upper and lower pairs of arms constructed as described, of the adjustable saddles or profile-holders and the stops therefor, the cranks W W, having the curved slots and connected to the tool-holders, and the levers for shifting the saddles, substantially as described.

404,942. MILLER-EXTERMINATOR. JOHN B. WOODS, Mineola, Tex. Filed Mar. 26, 1889. Serial No. 304,824. (No model.)

Claim.—A lamp having an external upwardly-projecting sleeve and a side socket and a wick projecting through said sleeve, in combination with a pole or standard fitting into said side socket and a pan having an inward sleeve fitting over said sleeve on the lamp, substantially as described.

404,943. CASH-CARRIER. EMIL P. SEIBE, Detroit, assignor to Edward A. Owen, Adolph A. Callis, and Arthur Callis, East Saginaw, Mich. Filed Oct. 1, 1888. Serial No. 286,634. (No model.)

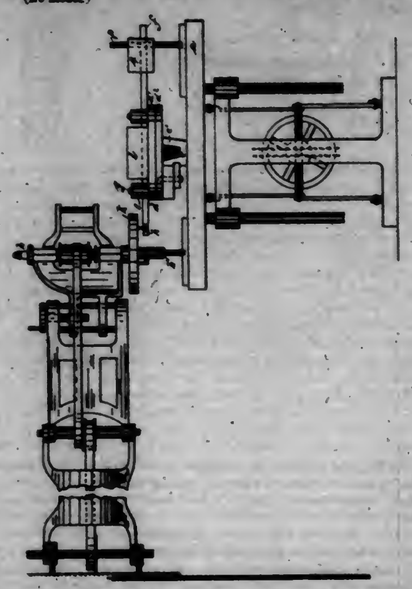


Claim.—1. In a cash-carrier apparatus, the combination, with the line-wire and the carrier mounted thereon, of two pulleys suspended above said wire, an endless strap on said pulleys, and a propelling-block attached to said strap and provided with a catch adapted to engage the carrier, said block adapted to be disengaged from the carrier by its forward end striking the forward pulley and tilting it, substantially as described.

2. In a cash and parcel carrier apparatus, the combination, with the usual taut wire and car, of an endless strap or cord extending between and embracing two pulleys situated at one end of the said wire, a propelling-block attached to said strap or cord and adapted to travel with it, a beveled latch on said propelling-block, constructed to engage with the car and retain it adjacent to the propelling-block until released, a strap wound upon a drum on one of the pulleys for revolving the same and projecting the propelling-block, and a spring adapted to return the propelling-block to its initial position, substantially as described.

3. A cash and parcel carrier mechanism consisting of the combination, with a line-wire, its supports, and a car, of pulleys F' F^2, belt F, and propelling-block F', actuating cord or strap G, and a retracting-spring, all situated at one end of the line-wire, substantially as described.

4. In a cash and parcel carrier apparatus, the combination, with the car and the propelling-block, the belt and pulleys, of the actuating cord or strap, said propelling-block provided with a latch to engage the car, said latch adapted to be automatically disengaged at or adjacent to the forward pulley, substantially as described.



404,944. CASH-CARRIER. EMIL P. SEIBE and FRANK S. CHURCH, Detroit, assignors to Edward A. Owen, Adolph A. Callis, and Arthur Callis, East Saginaw, Mich. Filed Oct. 13, 1888. Serial No. 288,017. (No model.)

Claim.—1. In a cash-carrier apparatus, a car adapted to pass around a curve in the track, said car having its bed-plate open at one side to pass the supporting-arms of the curved track-section, and a small tilting lever pivoted to the bed-plate above the opening, said lever below the pivot bent inward to a point adjacent to the wire, its lower end adapted to close the opening in the side of the bed-plate, except when passing the supporting-arms of the curved track-section, and also to prevent the wheels from riding up onto the wire when passing from station to station, substantially as described.

2. In a cash-carrier apparatus, a car having one side of its bed-plate open, a lever pivoted to the bed-plate above the opening and having its lower end bent inward adjacent to the wire, and a spring or springs to assist in returning the lever to its normal position, substantially as described.

404,945. ROUTING AND WOOD-WORKING MACHINE. HOSMER M. ALLEN, Newark, N. J. Filed Aug. 18, 1888. Serial No. 283,157. (No model.)

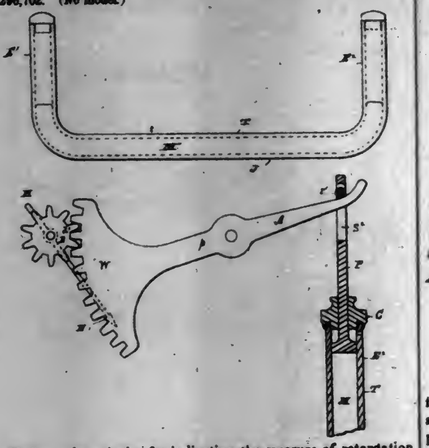
Claim.—1. In combination with a revolving and laterally-movable cutter, a table having a track or way thereon, a carriage movable on said track or way, and a guide shaft or rod f, arranged in connection with said carriage and said cutter, said parts being arranged and adapted to operate substantially as and for the purposes set forth.

2. In combination with the shaft b, adapted to receive a cutter, of an annular frame k, collar j, arm h, rod f, connected to said arm and sliding between bearings c of a carriage d, a track c, and a guide-pin p, adapted to engage a pattern and secured upon said guide-rod, substantially as and for the purposes set forth.

3. In combination with a revolving shaft free to move horizontally in any direction, a guide-rod free to move in any direction in a horizontal plane and direct the said shaft therein, and an adjustable guide pin and carrier, all said parts being arranged and adapted to operate substantially as and for the purposes set forth.

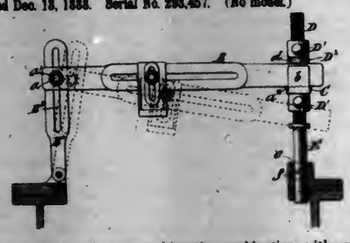
4. In combination with the laterally-movable cutter, a track or way and a carriage arranged thereon, said carriage being made in parts, one of which is pivotally movable on the other, and a guide-rod connected with said cutter and sliding on said pivotally-movable part of said carriage, substantially as and for the purposes set forth.

5. In combination with a revolving and laterally-movable cutter, a track or way adjacent thereto, a carriage movable on said track or way, and a rod sliding on said carriage and connected with said cutter, substantially as and for the purposes set forth.



6. In combination with a revolving and laterally-movable cutter, a track or way, a pivotal carriage movable on said track or way, and a rod adjusted on said carriage and connected with said cutter, substantially as and for the purposes set forth.

404,946. FLY-CATCHER. CARL R. K. ANDERSSON, New York, N. Y. Filed Apr. 15, 1889. Serial No. 307,370. (No model.)

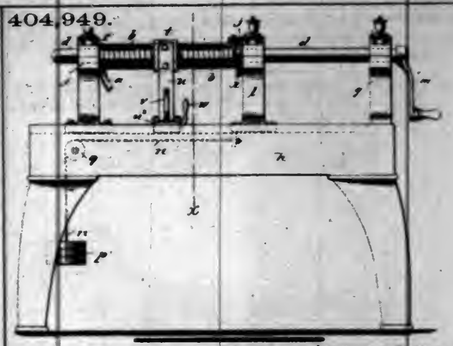


Claim.—The improved fly-net consisting of a dip-net of fine netting having the open end attached to the wire hoop of the staff and the drawn or gathered open bottom end and the funnel-trap of like material in the mouth of the net, all combined and arranged substantially as described.

404,947. DEVICE FOR INDICATING THE MEASURE OF RETARDATION APPLIED TO ARREST THE MOMENTUM OF A TRAIN. WILLIAM H. ARNOLD, Troy, N. Y. Filed Jan. 18, 1889. Serial No. 296,702. (No model.)

Claim.—In a device for indicating the measure of retardation applied to arrest the momentum of a moving train of cars, the combination, with a tube horizontally placed upon a locomotive and arranged parallel to the direction in which the latter must move, said tube having turned-up ends and containing mercury, of a piston arranged in one of the turned-up ends of said tube, a pivoted and geared sector making a connection with said piston by means of a lever-arm, a pinion provided with a pointer and meshing into said sector, and a dial-plate back of said pointer, substantially as and for the purposes set forth.

404,948. PLANING-MACHINE. ERNST F. AUTENRIETH, New York, assignor to the Glen Cove Machine Company, (Limited,) Brooklyn, N. Y. Filed Dec. 13, 1888. Serial No. 293,457. (No model.)



Claim.—1. In a planing-machine, the combination, with a presser-bar, of a swinging support therefor, to which the bar is connected near one of its ends and upon which it is adjustable, a support for the bar near its other end having a screw-threaded portion and an unscrew-threaded portion formed with the screw-threaded portion, the screw-threaded portion being provided with nuts, whereby the bar may be vertically adjusted, and the unscrew-threaded portion having a detachable connection with the frame of the machine, substantially as specified.

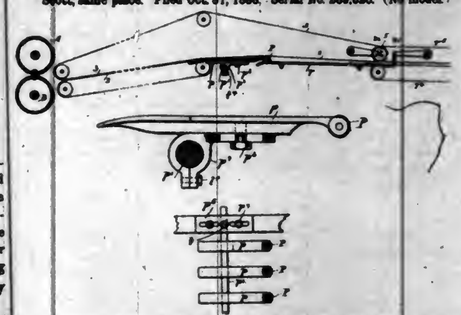
2. In a planing-machine, the combination, with a presser-bar, of a swinging support therefor near one end, a support for the same near the other end thereof, comprising a screw-threaded portion and an unscrew-threaded portion, said screw-threaded portion being provided with nuts, whereby the bar may be adjusted vertically, and the unscrew-threaded portion extending loosely through an aperture in the frame of the machine, and a set-screw for securing said unscrew-threaded portion in said aperture, substantially as specified.

404,949. PROCESS OF MAKING LEATHER WASHER-COILS. GEORGE H. AVERY, East Hampton, Mass. Filed Jan. 21, 1889. Serial No. 296,997. (No model.)

Claim.—The process of making a leather washer-coil, which consists, first, in winding a strip of leather spirally on a mandrel; second, subjecting said strip to a solidifying pressure in a direction transversely to the length of said strip, and, thirdly, finish-rolling the surface of the coiled strip, substantially as set forth.

404,949.

404,950. MEDICINE-DISPENSER. JOSHUA BARNES, Brooklyn, N. Y. Filed June 20, 1887. Serial No. 241,833. (No model.)



Claim.—1. The combination of a flexible elastic bulb with a flexible elastic sucking-nipple communicating with the said bulb, and a coupling and shield interposed between said bulb and nipple, for the purpose set forth.

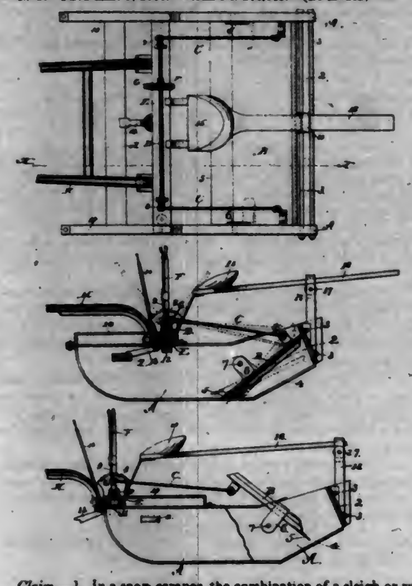
2. The combination of a flexible elastic bulb with a flexible elastic sucking-nipple communicating with the said bulb, and a hollow shield coupled to and forming a conduit between said bulb and nipple in the described arrangement for induction and eduction through the nipple by the bulb, for the purpose set forth.

3. The combination of a flexible elastic bulb with a sucking-nipple communicating with the said bulb, and a transparent hollow shield coupled to and forming a conduit between said bulb and nipple in the described arrangement for induction and eduction through the nipple by the bulb, for the purpose set forth.

4. The combination of a flexible elastic bulb with a sucking-nipple communicating with the said bulb, and a transparent reservoir coupled to and forming a conduit between said bulb and nipple in the described arrangement for induction and eduction through the nipple by the bulb, for the purpose set forth.

404,951. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. AUGUST R. BARTLAU, Plainfield, N. J., assignor to Walter Scott, same place. Filed Oct. 31, 1888. Serial No. 289,690. (No model.)

Claim.—1. The combination, with the sheet-conveying belts or tapes and bars or tapes for receiving the associated sheets, of a roller having a toothed or roughened surface for passing down the rear end of each sheet as the sheets are laid successively upon said bars or tapes, substantially as set forth.



2. The combination, with the sheet-conveying belts or tapes and bars or tapes for receiving the associated sheets, of the sheet-depressing roller P, guide-bars for directing the sheets to such roller, and means, substantially as specified, for adjusting such guide-bars and roller, as set forth.

3. The combination, with the sheet-conveying belts or tapes and bars or tapes for receiving the associated sheets, of the guide-bars p, toothed rollers carried by said guide-bars, the slotted arms p^3, to which the bars p are clamped, and the rod or shaft p', to which the arms p^3 are secured, substantially as specified.

4. The combination, with the sheet-conveying belts and bars or tapes for receiving the associated sheets, of a roller having a roughened surface for carrying down the rear edge of each sheet and a movable stop for the front edges of the sheet, substantially as set forth.

5. The combination, with the sheet-conveying belts and bars or tapes for receiving the associated sheets, of a roller having a roughened surface for carrying down the rear edge of each sheet, a movable stop for the front edges of the sheets, and a forwarding device for moving the associated sheets when the stop is raised, substantially as set forth.

404,952. SNOW-SCRAPER. GEORGE A. RIDER, East Greenbush, N. Y. Filed Mar. 3, 1888. Serial No. 266,063. (No model.)

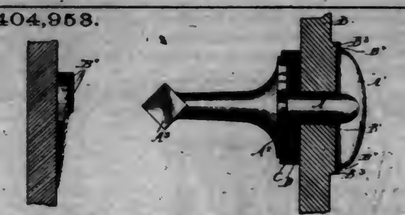
Claim.—1. In a snow-scraper, the combination of a sleigh or runners provided with a tilting face-board that is loosely fitted thereto, and a sliding cross-bar to which the animal-power is attached, and which is provided with a latch that is fitted to engage with a fixed part of said sleigh, the said sliding cross-bar being connected by pivoted rods to said face-board, as and for the purpose herein specified.

2. In a snow-scraper, the combination of a sleigh or runners provided with a loosely-fitted tilting face-board, a sliding cross-bar to which the animal-power is attached, and which is provided with a latch that is fitted to engage with a fixed part of said sleigh, and a rocking crank-shaft journaled on said cross-bar and provided with a hand-lever having a spring-latch that is fitted to engage in a notched quadrant, the cranks of said rock-shaft being connected by pivoted rods to said face-board, as and for the purpose herein specified.

3. In a snow-scraper, the combination of a sleigh or runners provided with stationary back-board, and a tilting face-board, which is loosely pivoted directly to said runners and whose uppermost edge is fitted to lie in close proximity to the face of said back-board, and the latter projecting above the uppermost edge of said face-board, so as to form a guard which will prevent the snow from escaping over the upper edge of the face-board, as and for the purpose herein specified.

4. In a snow-scraper, the combination of a sleigh or runners provided with a standard having a friction-roller journaled therein, and a sliding cross-bar having a driver's seat erected thereon, said seat being provided with a rearwardly-projecting arm which bears upon said friction-roller, as and for the purpose herein specified.

404,953. BOLT AND NUT. ADELBERT M. BRAINARD, Chicago, Ill. Filed Aug. 30, 1888. Serial No. 284,184. (No model.)



Claim.—1. A plate having a hole to admit the shaft of a bolt, and having on one or both faces of the plate one or more cams at the side of said hole, substantially as shown and described.

2. A plate having a hole to admit the shaft of a bolt, and having one or more cams at the side of said hole, said cams having depressions in their faces, substantially as shown and described.

3. A plate having a hole to admit the shaft of a bolt, and a slot or slots to admit the T-head of a bolt, and having on one or both faces one or more cams at the side of said hole, substantially as shown and described.

4. The combination, with a bolt having a shaft and a head at

404,953.

each end of such shaft, of one or more plates to surround said shaft, each plate being provided with one or more cams adapted to rest in contact with and engage one of said heads of the bolt, substantially as shown and described.

5. The combination, with a bolt having a shaft and a head at each end of such shaft, of one or more plates to surround said shaft, each plate being provided with one or more cams having depressions on their faces, said cams adapted to rest in contact with and engage one of said heads of the bolt, substantially as shown and described.

6. The combination, with a bolt having a shaft and a head at each end of such shaft, of one or more plates to surround said shaft, each plate being provided with one or more cams adapted to rest in contact with and engage one of said heads of the bolt, and a yielding washer suitably located on said shaft to regulate the longitudinal movement of the bolt, substantially as shown and described.

7. The combination, with a bolt having a shaft and a head at each end of such shaft, of one or more plates surrounding said shaft, each plate being provided with one or more cams having depressions in their faces, said cams adapted to rest in contact with and engage one of said heads of the bolt, and a yielding washer suitably located on said shaft to regulate the longitudinal movement of the bolt, substantially as shown and described.

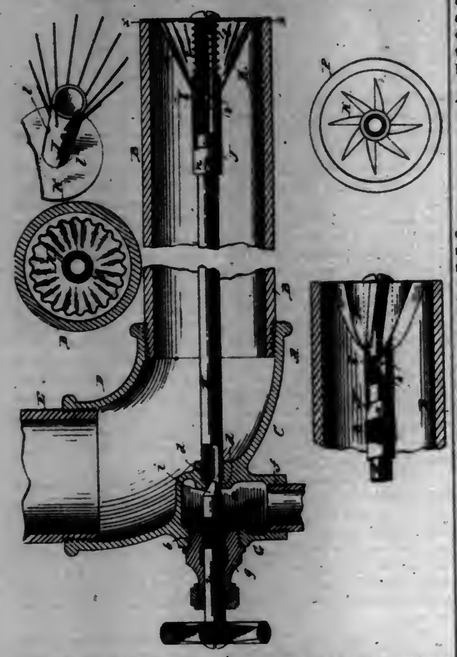
8. The combination, with a bolt having a shaft and a head at each end of said shaft, of a plate surrounding said shaft and provided with one or more cams having depressions on their inner faces, said cams adapted to rest in contact with and engage one of said heads, a yielding washer surrounding said shaft and interposed between said plate and the head of the bolt farthest from said plate, and a second washer provided with a rim surrounding said yielding washer and a portion of the adjacent head of the bolt, substantially as shown and described.

9. The combination, with a bolt having a shaft and a head at each end of said shaft, of a plate surrounding said shaft and provided with one or more cams having depressions in their faces, said cams being adapted to engage one of said heads of the bolt, and a washer of asbestus surrounding said shaft and interposed between said plate and the head of the bolt farthest from said plate, substantially as shown and described.

10. The combination, with a bolt having a shaft and a head at each end of such shaft, of a plate surrounding said shaft and provided with one or more cams having depressions on their faces, said cams being adapted to engage one of the heads of the bolt, a washer of asbestus surrounding said shaft and interposed between said plate and the head of the bolt farthest from said plate, and a second washer having a rim to surround said washer of asbestus and a portion of the adjacent head of the bolt, substantially as shown and described.

11. The combination, with a bolt having a shaft and a head at each end of said shaft, of two plates surrounding said shaft and having their meeting faces provided with cams, and one of the plates having on its outer face the depressions b^3, or their equivalent, to engage the adjacent head of the bolt, substantially as shown and described.

12. The combination, with a bolt having a shaft and a head at each end, the inner face of one of said heads being provided with one or more cams, of a plate surrounding said shaft, and having on one of its faces one or more cams adapted to rest in contact with the cam or cams on the inner face of the head of said bolt, substantially as shown and described.



404,954. HEADER ATTACHMENT FOR HARVESTERS. HENRY BRYAN, Modesto, Cal. Filed Oct. 20, 1888. Serial No. 288,687. (No model.)

Claim.—The thrasher and header frames, the block C, fixed to the side of the thrashing-machine, and a second plate or block pivoted thereto and having the vertical guides, in combination with the slide

moving in said guides secured at different points by a bolt, and a pivot-pin by which the header-frame is connected and supported, said pin being hinged to the vertically-moving slide, substantially as herein described.

404,955. HYDROCARBON-BURNER. JAMES H. BULLARD, Springfield, Mass. Filed Feb. 14, 1889. Serial No. 299,842. (No model.)

Claim.—1. A hydrocarbon-burner consisting of a tube adapted at one end to be connected with an air-conduit and open at its other end, a tube of smaller diameter supported within said air-tube adapted by one end to be connected with an oil-conduit and provided near its outer end with an aperture, and a spreader having outwardly-flaring and corrugated walls, substantially as described.

2. A hydrocarbon-burner consisting of a tube adapted at one end to be connected with an air-conduit and open at its other end, a tube supported within said air-tube adapted by one end to be connected with an oil-conduit and provided near to its outer end with an aperture, a sleeve movable on said oil-tube having an aperture, and a spring for acting on said sleeve to normally maintain it in a position for a non-registration of its aperture with that of said oil-tube, and a spreader in advance of said aperture, substantially as described.

3. A hydrocarbon-burner consisting of a tube B, open at its forward end, and a coupling, to one end of which the inner end of said tube is connected, a supplemental coupling on said main coupling comprising the passage *d* and the passage *f*, and the oil-tube H, connected with said passage *d*, provided near its outer end with an aperture through its side and communicating with the interior of said tube B, and having in advance thereof an outwardly-flaring spreader, substantially as described.

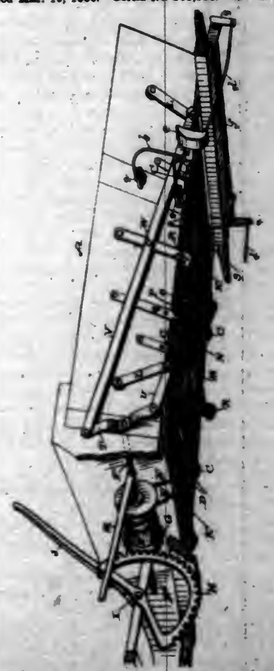
4. A hydrocarbon-burner consisting of an air-tube B, open at its forward end, and an elbow-coupling on said tube comprising the passages *b* and *d* and the passage *f*, the oil-tube H, connected with said passage *d*, provided near its outer end with an aperture through its side, in advance of which it is provided with an outwardly-flaring spreader, a gland fitted in said passage *b*, and a spindle having a screw engagement with said gland and provided with a tapered end adapted on the movement of said spindle to vary the open area of the orifice of said passage *d*, substantially as and for the purpose described.

5. A hydrocarbon-burner consisting of a tube adapted at one end to be connected with an air-conduit and open at its other end, an oil-tube supported within said air-tube adapted by one end to be connected with an oil-conduit and provided near its outer end with an aperture *k* through its side, and having a shouldered extremity, a sleeve longitudinally movable on said tube having a slot-and-pin engagement therewith and provided with an aperture to register with the oil-tube aperture and having the conical-shaped spreader, and the spring between the shouldered tube end and the sleeve, substantially as described.

6. In an apparatus for burning hydrocarbon, in combination, a burner comprising an air-tube open at its outer end, an air-compressor and a conduit leading therefrom and connected to said tube, a tube supported within said air-tube having at its forward end an aperture through its side, a sleeve movable on said oil-tube having an aperture and provided with a spring for acting on said sleeve, substantially as described, and a spreader in advance of said aperture, a service oil-tank, and a conduit leading therefrom to and connected with said burner oil-tube, substantially as described.

404,956. FINGER-RING. LEVI L. BURDON, Providence, R. I. Filed Oct. 4, 1888. Serial No. 287,160. (No model.)

Claim.—1. As a new article of manufacture, a ring or other class of articles, as hereinbefore described, having a longitudinally roundabout seamless plated exterior surface of metal and an interior portion of inferior metal, substantially as and for the purpose set forth.



2. The ring or other analogous articles hereinbefore described, consisting of a piece of plated or composite externally-seamless wire bent and united at the abutting ends by solder, substantially as specified.

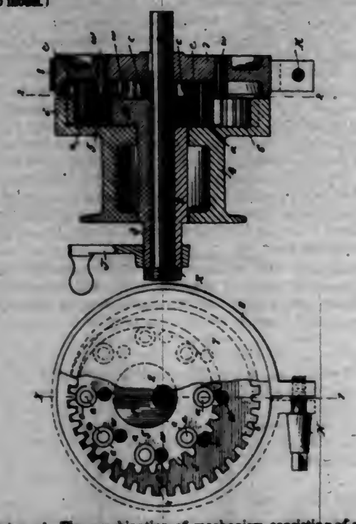
3. A composite ring having a roundabout seamless exterior surface *a*, of suitable metal, as alloyed gold, and an interior or filling portion, as *b*, of inferior metal or composition of metals united to said exterior portion, and having the ends of the ring united, substantially as shown and hereinbefore described.

4. The ring hereinbefore described, consisting of the exterior plate or shell *a*, of alloyed gold, seamless roundabout, and the interior or filling portion *b*, of gold of less value, united to the shell, thereby producing a filled ring having gold of different qualities, substantially as shown and set forth.

5. The composite tubular ring hereinbefore described, consisting of the longitudinally-seamless exterior plate or shell *a* and the longitudinally-seamless interior shell of inferior metal united to the outer shell, substantially as set forth.

404,957. DUMPING-WAGON. LEOPOLD BOSSE, San Francisco, Cal. Filed Mar. 19, 1889. Serial No. 303,933. (No model.)

Claim.—1. In a dumping-wagon, a bottom composed of sections hinged to the sides and meeting when closed at the center, arms extending from these hinged sections, a drum, and chain coiled around said drum and connecting with the arms of the sections, in combination with the pinion, segment, and operating-lever, whereby the chains may be coiled or uncoiled, substantially as herein described.



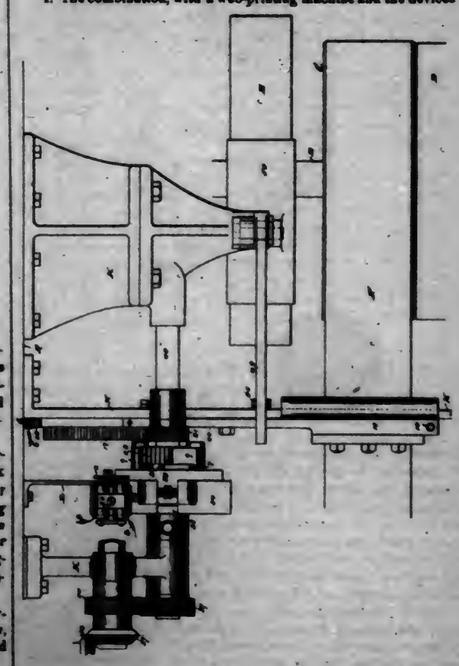
2. In a dumping-wagon, bottom sections hinged to the sides and closing toward the center, the winding-drum and actuating mechanism, and chains connecting said drum with the sections, whereby they may be closed by the rotation of the drum, in combination with locking-bars suspended by links from the sides of the wagon-body, so as to swing beneath the ends of the bottom sections when they are closed, substantially as herein described.

3. In a dumping-wagon, the hinged bottom sections closing toward the center, the winding-drum and operating mechanism whereby they are closed, and the horizontal bars suspended from the sides of the wagon and adapted to swing to and from each other, so as to lock or unlock the bottom sections, in combination with the connecting-rods and levers whereby the locking-bars are moved simultaneously, substantially as herein described.

4. The hinged centrally-meeting bottom sections, with mechanism for opening and closing the same, and the end locking-bars with connecting-levers, as shown, in combination with a central bar pivoted to one of the sections near its swinging edge, and the rod connecting said bar with a stationary point upon the side of the wagon, so that the bar is turned into a longitudinal position when the bottom sections begin to open and is turned into a transverse position beneath the sections when they are closed, substantially as herein described.

5. The hinged bottom sections closing toward the center, with the operating-drum and the end locking-bars and the central swiveled bar, in combination with the levers, and connecting-rods whereby the end bars are moved to lock or unlock the bottom sections, and the hooks R, which are moved simultaneously to engage or disengage with the ends of the central swiveled bar, substantially as herein described.

404,958. DIFFERENTIAL HOISTING MECHANISM. GEORGE P. CLEMSON, Springfield, Mass. Filed Aug. 22, 1888. Serial No. 283,441. (No model.)



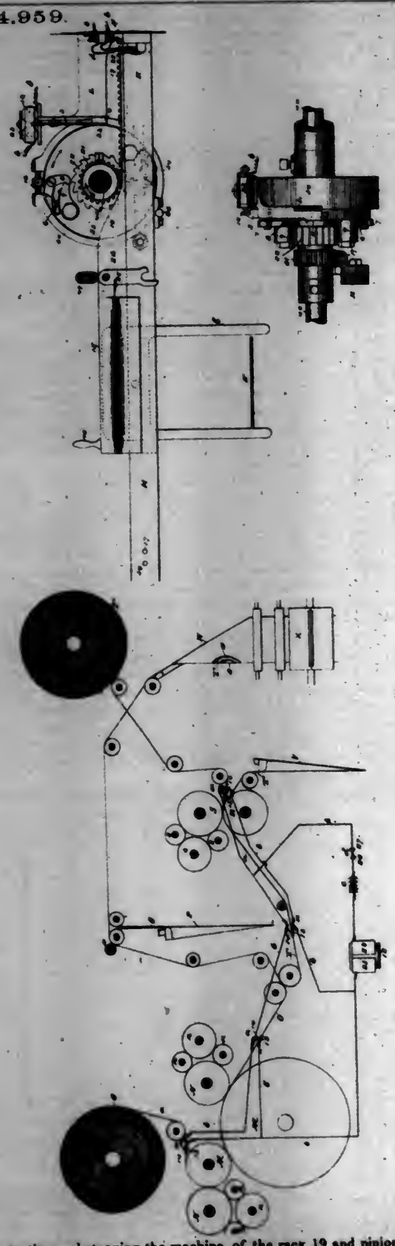
Claim.—1. The combination of mechanism consisting of a spur-gear carrying a series of pins, a pulley carrying a like series of pins for engagement with the pins on said gear, a rotatable eccentric acting on said spur-gear, as described, an internal gear with which said spur-gear engages, adapted to have a rotary motion about said eccentric, and a supporting-shaft, substantially as set forth.

2. The combination of mechanism consisting of a spur-gear carrying a series of pins projecting from the face thereof, a rotatable disk or pulley having also a like series of pins projecting from its face for engagement with the pins on said gear, a rotatable eccentric having said spur-gear thereon, a winding-spool integrally formed with an internal gear with which said spur-gear engages, said internal gear adapted to have a rotary motion about said eccentric, a supporting-shaft, and means, substantially as described, for rotating said eccentric, substantially as set forth.

3. The combination, with a pulley having a rim and the inwardly-extending flange 16, having a series of circularly-arranged pins *w*, projecting inwardly therefrom, of a spur-gear disposed within said flanged pulley, having an outwardly-extended and surrounding ring having a series of circularly-arranged pins thereon, an internal gear of longer diameter than said spur-gear surrounding same, and an eccentric for action on said spur-gear, as described, substantially as and for the purposes specified.

4. The combination, with a pulley 15, having a rim and the inwardly-extending flange 16, provided with a series of circularly-arranged pins *w*, projecting inwardly therefrom, of a spur-gear disposed within said flanged pulley, having an outwardly-extended and surrounding ring provided with a series of circularly-arranged pins thereon, and having the circular recess N, an internal gear of longer diameter than said spur-gear surrounding same, an eccentric for action on said spur-gear, as described, and the stop 17, pivoted on said pulley for engagement with or disengagement from the rim forming the wall of said recess, substantially as set forth.

404,959. STOP MECHANISM FOR WEB-PRINTING MACHINES. LUTHER C. CROWELL, Brooklyn, assignor to R. Hoe & Co., New York, N. Y. Filed June 22, 1887. Serial No. 242,108. (No model.)



Claim.—1. The combination, with a web-printing machine and the devices for starting and stopping the same, of connections, including a clutch mechanism, for operating the latter from the former, an electro-magnet for controlling the operation of said clutch mechanism, one or more circuit-closers located in the path of the web through the machine and arranged to be controlled by the web, and electrical connections between said circuit closer or closers and said electro-magnet, all substantially as described.

2. The combination, with a web-printing machine, the mechanism for acting on its driving-belt to apply and remove the power, and the brake mechanism, of connections, including a clutch mechanism, for operating the latter mechanism from the former, an electro-magnet for controlling the operation of said clutch mechanism, one or more circuit-closers located in the path of the web through the machine and arranged to be controlled by the web, and electrical connections between said circuit closer or closers and said electro-magnet, all substantially as described.

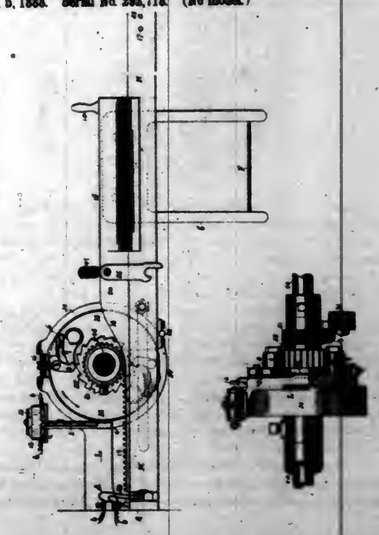
3. The combination, with a web-printing machine, of a belt-shifter for applying and removing the power, and brake-connections, including a clutch mechanism, for operating the belt-shifter and applying the brake from the printing-machine, an electro-magnet for controlling the operation of said clutch mechanism, one or more circuit-closers located in the path of the web through the machine and arranged to be controlled by the web, and electrical connections between said circuit closer or closers and said electro-magnet, all substantially as described.

4. The combination, with a web-printing machine and the devices

404,959.

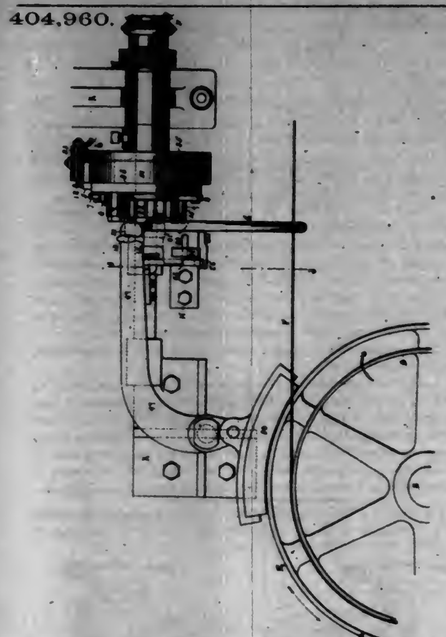
for starting and stopping the machine, of the rack 19 and pinion 21, for operating the starting and stopping mechanism, connections for operating said pinion from the printing-machine, including a clutch mechanism consisting of a ratchet and a pawl or pawls for making and breaking said connections, an electro-magnet for controlling said pawl or pawls, one or more circuit-closers located in the path of the web through the machine and arranged to be controlled by the web, and electrical connections between said circuit closer or closers and said electro-magnet, all substantially as described

5. The combination, with a web-printing machine and its belt-shifter and brake, of the rack 19 and pinion 21, for operating the belt-shifter and applying the brake, connections for operating said pinion from the printing-machine, including a clutch mechanism consisting of a ratchet and a pawl or pawls for making and breaking said connections, an electro-magnet for controlling said pawl or pawls, one or more circuit-closers located in the path of the web through the machine and arranged to be controlled by the web, and electrical connections between said circuit closer or closers and said electro-magnet, all substantially as described.



6. The combination, with a web-printing machine and the devices for starting and stopping the machine, of connections for operating said devices from the printing-machine, including a clutch mechanism for controlling said connections, and also including the disk 33 and friction-band 34, forming a yielding joint in said connections, an electro-magnet for controlling said clutch mechanism, one or more circuit-closers located in the path of the web through the machine and arranged to be controlled by the web, and electrical connections between said circuit closer or closers and said electro-magnet, all substantially as described.

7. The combination, with a web-printing machine and the devices for starting and stopping the same, of connections, including a clutch mechanism, for operating the latter from the former, an electro-magnet for controlling the operation of said clutch mechanism, one or more circuit-closers located in the path of the web through the machine and arranged to be controlled by the web, electrical connections between said circuit closer or closers and said electro-magnet, and a circuit-breaker *d*, controlled by the stopping and starting devices and arranged to break the circuit through the magnet when the devices are operated to stop the machine, all substantially as described.

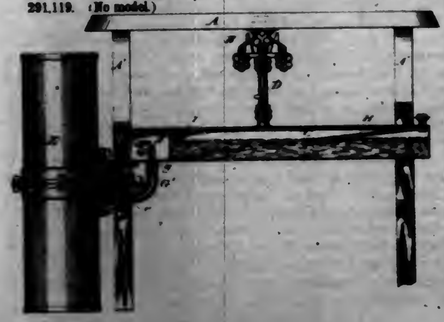


8. The combination, with a web-printing machine and its starting and stopping devices, of the rack 19 and pinion 21, for operating said devices, the disk 33, carrying a pawl or pawls 9 and driven through yielding frictional connections from the printing-machine, the ratchet 22, connected to the pinion 21 and arranged to be engaged by the pawl or pawls 9, the electro-magnet 23, having the lever 5, for tripping said pawl or pawl, one or more circuit-closers located in the path of the web through the machine and arranged to be controlled by the web, and electrical connections between said circuit closer or closers and said electro-magnet, all substantially as described.

9. The combination, with a web-printing machine and its starting and stopping devices, of the rack 19 and pinion 21, for operating said devices, the disk 33, carrying a pawl or pawls 9 and driven through yielding frictional connections from the printing-machine, the ratchet 22, connected to the pinion 21 and arranged to be engaged by the pawl or pawls 9, the electro-magnet 23, having the lever 5 for tripping said pawl or pawls, one or more circuit-closers located in the path of the web through the machine and arranged to be controlled by the web, electrical connections between said circuit-closer or closers and said electro-magnet, and a circuit-breaker *d*, controlled by the stopping and starting devices and arranged to break the circuit through the magnet when the devices are operated to stop the machine, all substantially as described.

404,960. STOP MECHANISM. LUTHER C. CROWELL, Brooklyn, assignor to R. Hoe & Co., New York, N. Y. Original application filed June 22, 1887, Serial No. 242,104. Divided and this application filed Dec. 5, 1888. Serial No. 292,718. (No model.)

404,960.

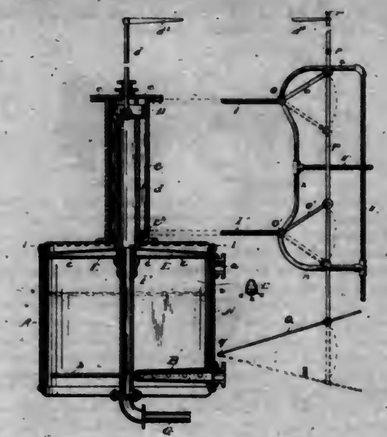


Claim.—1. The combination, with the driving-shaft B and the driven shaft 40, of the disk 33, driven by the shaft 40 through a yielding frictional connection, the pinion 21 and mechanism connected therewith for controlling the stopping and starting of the driving-shaft, and a clutch mechanism for connecting the pinion 21 to the disk 33, substantially as described.

2. The combination, with the driving-shaft B and the driven shaft 40, of the disk 33, driven by the shaft 40 through a yielding frictional connection, the pinion 21 and mechanism connectd therewith for controlling the stopping and starting of the driving-shaft, a pawl-and-ratchet clutch mechanism for connecting said disk and pinion, and a lever 5 for controlling said pawl-and-ratchet clutch mechanism, substantially as described.

3. The combination, with the driving-shaft B and the driven shaft 40, of the disk 33, driven by the shaft 40 through a yielding frictional connection, the pinion 21 and mechanism connected therewith for controlling the stopping and starting of the driving-shaft, a pawl-and-ratchet clutch mechanism for connecting said disk and pinion, a lever 5 for controlling said pawl-and-ratchet clutch mechanism, and an electro-magnet for controlling said lever, substantially as described.

4. The combination, with the driving-shaft B and a belt-shifter for applying power to and removing it from said shaft, and a brake for stopping said shaft, of the driven shaft 40, the disk 33, driven by said shaft 40 through a yielding frictional connection, the pinion 21, and a clutch mechanism for connecting said pinion and disk, and a rack-bar operated by said pinion to control said belt-shifter and brake, substantially as described.



404,961. VAPOR-STOVE. SAMUEL DANIELS, Chicago, Ill., assignor to J. McGregor Adams, same place. Filed Nov. 17, 1888. Serial No. 291,119. (No model.)

Claim.—1. The combination, with a gasoline-tank and an air-pressure device, of an intermediate air-chamber, a pipe leading from the air-pressure device to a central point of the air-chamber, and a diagonal air-pipe leading from the air-chamber to the top of the gasoline-tank, substantially as described.

2. The combination, with a vapor-stove frame, a gasoline-tank and an air-pressure device, said tank and pressure device being separate from each other and separately secured to the frame, of a flexible air-tube connecting the air-pressure device to the tank structure, substantially as described.

404,962. WATER-FILTER. CHESTER R. DAVIS and EDWARD H. RIDDELL, Chicago, Ill. Filed Dec. 17, 1887. Serial No. 258,941. (No model.)

Claim.—1. In a water-filter, the filter-tank, in combination with a series of vertically-movable delivery-pipes arranged within the tank and perforated, as described, and actuating devices whereby said pipes may be moved up and down through the filter-bed within the tank to wash the filter-bed without removing it from the tank, substantially as and for the purposes specified.

2. In a water-filter, the tank, in combination with the radial perforated arms, the hydraulic cylinder, the piston within said cylinder, the inlet-pipe, and the hollow piston-stem to which said arms are connected, substantially as and for the purposes specified.

3. The filter-tank A, in combination with the hydraulic cylinder C, provided with ports c' c^2, the inlet-pipe, the piston D, provided with hollow stem *d*, the perforated pipes E at the lower end of the stem, the pipes I I', and a valve mechanism for directing and controlling the hydraulic pressure and exhaust through said pipes to the cylinder, substantially as and for the purposes specified.

4. In a water-filtering apparatus, the filter-tank provided with a bed of suitable filtering material, in combination with the hydraulic cylinder mounted on the filtering-tank and provided with ports c' c^2, the piston D, with its hollow stem *d* extending into the filter-tank, the radial perforated arms attached to the end of the hollow stem within the tank, an inlet-pipe arranged to deliver water to the hollow stem and radial arms attached thereto, the pressure and exhaust pipes I I', the pipe J, the pressure and exhaust pipes J, L', the four-way cock K, and the lever k^2, connected to said cock, substantially as and for the purposes specified.

5. In a water-filtering apparatus, the filter-tank provided with a bed of suitable filtering material, in combination with the hydraulic cylinder mounted on the filtering-tank and provided with ports c' c^2, the piston D, with its hollow stem *d* extending into the filter-tank, the radial perforated arms attached to the end of the hollow stem within the tank, an inlet-pipe arranged to deliver water to the hollow stem and radial arms attached thereto, the pressure and exhaust pipes I I', the sliding rod provided with stops and connected to the controlling-valves, the rod d', attached to the piston and projecting out through the head of the cylinder, and the arm d^3, attached to the said rod, substantially as and for the purposes specified.

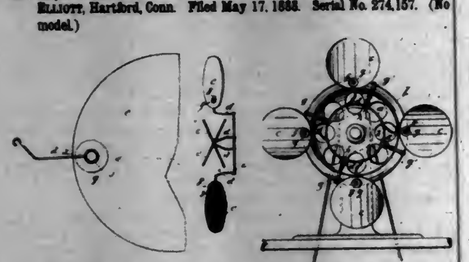
6. In a water-filtering apparatus, the filter-tank provided with a bed of suitable filtering material, in combination with a series of vertically-movable delivery-pipes arranged within the tank and perforated, as described, actuating devices whereby said pipes may be moved up and down through the filter-bed within the tank, an inlet-pipe arranged to deliver water to the said movable pipes, and shifting devices operated by the movement of the movable pipes, whereby

the latter may be moved up and down repeatedly and automatically through the filter-bed to wash the latter without removing it from the tank, substantially as and for the purposes specified.

7. In a water-filter, the perforated collecting-pipes *b*, in combination with the wire b^3, wound coarsely upon the pipes, the wire-netting b^5, wrapped upon the outside of the wire b^3, and the wire b^4, wound upon the outside of the said netting, substantially as and for the purposes specified.

8. The filter-tank, in combination with the hydraulic cylinder, the piston in said cylinder, the hollow piston-stem, the perforated pipes at the lower end of the stem, and an inlet-pipe arranged to deliver water into the hollow stem, substantially as and for the purposes specified.

404,963. AIR-VALVE. GEORGE M. DAVIS, Chicago, Ill. Filed Mar. 8, 1889. Serial No. 302,439. (No model.)

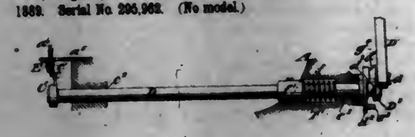


Claim.—1. The combination, with a radiator, of the valve-tube projecting inside of the steam-space and provided in the inner end with an inlet-opening and exteriorly with an escape-opening, and the expansion-stem inserted in said tube and closing said inlet-opening by expansion after the cold air is expelled and uncovering the same when the steam is shut off, substantially as and for the purpose set forth.

2. In air-valve, the combination, with the expansion-tube projecting inside of the radiator and having the outer enlarged mouth-end o threaded interiorly, and the exteriorly-threaded part a^3, of the expansion-stem inserted in said tube and provided with the threaded head a^3 engaging with the correspondingly-threaded mouth part, substantially as and for the purpose set forth.

3. In an air-valve, the combination, with the vented expansion-tube provided exteriorly with the threaded part a^3, and having the expansion end extending inside of the steam-space, of a radiator, and the expansion-tube provided longitudinally with a number of grooves and inserted in said tube, substantially as and for the purpose set forth.

404,964. SEWING-MACHINE FAN ATTACHMENT. WALTER S. ELLIOTT, Hartford, Conn. Filed May 17, 1888. Serial No. 274,157. (No model.)

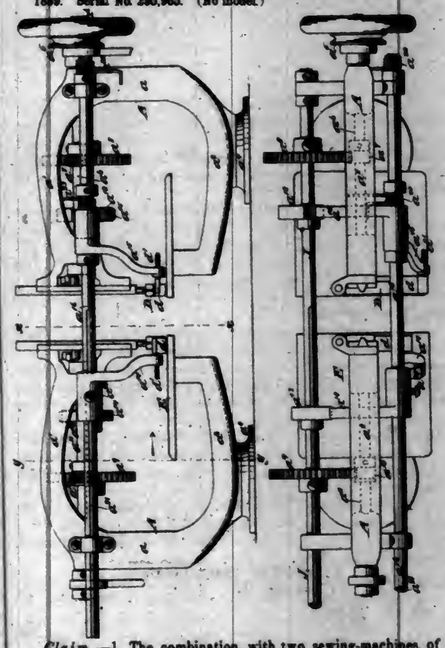


Claim.—1. The combination, in a rotary fan attachment for sewing-machines, of the base-ring *a*, wing-supporting arms *d*, and the fan-wings *c*, extensibly connected to the arms by friction pivot-joints adapted for variable radial projection of the wings, substantially as described.

2. In combination with the fly-wheel *b* of a sewing-machine, the rotary fan attachment having the ring *a*, the laterally-projecting fan-supporting arms *d*, and the spirally-adjustable fans, and the elastic bands and hooks connecting said ring and fly-wheel, substantially as described.

3. The combination, in a rotary fan attachment for sewing-machines, of the base-ring *a*, fan-wing-supporting arms *d*, attached to said ring, the ring or eye at the outer extremity of each arm, and a fan-wing pivoted to each arm through the ring or eye, and a friction-washer each side of the fan-wing, substantially as described.

404,965. SEWING-MACHINE. ALFRED FAULKNER, Jersey City, N. J., assignor to Eli W. Broadbent, New York, N. Y. Filed Jan. 10, 1889. Serial No. 296,962. (No model.)

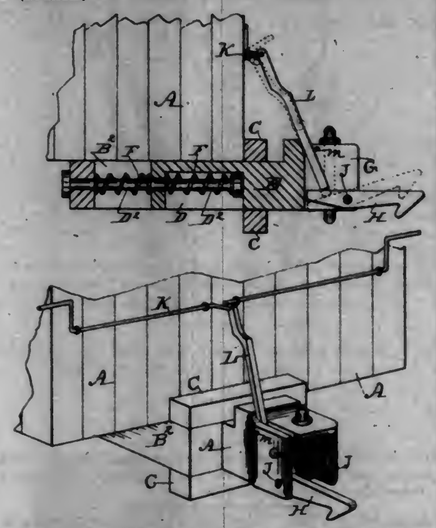


Claim.—1. In a sewing-machine, the combination, with a reciprocating needle, of a rock-shaft, a hooked looper mounted thereon, a cam disk or segment on said rock-shaft, a rigid cam adjacent to said cam disk or segment and against which the latter normally bears, and an eccentric-rod operated from the main shaft to impart rocking motion to said cam disk or segment, substantially as specified.

2. In a sewing-machine, the combination, with a reciprocating needle, of a rock-shaft, a hooked looper mounted thereon, a cam disk or segment on said rock-shaft, a rigid cam adjacent to said cam disk or segment and against which the latter normally bears, an eccentric-rod operated from the main shaft and provided with a longitudinally-extending cavity near its lower end, a coil-spring arranged in said cavity, a pin also in said cavity, said eccentric-rod being provided with a slot, and said crank disk or segment being provided with a pin extending through said slot, against which pin the pin first named bears, substantially as specified.

3. In a sewing-machine, the combination, with a reciprocating needle, of a rock-shaft, a hooked looper mounted thereon, a cam disk or segment on said rock-shaft, a rigid cam adjacent to said cam disk or segment and against which the latter normally bears, an eccentric-rod operated from the main shaft to impart rocking motion to said cam disk or segment, and a stop for limiting the movement of said cam disk or segment in one direction, substantially as specified.

404,966. SEWING-MACHINE. ALFRED FAULKNER, Jersey City, N. J., assignor to Eli W. Broadbent, New York, N. Y. Filed Jan. 10, 1889. Serial No. 296,965. (No model.)



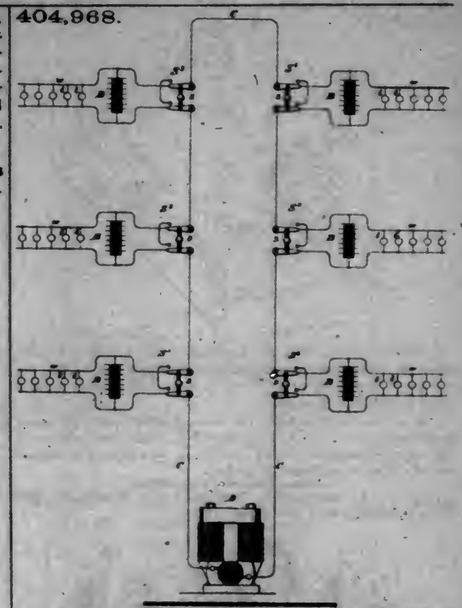
Claim.—1. The combination, with two sewing-machines, of a main shaft, a second shaft deriving motion from said main shaft, a third shaft deriving motion from the second-named shaft, cams on said second-named shaft, a rock-shaft, bell-crank levers on said rock-shaft, having one of their arms bearing upon said cams, and plaiting knives or tongues upon the other arms of said bell-crank levers, substantially as specified.

2. The combination, with two sewing-machines, of a main shaft, a second shaft deriving motion from the main shaft, a third shaft deriving motion from the second-named shaft, cams on said second-named shaft, a rock-shaft, bell-crank levers mounted on the rock-shaft, one of which levers is loose on said shaft and both of which have arms bearing against said cams, said cams being so timed that the levers are operated alternately in the same direction, and plaiting knives or tongues on the other arms of the levers, substantially as specified.

3. The combination, with two sewing-machines, of a main shaft, a second shaft deriving motion from the main shaft, a third shaft deriving motion from the said second shaft, cams on said second-named shaft, a rock-shaft, bell-crank levers mounted on said rock-shaft having arms bearing upon said cams, and plaiting knives or tongues on the other arms of said levers, said second-named shaft and the rock-shaft being arranged upon opposite sides of the machine, substantially as specified.

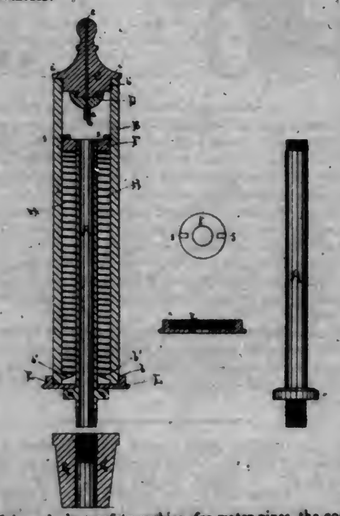
404,967. CAR-COUPLING. WILLIAM GREENWAY and JAMES STERLAND, Hastings, Nebr. Filed Oct. 22, 1888. Serial No. 288,991. (No model.)

Claim.—A draw-bar having a link-cavity adapted to receive a coupling-link of common form, a coupling-hook pivoted in a slot at the side of the link-cavity, and a pivoted bolt, or its equivalent, extended horizontally across the link-cavity, a rock-shaft in bearings fixed to the car, and a bar suspended from the rock-shaft to balance the hook by force of gravity and to elevate the hook by operating the rock-shaft, arranged and combined with a car to operate in the manner set forth, for the purposes stated.



404,968. METHOD OF DISTRIBUTING ELECTRICITY BY SECONDARY BATTERIES. WILLIAM W. GIBBONS, Haverford College, assignor to the Electro Dynamic Company, Philadelphia, Pa. Filed Feb. 1, 1889. Serial No. 298,337. (No model.)

Claim.—1. The improved method of distributing electricity herein described, which consists in generating electricity at or near a suitable source of power, conveying it to the point of consumption through the medium of a current of comparatively-low intensity, there storing it in the form of chemical energy, as in a secondary battery, and then simultaneously directing the current from said generator and storage apparatus into a working-circuit containing translating devices consuming current at a rate exceeding the capacity of the storage apparatus alone, substantially as described.

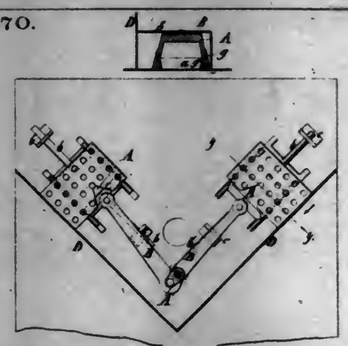


2. The improvement in the method of distributing electricity herein described, which consists in generating electricity at or near a suitable source of power, conveying it to two or more widely-separated points of consumption through the medium of a current of comparatively-low intensity, there storing it in the form of chemical energy, as in secondary batteries, and then simultaneously directing the current from said generator and storage apparatus into working-circuits containing translating devices, consuming current at a rate exceeding the capacity of the storage apparatus alone, substantially as described.

3. The method of distributing electricity herein described, which consists in generating electricity at or near a central point or station, conveying it to the point of consumption through the medium of a current of comparatively-low intensity, there storing it in the form of chemical energy, as in a secondary battery, and then simultaneously directing the current from said generator and storage apparatus into a working-circuit containing translating devices consuming current at a rate exceeding the capacity of either generator or storage apparatus when alone connected thereto, substantially as described.

404,968.

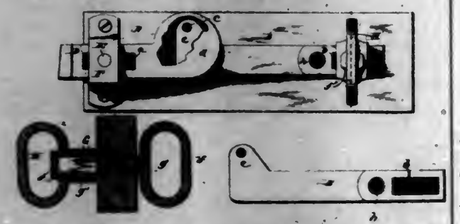
404,969. SAFETY-CUSHION FOR WATER-PIPES. ALFRED HATTERSLEY, Fort Wayne, Ind. Filed Feb. 9, 1887. Serial No. 226,999. (No model.)



Claim.—1. In a safety-cushion for water-pipes, the combination of a movable chamber B, having caps C and E, with a fixed inlet-tube A passing through cap E, and having a spring-rest and guide-plate F, constructed to permit the water to pass it freely, secured to its inner end, and a spring arranged between said guide-plate and the cap E, substantially as described.

2. In a safety-cushion for water-pipes, the combination, with a fixed and movable portion, one of them constituting a chamber, of a spring interposed between them, one of them constituting a water-receiving chamber, a cap C on said chamber provided with a vent-hole c, and an inwardly-opening valve covering said vent-hole, substantially as described.

404,970. SLIDE-VALVE FOR GAS-METERS. JOHN HEARNE, New York, N. Y., assignor to Joseph Flannery and Walter P. Elliott, both of same place. Filed Apr. 8, 1889. Serial No. 306,305. (No model.)



404,970.

Claim.—1. In a meter, the combination, with a slide-valve, of a guard for preventing the permanent displacement of the valve, the said guard being near to but normally out of contact with the said valve, substantially as specified.

2. In a meter, the combination, with a slide-valve and a soft-metal guide therefor, of a guard to prevent the permanent displacement of the valve, the said guard being near to and normally out of contact with the valve, substantially as set forth.

404,971. GATE-LATCH. MORTIMER F. HILL, Belleville, Ill. Filed June 4, 1888. Serial No. 275,966. (Model.)

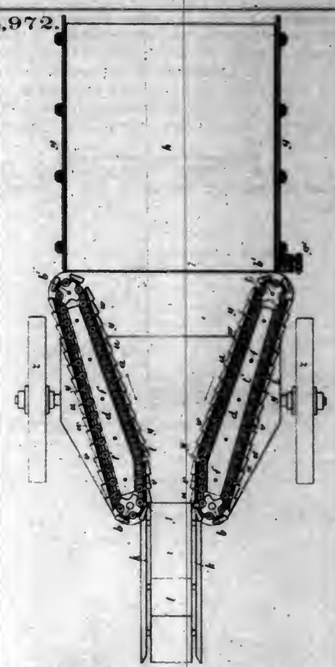
Claim.—1. The latch composed of two sections, one section having one end enlarged and weighted and provided with an open recess in its under side, and the other section having its meeting end provided with a vertical extension on its upper side entering the recess in the under side of the first section and pivoted at its extremity in the upper end of said recess, as set forth.

2. The combination of the latch composed of two parts having slotted outer ends, one of said parts having an expanded weighted recessed inner end, and the other part having its inner end provided with an extension pivoted within the recessed end of the first-mentioned part, the operating-shaft passing through the slot in the end of one part, and the pin passing through the slot in the end of the other part, as set forth.

3. The combination, with the latch composed of two parts, which are pivotally connected together and pivotally supported at one end and having a slot at its other end, of the keeper and the pin passing through the keeper and the said slot, substantially as and for the purpose described.

404,972. BALING-PRESS. JOHN H. HOWARD, JAMES H. HOWARD, and EDWARD T. BOURFIELD, Bedford, England. Filed July 13, 1888. Serial No. 280,367. (No model.) Patented in France July 2, 1888, No. 191,561; in Belgium July 6, 1888, No. 82,463; in New South Wales Aug. 20, 1888, No. 879; in Italy Sept. 30, 1888, XXII, 23,799, XLVII, 134, and in Canada Oct. 10, 1888, No. 29,905.

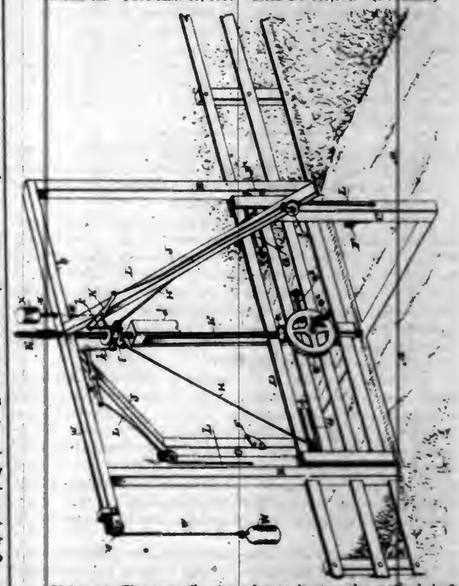
Claim.—1. In a machine for baling hay, straw, and other materials, and having endless feeding-platens, projecting slats or ribs *y* thereon, made with their rear edges thinner than their forward gripping-edges, substantially as and for the purpose set forth.



2. In combination with the two endless converging platens having ribs thicker at their forward than at their rear edges, a box or receptacle provided with an endless feed to convey the material to said platens, substantially as shown and described.

3. In combination with the endless conveying-platens having the described ribs, the receiving-table provided with the reduced portion *l*, substantially as and for the purpose set forth.

4. The receiving-platform *i*, provided with the grooves *k* near its opposite edges, and with clamps *j*, adapted thereto and serving to span the material at its top and at both of its sides.



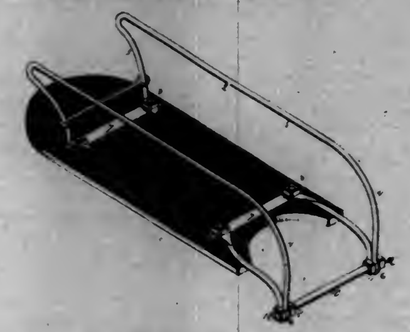
5. In combination, the receptacle *g*, having an endless conveyer

404,972.

h therein, the converging endless platens having the gripping-ribs *y*, and the table *i*, provided with the depression *l*, and side grooves *k*, substantially as shown and described.

404,973. GATE. FRED W. HYDE and ALVIN Z. DUTTERER, Daisville, Cal. Filed Mar. 13, 1889. Serial No. 303,168. (No model.)

Claim.—1. The centrally-pivoted gate having the vertical shaft E and the quartering gate-posts B and C in the roadway, in combination with the weight, the suspending cord or cable winding upon the central shaft of the gate, whereby the gate is turned, catches upon the gate-posts, pivoted latches on the gate, a sliding collar on the shaft E of the gate, connecting-rods between said collar and latches, and pivoted trip-levers having operating-cords, said levers being connected with the sliding collar, whereby the latches are relieved, substantially as described.



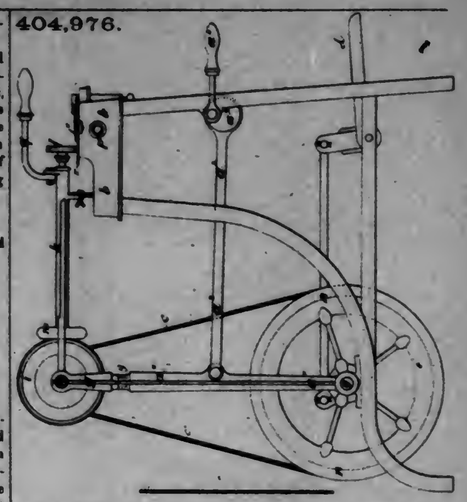
2. The centrally-pivoted gate and the revoluble shaft E, connected with said gate, in combination with the operating-weight and suspending-cord connecting it with the shaft, whereby the gate is turned, the quartering gate-posts and catches thereon, the pivoted latches carried by the gate, the trip-levers with their operating-cords, the sliding collar and connections, whereby the latches are relieved from the catches, and the means for winding up the weight, consisting of the pinion on the bottom of the shaft E and a spur-gear engaging said pinion, substantially as described.

404,974. GATE-LATCH. GEORGE G. LOAR, Atchison, Kans. Filed Aug. 3, 1888. Serial No. 281,907. (No model.)

Claim.—In a gate-latch, the combination, substantially as described, of the casing having cavity B and pin-hole D, and provided with a vertically-elongated slot A', extending laterally outward from said cavity B and formed in a common vertical plane with the pin-hole D, the pin operating in hole D, and the pin E', connected at one end with the pin E and extended laterally outward through the slot A', all being substantially as and for the purpose specified.

404,975. HAND-SLED. GUSTAV LUNDGREN, Rockford, Ill. Filed Oct. 10, 1888. Serial No. 287,718. (No model.)

Claim.—1. In combination, a sled-bottom, transverse bottom supports on the under side of the sled-bottom, two runners connected to the sled-bottom by bolts or rivets passing through the runners and bottom supports, each runner composed of a single piece of metal forming the runner and its knee-supports, and a transverse brace connecting the rear knees of the two runners, substantially as set forth.



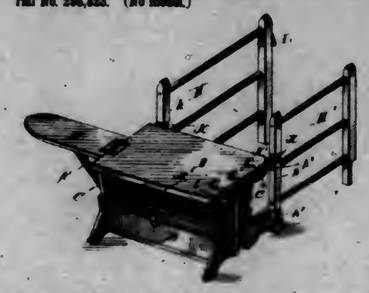
2. In combination, a sled-bottom, runners secured to said bottom, the forward upward ends of said runners being bent to form eyes, a brace having screw-threaded ends inserted through said eyes, and nuts for engaging said screw-threaded ends, substantially as set forth.

3. In combination, a sled-bottom, transverse supports secured to the bottom thereof, two runners, each of which is composed of a single piece of metal forming the runner proper and its knee-supports, the forward knee-support constructed to form an eye and terminating in an inwardly-curved arm, the end of said arm and the end of said knee being secured to the transverse supports, braces for connecting the rear knees and the forward knees, the brace connecting the forward knees passing through the said eyes of the forward knees, and nuts for engaging the end of said brace, substantially as set forth.

404,976. APPARATUS FOR SHARPENING THE CUTTERS AND FINGERS OF REAPING AND MOWING MACHINES. ROBERT MORGSON, Leigh, County of Lancaster, England. Filed May 4, 1887. Serial No. 237,085. (No model.) Patented in England July 1, 1886, No. 8,607; in France July 31, 1886, No. 177,711, and in Germany Aug. 15, 1886, No. 39,436.

Claim.—The combination of the fixed frame with a rocking frame, a fork swiveled on the latter, and a frame pivoted to the swiveled fork and carrying a spindle and grinding-tool, all substantially as described.

404,976.

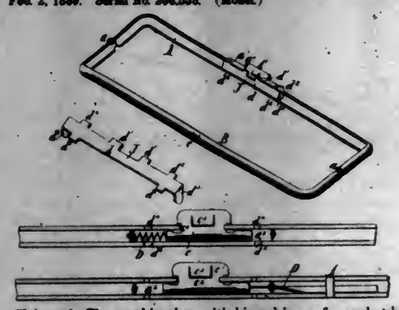


404,977. SASH-HOLDER. ARTHUR W. NELSON, Chicago, Ill. Filed Nov. 2, 1888. Serial No. 289,833. (No model.)

Claim.—In a window, the combination, with the inside bead provided with the recess *c* and the shoulder *c'*, of a spring arranged longitudinally and vertically in said recess, the interposed clamping-bar provided with a shoulder corresponding to and interlocking with the shoulder on the bead, substantially as and for the purpose set forth.

404,978. COMBINED SETTEE, IRONING-BOARD, AND CLOTHES-RACK. WILSON NORRIS, Mount Sterling, Ohio. Filed Feb. 6, 1889. Serial No. 298,823. (No model.)

Claim.—1. The combination, with a settee having side arms C C and back D, and studs *k'* on said back, of the racks H H', arranged in rear of said settee, the sleeves K, journaled upon said racks, and the slotted arms K', pivoted to said sleeves, their slots engaging said studs, substantially as described.



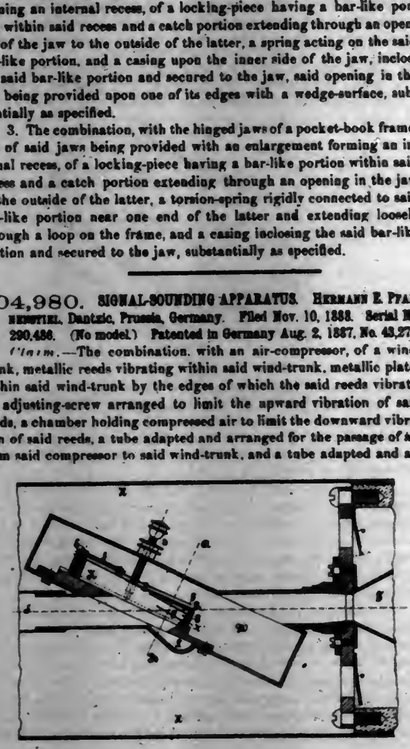
2. The settee having a base I and side arms or supports C, the hinges F on said supports, the ironing-board D, provided with slotted plates E, sliding on said hinges, and studs *k'* on said board D, in combination with the racks H H', journaled at their lower ends in said base in rear of the settee, the sleeves K', journaled upon said racks, and the slotted arms K', pivoted to said sleeves, their slots engaging said studs, substantially as described.

3. The settee having a base I and side arms or supports C, the hinges F on said supports, the ironing-board D, provided with slotted plates E, sliding on said hinges, as specified, the rearwardly-opening clips *k'* at the lower ends of the sides of said board, and the studs *k* in said sides remote from said clip, in combination with the racks H H', journaled at their lower ends in said base in rear of the settee, the sleeves K, journaled upon said racks, and the arms K', pivoted at one end to said sleeves and having longitudinal slots *k* engaging said studs

k', the bodies of said arms K' engaging said clips l^3 when the ironing-board is raised, substantially as described.

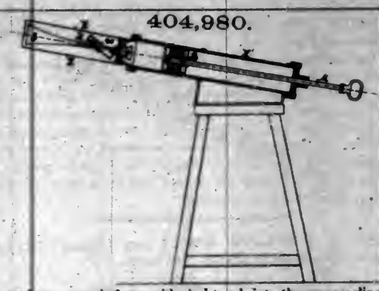
4. The settee provided with supports C, the ironing-board D, hinged thereto and adapted to form the back of said settee, and the press-board M, pivoted to the end of said ironing-board and adapted to be folded behind it, said press-board having a chamfered socket O' in its lower face, in combination with the leg N, hinged at its upper end to said press-board, and the catch O, pivoted transversely through the body of said leg and having a hooked end adapted to engage said socket, as and for the purpose set forth.

404,979. **FRAME FOR POCKET-BOOKS, &c.** ERNST OLDENBURGH, New York, N. Y., assignor to William Schimper & Co., same place. Filed Feb. 2, 1889. Serial No. 298,538. (Model.)



Claim.—1. The combination, with hinged jaws of a pocket-book frame, one of said jaws being provided upon its side with an enlargement forming an internal recess, of a locking-piece having a bar-like portion within said recess and a catch portion extending through an opening in the jaw to the outside of the latter, a spring acting on the said bar-like portion, and a casing upon the inner side of the jaw, inclosing the said bar-like portion and secured to the jaw, substantially as specified.

2. The combination, with the hinged jaws of a pocket-book frame, one of said jaws being provided upon its side with an enlargement forming an internal recess, of a locking-piece having a bar-like portion within said recess and a catch portion extending through an opening of the jaw to the outside of the latter, a spring acting on the said bar-like portion, and a casing upon the inner side of the jaw, inclosing said bar-like portion and secured to the jaw, said opening in the jaw being provided upon one of its edges with a wedge-surface, substantially as specified.



3. The combination, with the hinged jaws of a pocket-book frame, one of said jaws being provided with an enlargement forming an internal recess, of a locking-piece having a bar-like portion within said recess and a catch portion extending through an opening in the jaw to the outside of the latter, a torsion-spring rigidly connected to said bar-like portion near one end of the latter and extending loosely through a loop on the frame, and a casing inclosing the said bar-like portion and secured to the jaw, substantially as specified.

404,980. **SIGNAL-SOUNDING APPARATUS.** HERMANN E. PYANOWSKI, Dantzic, Prussia, Germany. Filed Nov. 10, 1888. Serial No. 290,436. (No model.) Patented in Germany Aug. 2, 1887, No. 43,279.

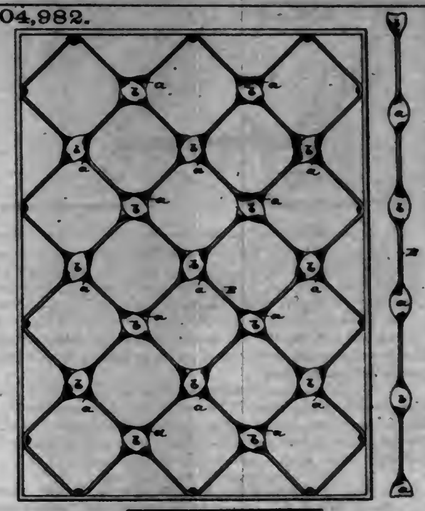
Claim.—The combination, with an air-compressor, of a wind-trunk, metallic reeds vibrating within said wind-trunk, metallic plates within said wind-trunk by the edges of which the said reeds vibrate, an adjusting-screw arranged to limit the upward vibration of said reeds, a chamber holding compressed air to limit the downward vibration of said reeds, a tube adapted and arranged for the passage of air from said compressor to said wind-trunk, and a tube adapted and arranged to carry air from said wind-trunk into the surrounding atmosphere, all substantially as and for the purpose set forth.

404,980.

404,981. **ALARM-SIGNAL FOR CABLE AND ELECTRIC RAILWAY CARS.** LOUIS PFINEST, Boston, and SUMNER A. PERRY, Springfield, Mass. Filed Jan. 31, 1889. Serial No. 298,286. (No model.)

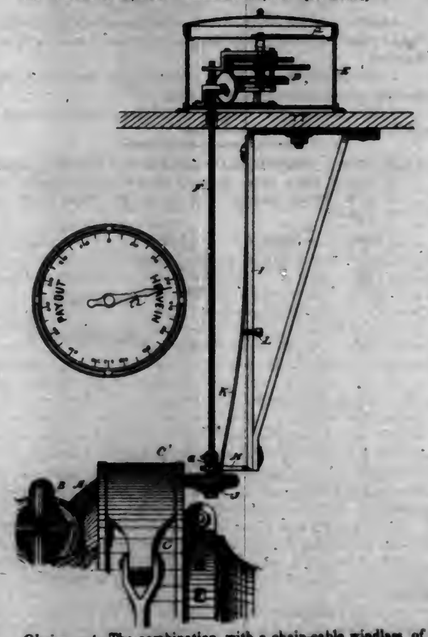
Claim.—1. In an alarm-bell and operating mechanism therefor, in combination, the gong and a horizontal carrier-plate therefor, from one end portion of which said gong is supported in a pendent position, said carrier-plate being at its other end portion provided with a vertical socket, a hammer-lever intermediately thereof pivoted on the under side of said carrier-plate and adapted to normally rest with its hammer end depressed and away from the gong, and having its opposite end resting under and against said socket, and a push-rod vertically movable in said socket and supported in its uppermost position by the end of the hammer-lever, substantially as described.

2. In an alarm-bell and operating mechanism therefor, in combination, the gong and a horizontal carrier-plate *g* therefor, from one end portion of which said gong is supported in a pendent position, said carrier-plate being at its other end portion provided with a vertical socketed boss, and intermediately with the pendent ear-pieces *i*, a hammer-lever intermediately thereof pivotally hung in said ear-pieces and normally resting with its hammer end depressed and away from the gong, and having its opposite end resting under and against the end of said socketed boss, and a headed push-rod movable in said socket and normally resting on the end of said lever and adapted to have the extent of its downward movement limited, whereby on the downward depression of said rod to its full extent the hammer-lever may still have a slight further movement before its end contacts with the bell, substantially as and for the purpose described.



3. The combination, with the car-platform having the hole *p*, of the carrier-plate *g*, provided with the socketed and upwardly-extended boss *k*, passing therethrough and provided with the ear-pieces *i*, the gong-bell and the bolt *q*, passing through same, the carrier-plate, and the platform-floor, the hammer-lever intermediately pivotally hung in said ear-pieces and normally resting with its hammer depressed, and a removable headed push-rod playing in said socket and normally resting on the end of said lever opposite its hammer, the extent of the downward movement of said push-rod being slightly less than the extent of the downward swing of the adjacent end of the hammer-lever, substantially as and for the purpose described.

404,982. **METALLIC GRILL OR GUARD.** NIELS POULSON, Brooklyn, N. Y. Filed Jan. 29, 1889. Serial No. 297,941. (No model.)



Claim.—1. A grill composed of crossed flat metallic bars severally formed at predetermined intervals, with alternately right-hand and left-hand spirals, and intersecting each other across said spirals, substantially as hereinbefore set forth.

2. A grill composed of interwoven flat metallic bars severally formed at predetermined intervals, with alternately right-hand and left-hand spirals, and intersecting each other across said spirals, substantially as hereinbefore set forth.

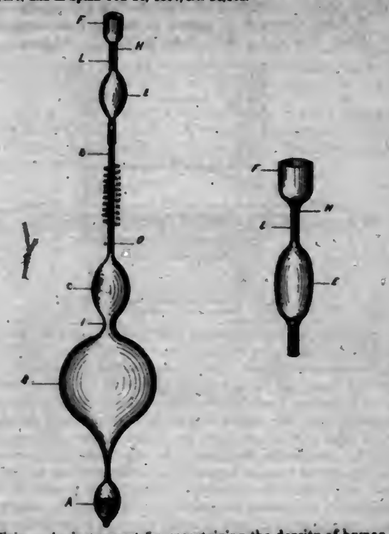
404,982.

404,983. **SHIP'S-WINDLASS INDICATOR.** DAVID H. RIVERS, Stoneham, Mass., assignor of one-half to Nicholas Smith, San Francisco, Cal. Filed Dec. 12, 1888. Serial No. 293,371. (No model.)

Claim.—1. The combination, with a chain-cable windlass, of a dial and index and train of gearing, a friction-wheel travelling in contact with the rotating drum of the windlass, and a shaft upon which said wheel is fixed, connecting it with a train of gearing and the index, substantially as herein described.

2. A rotary chain-cable windlass, a dial, an index, and a train of gearing fixed with relation thereto, in combination with a friction-wheel held in contact with the rotating portion of the windlass, the shaft of said wheel being connected with the train of gearing, so that the index-arm is moved over the dial to correspond with the rotation of the windlass, substantially as herein described.

3. The dial, the indicator, the train of gearing, the driving-shaft F, extending downwardly therefrom and having the frictional roller J fixed to its lower end, the slotted supporting-standard I, and the journal-box G, through which the shaft passes, fitted into said slot so as to have a motion to and from the windlass-drum C, in combination with the spring pressing upon the box, whereby the friction-roller is held in contact with the drum and adjusted to irregularities in the rotation of the same, substantially as herein described.



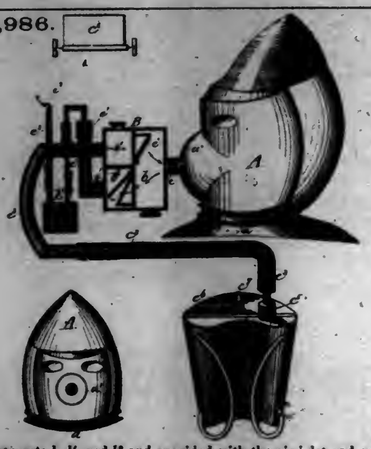
4. The rotating drum or windlass, a train of gearing, and an indicator connected therewith, a frictional roller, a shaft connecting the train of gearing with the frictional roller, a slotted guide in which the journal-box of the lower end of said shaft is fitted to move to and from the windlass-drum, a drum, a spring acting upon said box so as to hold the roller in contact with the drum, and a screw L, whereby the tension of the spring is regulated, substantially as herein described.

404,984. **WASH-TUB.** ALBERT G. ROBINSON, Brooklyn, N. Y. Filed Feb. 21, 1888. Serial No. 300,641. (No model.)

Claim.—The combination, with a wash-tub having an inclined or angularly-extending front face, of a detachable frame arranged upon the top of said tub and provided upon its front edge with a downwardly and angularly extending portion embracing the upper portion of the front face of the tub and upon its rear side with downwardly-extending projections for engaging the tub, substantially as specified.

404,985. **LACTOMETER.** AUGUSTE L. ROUSSE, Fontenay-le-Comte, France. Filed Nov. 1, 1887. Serial No. 254,090. (No model.) Patented in France Apr. 8, 1887, No. 182,916; in Luxemburg Oct. 11, 1887, No. 804; in Belgium Oct. 12, 1887, No. 79,177; in Germany Oct. 13, 1887, No. 42,964; in Italy Oct. 13, 1887, XXI, 22,485; in England Oct. 20, 1887, No. 14,368; in Austria-Hungary Oct. 20, 1887, No. 41,894 and No. 6,436, and in Spain Oct. 20, 1887, No. 11,872.

Claim.—An instrument for ascertaining the density of human or other milk, consisting of a graduated tube D, the lower end of which is extended to form three successive globular parts A B C, and thin necks between them, respectively, and the upper end being formed or provided with a cup-shaped tube F, which is contracted in or about the middle to form a small neck L, which cup-shaped tube F serves to hold the milk to be tested, substantially as described.

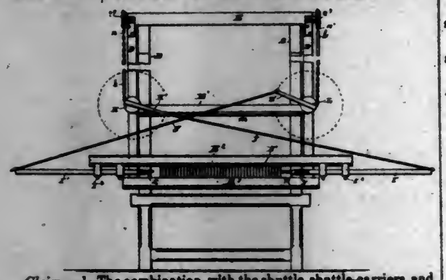


404,986. **INHALER.** JOSEF RUDOLFY, Szegedin, Austria-Hungary. Filed Mar. 23, 1887. Serial No. 232,815. (No model.) Patented in France Oct. 30, 1886, No. 179,356, and in Belgium Dec. 6, 1886.

Claim.—1. In an inhaler, the air-inlet pipe F, inserted in a hose G, in combination with the air-reservoir C, formed with a water-jacket c^4 and with the air-inlet D, formed with an air-whistle h^2, and water-vessel h^3, all substantially as and for the purpose specified.

2. In an inhaler, the reservoir C, formed at its top with a hot-water vessel c^3, communicating with the flexible air-inlet tube c^2, substantially as shown, and for the purpose specified.

3. The combination of the valve-box B, formed with the valve-



404,986.

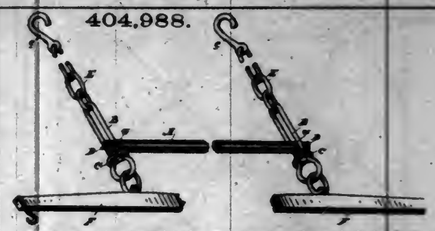
compartments *b*, *b'*, and *b²* and provided with the air inlet and outlet valves *c'* and *c²* and trap E, with the mask A and air-reservoir C, by means of the pipes *c* and *c'*, respectively, for the purposes specified, all substantially as set forth.

4. In an inhaler, the combination, with the air-inlet pipe F, of the wires *i*, inserted therein and electrically connected to an alarm-bell and press-button, respectively, all substantially as and for the purpose specified.

404,987. POSITIVE SHUTTLE-MOTION FOR LOOMS. CHARLES B. RUMSEY, Homer, N. Y., assignor to the Wire Fabric Company, same place. Filed Aug. 5, 1887. Serial No. 246,208. (No model.)

Claim.—1. The combination, with the shuttle, shuttle-carriers, and devices for transferring the shuttle from one carrier to the other when the carriers are brought together, of oscillating wheels having crank-pins connected with the carriers, and means for oscillating said wheels in corresponding arcs, one extremity of each of which is nearer a line drawn through their centers than the other, substantially as described.

2. The combination, with the shuttle, shuttle-carriers, and devices for transferring the shuttle from one carrier to the other when the carriers are brought together, of oscillating wheels having crank-pins, each of which is connected to the carrier on the side of the reed opposite it, and means for oscillating said wheels in corresponding arcs, one extremity of each of which is nearer a line drawn through their centers than the other, substantially as described.



3. The combination, with the shuttle, shuttle-carriers, and devices for causing the transfer of the shuttle from one carrier to the other when the carriers are brought together, of oscillating wheels connected with the carriers, and adapted to oscillate in opposite directions alternately in corresponding arcs, one extremity of each of which is nearer a line drawn through the centers than the other, a chain engaging said wheels, and means, substantially as described, for pulling said chain in opposite directions alternately, as set forth.

404,988. STRETCHER-BAR. REICH SCHMIDT, Marysville, Cal. Filed Mar. 27, 1889. Serial No. 305,018. (No model.)

Claim.—1. In combination with the stretcher-bar, the main links B, fitted upon the ends of the bar, and a fixed stop traversing each link forward of the bar to prevent said bar from binding in the forward portion of the links, substantially as described.

2. In combination with the stretcher-bar, the main links B, fitted upon the ends of the bar, and the stop-links C, fitted on the links forward of the bar to prevent said bar from binding in the forward portion of the links, substantially as described.

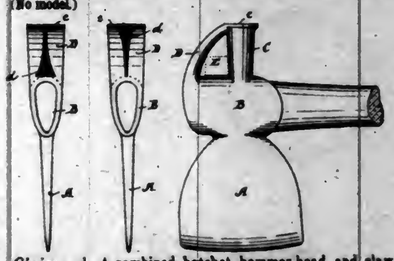
404,988.

3. In combination with the stretcher-bar, the main links B, fitted upon the ends of the bar and having enlarged forward ends, and the stop-links C, fitted on the links B between their enlarged forward ends and the front of the bar, whereby the latter is prevented from binding in the forward portion of the main links, substantially as described.

4. In combination with the stretcher-bar, the links B, fitted upon its ends and carrying the rear connections and the singletrees, and the set-screws seated on the ends of the bar to hold the links in place, substantially as described.

5. In combination with the stretcher-bar, the main links B, fitted upon its ends, the stop-links C, secured on the main links forward of the bar to prevent said bar from binding in the forward portion of the main links, and the set-screws seated in the ends of the bar for holding the links in place, substantially as described.

404,989. PROP-BLOCK WASHER FOR CARRIAGES. AMOS SEARLS, Newark, N. J., assignor to the Searls-Randall Company, same place. Filed Apr. 4, 1889. Serial No. 305,954. (No model.)



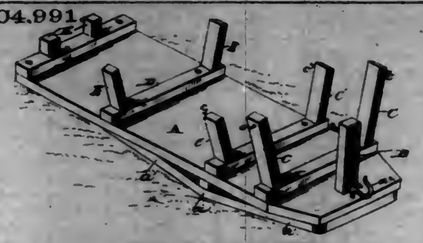
Claim.—1. A prop-block washer composed of a plate C with a flange *c* projecting through a covering A, substantially as set forth and described.

2. The plate C, provided with a flange D and covering A, substantially as and for the purpose set forth.

3. The combination of the plate C with flange *c* and coverings A and B, as and for the purpose set forth.

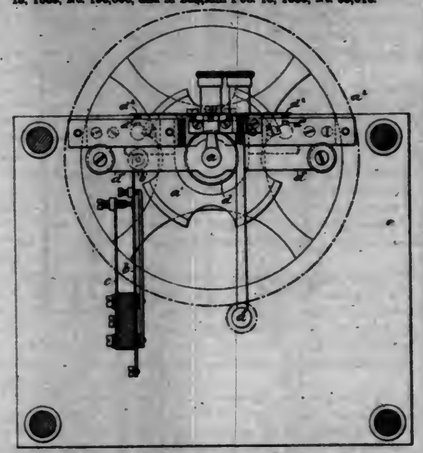
404,990. COMBINED CLAW-HAMMER AND HATCHET. GEORGE W. SIMONDS, Boston, Mass.; Melissa E. Simonds administratrix of said George W. Simonds, deceased. Filed Nov. 19, 1888. Serial No. 291,275. (No model.)

Claim.—1. A combined hatchet, hammer-head, and claw, the claw extending from the pole to the face of the hammer-head, substantially as shown and described.



2. As a new article of manufacture, a hatchet A, projecting from one side of the pole B, a hammer-head C, projecting from the opposite side of the pole B, and a claw D, extending from the outer end of the pole to the face of the hammer, substantially as shown and described.

3. A detachable tool, in combination with the hammer-head C, pole B, and claw D, the lower part of said tool being formed to fit the space *d* in the center of the claw D and the space E formed by the upper side of the pole B, side of the hammer-head C, and inner side of the claw D, said tool being secured in place by a screw H, substantially as shown and described.

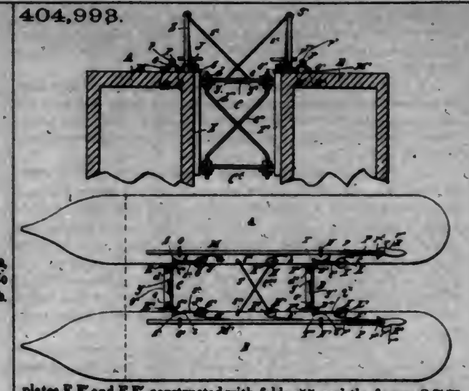


404,991. COTTON-CARRIER. ROBERT T. SMITH, Kaufman, Tex. Filed Jan. 22, 1889. Serial No. 297,164. (No model.)

Claim.—In a cotton-carrier, the bottom A, having the ridged portion *a* and the oppositely-inclined portions *a' a'*, said bottom being provided with a hook in front, the upright post in front for holding the lines, the posts C upon the sides near the front, to which the mouth of the bag is secured to be held open, and the upright posts on the sides in the rear of the posts C, for holding the bags when filled, substantially as described and set forth.

404,991

404,992. SPEED-INDICATOR. CHARLES SPRATT, New Cross Gate, County of Kent, England. Filed Feb. 26, 1888. Serial No. 301,011. (No model.) Patented in England Feb. 4, 1888, No. 1,711; in France Feb. 13, 1888, No. 186,060, and in Belgium Feb. 15, 1888, No. 85,016.

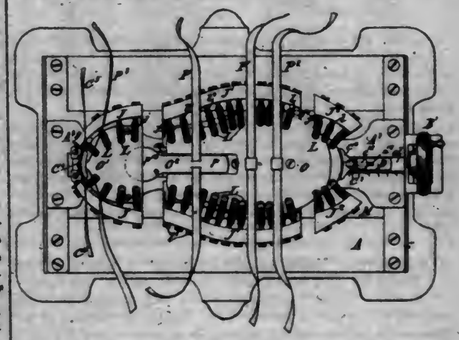


Claim.—1. A speed-indicator, substantially as described, consisting in a transmitter and receiver connected by electric circuits, and comprising clock-work which for a certain time allows a counting-circuit to be completed, a contact-maker actuated by the engine or machine and operating to close and open the counting-circuit during the interval allowed by the clock and more or less frequently in accordance with the speed of the engine or machine, an electro-magnet or electrical mechanism operated by the closing and opening of the counting-circuit, counting-wheels driven by such magnet or mechanism, and apparatus replacing the counting-wheels to the zero position after use and ready to again operate.

2. A speed-indicator, substantially as described, consisting in a transmitter and receiver connected by electric circuits, and comprising mechanism which for a certain time allows a counting-circuit to be completed, a contact-maker actuated by the engine or machine and operating to close and open the counting-circuit, an electro-magnet or equivalent mechanism operated by the closing and opening of the counting-circuit, counting-wheels operated by such mechanism, and a circuit-closer in the receiver in circuit with an electro-magnet or equivalent mechanism in the transmitter operating to start the mechanism when its indication is required.

3. The mechanism, substantially as described, for replacing the counting-wheels, consisting of parts which move the wheels into and out of gear with each other and with the driver, and cams on the axes of the wheels, and bars operating in conjunction with such cams to turn the wheels to the zero positions and to release them when they have again passed into the zero position.

404,993.



404,998. APPARATUS FOR COUPLING VESSELS. GUSTAV H. STEINBACH, Lichtenstein, Saxony, Germany. Filed Jan. 7, 1888. Serial No. 260,080. (No model.)

Claim.—1. The combination, with the hulls of ships, of sliding bars running in guides upon the decks thereof, eccentric-levers pivoted on said decks, helical springs attaching said bars and levers, spring-pawls upon said bars, winding-posts pivoted in said hulls, and ratchet-wheels upon said posts and engaged by said pawls, and cables wound around said posts and arranged to connect one hull with another, all substantially as and for the purpose set forth.

2. The combination, with the hulls of ships, of the upright metallic plates E E' and F F', constructed with folds e^{xx}, and the frames C C' C', constructed with the folds e^{x}, and adapted to fit to said upright metallic plates, winding-posts upon the decks of said hulls, and cables wound upon said posts attached to said frames to hold the same in place and extending from one winding-post to another to connect one hull with another, substantially as and for the purpose set forth.

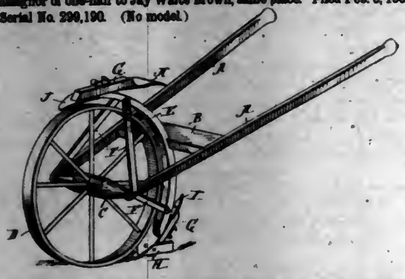
3. The combination, with the hulls of vessels, sliding bars arranged upon the decks thereof, as specified, eccentric-levers working against said bars, springs connecting said bars and levers, pawls upon said bars, winding-posts journaled in said hulls, ratchet-wheels on said winding-posts engaged by said pawls, and upright metallic plates folded and attached to the sides of said hulls, as described, of metallic frames, substantially as specified, having side pieces adapted to said metallic plates and attaching said hulls together, and cables wound upon said winding-posts passing through the upper rail of said frame, arranged as set forth, holding said parts in place and further securing said hulls together, all substantially as and for the purpose set forth.

404,994. FOOT-MEASURING MACHINE. EDWIN B. STIMPSON, (2d.) Brooklyn, N. Y., and Edwin B. Stimpson, (2d.) executor of Edwin B. Stimpson, (1st.) deceased, late of same place. Filed Dec. 18, 1888. Serial No. 294,094. (No model.)

Claim.—1. In a foot-measuring machine, the combination, with a heel-plate, of frame-like supports upon said heel-plate, a toe-plate, side plates, a screw, connections between the screw and the toe-plate and side plates, whereby when the screw is rotated movement lengthwise of the machine will be imparted to the toe and side plates, frame-like supports movable with said toe and side plates, and spring-actuated fingers loosely mounted in said supports and adapted to be pressed outwardly upon the insertion of the foot, said fingers having portions extending downwardly below the said plates, substantially as and for the purpose specified.

2. In a foot-measuring machine, the combination, with a heel-plate, of side plates, a toe-plate, frame-like supports adjacent to said heel-plate, a screw, connections between said side plates, the toe-plate, and the screw, whereby when the screw is rotated the side plates and toe-plate will be moved lengthwise of the machine, frame-like supports movable with said side plates and toe-plate, spring-actuated fingers loosely mounted in said frame-like supports and adapted to be moved outwardly upon the insertion of the foot, said fingers being provided with portions extending below said plates, and an upwardly-movable

impression-plate below said fingers, adapted when moved upwardly to press paper or other material against the lower ends of said fingers to cause the taking of an impression from the fingers, substantially as specified.



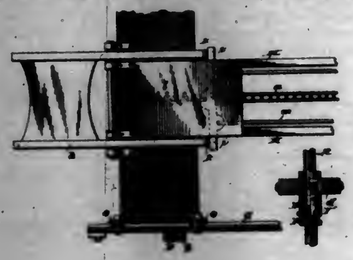
3. In a foot-measuring machine, the combination, with side plates, of a screw for imparting movement thereto, and guides acting on said side plates, whereby when the screw is rotated the side plates will be moved both lengthwise of the machine and widthwise thereof, substantially as specified.

4. In a foot-measuring machine, the combination, with a screw, of a toe-plate, side plates, a metal piece, a connection between the toe-plate and the screw, a connection between the side plates and the screw, a connection between said metal piece and the screw, and guides acting on said side plates, said screw being provided with threads of different pitch, whereby when rotated said toe-plate, side plates, and metal piece will be moved lengthwise of the machine at different speeds and the side plates will be moved by said guides widthwise of the machine, substantially as and for the purpose specified.

5. In a foot-measuring machine, a toe-plate having a movable section adapted to be moved independently of the toe-plate to lengthen or shorten the toe-plate, substantially as specified.

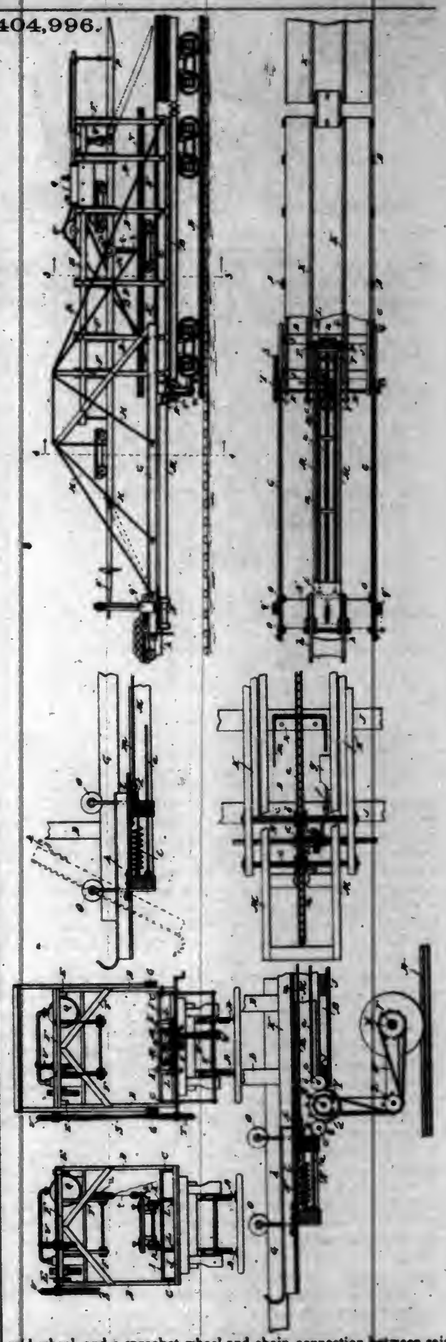
6. In a foot-measuring machine, the combination, with a toe-plate, of a movable section thereof adapted to be moved independently of the toe-plate to lengthen or shorten the toe-plate, and a locking device for securing said section when adjusted, substantially as specified.

404,995. HAND-CULTIVATOR. HENRY C. TUBBS, Bangor, Mich., assignor of one-half to Jay Waite Brown, same place. Filed Feb. 8, 1889. Serial No. 299,190. (No model.)



Claim.—1. A hand-cultivator comprising the handles, the wheel mounted between the ends of the handles, the yoke arranged in rear of the wheel, and the standards pivoted at their centers to the ends of the yoke and provided with the blades or shovels at both their ends, as set forth.

2. The improved cultivator herein described and shown, comprising the handles, the wheel mounted between the ends of the handles, the yoke secured at its center to the cross-bar between the handles, braces extending between the ends of the handles and the ends of the yoke, the standards pivoted at their centers to the ends of the yoke, and the cultivating-blades secured to the ends of the standards, as set forth.



404,996. TRACK-LAYING MACHINE. FERDINAND F. VOIGT, Chicago, Ill. Filed Sept. 22, 1888. Serial No. 286,112. (No model.)

Claim.—1. The combination, with a track-laying machine provided with a forward extension-frame, of a carrier working on said frame and a gear-connection between the said carrier and the axle of the machine, whereby the forward movement of the machine will cause the carrier to be advanced, substantially as described.

2. The combination, with a track-laying machine provided with a forward extension-frame and a carrier working on said frame, of a power-shaft, a sprocket-wheel mounted thereon, a sprocket-chain secured at its ends, respectively, to the carrier and working around

404,996.

said wheel, and a sprocket wheel and chain connection between said shaft and the axle of the machine, substantially as described.

3. The combination, with a track-laying machine provided with a forward extension-frame, a carrier working on said frame, and means for advancing and withdrawing said carrier, of an automatic stop device for limiting the movement outwardly of said carrier, substantially as described

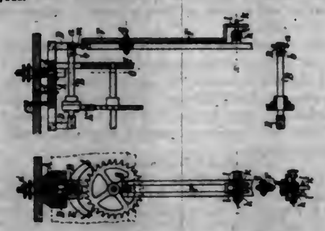
4. The combination, with a track-laying machine provided with a forward extension-frame, and a carrier working on said frame, of a power-shaft, a connection between said shaft and carrier, including a separable clutch device, whereby the rotation of said shaft will operate the carrier, and mechanism attached to said carrier for automatically unshifting the clutch and stopping said carrier, substantially as described.

5. The combination, with a track-laying machine provided with a forward extension-frame, and a carrier working on said frame, of a power-shaft, a sprocket-wheel mounted thereon, a sprocket-chain attached at its ends, respectively, to the carrier and working around said wheel and shaft, a clutch-lever, and a projection or incline on the carrier adapted and arranged to actuate the lever so as to shift the clutch, substantially as described.

6. The combination, with a track-laying machine provided with a forward extension-frame, and a carrier working on said frame, of a power-shaft, a sprocket-wheel mounted thereon, a sprocket-chain attached at its ends, respectively, to the carrier and working around said frame, a clutch connecting said wheel and shaft, a clutch-lever and a projection or incline on the carrier adapted and arranged to actuate the lever so as to shift the clutch, and a connection between said shaft and an axle of the machine for actuating the former, substantially as described.

7. The combination, with a track-laying machine provided with a forward extension-frame, of a carrier, means for advancing and withdrawing the same, a tilting track-section mounted on said carrier, and means for automatically tilting said section, substantially as described.

8. The combination, with a track-laying machine provided with a forward extension-frame, of a carrier working on said frame, means for advancing and withdrawing said frame, a tilting track-section, a lock device therefor, and means for automatically withdrawing said lock when the carrier reaches the limit of its forward movement, substantially as described.



9. The combination, with a track-laying machine provided with a forward extension-frame and a carrier working on said frame, of a tilting track-section on said carrier, a spring-actuated lock device therefor, a rod for operating said device, and a fixed projection on the machine engaging said rod when the carrier reaches the limit of its forward movement, whereby the lock device will be automatically unlocked, substantially as described.

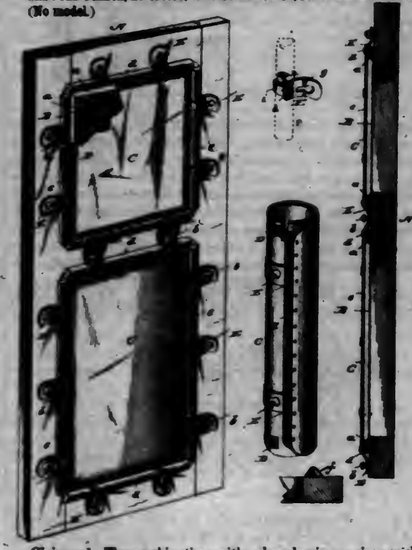
10. The combination, with a track-laying machine provided with a forward extension-frame, a carrier working on said frame, and a tilting track-section on said carrier, of means for advancing and withdrawing said carrier, an automatic stop device for limiting the outward movement of the carrier, and means for automatically and simultaneously tilting said track-section, substantially as described.

11. The combination, with a track-laying machine provided with a forward extension-frame and a carrier, of an overhead return-track, hinged end sections of said track adapted and arranged, respectively, to receive the tracks from the carrier when extended and deliver them at a point to the rear of the machine, substantially as described.

12. The combination, with a track-laying machine provided with a forward extension-frame and a carrier working on said frame, of overhead return-tracks having hinged end sections, supplemental tracks parallel therewith, and travelers working on said tracks provided with block and tackle and grappling-hooks for carrying the rails, substantially as described.

404,997. CLOCK-PENDULUM. JOSEPH WERNER, Dresden, Saxony, Germany, assignor to Arthur Dezendi, same place. Filed Oct. 10, 1888. Serial No. 287,778. (No model.) Patented in Germany Feb. 15, 1888, No. 44,446.

Claim.—The combination, with the vertically-adjustable carrier A, the anchor-spindle B, and the suspension-springs D, suspending the said spindle from said carrier, of the adjusting-lever F, suspended at its upper end from the anchor-spindle, the pendulum pivotally suspended from said lever between the ends of the latter, and also connected with the latter at the lower end thereof, and the adjusting-screw A, applied at the last-mentioned connection for the lateral adjustment of the pendulum, substantially as herein described.



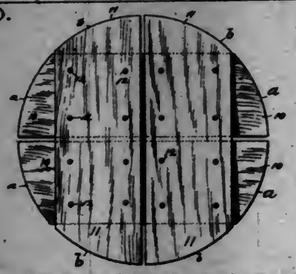
404,998. BLIND-STOP. MILEY B. WESTON, Fort Worth, Tex. Filed May 3, 1888. Serial No. 272,944. (No model.)

Claim.—1. The combination, with a shutter provided with pivoted slats, of a flat spring-metal fastening-plate provided with a slot for clearing the slat-pivot, and projections upon its surface for engaging with the end of the slat, and having its rear end secured to the shutter-frame and its front end projecting beyond the plane of the shutter-frame and forming a thumb-piece for operating said spring-plate, substantially as set forth.

2. A slat-fastener consisting of a flat spring-metal plate provided with slot *d*, the lugs *d'* at its rear end, the concavo-convex projections upon its surface, and the thumb-piece *e* at its front end, substantially as and for the purpose set forth.

404,999. SCREEN AND STORM DOOR. JOHN K. WIESENDANGER and JOHN ULRICH, La Crosse, Wis. Filed Dec. 12, 1888. Serial No. 293,347. (No model.)

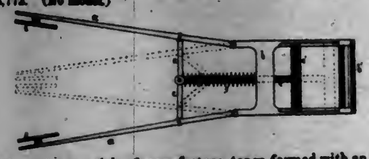
Claim.—1. The combination, with a door having a wire panel and a molding-strip around the same, of the flexible panel adapted to cover the said wire panel, the strips having flat or plain inner sides to embrace and confine the edges of the flexible panel upon the said molding-strips, and the tabs secured to the said strips and having elongated eyes to receive headed studs in the door-frame, substantially as specified.



2. The combination, with a door-frame having a wire or open-work panel and a molding surrounding the same, of the flexible panel C, having flat-sided strips secured to two opposite edges, tabs secured to the said strips to receive headed studs in the door-frame, and two opposite strips removably secured at opposite edges of the flexible panel, and also having tabs whereby the said strips may confine the panel upon the molding-strips of the main panel, substantially as specified.

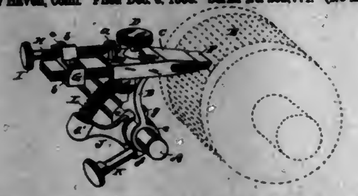
3. The flexible panel C, having the plates D secured thereto near its edges, the strips *c*, placed on the panel over the said plates D, and the tabs E, constructed as described and secured to said strips, whereby the four edges of the flexible panel may be confined upon the molding of the main panel, substantially as specified.

405,000. PACKAGE-HEAD. ISAAC J. W. ADAMS, Laurel, Del. Filed Mar. 5, 1889. Serial No. 301,985. (No model.)



Claim.—As a new article of manufacture, a package-head consisting of two pairs of slats 10 and 11, having curved ends and secured together at right angles to each other, the combined width of each pair of slats when secured together being less than the diameter of

405,000.



the package for which the head is made, whereby the ends of one pair of slats will project beyond the sides of the other pair and form a circular head having the grain of the wood exposed in its bearing-surface, all substantially as described.

405,001. TONGS. EDWARD P. BARTON, Ravenna, Ohio, assignor of one-half to Adaline Coy, same place. Filed Mar. 29, 1888. Serial 268,772. (No model.)

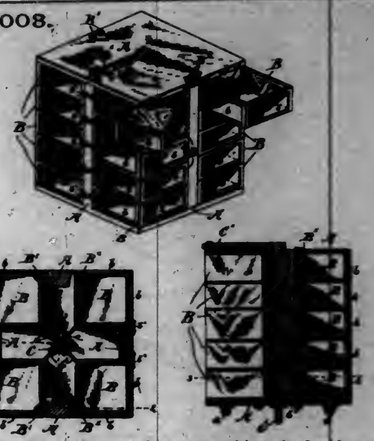
Claim.—As an article of manufacture, tongs formed with an open stationary handle *b'*, and a sliding T-shaped handle *c'* within the same, the lateral ends of the T-shaped handle arranged to slide in contact with the sides of the open handle *b'*, both handles being in the same plane with the arms *a a* and adapted to be grasped and operated with one hand, said handles being in combination with each other, frame *b*, arms *a a*, hinged at one end to the outer corners of frame *b*, struts or links *c c*, sliding rod *c*, frame *b* being perforated to receive said rod, and spring *f*, substantially as and for the purpose described.

405,002. BRUSH-HOLDER FOR DYNAMOS. WALTER S. BISHOP, New Haven, Conn. Filed Dec. 6, 1888. Serial No. 292,771. (No model.)

Claim.—1. The combination, with the brush F and the socket C, provided with the apertured lug *a*, of the clamp G, the screw H, having a circumferential groove *j*, and the notched pin *k*, substantially as specified.

2. The combination, with the loosely-pivoted brush-holding arm of a dynamo or electric motor, of a curved spiral spring and an adjustable arm forming the abutment for the spiral spring, substantially as specified.

3. The combination, in a brush-holder for dynamos and electric motors, of the brush-holding rod A, the arm B, provided with the sleeve *e*, placed on the said rod A, and provided with the socket C for receiving the brush, the brush F, the adjusting-screw H, pivotally connected with the socket C, and the clamp G, adapted to engage the brush F, substantially as specified.



4. The combination, with the brush-holding arm B and the rod A, arranged to support the said brush-holding arm, of the arm J, placed on the rod A, and provided with the clamping-screw K, for clamping the said arm upon the rod A, and furnished with the stop-lug *g*, substantially as specified.

405,003. SHOW-CASE. JOHN W. BLACKLEDGE, Indianapolis, Ind. Filed Feb. 5, 1889. Serial No. 298,736. (No model.)

Claim.—1. In a show-case, the combination of the frame A, having the vertical post arranged midway of each side thereof, the tiers of drawers severally arranged in the corners of said frame, the pivot-rods B', extending through one corner of each of said tiers, and the means, substantially as described, for securing said drawers in position.

2. In a show-case, the combination of the frame A, the tiers of drawers B, pivoted therein, each drawer being provided with an eye on its inner corner, the rod C, pivoted centrally in said frame and

405,008.

provided with a catch arranged to engage with each of said eyes, a lever on the top of said rod, and a lock for securing said lever in position, substantially as set forth.

405,004. KEY FOR TIME-PIECES. MARTIN BOOK, Bethlehem, Pa. Filed Nov. 16, 1888. Serial No. 291,045. (No model.)

Claim.—1. A key for time-pieces, comprising a handle, a pipe freely rotatable in either direction, and a manually-operated clutch one member of which is connected to the handle and the other member to the pipe for governing the rotation of the pipe to let down a spring gradually as well as to wind it, substantially as described.

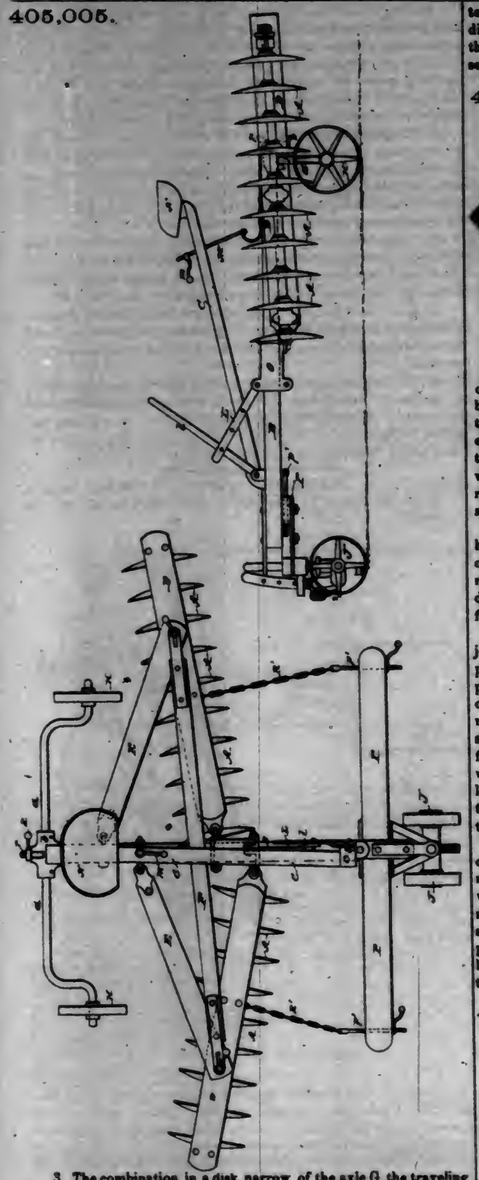
2. A key for time-pieces, comprising a pipe freely rotatable in either direction, a handle therefor, and a manually-operated friction-clutch interposed between the handle and pipe to regulate and to arrest the rotation of the pipe to thereby let down a spring as well as wind it, substantially as described.

3. A key for time-pieces, comprising a rotary pipe having a friction-cup on one end and a handle having a friction-plug, of wood, movable thereon toward and from the friction-cup, but not rotatable independently of the handle, substantially as described.

4. A key for time-pieces, comprising a rotary pipe, a handle, and a detent interposed between the handle and the pipe and interlocking with a fixed or rigid portion of the pipe to positively lock the pipe against rotation in either direction, substantially as described.

5. A key for time-pieces, comprising a rotary pipe, a handle, a clutch interposed between the handle and pipe, and a detent also interposed between the handle and pipe, substantially as described.

6. A key for time-pieces, comprising a freely-rotating pipe to engage the post or arbor of the mainspring, combined with a manually-operated friction-clutch by which the rotation of the pipe may be regulated so as to let down the spring gradually and easily without danger of breaking and without accident or injury to the workman, substantially as described.



7. A key for time-pieces, comprising a freely-rotating pipe to engage the post or arbor of the mainspring, combined with a friction-clutch by which the rotation of the pipe may be regulated so as to let down the spring gradually and easily without danger of breaking and without accident or injury to the workman, and a detent or locking device for such pipe, whereby its rotation may be arrested as desired, substantially as described.

405,005. DISK HARROW. GEORGE T. BOOTH, Christchurch, New Zealand. Filed Mar. 24, 1888. Serial No. 268,450. (No model.) Patented in New Zealand Dec. 5, 1888, No. 1,040, and in New South Wales Aug. 20, 1887, No. 142

Claim.—1. The combination, in a disk harrow, of the framing having a box *b*, the cranked axle G, journaled at its center in box-*b* and having at each point a squared portion, the bolt *r*, having a squared opening receiving the squared portion of the axle, and the nut on bolt *r*, substantially as set forth.

2. The combination, in a disk harrow, of the hinged pole C, the screw-bolt M, the handle-nut *m*, the cross-bar F, and the disk-bars D D, with or without a spring S, as described herein, and illustrated in the accompanying drawings.

405,005.

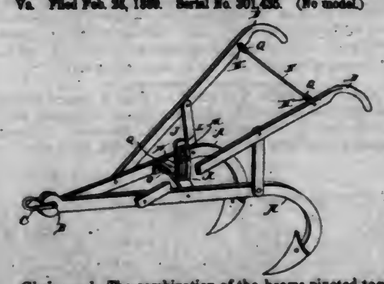
3. The combination, in a disk harrow, of the axle G, the traveling wheels H, the axle-box *b*, and the screw-bolt *r*, as described herein, and illustrated in the accompanying drawings.

4. In a disk-harrow, the combination of the framing and wheels forming the carriage, and the disk bars or frames hinged at their inner ends to the carriage at a point in advance of the wheels, and braces for sustaining the disk-bars in operative position, such disk-bars when not in use being adjustable on their hinge-connections, whereby they may be set out of operative position and supported on the carriage, substantially as set forth.

5. The combination, with the framing and wheels forming a carriage, of the disk-bars having a swivel-connection with said framing, whereby such bars may be set to different working angles and may be lifted at their outer ends and adjusted onto the carriage, substantially as set forth.

6. The combination of the carriage-frame, the disk-bars D, connected at their inner ends adjustably with said frame, the bar F, extended over the carriage-frame and engaged at its outer end with the disk-bars, and the seat bar connected at its lower end adjustably with the carriage-frame and bearing upon the said bar F, substantially as set forth.

405,006. ANIMAL-TRAP. AUGUSTUS BRAWN, Pleasant Hill, Nebr., assignor of one-half to John H. Douge, same place. Filed Jan. 24, 1888. Serial No. 261,802. (Model.)



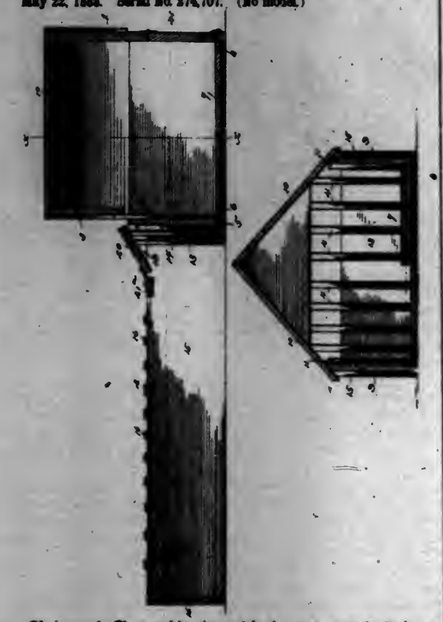
Claim.—1. In a trap, substantially as described, the combination of the casing or framing, the pivoted dump having side plate *u* and bottom K, the latch supported in the casing or framing and arranged to engage and secure the dump and movable into and out of such engagement, and the platform or tripper arranged immediately above the bottom K and pivoted between its ends, such platform being provided with a rigid arm or portion arranged to engage the latch and release same from the dump when the platform is tilted, substantially as set forth.

2. The improved trap herein described, consisting of the casing having partitions S and V and bait-holder L, the dump having pivoted platform or tripper J, provided with an arm or portion W, arranged to engage the latch D, the counterpoise connected with the dump, and the latch D, all substantially as and for the purposes set forth.

3. In a trap, the combination of the casing, a dump pivoted or journaled to said casing and having a side plate *u*, and provided in a plane approximately at right angles to plate *u*, with a tilting platform pivoted between its ends, a counterpoise whereby such dump when once turned to discharge the trapped animal may be returned to its normal position, a detent engaging the dump and arranged to hold same in its normal position, and an arm or portion on the tilting platform arranged to engage the detent, all substantially as described, whereby the weight of the trapped animal may tilt the platform, release the detent, and turn the dump to dump the animal, after which the counterpoise will return the dump to normal position, substantially as set forth

4. In a trap, substantially as described, the combination of the casing, the dump formed of side plate *u* and base-plate K, and journaled at the juncture of plates *u* and K to the casing, the detent whereby to secure the dump in normal position, the counterpoise connected with the dump and adapted to return it to its normal position, and the tilting platform or trip arranged directly over the plate K, pivoted between its ends to the dump, and having an arm or portion by which to engage and release the detent, all substantially as and for the purposes specified.

405,007. DOUBLE-SHOVEL PLOW. ELISHA C. BURNETT, Wilkes, Va. Filed Feb. 28, 1889. Serial No. 301,435. (No model.)

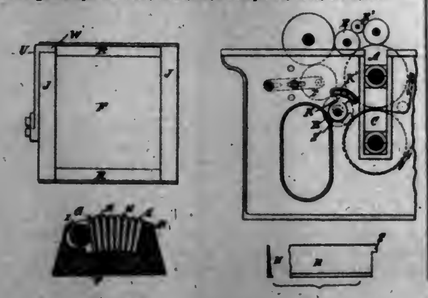


Claim.—1. The combination of the beams pivoted together at their front ends and the coupling consisting, essentially, of two brackets, one secured to each beam, one of said brackets having a vertical arm provided with a longitudinal slot and the other one having a vertical arm carrying a headed stud engaging said slot, as set forth.

2. The combination, with the beams pivoted together at their front ends, of the coupling connecting the beams, and consisting, essentially, of two brackets, one secured to each beam, one of the brackets having a vertical arm provided with a longitudinal slot and

the other bracket being composed of a horizontal bar provided with a longitudinal series of vertical perforations, and the angle-iron having its vertical arm provided with a headed stud engaging the longitudinal slot of the other bracket and its horizontal arm carrying a pin adapted to engage one of the openings in the said horizontal bar, as set forth.

405,008. HEN-COOP. EBENEZER BUTTERICK, Brooklyn, N. Y. Filed May 22, 1888. Serial No. 274,707. (No model.)



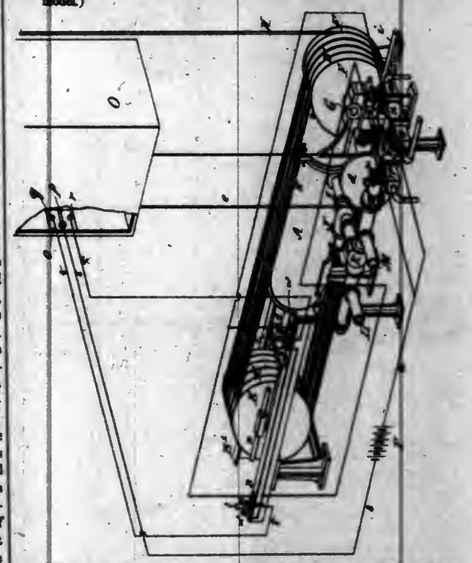
Claim.—1. The combination, with the coop or main inclosure having a slatted front, of the runway in front of the said coop and having its sides at their inner ends overlapping the sides of the coop, whereby the runway and coop may be set at different inclinations without causing an open joint between them, substantially as set forth.

2. The combination of the coop having the upper part of its front closed and the lower part slatted, with the runway having a vertically-swinging door inclined from the closed upper part of the front of the coop downward to prevent rain from driving through the slatted part, substantially as set forth.

3. The combination of the coop having its front closed above the top edges of its sides and slatted below the same, the said sides being extended in front of the slats, and cleats 11, forming vertical ways to allow a board to be inserted therein against the front sides of the slats, with the runway having the inner ends of its sides overlapping the sides of the coop, the vertical cleats 14 on the inner faces of the sides of the runway near their inner ends and abutting against the extended ends of the coop, and the inclined hinged door 20 on top of the runway at its inner end, substantially as set forth.

405,009. PRINTING MACHINERY. JOHN H. BUXTON, DAVID BRAITHWAITE, and MARK SMITH, Manchester, County of Lancaster, England. Filed May 11, 1888. Serial No. 273,008. (No model.) Patented in England Apr. 20, 1886, No. 5,470, and Apr. 23, 1888, No. 5,989.

Claim.—1. In combination with an impression-cylinder and a main printing-cylinder co-operating permanently therewith, an auxiliary printing-cylinder to co-operate with said impression-cylinder provided with a removable type-holding box and movable bars, and adjusting devices for moving said auxiliary cylinder into or out of action at will, whereby the press is adapted for making a single impression or for making a main impression and a minor impression.



2. The printing-cylinder provided with the groove or recess and the removable type-confining box seated therein, in combination with the sliding detent or clamp mounted in said cylinder and having one end arranged to engage and confine the box and its other end exposed, whereby the detent may be moved endwise out of engagement with the box to permit the removal of the latter.

3. The printing-cylinder, in combination with a box removably seated therein, the type within the box, the tapered rules having shoulders to hold the type, and end projections to engage the box, and a pressure device within the box to confine the type and the rules.

4. In a type-holding box for a printing-cylinder, the end plates or shoulders J, one of said shoulders being recessed, in combination with the movable plate U, arranged to enter said recess, substantially as described.

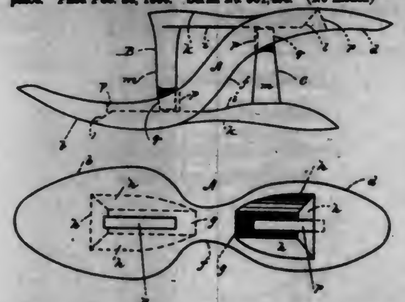
5. The type-holding box for a printing-cylinder having the convex bottom and radial sides, the rows of type seated in said box, and the tapered rules extending longitudinally between the said rows parallel, or substantially so, with the radial sides of the box, and the lateral pressure device acting to confine said type and rules.

405,010. ELECTRICALLY-CONTROLLED ENGINE. JAMES R. BYRNE, Brooklyn, N. Y. Filed Apr. 19, 1888. Serial No. 271,183. (No model.)

Claim.—1. The combination, with the valve-operating mechanism of a hydraulic elevator, of an auxiliary cylinder provided with separate supply and discharge valves, electro-magnets arranged to operate the said valves, and a piston contained by the cylinder and connected with the valve-operating mechanism of the elevator, substantially as described.

2. The combination, with the valve-operating mechanism of an elevator, of a cylinder provided with a piston connected with the elevator-valve, separate supply and discharge balanced valves connected with the cylinder and provided with armatures, and electro-magnets arranged to operate the said valves, the discharge-valves being arranged to remain normally open and the supply-valves normally closed, substantially as described.

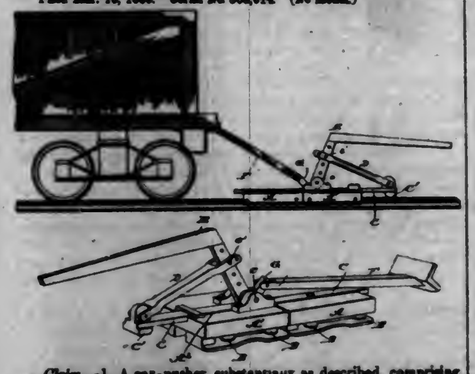
3. In valve-operating mechanism for elevators, the combination, with a double cylindrically-bored valve-seat, of a valve formed of two recessed disks, each provided with ports extending from the recess to the periphery, substantially as described.



4. The combination, with the magnet attached to the valve-chest, having chambers and valve-seats, as specified, of the balanced valves arranged in line and having recesses in the upper side, and side ports which communicate with said recesses, and the armatures attached to the valve-stems, as shown and described.

5. The combination, with the valve-operating mechanism of an elevator, of an auxiliary cylinder provided with a piston connected with the valve-operating mechanism, separate supply and discharge valves connected with the auxiliary cylinder and provided with armatures, controlling electro-magnets arranged in the casing of the said valves, an electric generator, (such as a battery,) circuit-wires leading from the generator to the magnets and elevator-car, and a switch for shifting the current from one set of electro-magnets to the other, substantially as described.

6. The combination, with the valve-operating mechanism of a hydraulic elevator, of an auxiliary cylinder provided with a piston and furnished with supply and discharge valves, armatures attached to the supply and discharge valves, electro-magnets arranged to control the supply and discharge valves, an electric generator, a switch attached to the elevator-car, circuit-controlling devices attached to the elevator mechanism and arranged to be operated thereby when the car reaches the upper or lower part of its excursion, and the circuit-wire, substantially as described.



7. The combination, with the cylinder 16, having the piston 17, of supply-valves 19 19ª and discharge-valves 19ᵇ 19ᶜ, adjusting-screws 27, the valves 19ª and 19ᵇ being constructed to remain normally open armatures 26, carried by the valves, and electro-magnets 30, arranged adjacent to the armatures, substantially as described.

405,011. LAST. ANDREW K. CHASE, Nashua, N. H., assignor to himself, John R. McGuire, John J. Flood, and James O'Neil, all of same place. Filed Feb. 20, 1889. Serial No. 301,466. (No model.)

Claim.—A reversible last-body having two sole portions of different sizes facing in opposite directions, horizontal flaring sockets in the sole portions, and longitudinal rectangular slots extending through said body from the bottoms of said sockets, in combination with adjustable shanks adapted to fit said horizontal sockets and provided with vertical arms having wedge-shaped ends for projecting into said rectangular slots, substantially as described.

405,012. CAR-PUSHER. JOSEPH C. CHERRMAN, Sewell Depot, W. Va., assignor of two-thirds to R. H. Myles and Wm. H. Taylor, same place. Filed Mar. 16, 1888. Serial No. 303,614. (No model.)

Claim.—1. A car-pusher, substantially as described, comprising independent foot-sections adapted to slide freely along the rail in one direction and provided with grippers or clamps whereby to prevent their movement along said rail in a reverse direction, the lever mechanism, and connections, all being substantially as described, whereby the foot-sections may be operated in the manner and for the purposes set forth.

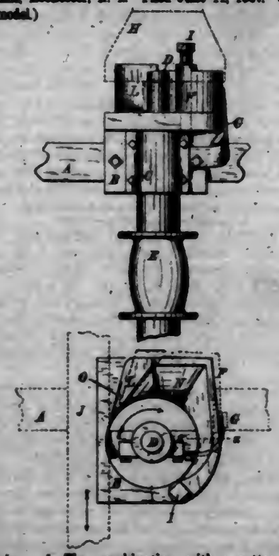
2. In a car-pusher, substantially as described, the combination of two foot-sections and a connection therebetween, such sections being formed with a way for the track-rail and having clamp mechanism by which to grip the rail and prevent the movement of the sections in one direction thereabout, all substantially as and for the purposes set forth.

3. In a car-pusher, a foot-section having a way for the rail, provided at one side of such way with a clamp or clamps adapted to permit the movement of the section along the rail in one direction and to prevent its movement in the reverse direction, and provided at the opposite side of the way with an adjustable bearing, whereby the section may be adapted to rails of different widths, substantially as set forth.

4. In a car-pusher, the combination of the front and rear foot-sections adapted to slide freely forward along the rail and to be clamped as against rearward movement, the slide-bar secured to the front section and extended in rear of the rear section, the fulcrum-bar pivoted at one end to the slide-bar, the lever pivoted to said fulcrum-bar and to the rear foot-section, and the pusher-bar, all substantially as and for the purposes set forth.

5. In a car-pusher, the front and rear foot-sections adapted to slide in one direction and clamp as against movement in opposite direction on the rail, a fulcrum-bar connected at one end with the front section, the lever pivotally connected with the rear section and fulcrumed to the fulcrum-bar, and the push-bar, all substantially as set forth.

6. In a car-pusher, the combination of the foot-section frame, the grippers pivoted therein near its opposite ends and on the same side of the way for the rail, and the spring-bar extended between said grippers and arranged to operate the same, substantially as set forth.



7. The combination, in a car-pusher, of the front foot-section, the rear foot-section, a slide-bar secured to the front section extended rearwardly beyond the rear section and constructed at its rear end to bear on the rail, the fulcrum-bar pivoted at one end to said slide-bar near its rear end, the lever, and the push-bar, all substantially as set forth.

8. In a car-pusher, the combination, with the front foot-section and the rear foot-section, of the lever, the block or support G, and the push-bar adapted for connection with either the lever or the support G, substantially as set forth.

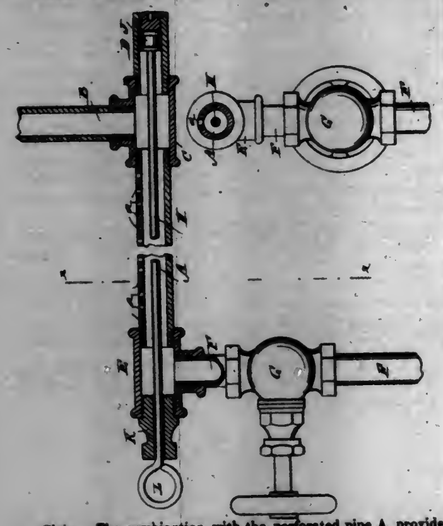
405,013. DESSERT-FOOD COMPOUND. WILLIAM P. CLOTWORTHY, Baltimore, Md. Filed Mar. 30, 1889. Serial No. 305,406. (No specimens.)

Claim.—The herein-described nutritious, easily-digested, and palatable food compound or mixture in dry and powdered form, to be used for culinary purposes as a dessert, consisting of vanillin, powdered sugar, and powdered starch, in about the proportions specified.

405,014. CHIP-BREAKER FOR PLANING-MACHINES. JOHN CONNELL, Rochester, N. Y. Filed June 11, 1887. Serial No. 240,984. (No model.)

Claim.—1. The combination, with a cutter-head, of a chip-breaker arranged in proximity thereto, having the surface next the head, against which the chips first strike, inclined to the plane of the axis of the cutter-head, as set forth.

2. The combination, with a cutter-head, of a chip-breaker partially encircling it, having the surface next the head, against which the chips first strike, inclined to the plane of the axis of the head, substantially as described.



3. The combination, with a vertical cutter-head, of a chip-breaker partially encircling it, having the inner surface, against which the chips first strike, inclined to the plane of the axis of the head, and a hood connected with an exhaust-fan arranged over the cutter-head, substantially as described.

4. The combination, with a rotating cutter-head, of the pivoted chip-breaker E, having the lip L acting on the material to break the chip, and the surface N, against which the chips first strike, inclined to the plane of the axis of the head, substantially as described.

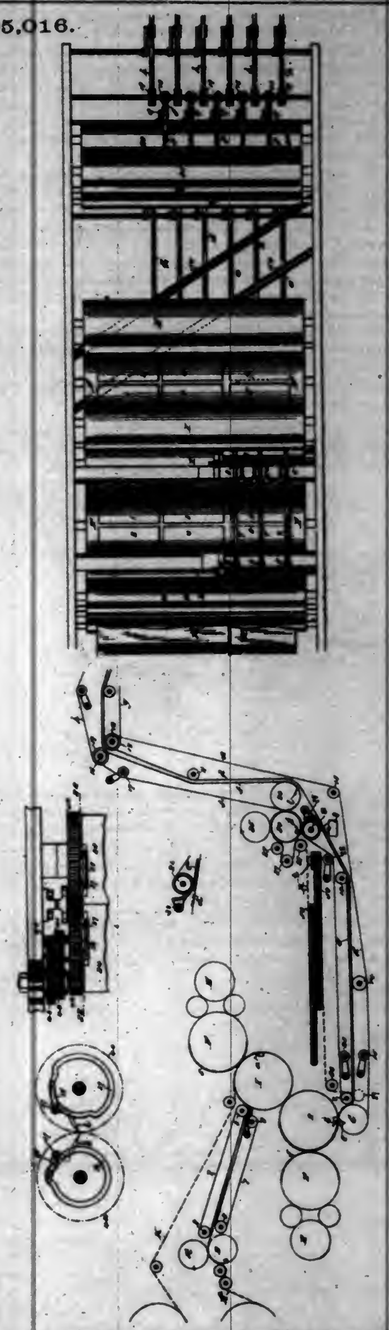
5. The combination, with a rotating cutter-head, of the pivoted chip-breaker F, having the lip L operating on the surface of the material to break the chips, and the inner surface N, against which the chips first strike, inclined to the plane of the axis of the head, substantially as described.

6. The combination, with a rotating cutter-head, of a surface arranged in proximity thereto, against which the chips first strike, inclined to the plane of the axis of the cutter-head, substantially as described.

405,015. SPRAY-CYLINDER CLEANER FOR PAPER-MACHINES. GRANVILLE D. CRANDE, Valatie, N. Y. Filed Apr. 14, 1888. Serial No. 270,613. (No model.)

Claim.—The combination, with the perforated pipe A, provided with supply-pipe B, the cap D, forming an extension of the tube A, the discharge-pipe F, and the plug K in the end of the tube A, of the rod H, provided with the handle L, and the swab J on the inner end of the rod H, substantially as herein shown and described.

405,016. PRINTING AND DELIVERY MECHANISM. LUTHER C. CROWELL, Brooklyn, assignor to Robert Hoe, Peter S. Hoe, Stephen D. Tucker, Theodore H. Mead, and Charles W. Carpenter, New York, N. Y. Filed Mar. 3, 1888. Serial No. 266,606. (No model.)



Claim.—1. The combination, with a form-cylinder, of a co-operating impression-cylinder provided with sheet-retaining devices extending a portion of its length, whereby a web may be printed by one end of said cylinders and sheets by the other, substantially as described.

2. The combination, with a form-cylinder, of a co-operating impression-cylinder provided with sheet-retaining devices extending a portion of its length, means for presenting two webs to said cylinders side by side, and a cutting mechanism for dividing one of said webs into sheets before it is printed, substantially as described.

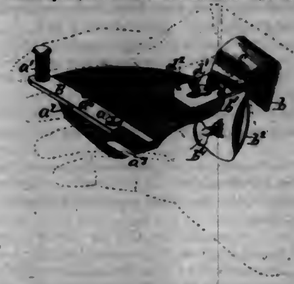
3. The combination, with a form-cylinder, of a co-operating impression-cylinder provided with sheet-retaining devices extending a portion of its length, means for presenting two webs to said cylinders side by side at different speeds, and a cutting mechanism for dividing one of said webs into sheets before it is printed, substantially as described.

4. The combination, with the form-cylinders F, of the impression-cylinders I, provided with coacting sheet-retaining devices *a b*, extending a portion of the length of the cylinders, means for presenting two

405,016.

webs to said cylinders side by side and at different speeds, a cutting mechanism for dividing one of said webs into sheets before it is printed, and a cylinder having sheet-retaining devices for taking the sheets from the last impression-cylinder, substantially as described.

5. The combination, with the form-cylinders F and the impression-cylinders I, provided with sheet-retaining devices *a b*, of means for presenting a web and sheets side by side to said cylinders, and web-turning mechanism for transferring the web laterally, after being printed, into position to be associated with the sheets, substantially as described.



6. The combination, with the form-cylinders F and the impression-cylinders I, provided with sheet-retaining devices *a b*, of means for presenting a web and sheets side by side to said cylinders, web-turning mechanism for transferring the web laterally, after being printed, into position to be associated with the sheets, and a web-cutting and sheet-collecting mechanism, substantially as described.

7. The combination, with the form-cylinders F and the impression-cylinders I, provided with sheet-retaining devices *a b*, of means for presenting a web and sheets side by side to said cylinders, tapes for conveying the sheets from the last impression-cylinder, and web-turning mechanism for transferring the web laterally into position to be associated with the sheets, substantially as described.

8. The combination, with the form-cylinders F and the impression-cylinders I, provided with sheet-retaining devices *a b*, of means for presenting a web and sheets side by side to said cylinders, tapes for conveying the sheets from the last impression-cylinder, web-turning mechanism for transferring the web laterally into position to be associated with the sheets, and a web-cutting and sheet-collecting mechanism, substantially as described.

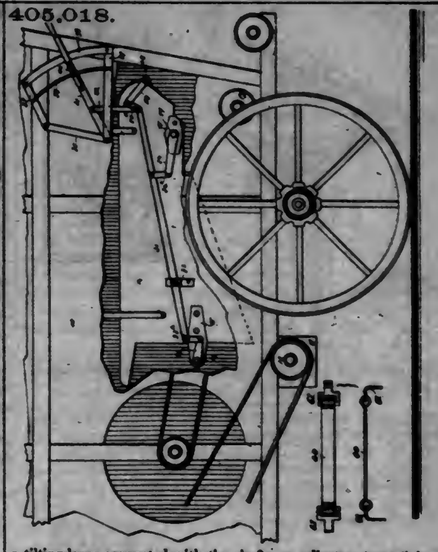
9. The combination, with a web-cutting and sheet-collecting mechanism for operating upon a main web, and tapes for conveying the collected sheets from the collecting mechanism, of tapes for conveying supplement-sheets to said collecting mechanism to be associated with the main sheets, and a switch for directing the supplement-sheets either to the collecting mechanism or to the tapes leading therefrom, substantially as described.

405,017. FRUIT-GATHERER. CHARLES H. CURTIS, Astor, Fla. Filed Sept. 3, 1888. Serial No. 284,402. (No model.)

Claim.—1. In a fruit-clipper, the combination, with the plate A, of a clamping device consisting of the curved back part *b*, the palm part *b'*, shaped to fit the hand between the thumb and forefinger, a concavo-convex plate loosely attached to the part *b'*, a thumb-screw for setting said plate into the palm of the hand, and the lug D, substantially as and for the purpose set forth.

2. In a fruit-clipper, the combination, with the plate A, of a clamping or attaching device consisting of the parts *b b'*, clasping the hand between the thumb and forefinger, and provided with the lug D, and the means described for adjustably securing said clamp in relation to the plate A, substantially as and for the purpose set forth.

3. In a fruit-clipper, the combination, with the plate A, provided with a number of perforations, of a clamp provided with the lug D, having the elongated slot *d'*, the thumb-screw *d'*, and the pivot-pin d^3, projecting from the under side of said lug and engaging with said perforations, substantially as and for the purpose set forth.



4. A fruit-clipper consisting, essentially, of the plate A, notched to receive the stem of the fruit, a cutting-blade pivoted to the upper side of said plate and arranged to traverse said notch, a spring for returning said blade to a normal position, a hand-clamp provided with the lug D and the parts *b b'*, the palm-plate b^3, a thumb-screw for adjusting the latter plate, and a thumb-screw for securing said clamp to the plate A, substantially as and for the purpose set forth.

405,018. ADJUSTABLE SIEVE ATTACHMENT FOR THRASHING-MACHINES. WILT K. DOSS, Marengo, Iowa. Filed Feb. 26, 1889. Serial No. 301,163. (No model.)

Claim.—1. The combination, with the shoe of a grain-separator, of a front and rear shaft journaled therein, front and rear vertical slides connected to the said shafts, having grooves in their inner faces, a sieve, a tilting-lever connected with the front and rear shafts, and an adjusting-lever linked to the tilting-lever, substantially as shown and described.

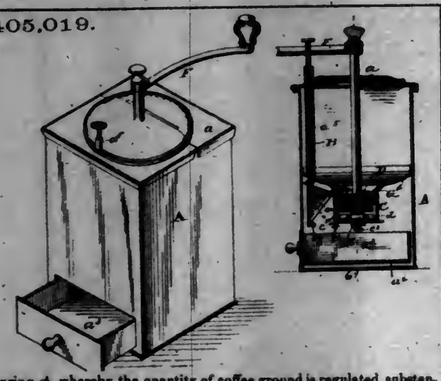
2. The combination, with the shoe of a grain-separator, of a front and rear shaft journaled therein, front and rear vertical slides connected to the said shafts, having grooves in their inner faces, a sieve,

405,018.

a tilting-lever connected with the shafts, an adjusting-lever linked to the tilting-lever, and a tail-board operated from the tilting-lever simultaneously with the slides, all combined for operation substantially as shown and described.

3. The combination, with the shoe of a grain-separator and a front and rear shaft journaled therein, of slides connected to the front shaft, having transverse grooves in the inner face, rear slides attached to the rear shaft, also provided with transverse grooves in the inner face and with a vertical channel, a sieve, a spring-key inserted in the said channels, a tilting-lever connecting the shafts, and an adjustable lever linked to the tilting-lever, all combined for operation substantially as shown and described.

4. The combination, with a grain-separator, a front and rear shaft journaled therein, a tilting-lever connecting the said shafts, and an adjusting-lever linked to the tilting-lever, of forward slides having transverse grooves in their inner faces attached to the forward shaft, rear slides provided with transverse grooves, and an intersecting vertical channel attached to the rear shaft, sieves horizontally held in the grooves of the front and rear slides, and a spring-key capable of insertion in the channel of the rear slides, and a contact with the rear end of the sieves, substantially as shown and described.

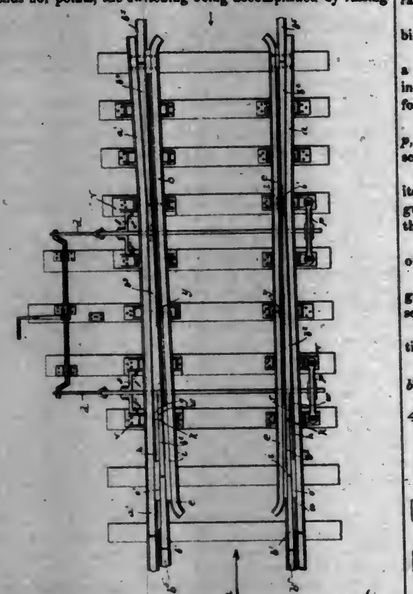


5. The combination, with a grain-separator, a front and rear shaft journaled therein, a tilting lever connecting the said shafts, and an adjusting-lever linked to the tilting-lever, of forward slides having transverse grooves in their inner faces attached to the forward shaft, rear slides provided with transverse grooves, and an intersecting vertical channel attached to the rear shaft, sieves horizontally held in the grooves of the front and rear slides, a spring-key capable of insertion in the channel of the rear slides and of contact with the rear end of the sieves, and a tail-board held to slide in the shoe, operated from the tilting-lever simultaneously with the movement of the slides, substantially as shown and described.

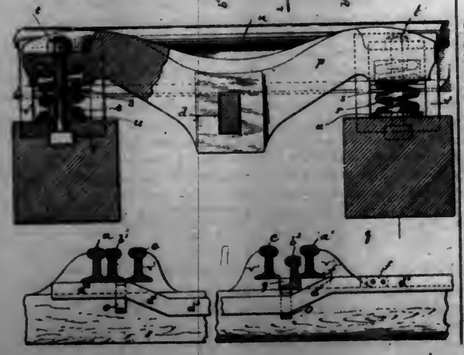
6. The combination, with the shoe of a grain-separator, front and rear shafts journaled therein, a tilting-lever connecting the said shafts, and an adjusting-lever linked to the tilting-lever, of front slides attached to the forward shaft, provided with a grooved inner face, rear slides attached to the rear shaft, provided with a transversely-grooved inner face and a vertical intersecting channel, a sieve, a spring-key capable of insertion in the channel of the rear slides, a sliding tail-board provided with racks upon the under surface, a shaft journaled in the shoe to the rear of the tail-board, provided with mutilated pinions capable of engagement with the racks, and a detachable connection between the pinion-shaft and the tilting-lever, all combined for operation substantially as and for the purpose specified.

405,019. COFFEE-MILL. LOUIS DEUDS, New York, N. Y. Filed Feb. 5, 1889. Serial No. 298,732. (No model.)

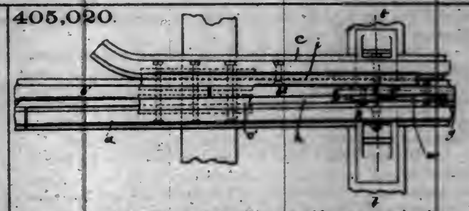
Claim.—In a coffee box and mill, the combination of the outside casing, the drawer for holding the ground coffee in the lower part of said casing, the vertical rod inclosed in the inner casing, the grinding shell and cone, said cone having the crank attached to its upper end, the discharge-box, the sweeps *d*, the hinged upwardly-moving cap c^2, on which the lower end of the vertical rod rests, and the spiral



405,019.



spring d^4, whereby the quantity of coffee ground is regulated, substantially as described and set forth.



405,020. RAILROAD-SWITCH. JOHN A. DUGGAN, Quincy, Mass., assignor to the Burnham & Duggan Railway Appliance Company, Portland, Me. Filed July 17, 1886. Serial No. 208,288. (No model.)

Claim.—1. A switch having guard and stock or outside rails supported upon solid bearings, to which they are fixed so as to permit of no motion, in combination with a middle or switch rail having neither ends nor points, the switching being accomplished by raising

405,020.

the central portion of the switch-rail on one side and lowering it on the other, substantially as and for the purpose above described.

2. In a railroad-switch, a switch-rail having the middle part adapted to be raised and lowered and connected with sections of the switch-rail which form inclines when the middle portion is lowered, the inclined parts being jointed at one end to the fixed section of the rail and at the other end to the vertically-moving middle part, substantially as and for the purpose above described.

3. The horizontally-moving operating-rods *d*, having thereon the inclines d^7 d^7, and the horizontal supporting-faces d^8 d^8, in combination with the switch-rails and straps *e e*, substantially as and for the purpose above described.

4. The operating-rod, the switch-rail having neither ends nor points, the central portion of which is capable of being elevated and depressed throughout its entire length, and the arms *f f*, provided with the supporting-pieces *f' f'*, in combination, substantially as described.

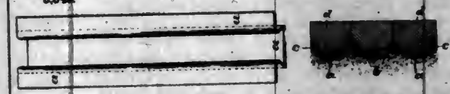
5. The operating-rod *d*, the yoke *p*, the springs *s s*, and the switch-rails, in combination, substantially as described.

6. The yoke *p*, the spring *r*, bolt *s*, nut *t*, and washer *u*, in combination, substantially as and for the purpose above described.

7. The double chair *v*, provided with outside braces and having a central recess, in combination with the stock-rails and guard-rails independently secured to said braces, respectively, substantially as and for the purpose above described.

8. The incline *w*, in combination with the switch-rail, the yoke *p*, and the spring *r*, substantially as and for the purpose above described.

9. The stock-rail lapping by the joint between b' and b^3, having its top substantially level with the switch-rail and bolted through the guard-rail, in combination with the guard-rail, substantially as and for the purpose above described.



10. The blocks *i* and *o'*, in combination with the parts b' and b^3 of the middle rail, substantially as and for the purpose above described.

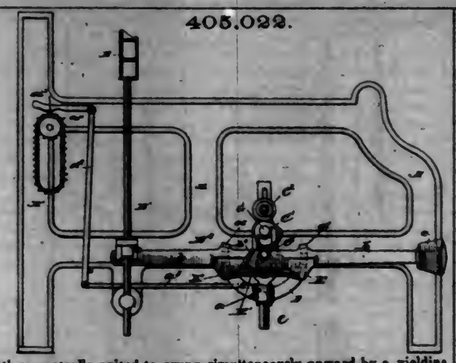
11. The vertically-sliding blocks *l' l'*, in combination with the guard and switch rails, substantially as and for the purpose above described.

12. The blocks *y y*, in combination with the middle rail, substantially as and for the purpose above described.

13. The pieces *k' k'*, in combination with the piece *i* and the parts b^2 b^3, substantially as and for the purpose above described.

405,021. PARQUET OR OTHER FLOORING. JOSEF F. HOSER, London, County of Middlesex, England. Filed May 22, 1888. Serial No. 274,757. (No model.) Patented in France June 19, 1886, No. 176,877; in Belgium June 19, 1886, No. 73,561, and in England Mar. 4, 1887, No. 3,348.

Claim.—1. The combination of a foundation-bed, binding-strips embodied in said bed and provided with undercut exterior surfaces and undercut channels, a layer of cement covering said foundation-bed and entering said channels, and floor-blocks supported on said layer and locked thereto by the entrance of the cement into said recesses, substantially as described.



2. The combination of a foundation-bed, sheet-metal strips of dovetail cross-section dovetailed to said bed, a layer of cement covering said foundation-bed and dovetailed thereto, and a flooring composed of blocks dovetailed to said layer.

405,022. SHUTTLE-BOX-OPERATING LEVER FOR LOOMS. JOSEPH A. EVANS, Philadelphia, Pa. Filed Dec. 31, 1888. Serial No. 295,042. (No model.)

Brief.—The object of the invention is to provide a yielding lever of simple construction which will admit of the loom being operated at a high speed with safety.

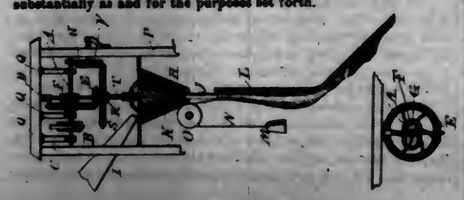
Claim.—1. The combination, with the anchor and shuttle-boxes of a drop-box loom, of the shuttle-box lever constructed in two sections centrally united to swing simultaneously upward by a yielding connection, substantially as set forth.

405,022.

2. The combination, with the anchor and shuttle-boxes of a drop-box loom, of the shuttle-box lever above the anchor and constructed in two sections pivoted together on a fixed pivot projecting from the loom-frame to swing upward simultaneously when both sections are struck at the same time by said anchor, and operating as a single part when one section at a time is struck, substantially as set forth.

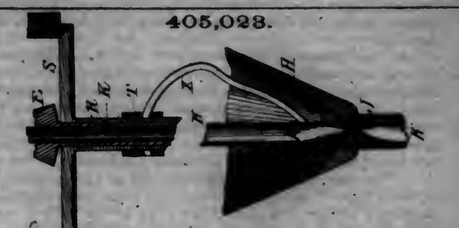
3. The combination, with the anchor and shuttle-boxes of a drop-box loom, of a shuttle-box lever constructed in two sections pivoted together and to the loom-frame by a single pivot or stud projecting from said frame above the anchor to permit of their simultaneous vertical movement, and a spring connecting the two sections below and at opposite sides of their pivotal point, substantially as set forth.

4. The combination, with the anchor and shuttle-boxes of a drop-box loom, of the shuttle-box lever constructed in two sections overlapped at their inner ends, provided with aligning apertures in said ends, and each having a series of stepped notches for the anchor to engage, a fixed pivot or stud projecting from the loom-frame through said apertures in the overlapped ends of the lever-sections to permit them to swing simultaneously upward, each section having a projection or lip engaging the inner end of the opposite section to hold the two sections in horizontal alignment, and a spring connecting the two sections below and at opposite sides of the pivot, substantially as set forth.



5. The combination, with the anchor and shuttle-box of a drop-box loom, of a shuttle-box lever consisting of two sections having beveled inner ends, a surface recess upon the inner face of one section and the outer face of the other, which recesses are provided with an inclined transverse wall, a lip formed upon each section projecting over the recess, a spring adapted for attachment to the several sections, and a projection integral with each section having notches stepped therein, substantially as shown and described.

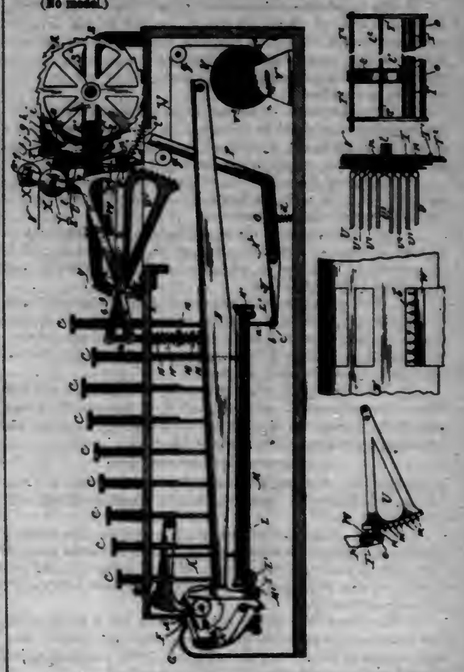
6. In a drop-box loom, a shuttle-box lever constructed in two sections overlapped at their inner ends, a pivot uniting said overlapped ends and adapted to be connected to a loom-frame, the two sections each having a projection engaged by the end of the opposite section when the two sections are in alignment and permitting the upward swing of both sections on the pivot, and a spring uniting the two sections below the pivot and holding them normally in line with each other to operate as a single part, substantially as set forth.



7. In a drop-box loom, a shuttle-box lever consisting in the two sections *b b'*, overlapped at their inner inclined ends and provided with pivot-apertures b^5, stepped projections *d d* on their inner sides, inclined surface recesses b^4 on the outer faces of each section for the inclined end of the opposite section to engage, and projections E, the spring E', secured at its ends to said projections, and the weight *e* on the section *b'*.

405,023. COLLAR-STUFFING MACHINE. CALVIN EWING, San Francisco, Cal. Filed Mar. 7, 1888. Serial No. 266,471. (No model.)

Claim.—1. In combination with the tube J and spiral stuffing rod K, the cam G, and yoke F, connected, constructed, and operated substantially as and for the purposes set forth.



405,023.

2. The combination and arrangement of the stuffing-tube J, the stuffing-rod K, the feed-box H, the stirrers X, the sleeve T, the wheel S, the wheels U and V, and pinion W, the main driving-shaft A, the wheel D, the cam G and yoke F, the pinion E, the weight M, the cord N, and sheave O, constructed and operated substantially as and for the purposes set forth.

405,024. ADDING-MACHINE. DORR E. FELT, Chicago, Ill., assignor, by direct and mesne assignments, to the Felt & Tarrant Manufacturing Company, same place. Filed Jan. 19, 1883. Serial No. 261,294. (No model.)

Claim.—1. The combination, with the series of keys of an adding-machine, of a series of levers L, operated by said keys, a series of numeral-wheels A, type-heads, as U U' U² U³, a series of levers N, a rock-shaft N', common to all of said levers, stops J, wheels R and R', and an escapement mechanism between each of the levers L and the wheel R, substantially as and for the purposes specified.

2. The combination, with the series of keys of an adding-machine, a series of levers N, a common rock-shaft N', upon which said levers are mounted, and connections between said keys and levers, of an arm or lever O, carried by the rock-shaft, a bar P, connected with such arm or lever and carrying a compound pawl *e i*, a coacting escapement-wheel R, a pressure-bar T, and a wheel R', having teeth for advancing the pressure-bar, substantially as described.

3. The combination, with the series of keys of an adding-machine, of a series of stop-levers L, connections between said keys and levers, a series of levers N, operated from the stop-levers, a rock-shaft N', common to all of the levers N, an arm O, carried by the rock-shaft, a bar P, connected with said arm and carrying a double-acting pawl, an escapement-wheel R, with which the pawl coacts, a wheel R', connected with the wheel R and having a series of teeth, a moving power for both the wheels R and R', a pawl coacting with the

teeth of the wheel R', and a swinging pressure-bar T, substantially as described.

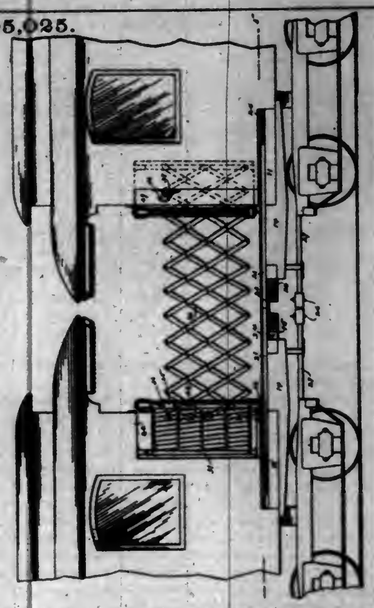
4. The combination, with the series of keys of an adding-machine, an escapement mechanism, and the bar P, carrying a double-acting pawl, of the toothed wheel R', means for actuating the escapement mechanism and the toothed wheel R', and the pressure-bar T, acted on by the toothed wheel, whereby said pressure-bar is forced against the paper to make an impression thereon with the descent of each key of the adding-machine, substantially as described.

5. The combination of the series of keys of an adding-machine, the levers L and N, connections between said levers, substantially as described, a common rock-shaft N', on which all the levers N are mounted, an arm O, carried by said rock-shaft, a bar P, pivotally connected with said arm and carrying a double-acting pawl, the escapement-wheel R, and the connected wheel R', whereby said wheel R' is advanced step by step with the striking of each key, substantially as described.

6. The combination, with the series of keys of an adding-machine, the bar P, carrying a compound pawl *e i*, and connections, substantially as described, between said bar and keys, of an escapement-wheel R, controlled by said pawl, the toothed wheel R', means for moving both wheels R R', the rubber *l*, and the pressure-bar T, substantially as described.

7. The combination, with several series of keys C of an adding-machine, a series of vibrating levers D, operated by said keys, and a series of numeral-wheels, of a recording-head for each series of keys, and connections between each vibrating lever and recording-head for operating said recording-head by the movement of said lever, substantially as described.

8. The combination of several series of keys C, a series of vibrating levers D, actuated by said keys, a series of numeral-wheels, a series of type-heads, and connections between the vibrating levers and the type-heads, substantially as described.



9. The combination of the keys C, the numeral-wheels A, and the levers D with rods, as 15, springs, as 17, arms, as 2, and a series of type-heads, substantially as described.

10. The combination of the numeral-wheels A, the series of keys C, stops J, levers L, levers N, rock-shaft N', having arm O, bar P, connected to said arm, and an escapement mechanism actuated by said bar, substantially as described.

11. The combination of a series of levers L and series of arms or levers N, a rock-shaft N', common to the levers N, arm O, a bar P, pawls *e* and *i*, wheel R, toothed wheel R', rubber *l*, and pressure-bar T with keys C, levers D, and a series of recording-heads operated from the levers, substantially as specified.

12. The combination, with the rock-shaft N', levers N, mounted thereon, and the levers L, and rock-shaft M, of the inclined connecting-arms L' between the levers L and rock-shaft M, for giving said levers uniform support, substantially as described.

405,025. PLATFORM FOR RAILWAY-CARS. ROBERT S. C. FULLER, New York, N. Y. Filed Feb. 12, 1889. Serial No. 299,609. (No model.)

Claim.—1. The combination, with a rigid platform, of an auxiliary platform pivoted thereon, capable of independent movement and provided with an opening in the forward end, and a door covering said opening, capable, when open, of exposing the draw-head, substantially as shown and described.

2. The combination, with a rigid platform and a spring at the rear of the same, of an auxiliary platform pivoted upon the fixed platform, capable of independent movement and having a bearing against the said spring, substantially as shown and described.

3. The combination, with a rigid platform and a spring pivoted at the rear of the same, of an auxiliary platform pivoted upon the fixed platform, slotted at the pivotal point to have longitudinal movement, the said platform being capable of independent movement and having a bearing against said spring, substantially as and for the purpose specified.

4. The combination, with the bottom of a railway-coach, provided with a horizontal recess in the upper face, a platform rigidly secured to the said bottom, and a spring pivoted in the floor-recess, of an auxiliary platform pivoted upon the fixed platform, capable of independent movement and having the rear end in contact with the said spring, substantially as shown and described.

5. The combination, with the bottom of a railway-coach, provided with a horizontal recess in the upper face, a platform secured to the said bottom, and a spring pivoted in the floor-recess, of an auxiliary platform pivoted upon the fixed platform, capable of independent movement and contact with the said spring, and wear-plates secured to the end of said platform at each side of the center, having a recessed under face, all combined for operation substantially as shown and described.

6. The combination, with the bottom of a railway-coach, provided with a horizontal recess in the upper face having an irregular rear wall, a platform rigidly secured to the said bottom, and a spring pivoted in the floor-recess, of an auxiliary platform of greater length than the fixed platform, pivoted to the rear and capable of independent movement and bearing against said spring, diagonal wear-plates secured to the rear end of the platform, one at each side of the center, and provided with a recessed under face, and a door hinged to the pivoted platform at the forward end, adapted to cover the recess produced therein, all combined for operation substantially as shown and described.

7. The combination, with the bottom of a railway-coach, provided with a horizontal recess in the upper face having an irregular rear wall, a platform rigidly secured to the said bottom, a block pivoted in the floor-recess near the center, and a bow-spring rigidly secured to the said block, of an auxiliary platform pivoted to the fixed platform and having a movement independent thereof and a bearing against the said spring, a friction-roller journaled in the base-wall of the floor-recess in contact with the pivoted platform, and a wear-plate secured to the rear of the platform, one plate at each side of the center, the said plates provided with a recess in the under face to receive the ends of the bow-spring, all combined for operation substantially as shown and described.

8. The combination, with a rigid platform, of an auxiliary platform pivoted thereon, of greater length than the fixed platform, and means, substantially as shown and described, for supporting the outer projecting ends of the pivoted platform, as and for the purpose specified.

9. The combination, with a rigid platform, of an auxiliary platform pivoted thereon, capable of independent movement and of greater length than the fixed platform, and fingers secured to the end sills of the fixed platform, adapted for contact with the under face of the projecting portion of the pivoted platform, all combined for operation substantially as shown and described.

10. The combination, with a rigid platform and fingers horizontally secured to the end sill of the same and an opposed platform, the upper surface of which is recessed to receive said fingers, of an auxiliary platform pivoted upon each fixed platform, having their ends projected beyond the sills above the fingers to contact each other, substantially as shown and described.

11. The combination, with a rigid platform and a spring pivoted at the rear of the same, of an auxiliary platform pivoted upon the fixed platform, capable of independent movement and having a bearing against said spring, and horizontal fingers attached to the end sill of the fixed platform, adapted for engagement with the under face of the pivoted platform, substantially as shown and described.

12. The combination, with a rigid platform, a spring pivoted to the rear of the same, and graduated fingers horizontally secured to the end sill of the fixed platform, of an auxiliary platform pivoted upon the fixed platform, capable of independent movement, and of greater length than the said fixed platform, and slotted for contact with the said spring, all combined for operation substantially as shown and described.

13. The combination, with a fixed platform provided with an end sill having a recess at each side of the center and ribs formed upon the recessed face, of an opposing fixed platform, fingers horizontally secured to the end sill of the latter platform, adapted for contact with the said recessed sill, and an auxiliary platform pivoted upon each of the fixed platforms, having square abutting outer ends projected beyond the sills of the said fixed platforms and above the said fingers all combined for operation substantially as shown and described.

14. The combination, with a railway-coach provided with a fixed platform and an auxiliary platform pivoted upon the fixed platform, of a folding gate attached to one side of the coach near each end and adapted to project over the platform of the adjacent coach and to be secured to the said coach, substantially as shown and described.

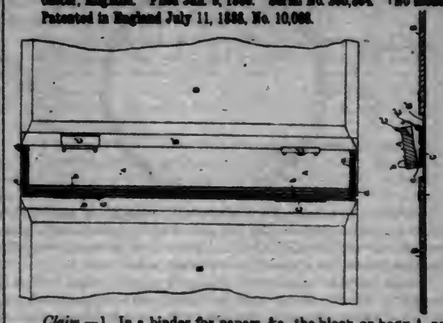
15. In a railway-coach, the combination, with a body provided with side recesses at each end, a fixed platform, and an auxiliary platform pivoted upon the fixed platform, of a folding gate secured within one of the side recesses, adapted to travel upon the platform, and a spring-actuated latch secured in the opposite side recess, all combined for operation substantially as shown and described.

16. In a railway-coach, the combination, with a body provided with side recesses at each end, a fixed platform, and an auxiliary platform pivoted upon the fixed platform, of a folding gate secured within one side recess, a horizontal spring-actuated latch secured in the opposite side recess, and a second folded gate pivoted upon the ends of the coach adjacent to the recess carrying the latch, all combined for operation substantially as shown and described.

17. In a railway-coach, the combination, with a body provided with side recesses at each end, a fixed platform, and an auxiliary platform pivoted upon the same, of a folding gate secured within one side recess, a spring-actuated latch held within the opposite recess, a second folding gate pivoted upon each end of the coach contiguous to the spring-actuated latch, and a third folding gate secured to the end of the coach-hood, substantially as shown and described.

18. In a railway-coach, the combination, with a body provided with side recesses at each end, a fixed platform, and an auxiliary platform pivoted to the fixed platform and extending beyond the same, of a folding gate secured within one of the side recesses of the coach, a spring-actuated latch secured within the opposite recess, a second folding gate pivoted at each end of the coach, a third folding gate hinged to the end of the coach-hood, provided with a locking device at the lower end, adapted for contact with the outer end of the pivoted platform, and means, substantially as shown and described, for securing the end gate in a horizontal position beneath the hood, as and for the purpose specified.

19. In a railway-coach, the combination, with a body provided with a pocket formed in each end and a fixed platform, of an auxiliary platform pivoted upon the fixed platform and a brake device located within the said pocket, substantially as and for the purpose specified.



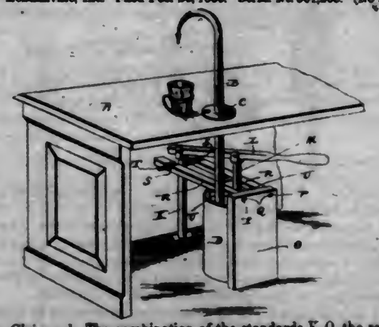
20. In a railway-coach, the combination, with a body provided with side recesses at each end, a fixed platform, a pocket in each end adjacent to one of the said recesses, and an auxiliary platform pivoted upon the fixed platform, of a folding gate secured within one side recess and a latch horizontally held in the opposite side recess, a second folding gate pivoted at each end of the coach, a third folding gate hinged to the end of the coach-hood, provided with a locking device adapted for contact with the outer end of the pivoted platform, a brake device located within the pocket of the body, and means, substantially as shown and described, for retaining the end-gate in a horizontal position beneath the hood, substantially as and for the purpose specified.

21. In a railway-coach, the combination, with a body having a bottom provided with a horizontal recess in the upper face, a platform rigidly secured to the bottom, and a spring pivoted in the floor-recess, of an auxiliary platform pivoted upon the fixed platform, of greater length than the fixed platform, capable of independent movement and having the rear end in contact with the said spring, a sliding folding gate secured at one side of the coach-body, adapted to travel upon the auxiliary platform, a latch attached to the opposite side of the body, a brake device located in a pocket formed in the end of the coach-body, a second folding gate pivoted to each end of the coach, and a third folding gate hinged to the end of the coach-hood, with means, substantially as shown and described, for locking the end-gate in a vertical and in a horizontal position, as and for the purpose specified.

22. The combination, in a railway-coach provided with doorways having a double-spaced partition at one side, of two sliding doors located between the partitions, one door provided with a transverse groove extending nearly from side to side, and the other door having secured thereto a lug capable of entering and sliding in the said groove, substantially as shown and described.

23. In a railway coach, the combination, with a body provided with a pocket at each end, doorways having a double-spaced partition, and fixed platforms, of an auxiliary platform pivoted upon each of the fixed platforms, a brake device located within the said pocket, sliding doors located between the said partitions, one door provided with a transverse groove extending, essentially, from side to side, and the other door with a lug capable of entering the said groove and sliding therein, all combined for operation as and for the purpose specified.

405,026. BINDER OR FILE FOR DOCUMENTS. PETER GARTON, ROBERT GARTON, and JOHN GARTON, Newton-le-Willows, County of Lancaster, England. Filed Jan. 9, 1889. Serial No. 296,864. (No model.) Patented in England July 11, 1888, No. 10,068.



Claim.—1. In a binder for papers, &c., the block or body A, provided at its ends with the series of notches *a*, in combination with the independent fastening cords or strings *b*, extending lengthwise of the upper face of the block and in the said notches, and the stops or projections on the said cords arranged to engage the under face of the block to prevent their escape.

2. The block A, provided with the notch *a*, in combination with the fastening-string *b*, extending lengthwise of the upper face of said block and into the notch, and the stop or projection on said string in position to engage the under face of the block at the side of the notch, whereby the string may be removed to permit the insertion or removal of papers by disengaging the projection from the block.

3. In a binder for papers, the binding-rack A, the binding-cords extending along its upper face and terminating beneath the same, in combination with the cover or back hinged to said rack, whereby the latter may be tilted to permit the manipulation of the fastening-strings.

4. In a binder for papers, the binding rack A, the series of independent fastening-cords extending lengthwise of its upper face, their free ends terminating beneath the same, in combination with the back or cover B, hinged to said rack at one edge, and the fastening device for securing the opposite edge to the cover, whereby the free ends of the cords are confined and protected between the cover and the rack.

405,027. SODA-WATER APPARATUS. GEORGE W. GILBERT, Kendallville, Ind. Filed Feb. 26, 1889. Serial No. 301,205. (No model.)

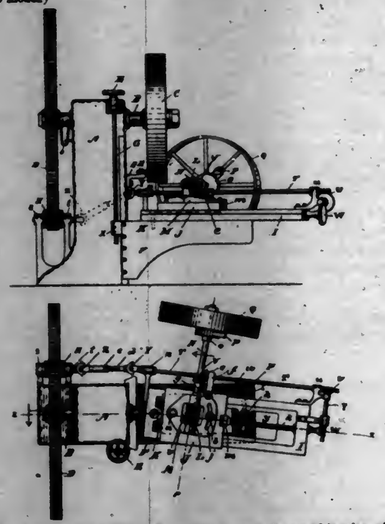
Claim.—1. The combination of the standards K O, the reservoir arranged between the standards, the cylinder arranged in the reservoir, the discharge-pipe leading therefrom, the piston working in the cylinder, the bearing-plates mounted on the base of the cylinder, and beams engaging the standards and bearing on said plates, as set forth.

2. The combination of the standards K O, the reservoir between the same, the cylinder within the reservoir, having an enlarged base, the plates U, bearing on the enlarged base of the cylinder, the cross-bar T at the upper end of the standard K, and the beams R, having

their front ends engaging the standard O, and their rear ends provided with transverse notches engaging the cross-bar T, and their intermediate points bearing on the plates U, as set forth.

405,028. EARTHENWARE. CHARLES C. GILMAN, Eldora, Iowa. Filed Oct. 22, 1887. Serial No. 253,133. (No model.)

Claim.—A burned porous earthenware product having incorporated therein fibers of asbestine wool, substantially as described.



405,029. WIRE BARREL-HOOP. EDWARD C. GORDON, Chetopa, Kans. Filed Nov. 30, 1888. Serial No. 292,183. (No model.)

Claim.—1. A barrel-hoop composed of a length of wire wound to form a number of strands, the ends of the length of wire being locked, substantially as specified, and the body of the hoop being held in place at intervals by bands, substantially as described.

2. A barrel-hoop composed of a length of wire wound to form a number of strands, formed upon its leading end *a* with a loop *b* and portion *c*, and its other end bent through the loop *b*, the bent portion *e* being secured in place by a band *f*, and other bands *g* at intervals throughout the body of the hoop, substantially as specified.

405,030. MACHINE FOR CUTTING SPUR AND WORM GEARS. GEORGE R. GRANT, Malden, Mass. Filed Dec. 12, 1887. Serial No. 257,714. (No model.)

Claim.—1. In a machine for cutting gears, the combination of a spindle for holding the gear-blank, a carriage for holding the cutter-shaft, means for feeding the carriage, whereby the cutter is carried across the face of the blank, a cutter-head adjustably attached to the carriage, a cutter-shaft held by the cutter-head, and a positive connecting mechanism, whereby rotary motion is communicated from the cutter-shaft to the gear-spindle, substantially as described.

2. In a machine for cutting gears, the combination of a spindle for holding the gear-blank, a carriage for holding the cutter-shaft, means for feeding the carriage, whereby the cutter is carried across the face of the blank, a cutter-shaft adjustably secured to the carriage, whereby it may be set at an angle corresponding to that of the thread of the cutter to be employed, and a positive connecting mechanism, whereby rotary motion is communicated from the cutter-shaft to the gear-spindle, substantially as described.

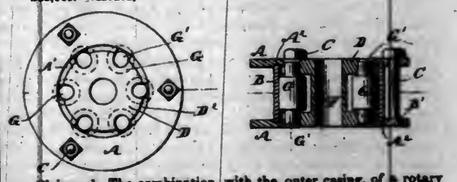
3. In a machine for cutting gears, the combination of a spindle for holding the gear-blank, a carriage for holding the cutter-shaft, means for feeding the carriage, whereby the cutter is carried across the face of the blank, said carriage being made adjustable to vary the angle of its feed to the gear-spindle, a cutter-shaft adjustably secured to the carriage, whereby it may be set at an angle corresponding to that of the thread of the cutter to be used, and a positive connecting mechanism, whereby rotary motion is communicated from the cutter-shaft to the gear-spindle, substantially as described.

4. In a machine for cutting gears, the combination of a spindle for holding the gear-blank, a carriage for holding the cutter-shaft, said carriage being made adjustable to vary the angle of its feed to the gear-spindle, means for feeding the carriage, whereby the cutter is carried across the face of the blank, a cutter-head adjustably attached to the carriage, a cutter-shaft held by the cutter-head, and a positive connecting mechanism, whereby rotary motion is communicated from the cutter-shaft to the gear-spindle, substantially as described.

5. In a machine for cutting gears, the combination of a spindle for holding the gear-blank, a cutter-carriage for holding the cutter-shaft, means for feeding the carriage, whereby the cutter is carried across the face of the blank, a cutter-shaft and a spiral cutter secured on the carriage at an angle with the direction of the feed of the carriage substantially equal to the angle of the thread of the cutter with its axis, and a positive connecting mechanism, whereby rotary motion is communicated from the cutter-shaft to the gear-spindle, substantially as described.

6. In a machine for cutting gears, the combination of the frame A, the spindle B, the adjustable bed F, the frame I, adjustably secured on the bed F, the carriage J, sliding on the frame I, means for feeding the carriage on the frame I, the cutter-shaft N, adjustably secured to the carriage, and the positive connecting mechanism, whereby rotary motion is communicated from the cutter-shaft to the gear-spindle, substantially as described.

7. In a machine for cutting gears, the combination, with the gear spindle B, the cutter-shaft N, and the positive connecting mechanism, whereby rotary motion is communicated from the cutter-shaft to the gear spindle, of the pulley Q, loosely connected with the shaft N by a ratchet and pawl, whereby the accidental rotation of the shaft in the wrong direction is prevented, substantially as described.

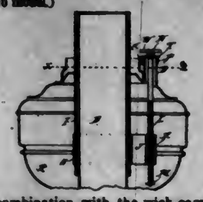


8. In a machine for cutting gears, the combination, with the frame-work and the horizontal spindle for holding the gear-blank having a play or movement within its bearings in the direction of its length, of the rest R, for the rear side of the gear-blank, substantially as described.

9. In a machine for cutting gears, the combination, with the frame-work and the horizontal spindle for holding the gear-blank having a play or movement within its bearings in the direction of its length, of the rest R, for the rear side of the blank, and the spring *o*, whereby the blank is pressed against the rest, substantially as described.

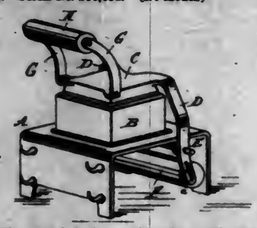
10. In a machine for cutting gears, the combination, with the cutter-shaft N, of the carriage J and bed F, arranged under the cutter-shaft for the purpose of supporting and operating the same and having apertures arranged substantially one above the other and under the cutter-shaft, whereby a clear passage is formed through which the chips may fall from the cutter, substantially as described.

11. In a machine for cutting gears, the combination, with the cutter-shaft N, of the sliding carriage J and the fixed bed F, an aperture in the carriage substantially under the cutter-shaft, and a long aperture in the fixed bed substantially under the aperture in the carriage, whereby a clear passage is formed through which the chips may fall from the cutter, substantially as described.



405,031. ANTI-FRICTION BEARING. ESTHUEL G. HANDY and GEORGE H. HANDY, Monroe, N. Y. Filed Sept. 20, 1888. Serial No. 285,865. (Model.)

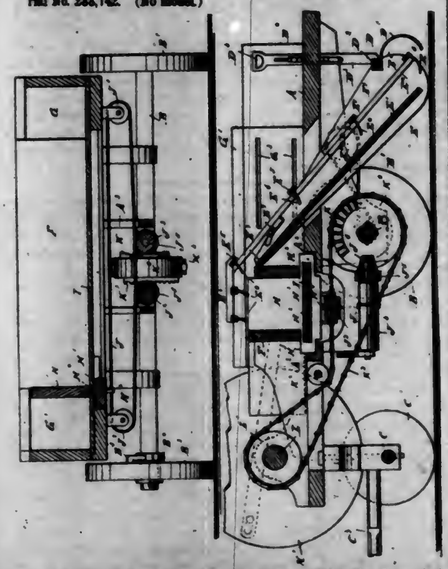
Claim.—1. The combination, with the outer casing, of a rotary tubular box therein and a series of rollers journaled thereon parallel with its axis, the faces of the rollers contacting with the inner side of the casing, and there being a space formed between the outer surface or periphery of the tubular box and the rollers to prevent frictional contact, substantially as set forth.



2. In an anti-friction bearing, a casing consisting of two plates A, each provided on its inner side with a circumferential groove and a band-ring seated in said grooves, in combination with a box consisting of a tube F, grooved and recessed flanges D, secured to the respective ends of said tube, and rollers G, journaled in the recesses of said flanges D, substantially as shown and described.

405,032. LAMP. HIRAM W. HAYDEN, Waterbury, Conn., assignor to Holmes, Booth & Haydens, same place. Filed Mar. 9, 1888. Serial No. 266,672. (No model.)

Claim.—The combination, with the wick-carrying ring H, provided with an arm J, bearing a nut K, of the vertical screw-threaded shaft L, terminating at its upper extremity in a manipulating-button W, and bearing a locking-ring P, provided with a tongue S, adapted and arranged to engage with perforations in the walls at the sides of a slot on the top of the oil-fount, substantially as shown and described.



405,033. INKSTAND. JOHN J. HOEY, New York, N. Y. Filed Sept. 23, 1888. Serial No. 286,602. (No model.)

Claim.—1. The stand A, in combination with cover C, having arms G and D, the latter pivoted below the ink-receptacle and provided with the weight F, substantially as described.

2. The cover C, provided at its rear corners with the downwardly-projecting arms D and at the top with the upwardly-projecting arms G, substantially as described.

405,034. COMBINED HAY-RAKE AND BALING-PRESS. JOHN A. HOUTON and GILBERT L. WIARD, Atkinson, Nebr., assignors to themselves and Harry W. Mathews, same place. Filed Oct. 22, 1888. Serial No. 288,742. (No model.)

Claim.—1. The combination, with the parallel baling-boxes having a common receiving-box at right angles thereto, of the alternately-operating plungers in said baling-boxes, the reciprocating plunger in said receiving-box having two working-faces, and an operating mechanism outside of the receiving-box connected with said plunger therein, substantially as set forth.

2. A combined hay-rake and double baling-press comprising the hay-rake, the elevator, the longitudinally-extending baling-boxes, their alternately-operating plungers, and a feeder delivering alternately into said baling-boxes, substantially as set forth.

3. The combination, with a hay-rake and an elevator, of a transverse receiving-box into which the said elevator discharges, a plunger operating in the said receiving-box, a baling-box located at each end of the said receiving-box, and plungers operating in the said baling-boxes, substantially as shown and described.

4. The combination, with a hay-rake and an elevator, of a transverse receiving-box into which said elevator discharges, a plunger operating in the said receiving-box, a baling-box located at each end of the said receiving-box, plungers operating in the said baling-boxes, and followers held adjustably in the said baling-boxes, substantially as shown and described.

5. The combination, with a platform and a main driving-axle having a rotary motion, of a hay-rake held adjustably on the rear end of the said platform, an elevator receiving its motion from the said main axle and fed by the said hay-rake, a receiving-box held transversely on the upper end of the said elevator, a plunger moving transversely in the said receiving-box, deriving its motion from the said main axle baling-boxes located at the ends of the said receiving-box, a follower held adjustably in each of the said baling-boxes, and plungers moving in the said baling-boxes and deriving their motion from the said main axle, substantially as shown and described.

6. The combination, with a platform and a main axle, of a receiving-box located transversely on the said platform, a plunger mounted to slide in the said receiving-box, a rope connected by its ends to the said plunger, wheels around which the said rope is wound, beveled gear-wheels held on the said wheels, and segmental gear-wheels held on the said main axle and adapted to engage the said bevel gear-wheels alternately, substantially as shown and described.

7. The combination, with a platform and a main axle, of two baling-boxes located longitudinally on the said platform, plungers operating alternately in the same direction in the said baling-boxes, pitmen pivotally connected with the said plungers, crank-disks pivotally connected with the said pitmen, a shaft carrying the said crank-disks and deriving a rotary motion from the said main axle, a receiving-box mounted transversely on the said platform and discharging at its ends into the said baling-boxes, and a plunger held to slide in the said receiving-box and operated from the said main axle, substantially as shown and described.

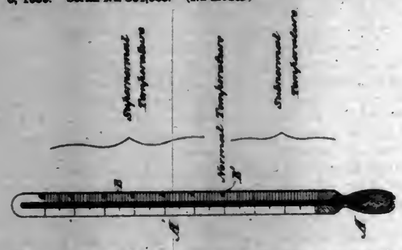
8. The combination, with a platform and a main axle, of two baling-boxes located longitudinally on the said platform, plungers operating alternately in the same direction in the said baling-boxes, pitmen pivotally connected with the said plungers, crank-disks pivotally connected with the said pitmen, a shaft carrying the said crank-disks and deriving a rotary motion from the said main axle, a receiving-box mounted transversely on the said platform and discharging at its ends into the said baling-boxes, a plunger held to slide in the said receiving-box and operated from the said main axle, and adjustable followers held in the said baling-box, substantially as shown and described.

9. A combined raking and baling machine consisting of a supporting-frame mounted on drive-wheels, a hay-rake, an elevator receiving the hay from said rake, a receiving-box into which said elevator discharges, a plunger reciprocating in said box, a baling-box, a plunger reciprocating in said baling-box, and operating mechanism, substantially as set forth.

405,035. BOTTLE-STOPPER. THOMAS B. HOWE, Scranton, Pa., assignor to the Scranton Jar and Stopper Company, same place. Filed Nov. 30, 1888. Serial No. 292,284. (No model.)

Claim.—1. In a bottle-stopper fastening, the combination, with the bottle having the abrupt shoulder, the neck-wire, and the link or bail piece pivotally connected thereto, of the stopper, the catch-wire connected thereto and having both its ends bent down and pivotally connected to the link or bail piece on one side of the stopper, and having the diverging downwardly-extending portion on the opposite

side of the stopper, with the horizontal portion for engaging the abrupt shoulder bent inward at the center, substantially as described.



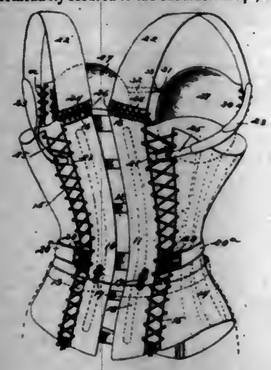
2. In a bottle-stopper fastening, the combination, with the bottle having the abrupt shoulder, the neck-wire, and the link or bail piece pivotally connected thereto, of the stopper, the catch-wire connected thereto and bent down and pivotally connected to the bail-piece by both its ends on one side the stopper, and the diverging downwardly-extending portions on the opposite sides of the stopper, with the horizontal portion for engaging the abrupt shoulder bent inward at the center, and the thumb-piece at the center of such inwardly-bent portion, whereby the same is permitted to spring outward while being locked, substantially as described.

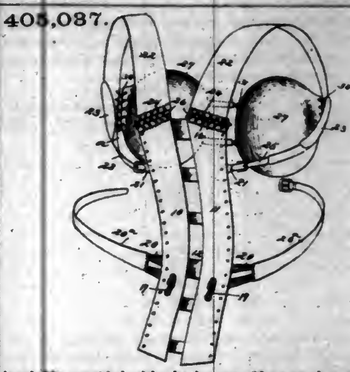
3. The combination, with the bottle, of the metal cap-plate having the depending annular extension screw-threaded on both sides, the stopper fitting within the extension, the rubber washer around the same co-operating with the bottle-mouth to make a tight joint, and the catch-wire for retaining the stopper in position, substantially as described.

4. The combination, with the bottle, of the metal cap-plate having the depending annular extension screw-threaded on both sides, the stopper fitting within the extension, the rubber washer around the extension and having the downwardly-projecting annular flange extending over the edge of the extension on the cap-plate and adapted to fit within the mouth of the bottle to make a tight joint; and the catch-wire for retaining the stopper in position, substantially as described.

5. In a bottle-stopper fastening, the combination, with the catch-wire and neck-wire, of the link or bail piece connecting the neck-wire and catch-wire formed of the single piece of wire bent into the two side links with the eyes at each end forming separated bearings, as described, and the connecting-piece uniting said side links, substantially as and for the purpose set forth.

405,086. CLINICAL THERMOMETER. ROBERT H. HUMSTOCK, San Antonio, Tex., and ERNESTO CHÁVES, Guanajuato, Mexico. Filed Mar. 6, 1889. Serial No. 301,933. (No model.)



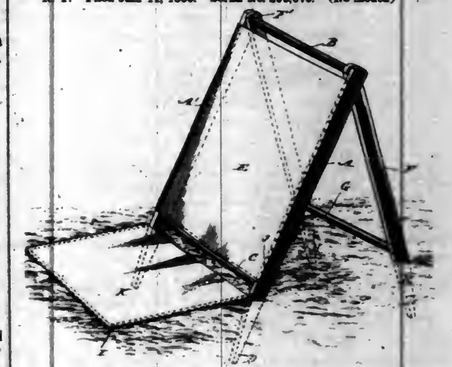


Claim.—1. A scale for thermometers having the zero-mark placed at the normal temperature of the body.

2. As an improved article of manufacture, a clinical thermometer, having a zero-mark of the scale placed at the normal temperature of the body, substantially as shown and described.

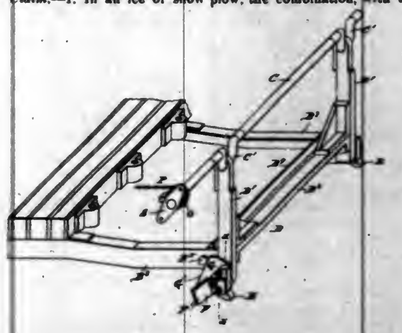
405,037. CORSET. LUCY J. JAMES, Pomona, Cal. Filed Feb. 5, 1889. Serial No. 298,717. (No model.)

Claim.—1. A corset comprising the back-stays 10 and 11, connected together, the shoulder-straps 22, provided with the elastic tape 25 at one end and detachably secured to the back-stays, the breast forms or pads detachably secured to the shoulder-straps, and the waist-

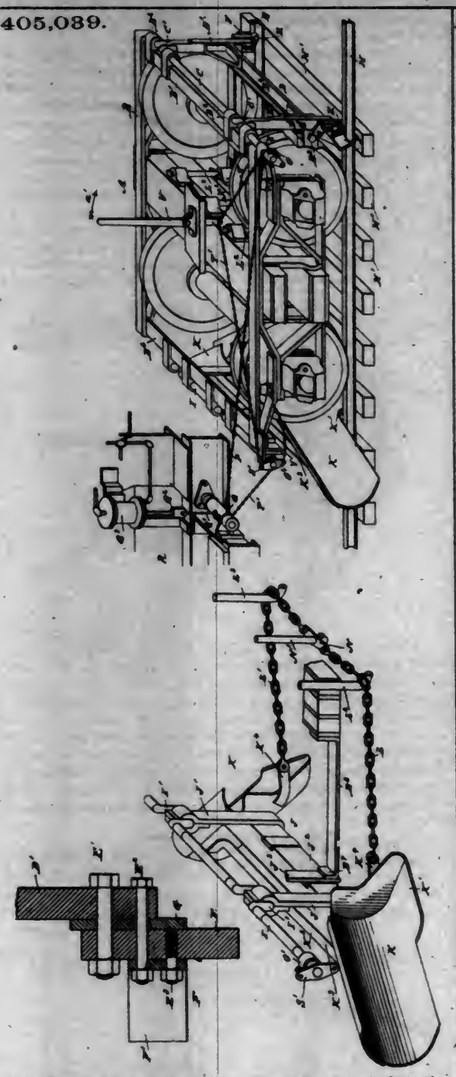


band 20ᵇ, provided with elastic tapes 20, secured to the back-stays, substantially as herein shown and described.

2. The herein-described corset, consisting of the back-stays 10 and 11, connected together, the side pieces 13 and 14, detachably secured to the back-stays, the shoulder-straps 22, detachably secured to the upper ends of the said stays, the detachably-connected breast forms or pads 27, detachably secured to the shoulder-straps, and the waistband 20ᵇ, secured to the back-stays, as specified.



405,088. BEACH-CHAIR. CHARLES E. KOEHLING, New York, N. Y. Filed Jan. 11, 1889. Serial No. 296,079. (No model.)



Claim.—The herein-described beach-chair, consisting of a back-rest formed of side pieces A A', united by rounds B C, and covered with the flexible material E, a brace-frame formed of the side pieces F F', united by the round G, and pivoted to the upper ends of the side pieces A A' and the metallic seat-frame I, pivoted to the side pieces A A' a short distance from their lower ends and covered with the water-proof material K, the said water-proof material being separate from the flexible material E, as specified.

405,089. ICE OR SNOW PLOW FOR RAILROAD-TRACKS. EDWARD LESLIE, Orangeville, Ontario, Canada. Filed May 2, 1888. Serial No. 272,552. (No model.)

Claim.—1. In an ice or snow plow, the combination, with the

405,089.

truck-frame, of front and rear frames adapted to be raised simultaneously or independently, and plows and scrapers secured to the said front frames, and flangers secured on the said rear frames, substantially as shown and described.

2. In an ice or snow plow, the combination, with the truck-frame provided with a shaft having crank-arms, and which is adapted to turn, of a frame pivotally suspended upon said crank-arms, and plows secured on the said frame, substantially as shown and described.

3. In an ice or snow plow, the combination, with the truck-frame provided with a shaft having crank-arms, and which is adapted to turn, of a frame pivotally suspended upon said crank-arms, and scrapers secured to the said frame, substantially as shown and described.

4. In an ice or snow plow, the combination, with the truck-frame provided with a shaft having crank-arms, and which is adapted to turn, of a frame pivotally suspended upon said crank-arms, and flangers supported on the said frame, substantially as shown and described.

5. In an ice or snow plow, the combination, with a truck-frame, a shaft mounted on the said truck-frame and having crank-arms, and a lever held on the said truck-frame for turning the said shaft, of a frame hung on the said shaft, and plows and scrapers held on the said frame, substantially as shown and described.

6. In an ice-plow, the combination, with a truck-frame, of a shaft journaled in the said truck-frame and provided with crank-arms, and a frame hung on the said crank-arms and guided on the said truck-frame, substantially as shown and described.

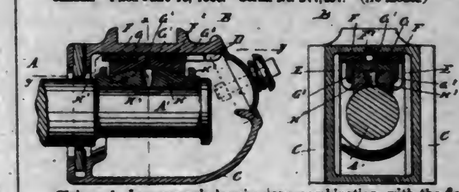
7. In an ice-plow, the combination, with a truck-frame, of a shaft journaled in the said truck-frame and provided with crank-arms, a frame hung on the said crank-arms and guided on the said truck-frame, and plows and scrapers held on the said frame, substantially as shown and described.

8. In an ice-plow, the combination, with a truck-frame, of a shaft journaled in the said truck-frame and provided with crank-arms, a frame hung on the said crank-arms and guided on the said truck-frame, and flangers secured to the said frame, substantially as shown and described.

9. In an ice or snow plow, a drum carried upon a car-body and adapted to be turned, in combination with shafts carried by a truck-frame having crank-arms and adapted to turn, frames pivotally suspended upon said crank-arms, and plows, scrapers, and flangers held on the said frames, the said drum and shafts being operatively connected by means of chains, substantially as shown and described.

10. In an ice or snow plow, the combination, with the post or device which carries the ice-plow, and the ice-plow, of two bolts of unequal strength, substantially as shown and described, whereby the weaker bolt will be sheared off in case of contact with a solid obstruction, as set forth.

11. In an ice or snow plow, the combination, with two bolts of unequal strength, of an ice-plow held on the said two bolts, and a scraper secured to the said ice-plow, substantially as shown and described.



12. In an ice or snow plow, the combination, with a post, of two bolts of unequal strength and secured to the said posts, an ice-plow held on the said bolts, and a scraper secured to the said ice-plow, substantially as shown and described.

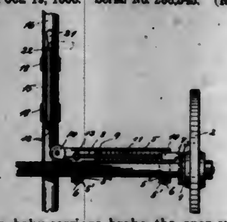
13. In an ice or snow plow, the combination, with flangers, of chains connected with the said flangers, and a fixed plate, to which the said chains are secured, and which will break centrally when the flangers receive an abnormal strain, substantially as shown and described.

14. In an ice or snow plow, the combination, with a frame mounted to swing, and flangers held on the said frame, of chains connected with the said flangers, and a fixed plate, to which the said chains are secured, and which will break when the flangers receive an abnormal strain, substantially as shown and described.

15. In an ice or snow plow, the combination of the flangers and the plate N, connected with the flanger-chains and weakened at the center, substantially as shown and described.

405,040. CAR-AXLE BOX. EDWARD LESLIE, Orangeville, Ontario, Canada. Filed June 18, 1888. Serial No. 277,457. (No model.)

Claim.—1. In a car-axle bearing, the combination, with the flat key fitting into the casing provided with a central aperture, of an intermediate plate held on the under side of the said key and the circular offset fitting into the aperture formed in the said key, substantially as described.



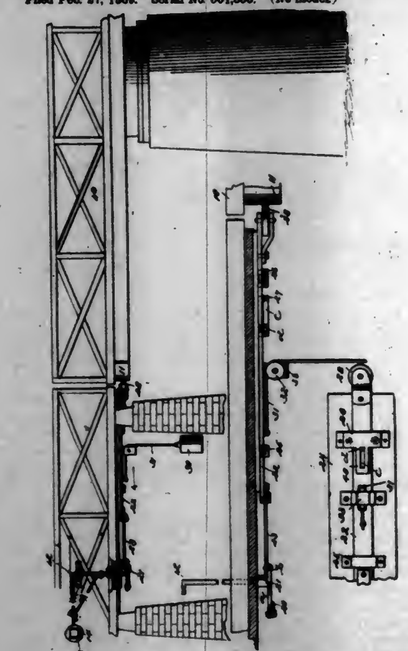
2. In a car-axle bearing, the combination of a flat key fitting into the casing, a central aperture formed therein, an intermediate plate on the under side of the said flat key and with a semi-cylindrical concave bearing on the under side, and downwardly-extending flanges formed on the side of said plate, and an axle-brass fitted between said flanges and provided with a semi-cylindrical convex bearing on its upper side, substantially as described.

3. In a car-axle bearing, the combination of a flat key fitted in the casing, a central aperture formed therein, an intermediate plate bearing against the under side of the key and provided with a circular offset fitting into the opening in the key, having on its under side a semi-cylindrical concave recess, downwardly-extending flanges, and an axle-brass having its bearing on the bottom of the intermediate plate and provided on its upper side with a semi-cylindrical convex surface and arranged within the downwardly-extending flanges, substantially as described.

4. In a car-axle bearing, the combination, with the box or casing, of a key fitted in the casing and provided with a central opening, an intermediate plate bearing against the bottom of the key and having a circular hub fitting within the aperture formed in the key, the said

intermediate plate being provided with an oil-hole and the semi-cylindrical concave under surface, and an axle-brass fitted to bear against the under side of the intermediate plate and provided with a central conical oil-aperture, substantially as described.

405,041. BRAKE FOR BABY-CARRIAGES. ISAAC LEVY, Newport, R. I. Filed Oct. 19, 1888. Serial No. 288,543. (No model.)



Claim.—1. In a baby-carriage brake, the open-ended casing 5, having integral arms overlapped at their ends to form axle-receiving sleeves 4', and the sliding locking-bolt mounted in said casing, substantially as set forth.

2. A ratchet-collar for the hubs of baby-carriages formed in two hinged parts with a fastening for holding the collar clamped to the hub, substantially as shown and described.

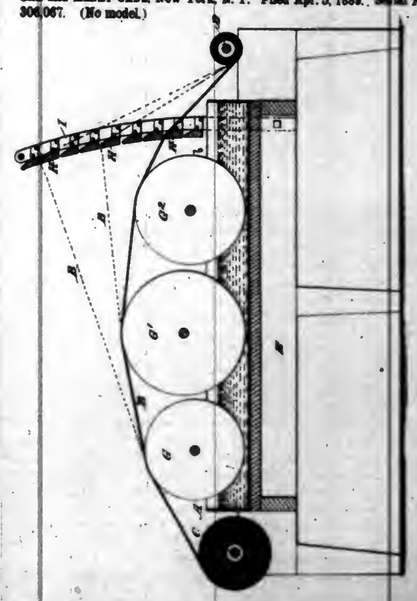
3. A brake for baby-carriages, consisting of collar 1 on the inner face of the hub of one of the rear wheels, and having ratchet-teeth 3, a bolt 7, with spring 11, for holding it in engagement with ratchet-teeth 3, mounted on the axle 4, adjacent to teeth 3, a casing 5, secured to the axle by sleeves having overlapping slotted ends held by a set-screw, the casing covering the bolt and spring, and a guide-rod 8, mounted in a guide-block 9 on the axle, a pulley 14 on the inner end of casing 5, a tubular casing 15, with a slot 22 at its upper end, mounted on one of the handle-arms 16, an L-shaped handle 20 in the upper end of casing 15, with an arm 21 fitting slot 22, and a chain 12, connected at one end to handle 20, extending through casing 15, passing under pulley 14, and connected to the end of guide-rod 8, substantially as shown and described.

405,042. DRAW-BRIDGE SIGNAL. MOSES H. LONG, Sabula, Iowa. Filed Feb. 27, 1889. Serial No. 301,356. (No model.)

Claim.—1. The combination, in a draw-bridge signal, of the vertically-adjustable crane 12, having a sliding collar 15, provided with a set-screw, a wear-plate 17, and a lever 19, having a collar or hub 18 on the lower end of the vertical arm of the frame, a set-screw *e* therefor, with the slide projecting beyond the draw-opening, and connections between the rear end of the slide and the lever 19, substantially as set forth.

2. The combination, with a bridge provided with a cam-face, of a slide provided with an anti-friction roll, straps by which the slide is supported, one of said straps being provided with a slot, a stud carried by the slide which rides in said slot, a weight connected with the slide, a bell-crank lever, connections between the bell-crank lever and the slide, a crane, a lever-arm carried thereby, and connections between said lever-arm and the bell-crank lever, substantially as described.

3. The combination, with a bridge provided with a cam-face, of a slide carrying an anti-friction roll against which the cam-face at times will bear, a weight connected to the slide, a bell-crank lever provided with slotted arms, a link connected to the slide and adjustably connected to one of the bell-crank-lever arms, a crane, a slotted lever-arm adjustably connected thereto, and a link connecting said lever-arm and one of the bell-crank-lever arms, substantially as described.

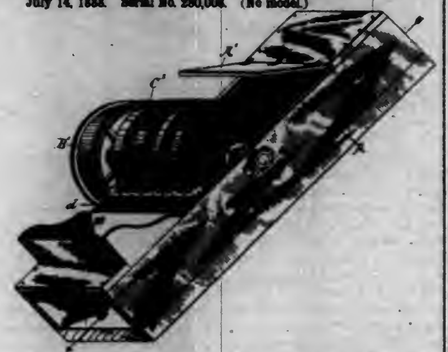


405,043. STAND FOR SEWING-MACHINES. WILLIAM A. MACK, Norwalk, Ohio. Filed Mar. 6, 1885. Serial No. 157,877. (No model.)

Claim.—1. In a sewing-machine stand, the combination, with two or more shelves supported in position by metallic arms, of two or more drawers supported on the upper side of said shelves, and each guided longitudinally by a tongue operating within a groove, substantially as set forth.

2. In a sewing-machine stand, the combination, with two or more shelves supported in position by detachable metallic arms, said arms extending within grooves or openings arranged transverse to the length of said shelves, of two or more drawers supported on the upper side of the latter, and a tongue or groove for guiding the same, substantially as set forth.

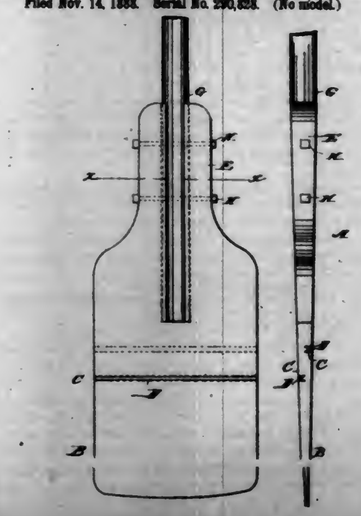
405,044. APPARATUS FOR COATING PAPER. GEORGE MANAHAN and HENRY GADE, New York, N. Y. Filed Apr. 5, 1889. Serial No. 306,067. (No model.)



Claim.—1. The combination, with the web-carrying roller C, web take-up roller D, the vat A, and two or more smearing or coating rolls projecting down within the vat and arranged one behind the other, of a rack of fixed scrapers H H, arranged one above the other and extending above and to and below the level of the smearing-rolls, essentially as and for the purposes herein set forth.

2. The combination, with the vat A and the series of smearing or coating rolls arranged to work therein, of the fixed scrapers H H, arranged one above the other, and in overhanging relation with one another above and over the vat, substantially as specified.

3. The scrapers H, constructed with a recess *d* intermediately of their length and arranged one above the other, as described, in combination with the series of smearing-rolls, the vat, and the web-carrying and take-up rollers, essentially as and for the purpose herein set forth.

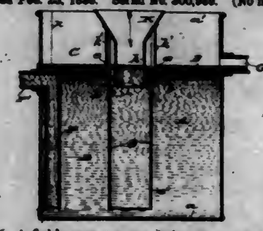


405,045. MAGNETIC MACHINE FOR REMOVING MINERAL SUBSTANCES FROM GRAIN. MARTIN L. MOWERS, Dayton, Ohio. Filed July 14, 1888. Serial No. 280,008. (No model.)

Claim.—1. The combination of the grain-spout A, the shaft B, journaled in bearings in its sides between its receiving and discharging ends, the series of wheels C, mounted thereon and extending partly inside and partly outside said grain-spout, each being provided with a series of magnets C' in its periphery, and the wiper D, mounted on the outside of said spout and formed to extend between said wheels and rest against the sides and edges of said magnets, all substantially as set forth.

2. The combination of the grain-spout A, the shaft B, journaled in suitable bearings and extending transversely through said spout, means for driving said shaft, a series of wheels C arranged thereon, each provided with a series of magnets C' in its periphery, and a wiper D, arranged on the outside of said spout in contact with said wheels substantially as described, and for the purposes specified.

405,046. BAKER'S PEEL. GUSTAV A. NAUMANN, New York, N. Y. Filed Nov. 14, 1888. Serial No. 290,828. (No model.)

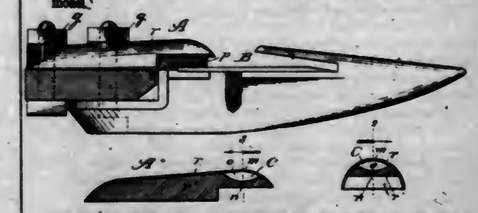


Claim.—1. A baker's peel having its blade provided with transversely-extending ribs embedded therein and serving to prevent the blade from warping, substantially as described.

2. A baker's peel consisting of a wooden blade having transversely-extending and U-shaped ribs embedded in opposite sides of the same, substantially as described.

3. The herein-described baker's peel, consisting of the wooden blade B, having the recess F in its upper end and the transversely-extending grooves C in opposite sides, the metal ribs D, secured in the grooves, and the handle G, secured in the said recess, as specified.

405,047. FLUID-SEPARATOR. THOMAS J. NEWBERY, Wilmington, N. C. Filed Feb. 23, 1889. Serial No. 300,989. (No model.)

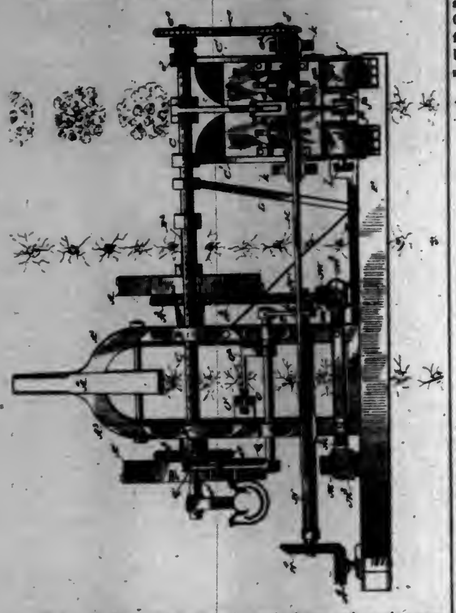


Claim.—1. A fluid-separator consisting of a vessel or tank provided with a horizontal diaphragm forming an upper and lower chamber, a central tube communicating at its upper end with the upper chamber, its lower end extended within the lower chamber near the bottom thereof, a discharge-pipe connected with the lower chamber above the lower end of the central tube, a discharge-pipe connected with the lower portion of the upper chamber, and a funnel or tube adapted to enter the upper end of the central tube and projected therein to a point below the diaphragm, substantially as and for the purpose described.

2. The combination, with the vessel A, provided with a horizontal diaphragm forming an upper and lower chamber, a discharge-pipe connected with the upper chamber just above the diaphragm, and a discharge-pipe connected with the lower chamber just below the diaphragm, of the tube E, centrally disposed within the lower chamber, its upper end projected above the diaphragm, its lower end extended to near the bottom of the vessel, and a funnel or tube K for leading the mixed fluid into the said vessel, said tube K projected within the upper end of the central tube a short distance below the diaphragm, said tube K being of a less diameter than the central tube E, substantially as and for the purpose described.

3. The hereinbefore-described improvement in fluid-separators, consisting of the vessel A, provided with a horizontal diaphragm forming an upper and lower chamber, a central tube communicating with the upper chamber and extended to near the bottom of the vessel A, a discharge-pipe F, connected with the lower chamber near the upper end thereof, and an outlet-cock J at the lower end thereof, a discharge-pipe G, connected with the lower portion of the upper chamber, and a funnel or tube K for leading the mixed fluid to the vessel, said tube projected within the central tube to a point below the diaphragm, said tube K being of a smaller diameter than the tube E, all arranged substantially as and for the purpose described.

405,048. CUTTER-BAR GUIDE FOR HARVESTERS. JOSEPH D NOREN, La Porte, Ind. Filed Dec. 20, 1888. Serial No. 294,164. (No model.)



Claim.—1. In a guide A for the cutter-bars of harvesting-machines, the combination of a metal cap *r* and a wooden filling *r'* within the cap substantially as described.

2. A guide A for the cutter-bars of harvesting-machines, comprising a metal cap *r* and a filling *r'* within the cap provided with a lubricant-receptacle, substantially as described.

3. A guide A for the cutter-bars of harvesting-machines, comprising a cap *r*, provided with a perforation *m* near one end, a wooden filling *r'* within the cap, having a concavity *o* coincident with the perforation in the cap, and an opening *n* in its base, substantially as described.

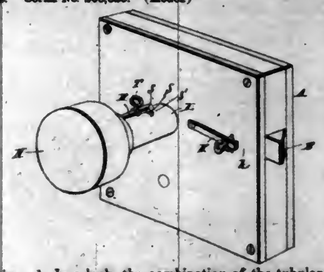
405,049. COTTON-HARVESTER. RICHARD H. PURNELL, Rosedale, assignor of one-half to William E. Ringo, Mound Landing, Miss. Filed Aug. 23, 1888. Serial No. 283,528. (No model.)

Claim.—1. The combination of a main frame and running-gear, a hollow shaft C, made of a length to extend transversely across three rows of plants, a driving-shaft arranged within the same and geared to one of the supporting-wheels, and a cotton-picking device supported on wheels and pivotally connected by draft-arms to the outer end of the hollow shaft and having its operating parts connected to and worked by the driving-shaft within said hollow shaft, substantially as shown and described.

2. The combination, with the main frame and running-gear and the hollow shaft C, with a drive-shaft within it, of the picking-box supported on wheels and pivotally connected to the hollow shaft, and an adjusting-lever for raising and lowering the picking-box, and mechanism for operating the picker, substantially as shown and described.

3. The combination, with the main frame and running-gear, the hollow shaft C, with drive-shaft within it, a clutch-gear for connecting one of the supporting-wheels with said drive-shaft, a picking device supported on wheels and pivotally connected to the outer end of the hollow shaft and geared to and operated by the drive-shaft, a main cotton-carrier F, consisting of a trough or box with an endless belt having one end connected to the picking device and the other mounted upon the main frame, and a gearing with interposed clutch connecting the belt of its carrier to one of the main drive-wheels, substantially as shown and described.

4. The combination of the hollow shaft C, the picking-box D, made in two halves, the draft-arms C' C', connecting the box to the hollow shaft in a pivotal manner, the cross-head I, adjustable arm J^3, legs J J, with rollers at their lower ends, the guide-bar *l* on the box, and the braced frame composed of bars K and L and the main frame A^3, substantially as and for the purpose described.

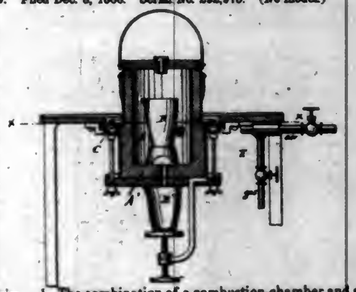


5. The combination, with the picker-box D, made in two halves, with curved pieces *a a*, guard-ribs *b*, teeth c^3, and rod b^3, of the horizontal belts *d d*, arranged in the bottom on each side, the vertical picker-cylinder E, with teeth *c*, the elevator-belt *f*, the grating *g*, and beater *h*, substantially as shown and described.

6. The combination of a pair of vertical picking-cylinders, a pair of horizontal belts to receive the cotton, located at the bottom of the picking-cylinders, a pair of toothed elevator-belts arranged vertically at the rear ends of the horizontal belts, a beater for driving down the hulls and sticks, and a revolving brush arranged upon the opposite side of the elevator-belt, substantially as and for the purpose described.

7. The combination, in a cotton-harvester, of the frame having the running-gear, the hollow shaft C, supported thereon, the picking-box arranged at the outer end of the shaft, a revolving shaft extending through the hollow shaft and operating the picker devices, and a cotton-carrier consisting of a trough or box F, with a belt in it connected at one end to the picker-box and at the other to the running-gear and arranged transversely to the line of draft, as described.

8. The combination, with the hollow shaft C and the inner drive-shaft c^7, of the picking-box D, mounted upon wheels, the draft-arms C' C', pivotally connecting the same to the hollow shaft, a sliding frame connected to the wheels for adjusting the box vertically, the braced frame K L, and the guide *l*, substantially as shown and described.



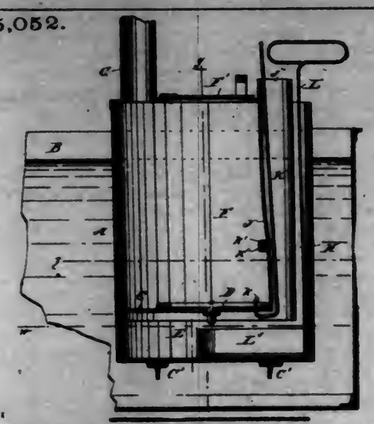
405,050. LATCH AND LOCK COMBINED. WILLIAM W. PURSEL and FRANK P. PURSEL, Berwick, Columbia County, Pa. Filed Mar. 29, 1888. Serial No. 268,825. (Model.)

Claim.—1. In a lock, the combination of the tubular shaft connected to the tumbler, the shaft O, mounted in the tubular shaft and having a groove or notch in its side adapted to be aligned with an aperture in the tubular shaft, the spring-latch mounted on the tubular shaft and engaging the said aperture and groove or notch, and the sliding ring or handle T, mounted on the latch, all constructed, arranged, and operated substantially as and for the purpose specified.

2. In a lock, the combination, with the tumbler having a barrel provided with a groove, of the tubular shaft mounted in the said barrel and having a rib M on its side engaging the said groove, the removable knob on the end of the shaft, the knob-shaft O, mounted in the tubular shaft and having a head *o* engaging a shoulder *s* in the tubular shaft, the knob attached to the shaft O, and the spring-latch R, mounted on the tubular shaft and adapted, when in its normal position, to lock the said shafts together, substantially as specified.

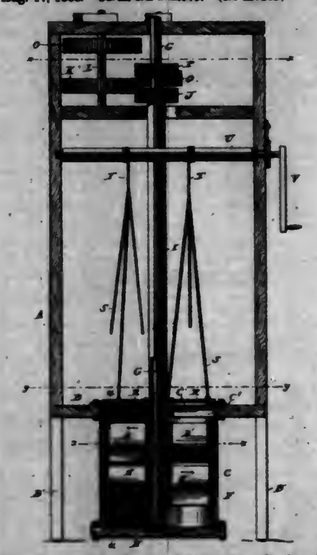
405,051. GAS-FURNACE. EDWARD P. REICHELM, Jersey City, N. J. Filed Dec. 8, 1888. Serial No. 292,975. (No model.)

Claim.—1. The combination of a combustion-chamber and a ring-shaped distributing-chamber, said ring-shaped distributing-chamber being constructed in two circular sections, one section of which is provided with burner-tubes extending inwardly through the walls of the combustion-chamber.



2. The combination of a combustion-chamber, an annular distributing-chamber surrounding the combustion-chamber, and a number of burner-tubes extending inward from the distributing-chamber through the walls of the combustion-chamber, said burner-tubes being disposed tangentially to a circle within the combustion-chamber and inclined downward from the distributing-chamber.

405,052. TANK-HEATER. HANFORD REYNOLDS, Gifford, Ill. Filed Feb. 13, 1889. Serial No. 299,707. (No model.)



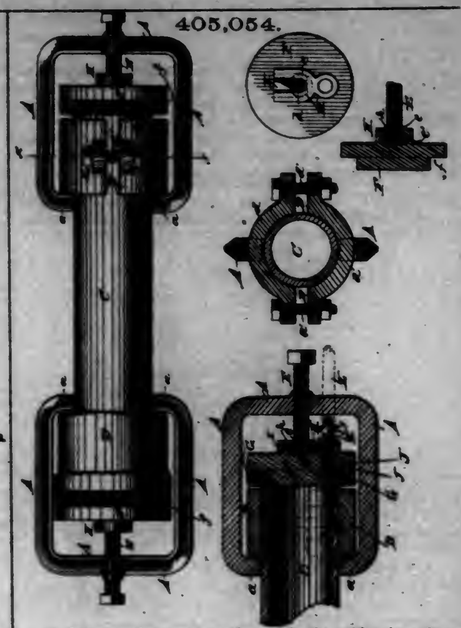
Claim.—1. The casing A, having the flange C, grate D, and vertical partition J, formed with a socket, in combination with the shaker adapted to be fulcrumed at the said socket and engaged at its lower end with the grate, substantially as described.

2. The shaker K, formed with the upwardly-projecting point *k* at its lower end and stud *k'* near its center, in combination with the heater having the vertical partition J, forming a side passage, and having the pivoted grate D near its bottom, the partition being formed with a socket to retain the stud *k'* to fulcrum the shaker, substantially as described.

405,052.

405,053. WATER-WHEEL. JAMES T. ROSS, Locust Grove, Pa. Filed Aug. 17, 1888. Serial No. 282,973. (No model.)

Claim.—The combination, with the water-wheel casing, of the upper horizontal rimless water-wheel D, having inclined buckets D', and the lower horizontal water-wheel E, having oppositely-inclined buckets E' and a surrounding rim extending upwardly and inclosing the rimless wheel, a space being formed between the exterior of the rim and the interior of the casing, substantially as and for the purpose specified.



405,054. PIPE-TESTING MACHINE. MICHAEL SEXTON, New York N. Y. Filed Jan. 25, 1889. Serial No. 297,514. (No model.)

Claim.—1. A pipe-testing apparatus consisting of clamping devices comprising open-ended frames adapted to hook onto or grip the pipe or a collar thereon, screws fitted at the outer ends of the clamp-frames, and head-plates swiveled to the screws and adapted to close the ends of the pipe, one of said head-plates having a testing-fluid inlet, substantially as herein set forth.

2. In pipe-testing apparatus, the combination, with a clamp-frame A, having hooks *a a* at its open end, of a screw E, fitted at the opposite end of the clamp-frame, and a head-plate swiveled to the screw and adapted to bear directly or by a packing onto the end of a pipe, substantially as herein set forth.

3. In pipe-testing apparatus, the combination, with a pipe, of a collar clamped thereto, a clamp-frame A, having hooks *a a*, engaging the collar, a screw fitted in the clamp-frame, and a head-plate swiveled to the screw and adapted to bear directly or by a packing onto the end of the pipe, substantially as herein set forth.

405,054.

4. In pipe-testing apparatus, the combination, with a clamp-frame adapted to grip the pipe, and a screw E, fitted in said frame and having a reduced end *e* and washer *e'*, of a head-plate having a T-shaped slot A, into which the parts *e e'* are passed, and a bit or wedge I, inserted in the slot behind the screw, substantially as described, for the purposes set forth.

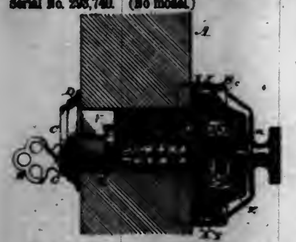
405,055. SAFETY-HOOK FOR HARNESS. CHARLES SMITH, Rogers, Ark. Filed Jan. 17, 1889. Serial No. 296,586. (No model.)

Claim.—1. The combination, with a hook proper, of a swinging loop B, having its two arms pivoted, respectively, to the back and to the free end of said hook on aligned pivots at right angles to the length of the hook, one of said arms being provided with an extension *b'*, adapted to close the mouth of the hook when in operative position, substantially as described.

2. The combination, with a hook having a curved offset a^3 extending partially over its mouth, of the loop having its arms pivoted respectively, to the back and free end of the hook, and a closing-arm formed by an extension of one arm of the loop and provided with a curved free end to fit beneath the offset or shoulder a^3, substantially as specified.

3. The combination, with a hook having its back a^3 provided with the lateral ears or extensions D D, of the loop embracing the hook and having its arms pivoted, respectively, to the back and free end of the hook, and the closing-arm connected to one arm of the loop and traveling at its free curved end over the said ears or extensions D D, substantially as and for the purpose specified.

405,056. WASH-BOILER. ASA P. TABB, Rockport, Mass. Filed Oct. 17, 1888. Serial No. 288,316. (No model.)



Claim.—1. The combination, with a boiler-body provided with loops, of a cover provided with hooks adapted to engage the said loops, substantially as described.

2. The combination, with a boiler-body provided with loops, of a cover provided with hooks adapted to engage said loops, the hooks being connected to the inside of the cover-flange and extending through the top of the cover, substantially as described.

3. A boiler-cover having suspension-hooks secured to its inner side and projecting at their outer ends through the cover and forming stop projections 16, substantially as set forth.

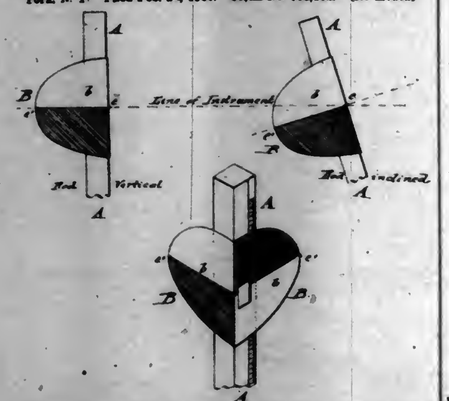
405,057. LOCK. WARREN H. TAYLOR, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Dec. 15, 1888. Serial No. 293,740. (No model.)

Claim.—1. The combination, with a tumbler-case or escutcheon for a lock, of a key-hub and a connecting-bar for connecting the hub operatively with a door-latch, the hub and connecting-bar being hooked together by means of a pin and pin-hole, substantially as set forth.

2. In a tumbler-case or escutcheon for a lock, a key-hub provided with a slot for receiving a connecting-bar and a lug or pin projecting over or within the lines of the slot and adapted to hook one end of the connecting-bar in place, substantially as set forth.

3. A connecting-bar for an escutcheon-lock provided with a hole in one end for hooking it to a key-hub, substantially as set forth.

4. A connecting-bar for a lock weakened transversely at intervals, so that it can be readily broken off for fitting it to place, substantially as set forth.



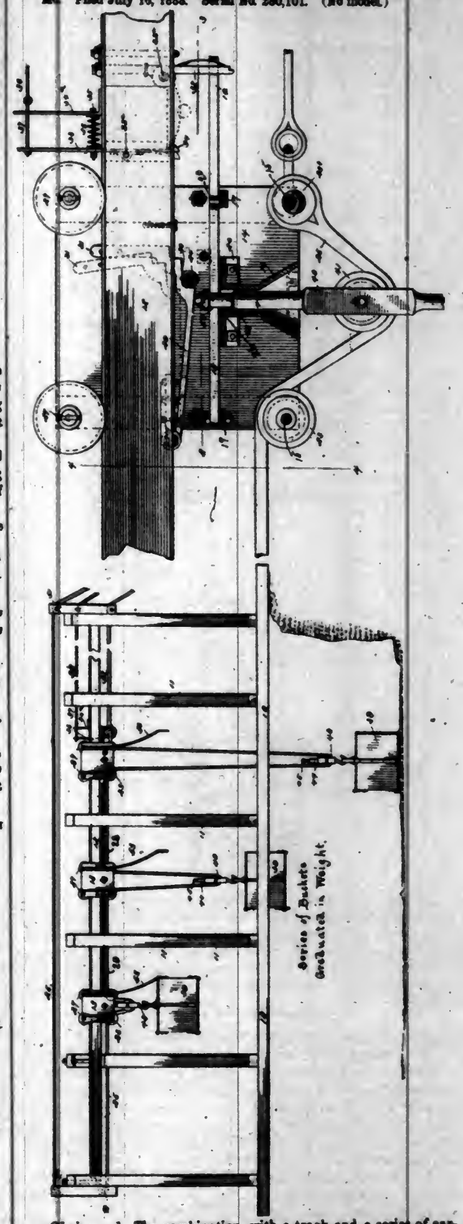
5. In an escutcheon-lock, an improved escutcheon-holding screw weakened at intervals, adapting it to be broken off, substantially as set forth.

6. In a lock, a roll-back I, provided with a slot extending entirely through it for receiving one end of a connecting-bar, substantially as set forth.

7. In a lock, the combination, with the through-slotted roll-back, of the connecting-bar and key-hub, substantially as set forth.

8. In a lock, the combination, with a through-slotted roll-back, a connecting-bar, a key-hub, and two bolt-rods arranged so as to leave a space for the end of the connecting-bar, substantially as set forth.

405,058. SURVEYOR'S TARGET. SAMUEL C. THOMPSON, New York, N. Y. Filed Feb. 20, 1889. Serial No. 301,182. (No model.)



Claim.—1. A surveyor's target formed of two halves arranged at right angles to each other, substantially as set forth.

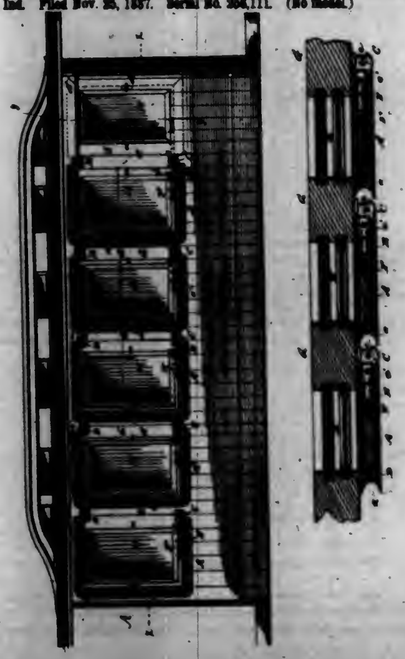
2. A surveyor's target formed of two halves arranged at right angles to each other and provided with vertical and horizontal intersecting lines, substantially as set forth.

3. A surveyor's target formed of two halves arranged at right angles to each other and provided with vertical and horizontal intersecting lines, and with pins at the intersection of said lines and at the outer ends of the horizontal line, substantially as set forth.

405,059. SUSPENDED RAILWAY. JOHN THOMSON, Kansas City, Mo. Filed July 16, 1888. Serial No. 280,101. (No model.)

Claim.—1. The combination, with a track and a series of carriages adapted to travel thereon and having pulleys journaled in their lower portions, of a corresponding series of buckets of graduated weights, a like series of latch-sheaves adapted for connection with said buckets, and a rope which is secured to the forward carriage of the series and then passes successively through each latch-sheave and over the pulleys of each carriage of the combined series, as shown and described, whereby the said rope serves as the means of hoisting all the said buckets successively, as set forth.

2. The combination, with a track, a series of carriages traveling thereon having pulleys journaled in their lower ends, and a series of buckets of graduated weight, of latch-sheaves adapted to engage said buckets, and a rope secured to the forward carriage, passing alternately over the carriage-pulleys and through the latch-sheaves, substantially as shown and described.



3. The combination, with a track, a series of carriages traveling thereon having pulleys journaled in their lower ends, and a series of buckets graduated in weight from the forward to the rear, the forward bucket being the heaviest, of latch-sheaves adapted to engage said buckets, and a rope secured to the forward carriage, passing alternately over the carriage-pulleys and through the latch-sheaves, as and for the purpose specified.

4. The combination, with a track, a series of carriages traveling thereon having pulleys journaled in their lower ends, a series of buckets graduated in weight from the front to the rear, the heaviest bucket being at the front, and latch-sheaves adapted to carry said buckets, of stay-rods projected downward from the carriage, a rope secured to the forward carriage, passing alternately over the carriage-pulleys and through the latch-sheaves, and means, substantially as shown and described, for locking the latch-sheaves in the carriages and releasing said carriages, as and for the purpose specified.

5. The combination, with a track, a series of carriages traveling thereon having pulleys journaled in their lower ends, coupling-rods uniting said carriages, a series of buckets graduated in weight from front to rear, the rear bucket being the lightest, and latch-sheaves adapted to carry said buckets, of a rope secured to the forward carriage, passing alternately over the carriage-pulleys and through the latch-sheaves, and means, substantially as shown and described, for locking the carriages upon the track and automatically releasing the same, as set forth.

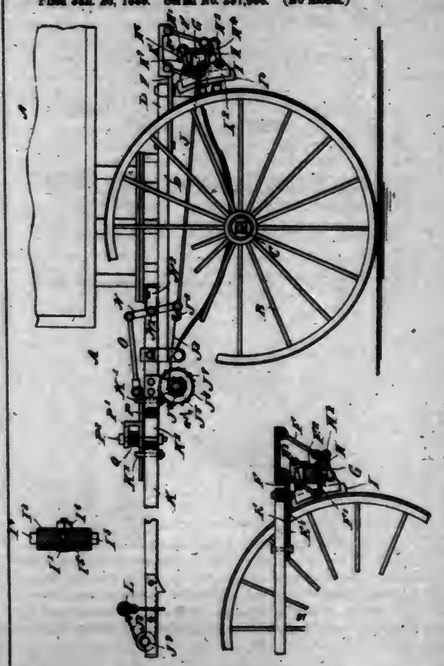
6. The combination, with a track, a train of united carriages traveling upon the same, a transverse stop-bar secured in the said carriages, and pulleys journaled therein, and a gravity-latch pivoted in the track engaging the stop-bar of the forward carriage, of a series of buckets graduated in weight, latch-sheaves attached to said buckets, and a rope secured to the forward carriage, passing alternately over the carriage-pulleys and through the latch-sheaves, substantially in the manner and for the purpose specified, whereby the buckets are raised alternately from the rear and the carriages released when elevated, as set forth

405,060. SMOKE AND DUST FENDER FOR CAR-WINDOWS. ELIJAH F. WALLER, Hanson, Ky., and OTTO A. CARLSTEDT, Evansville, Ind. Filed Nov. 25, 1887. Serial No. 256,111. (No model.)

Claim.—1. A smoke and dust fender for car-windows, consisting of a guard-plate extended around the side, top, and bottom of a window and hinged to the car-body between two windows, substantially as shown and described, whereby the same fender may be used for either of the two windows and will guard either window at the side, top, and bottom, as and for the purposes herein set forth.

2. A smoke and dust fender for car-windows, consisting of a guard-plate extended around the side, top, and bottom of a window and hinged to the car-body between two windows to serve for either of them, and latch devices locking the fender at either window, substantially as herein set forth.

405,061. SPEAKING-TUBE. JOSEPH WALTER, New York, N. Y. Filed Mar. 6, 1889. Serial No. 302,156. (No model.)



Claim.—1. The combination, with the mouth-piece of a speaking-tube, of a casing back of the mouth-piece, a whistle arranged at an angle of inclination at the upper part of the casing, an inclined plate converging toward the whistle and having an aperture arranged at the lower part of the casing, and a pendent valve hinged back of the apertured plate, substantially as set forth.

2. The combination, with the mouth-piece of a speaking-tube, of a casing back of said mouth-piece, an inclined whistle in said casing, an inclined and apertured plate converging toward the whistle, a pendent valve hinged back of the apertured plate, and an indicator hinged in front of said plate, substantially as set forth.

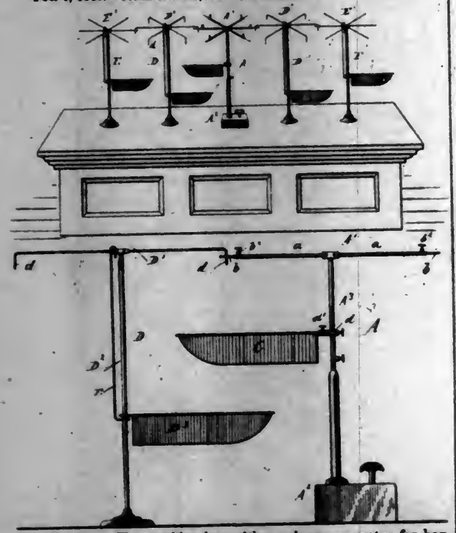
3. The combination, in a speaking-tube, of a mouth-piece having a ring-shaped flange at its inner end, a casing back of said mouth-piece communicating at the rear end with the speaking-tube, a whistle located in inclined position at the upper part of said casing, an inclined and apertured plate converging toward the whistle, a pendent valve hinged back of said apertured plate, and an indicator hinged in front of the inclined plate and provided with a cup-shaped upper part, substantially as set forth.

405,062. WAGON-BRAKE. LESLIE WETHERBEE, Clayton, Mich. Filed Jan. 26, 1889. Serial No. 297,698. (No model.)

Claim.—1. In a wagon-brake, the combination, with the pole and the neck-yoke held thereon, of a brake-beam connected with the said neck-yoke and mounted to swing, arms held to turn on the said brake-beam, and brake-blocks pivotally connected with the said arms, substantially as shown and described.

2. In a wagon-brake, the combination of a brake-beam suspended from the rear ends of the hounds by means of a pivotal connection, and brake-blocks pivotally connected to the beam, substantially as described.

3. In a wagon-brake, the combination, with a brake-beam mounted to swing, of a set of parallel arms mounted to turn on each end of the said brake-beam, and a brake-block pivotally connected with the outer ends of each set of the said parallel arms, substantially as shown and described.



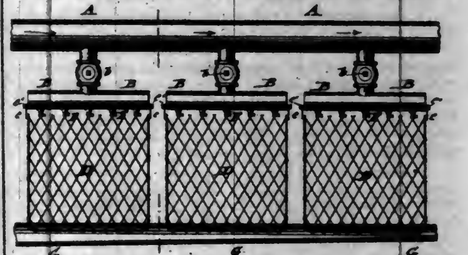
4. In a wagon-brake, the combination, with a brake-beam mounted to swing, of a set of parallel arms mounted to turn on each end of the said brake-beam, a brake-block pivotally connected with the outer ends of each set of the said parallel arms, and a spring held on each set of parallel arms to hold the said brake-blocks out of contact with the wheels when backing up the wagon, substantially as shown and described.

5. In a wagon-brake, the combination, with a brake-beam mounted to swing, of a set of parallel arms mounted to turn on each end of the said brake-beam, a brake-block pivotally connected with the outer ends of each set of the said parallel arms, and a lug secured on each end of the brake-beam and passing over one of the said parallel arms to prevent the brake-blocks from opening too far, substantially as shown and described.

6. In a wagon-brake, the combination, with the pole and the neck-yoke held thereon, of a pulley held in the front end of the said pole, a chain passing over the said pulley and connected with the neck-yoke, a shaft held near the rear end of the said pole and carrying a large pulley, on which winds the said chain, a second smaller pulley held on the said shaft, and a second chain held on the said pulley and connected by a rod with a swinging brake-beam, substantially as shown and described..

7. In a wagon-brake, the combination, with the pole and the neck-yoke held thereon, of a pulley held in the front end of the said pole, a chain passing over the said pulley and connected with the neck-yoke, a shaft held near the rear end of the said pole and carrying a large pulley on which winds the said chain, a second smaller pulley held on the said shaft, a second chain held on the said pulley, a rod connected with the said second chain, and a brake-beam mounted to swing and connected with the said rod, substantially as shown and described.

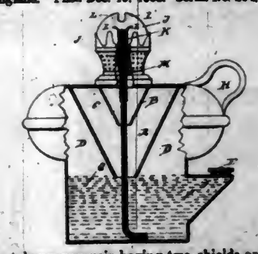
405,063. FLY-FAN. CHARLES F. WILSON, New York, N. Y. Filed Feb. 6, 1889. Serial No. 298,582. (No model.)



Claim.—1. The combination, with a primary or motor fan having a spider-frame and fan-blade rotated by a prime motor, of a number of secondary fans arranged at both sides of the primary fan and provided with fan-blades, and the spider-frames, the alternating spider-frames having downwardly-bent and straight arms, substantially as set forth.

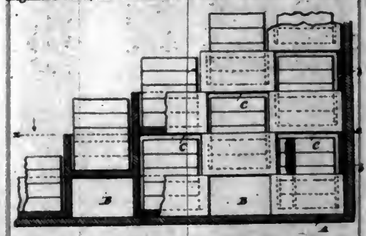
2. In a system of fly-fans, a primary or motor fan formed of a spider-frame and an adjustable fan-blade applied to the spindle of said spider-frame, a prime motor for rotating said spider-frame and fan-blade, and a number of secondary fans provided with rotary spider-frames, fan-blades rotating with said spider-frames, the alternating spider-frames having downwardly-bent and straight arms, substantially as set forth.

3. In a fly-fan, the combination of a supporting-stand, a spider-frame supported at the upper end of said standard, a suspending hanger-rod connected with the hub of said spider-frame and provided with a guide-eye or sleeve for the upright standard, and a radial fan-blade on said hanger, substantially as set forth.



405,064. AIR-COOLING APPARATUS. JOSEPH L. WOOD, New York, N. Y. Filed Jan. 4, 1889. Serial No. 295,422. (No model.)

Claim.—1. The combination of a brine-supply pipe, discharge-heads connected with the same, said heads having rows of openings at the under side, distributing-screens suspended from said heads and provided with wire shanks, and adjustable plugs located on the wire shanks and extending into the openings of the heads, substantially as described.



2. The combination, with a valved brine-discharge head having rows of openings at the under side, one row of openings alternating with the adjoining ones, of a number of screens suspended from said head and provided with wire shanks extending into the openings and with adjustable plugs surrounding said shanks and having conically-tapering ends, and clamping-screws, substantially as set forth.

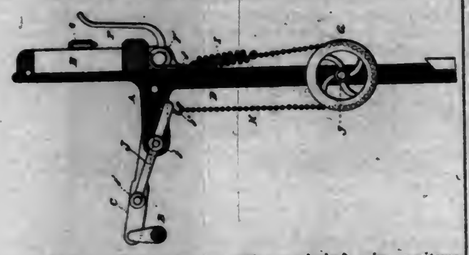
405,065. OIL-LAMP. FREDERICK J. ALLMOT, Plaistow, County of Essex, England. Filed Dec. 19, 1888. Serial No. 294,023. (No model.)

Claim.—A lamp-reservoir having two shields or baffles A and B and a feeding-aperture *f* below the level of the bottom of the shield or baffle B, the capacity of the upper part D of the reservoir being at least one-half that of the entire reservoir, substantially as and for the purpose hereinbefore set forth, and illustrated in Figs. 1 and 2.

405,066. METHOD OF BURNING BRICK. JAMES C. ANDERSON, Highland Park, Ill. Filed June 9, 1888. Serial No. 276,615. (No model.)

Claim.—An improvement in the art of burning brick in seggars, which consists in arranging the seggars in the kiln so as to form open cells between and above the same, filling the seggars and the open cells with the brick to be burned, and finally burning the brick, as set forth.

405,067. PAPER BAG. JAMES ARKELL, Canajoharie, N. Y., assignor to Sarah Hall Arkell, same place. Filed Feb. 27, 1888. Serial No. 301,369. (No model.)

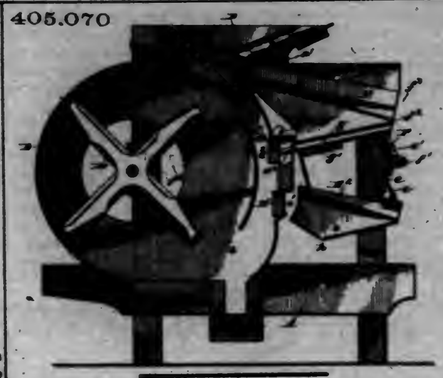


Claim.—A paper bag or sack having throughout its body portion corrugations or indentations which render said body portion more pliable and which make it more stretchable or superficially elastic than the body portion of a bag composed of the same stock, but not so corrugated or indented.

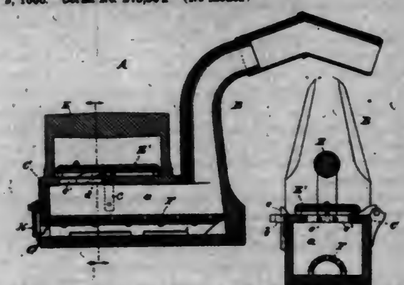
405,068. SOFT-TIE PAPER BAG. JAMES ARKELL, Canajoharie, N. Y., assignor to Sarah Hall Arkell, same place. Filed Feb. 27, 1889. Serial No. 301,370. (No model.)

Claim.—The improved soft-tie paper bag hereinbefore described, the mouth end or portion of which has compressed corrugations or crimps of a depth about equal to the thickness of the paper, whereby said mouth end or portion is softened without detriment to the strength of the fabric, all substantially as hereinbefore set forth.

405,069. SHUTTLE CHECKING AND RELIEVING MECHANISM FOR LOOMS. EDWARD M. BALL, South Berwick, Me., assignor to James Hamilton, Herbert R. Hamilton, and Napoleon Boisvert, all of Salmon Falls, N. H. Filed May 24, 1888. Serial No. 274,900. (No model.)



Claim.—The combination, with a crank-shaft, a lay, a pitman connecting the crank-shaft and lay, and a rock-shaft carrying a binder-arm, of a spring connected to the rock-shaft, a guide-pulley journaled on one of the lay-swords below the spring, a lever fulcrumed at an intermediate point of its length on the lay and pivoted at one end to the lay-pitman at a point in juxtaposition to the pivot-connection of said lay-pitman to the crank-shaft, and a chain passing around the guide-pulley and connected at its ends to the other end of said lever and the spring, substantially as and for the purpose described.

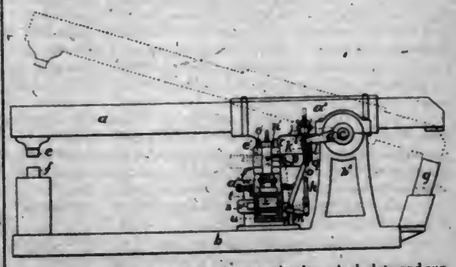


405,070. GRAIN-CLEANER. BENJAMIN P. BARNEY, Harper, Kans. Filed Jan. 23, 1889. Serial No. 297,304. (No model.)

Claim.—The combination of the blast-fan, the fan-case, the blast trunk extending over the fan-case toward the front thereof and having the valved openings, the grain-receiving spout at the bottom of said trunk, the upper shoe having its bottom board arranged to discharge into said trunk and provided with a slide-covered opening and the lower screen-shoe arranged to receive from the upper shoe whereby the grain may at will either be discharged from the upper shoe through the blast or receive a second sifting, substantially as specified.

405,070

405,071. SAD-IRON. WILLARD BELL, Greencastle, Ind. Filed May 9, 1888. Serial No. 273,364. (No model.)

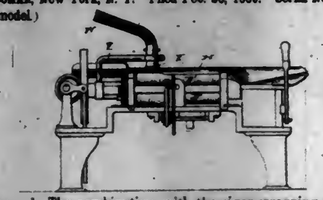


Claim.—1. The sad-iron having in its bottom a serially apertured or perforated plate semicircular in cross-section, a corresponding opening in its rear end, and pivoted skeleton plate, applied to form a rim or flange around said opening at the bottom of and partly covering said opening, substantially as and for the purpose specified.

2. The sad-iron having in its bottom the serially apertured or perforated plate, semicircular in cross-section, a corresponding opening in its rear end or wall, a skeleton or aperture plate forming a flange at the bottom of and partly covering said opening, and a second plate or door applied to the sad-iron upon a common pivot-bolt, substantially as and for the purpose specified.

3. The sad-iron having its cover or top provided with a series of viewing-apertures, said cover or top also having applied thereto a raised shield or deflector provided with a mica-covered viewing-opening in alignment with the aforesaid apertures, substantially as and for the purpose set forth.

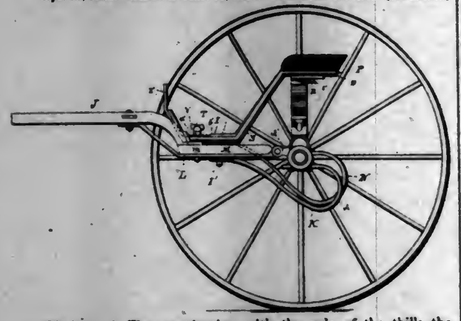
405,072. STEAM-HAMMER. JOHN H. BLAKE, Deering, Me. Filed Mar. 9, 1889. Serial No. 302,696. (No model.)



Claim.—1. In a steam belve-hammer having a bed-plate and supporting-standards, a belve-hammer mounted on a trunnion journaled in said standards, a steam-cylinder with piston and piston-rod, a cross-head connecting piston-rod and helve, a steam-chest with ports opening into the cylinder one above the other below the piston, a valve adapted to open and close the ports alternately, and a valve-stem adapted to move up and down in a stem-hole in a fixed block, said stem having a vertical slot therein, the combination, with said stem,

of a horizontal slide moving in said block and passing through the slot in the valve-stem, said slide having a slot therein, as described, to operate the valve, a lever attached to said slide, and a vertical rod attached to an arm on the lever, said rod being operated by an arm rigidly fixed on the trunnion, all substantially as and for the purposes hereinbefore set forth.

2. In a steam-hammer having cylinder, piston, piston-rod, cross-head connecting helve and piston-rod, a steam-chest with ports opening one above the piston the other below, a valve adapted to open and close said ports alternately, a valve-stem running in a fixed block *o*, as described, the combination, with horizontal slide *p*, having slot *r*, lever *o*, attached to slide *p* in slot *q*, rigid arm *m*, attached to lever *o*, vertical rod *h*, attached to arm *m* and having a screw-thread at the top, and arm *g*, rigidly set on trunnion *e* and having the pivoted clasp *i*, of nuts *j* and *k*, the one above the other below the clasp *i*, substantially as and for the purposes hereinbefore set forth.



405,073. CIGAR WRAPPING AND ROLLING MACHINE. CLARK W. BOMAN, New York, N. Y. Filed Feb. 28, 1889. Serial No. 301,523. (No model.)

Claim.—1. The combination, with the cigar wrapping or receiving rolls, of a blast-nozzle placed opposite the point where the front end of the wrapper enters, to discharge air at that point upon said portion of the wrapper, substantially as and for the purposes hereinbefore set forth.

2. The combination of the cigar wrapping or receiving rolls, the table over which the wrapper passes to said rolls, and the blast-nozzle for tucking the front end of the wrapper between the rolls, substantially as and for the purposes hereinbefore set forth.

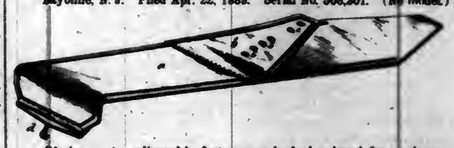
405,074. ROAD-CART. FRANK H. BOSI, Sioux City, Iowa. Filed Apr. 18, 1888. Renewed Mar. 26, 1889. Serial No. 304,921. (No model.)

Claim.—1. The combination, with the axle, of the thills, the angle-braces connecting the thills and axles, the short arms secured upon the rear horizontal portions of the corresponding angle-braces, and the curved side springs having their rear ends secured to the axle by clips or otherwise and their front ends secured to the corresponding short arms, the bolts passing through eyes in the underlying angle-braces, substantially as specified.

2. The combination, with the axle, the head-block, and the transverse elliptic spring, of the body, the slotted metal straps secured to the bottom of the seat and foot-rest, the strong metal strap bolted to the upper section of the elliptic spring and having upturned perforated ends, the curved central longitudinal spring secured to the axle at its rear end and having its front end perforated, and the adjusting bolts and nuts, substantially as specified.

3. The combination, with the axle, head-block, elliptic spring, and body, having its foot-rest slotted longitudinally and centrally, of the slotted metal strap secured to the upper surface of the foot-rest, with the slot coincident with the slot thereon, the curved central longitudinal spring secured to the axle at its rear end and having its front end perforated, the adjusting bolt and nut, the corrugated washer, and the corrugated slotted plate, substantially as specified.

4. The combination, with the axle, head-block, elliptic spring, and the strap secured centrally to the upper section of said spring and provided with upturned perforated ends, of the body supported on a longitudinal spring under its foot-rest, the slotted straps secured under the seat, and the adjusting bolts and nuts, substantially as specified.



405,075. LIQUID-MEASURE. DAVID BOTHWELL, Hannibal, N. Y. Filed Feb. 20, 1889. Serial No. 300,562. (No model.)

Claim.—1. The combination, with the body A, provided with a faucet 2, and with a strap 11 across the top, of an overflow-tube 4, inserted through the bottom of the body, a rod secured to the tube 4, a gage secured upon the top of the rod and provided with a rack upon its rear face and a graduated scale upon its front face, and a pinion mounted upon a shaft journaled in ears upon the top of the body, and means for rotating the pinion, as set forth.

2. The combination, with the body A, provided with a faucet 2, and with a strap 11 across the top, of an overflow-tube 4, inserted through the bottom of the body, a rod secured to the tube 4, a gage secured upon the top of the rod and provided with a rack upon its rear face and a graduated scale upon its front face, and engaging with a guide-slot in the strap 11, and a pinion mounted upon a shaft journaled in ears upon the top of the body, and means for rotating the pinion, as set forth.

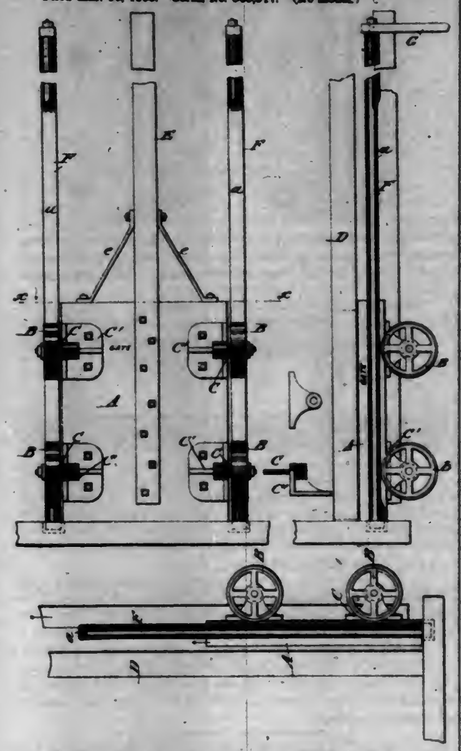
405,076. FASTENER FOR GLOVE-PACKAGES. CHARLES T. BULL, Bayonne, N. J. Filed Apr. 22, 1889. Serial No. 308,201. (No model.)

Claim.—An adjustable fastener or inclosing-band for packages of gloves, comprising a strip of paper, linen cloth, or analogous material adapted to receive the manufacturer's name, trade-mark, or other matter, and a flap secured to said band and provided with a series of devices adapted to engage with and be secured to a device on the other end of said band, whereby the band can be secured around the glove-package and adjusted from time to time, as desired, substantially as set forth.

405,077. SPINDLE FOR WINDING YARN OR THREAD ON CARDS. JOHN J. CLARK, New York, N. Y. Filed Nov. 30, 1888. Serial No. 292,171. (No model.)

Claim.—A spindle for winding yarn upon cards, provided with a catch to hold the free end of said yarn, and adapted to draw the same under the turns of the wound yarn when the card is withdrawn from the spindle, substantially as herein set forth.

405,078. WICK-RAISING SHAFT. WILLIAM H. CLEMES, Cleveland, Ohio, assignor to the Taylor & Boggis Foundry Company, same place. Filed Nov. 14, 1888. Serial No. 290,853. (No model.)



Claim.—1. The wick-raising shaft formed as a series of cranks, substantially as set forth.

2. The wick-raising shaft formed with a series of cranks, constituting distinct wick-engaging points, no two of which are located in the same radial plane of the shaft, substantially as set forth.

3. The wick-raising shaft formed with a series of cranks in spiral sequence, constituting distinct and relatively-disconnected engaging-points respectively located in different lines parallel with the main line of the shaft, substantially as set forth.

405,079. WATER-GATE. CLEVELAND J. CHESSET, Lowell, Mass. Filed Mar. 16, 1889. Serial No. 303,517. (No model.)

Claim.—1. In combination with the water-gate and its wheels, the vertical cam-shafts having flat or oval faces and adapted to operate substantially in the manner and for the purpose described.

2. In a water-gate, the vertically-moving gate provided with suitable wheels, in combination with the vertical shafts having longitudinal flat or oval faces, said shafts being located in contact with the wheels and adapted to be rotated to lift the gate from its seat, substantially as described.

3. The combination of the water-gate provided with suitable wheels and a start attached thereto, the vertical slides which form the seat for the gate, the vertical cam-shafts having longitudinal flat or oval faces *a a*, said shafts being properly held at top and bottom and located in contact with the wheels, as specified, and the devices for rotating said shafts and permitting the gate to be lifted or lowered, substantially as described.

4. The combination of the water-gate A, having the wheels B B B B, the vertical slides on which the gate has a bearing, and the vertical cam-shafts F F, having longitudinal flat or oval faces *a a*, substantially as described.

5. The combination of the water-gate A, the casting C, secured thereto and having journals C, the wheels B, mounted on said journals, and the cam-shafts F F, having flat or oval faces *a a*, all arranged for joint operation, as specified.

6. The combination of the gate A, the casting C, secured thereto, having journals C, the wheels B, mounted on said journals, the start E, secured to the gate, the slides D D, on which the gate has a bearing, and the cam-shafts F F, having flat or oval longitudinal faces *a a*, said shafts being properly held at top and bottom and located in contact with the wheels B, so that by the rotation of said shafts the gate may be lifted from its seat, substantially as described.

405,080. HOOF PARER AND TRIMMER. WILLIAM CORWELL, Neff, Ind., assignor of one-half to Harison H. Clevenger, same place. Filed Aug. 4, 1886. Serial No. 208,082. (No model.)

Claim.—1. The combination, with a handle-bar and main piece secured to said handle-bar, of a paring-knife and trimming-knives formed integrally with said main piece, substantially as described.

2. The combination, with a handle-bar provided with a handle

405,080.

and an arm-rest and a main piece secured to said handle-bar, of paring and trimming knives formed integrally with said main piece, substantially as described.

3. The combination, with a handle-bar and main piece secured thereto, of a straight knife formed on the forward end of said main piece and two rearwardly and outwardly extending knives formed on the rear end of said main piece, substantially as described.

4. The combination, with a handle-bar and a handle, of an enlarged portion provided with a bearing formed in said handle-bar, a base-plate provided with a pivot-post adapted to enter and be secured within said bearing, and knives secured to said base-plate, substantially as described.

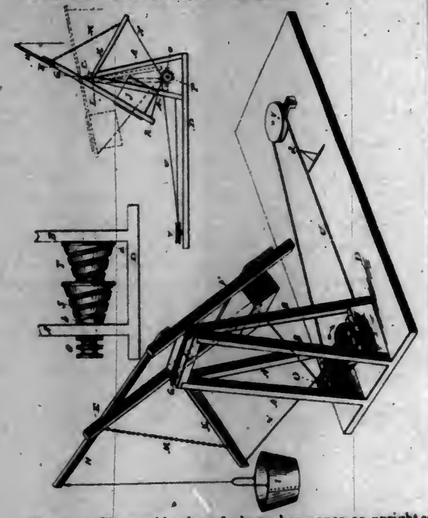
5. The combination, with a handle and handle-bar provided with a perforation, of a detent, a base-plate provided with a series of perforations secured to said handle-bar, said detent adapted to enter the perforations in the handle-bar and base-plate, and knives secured to said base-plate, substantially as described.

6. The combination, with a handle-bar having an enlarged portion provided with a perforation and a bearing and a handle, of a detent secured to said handle-bar and adapted to enter the said perforation and one of a series of perforations formed in a base-plate, said base-plate provided with a pivot-post which is secured within said bearing, and knives secured to said base-plate, substantially as described.

405,081. ROAD-CART. JOHN W. COOMER, Sturgeon, Mo. Filed Feb. 16, 1889. Serial No. 300,111. (No model.)

Claim.—1. In a road-cart, the combination of the body or seat frame swiveled for lateral movement at its front end to the thills, the springs attached to the thills and provided with supporting-arms extending over the side bars of the body or seat-frame, and the loose links connected at their upper ends to the supporting arms and at their lower ends to the said side bars or straps, substantially as specified.

2. In a road-cart, the combination of the body or seat-frame swiveled at its front end to the cross-bar, the transverse shaft attached at its ends to the thills and extending over the body or seat-frame, the springs coiled on the said shaft and provided with supporting-arms which extend over the body or seat-frame, and the links connecting the free ends of the supporting-arms to the body or seat-frame, substantially as specified.



3. In a road-cart, the combination of the body or seat-frame provided with a front bar which is connected to the cross-bar to the thills, the transverse shaft arranged between the thills, the springs coiled on the said shaft and provided with supporting-arms, the series of rings, eyes, or loops on the body or seat-frame beneath the supporting-arms, and the links depending from the extremities of the supporting-arms and provided at their lower ends with hooks to engage the said rings, eyes, or loops, substantially as specified.

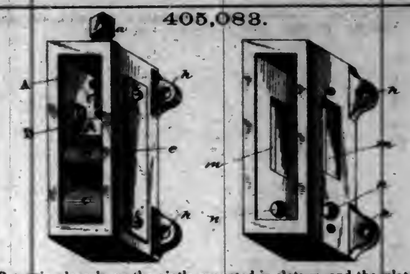
4. In a road-cart, the combination, with the thills having a cross-bar C, of the transverse shaft connected to the thills in rear of the cross-bar, the body or seat-frame having the front bar O swiveled at its center to the cross-bar, the U-shaped side bars or straps P, which depend from the extremities of the front bar, pass under the said shaft, and are connected at their rear ends by the seat, the springs coiled on the extremities of the said shaft, attached rigidly at their outer ends to the thills, and provided with the rearwardly-extend-

ing supporting-arms S S, the rings, eyes, or loops V V, arranged in series on the side bars or straps under the free ends of the supporting-arms, and the hooks connecting links T T, depending from the extremities of the supporting-arms and engaging the said rings, eyes, or loops, substantially as and for the purpose specified.

5. In a road-cart, the thills, the cross-bar connecting the thills, the curved brace E, connected at its ends to the thills and arranged at its center in contact with the center of the cross-bar, the U-shaped bolt connecting the centers of the cross-bar and the carved brace, the hook-plate affixed to the upper side of the cross-bar at its center and provided with a hook *i*, and the brace-rods attached at its ends to the thills in rear of the cross-bar and looped at its center over the hook *i*, in combination with the body or seat-frame connected to the cross-bar, substantially as and for the purpose specified.

405,082. **DERRICK.** LEVI S. DEMING, Middletown, Conn. Filed Feb. 18, 1889. Serial No. 300,227. (No model.)

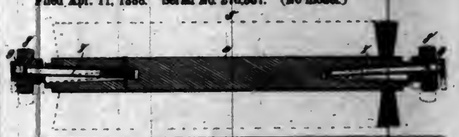
Claim.—1. The combination of a beam hung upon an upright so as to form a projecting arm both sides of the point of hanging, one arm adapted to carry the load, a counter-balance upon the other arm of substantially one-half the load, a third arm projecting from the beam near the pivot at substantially right angles and downward, a pulley and a line connected by one end to the counterbalance-arm of the beam and the other end to the said third arm, the said line passing around said pulley, the said pulley being adapted to be rotated under the application of power thereto, substantially as described.



2. The combination of a beam hung upon an upright and so as to swing thereon, the beam extending both sides of the pivot and so as to form two arms, one of said arms adapted to carry the load, a counter-balance on the other arm, the third arm extending from the beam near the hanging point downward, a line connected by one end to the counterbalance-beam and by the other to the said third arm, a pulley around which the said line is run, a pair of drums upon the shaft of said pulley, and a line fixed by one end to one drum and by the other to the other drum, the line extending to a distant point around a stationary pulley, one run of said line adapted for the application of power, substantially as described.

3. The combination of a beam hung upon an upright and so as to form an arm projecting each side of said upright, one arm adapted to carry the load, a counter-balance arranged upon the other arm, a third arm K, hinged to the beam near the hanging point, a connection L between the said arm K and the beam to support said arm K at substantially right angles to the beam, a pulley O, arranged upon a shaft in suitable stationary bearings, a line N, attached by one end to the arm F of the beam and by the other end to the arm K, said line passing around the said pulley O, and means, substantially such as described, for producing the revolution of the said pulley O, substantially as and for the purpose specified.

405,083. **TWINE-TENSION FOR HARVESTERS.** WILLIAM H. DICK, Taylorville, Ill. Filed Sept. 15, 1888. Serial No. 285,061. (No model.)

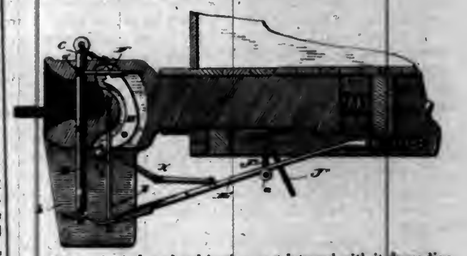


Claim.—In a tension device for twine-binders, the combination of the frame A, having the slots *m* and perforations *n*, the roller C, loosely journaled in a pintle mounted in the perforations *n*, the roller

405,083.

B, turning loosely on the pintle, mounted in slots *m*, and the plates *c*, secured to the frame and overlying the slots and perforations, and thereby holding the rollers and pintles in place, substantially as described.

405,084. **CARPET-SWEEPER.** WALTER J. DREW, Grand Rapids, Mich., assignor to the Bissell Carpet Sweeper Company, same place. Filed Apr. 11, 1888. Serial No. 270,337. (No model.)



Claim.—1. A brush-carrying shaft for a carpet-sweeper having its driving wheel or pulley loosely or flexibly connected therewith to permit the shaft to rise and fall independent of the said driving wheel or pulley, substantially as described.

2. The combination, with a carpet-sweeper casing having driving mechanism, of a brush-carrying shaft having a loosely or flexibly attached driving wheel or pulley and capable of rising and falling independent of said driving wheel or pulley, substantially as described.

3. The combination, with a sweeper-casing and driving mechanism, of a brush-driving wheel having a bar or rod, and a brush-carrying shaft loosely or flexibly connected with the bar or rod and capable of rising and falling independent of the said driving wheel or pulley, substantially as described.

405,085. **CAR-COUPLING.** RICHARD J. EDWARDS, Galena, Ill. Filed Mar. 14, 1889. Serial No. 303,210. (No model.)

Claim.—1. A draw-head having cast integral with it depending ears *b b*, substantially as described.

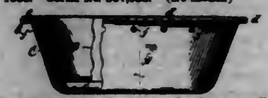
2. The combination, with the draw-bar and draw-head, of the coupling and ejecting pins, the pivoted lever E, the crank-shaft provided with a crank-arm J', and an anti-friction roller journaled on this crank-arm, as described.

3. The combination, with the draw-head, of the coupling-pin, the sliding dog F, the lever H, pivoted in a recess back of the mouth of the draw-head, and means for operating this lever H, substantially as described.

4. The combination, with the draw-head, of the coupling and ejecting pins, the pivoted lever E, the dog F, and lever H, and a rod K, pivotally connected to lever E and adapted to operate the said lever H, substantially as described.

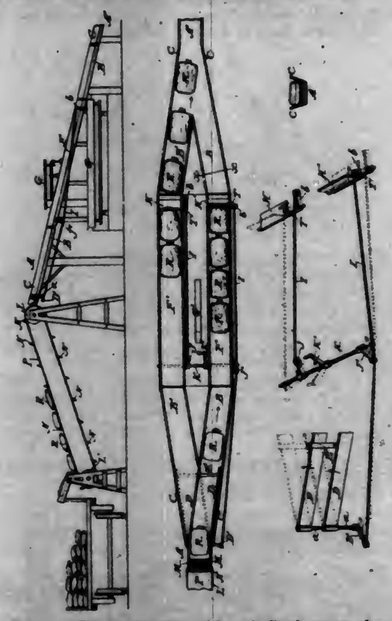
5. The combination, with the draw-head, of the coupling and ejecting pins, a pivoted lever E, connected to ejecting-pin, a sliding dog F, and pivoted lever H, the latter being provided with an extension *d*, a jointed rod K, connected to the lever E and adapted to impinge against said extension *d*, and a bracket, substantially as described.

405,086. **THILL-COUPLING.** BENJAMIN FARNEST, Hagerstown, Md. Filed Mar. 6, 1889. Serial No. 302,195. (No model.)



Claim.—The thill-coupling having the spring or buffer contriv-

405,086.



ance, consisting of the spring-metal plate having its upper end coincidently curved with the thill-bolt-receiving eye, and its lower horizontal portion provided with an aperture or slot, the straight plate having its upper end provided at the corner edges with projections or arms resting upon the upper edges of the side portions of the thill-iron, said straight plate having its lower end hooked into the slot or aperture of said horizontal portion of the spring-metal plate and the thumb or tension screw working in the spring-metal plate and bearing against the straight plate, substantially as set forth.

405,087. **COOKING UTENSIL.** FRED H. FERGUSON, Buffalo, N. Y. Filed Oct. 3, 1888. Serial No. 287,322. (No model.)

Claim.—A cooking utensil composed of two similarly-shaped pans or vessels A B, arranged one within the other, with a closed chamber or air-space C formed between the walls and bottoms of the two vessels, both vessels being rigidly secured at their upper edges by the flange of the inner vessel being bent or folded over and under the flange or rim of the outer vessel, the outer vessel being provided with a series of air-escape openings *f*, arranged close to the upper edge of the pan, substantially as set forth.

405,088. **APPARATUS FOR TRANSFERRING, WEIGHING, AND DELIVERING BAGS OF GRAIN.** WILLIAM R. FERGUSON, Montclair, N. J. Filed Feb. 13, 1889. Serial No. 299,735. (No model.)

Claim.—1. The combination, with an inclined way or chute, of an independent vertically-moving section interposed in the length thereof to form a continuous unbroken extension of said inclined way or chute, a weighing-scale upon which said section is mounted, and a movable stop adjusted at the lower end of the section, substantially in the manner and for the purpose herein set forth.

2. The combination, in an apparatus for weighing bagged grain in the course of its delivery or transfer, of two inclined ways converging and merging at each end into a single way, an independent section introduced in each way to form a continuation thereof, an independent weighing-scale upon which said section is mounted, and a switch at the upper intersection of the branch ways, substantially in the manner and for the purpose herein set forth.

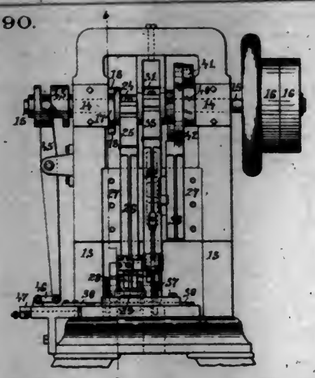
3. The combination, in an apparatus for weighing bagged grain in the course of its delivery or transfer, of two inclined ways converging and merging at each end into a single way, an independent section introduced in each way to form a continuation thereof, an independent weighing-scale upon which said section is mounted, a movable stop at the foot of each section, a transverse rock-shaft actuated by a suitable lever, rods connecting each stop device with arms upon said shaft, whereby when one stop is elevated above the level of its way by an oscillation of the shaft the other stop shall be depressed, and vice versa, a pair of switch-plates pivoted at the upper intersection of the double ways with the single way to connect said single way with either of the others, and a coupling-rod connecting the rock-shaft actuating the stops with said switch-plates, whereby the bars are carried automatically into connection with the way whose stop is elevated, substantially in the manner and for the purpose herein set forth.

4. The combination, substantially as set forth, of an endless elevating-chain, an inclined way extending from its upper end and branching into two parallel ways which merge again into one, movable sections interposed in the branch ways to form a portion of the length thereof, weighing-scales supporting each section, a movable stop at the foot of each of said sections, a switch at the upper intersection of the branch ways to divert the articles sliding down the single way into either branch, and devices, substantially as described, controlling the stops and switch, whereby when the stop at the foot of one of the weighing-sections is depressed the stop on the opposite section will be elevated and the switch turned to divert the descending articles upon said section, in the manner and for the purpose herein set forth.

405,089. **ELECTRIC SELF-WINDING CLOCK.** JAMES H. GERRY, Brooklyn, assignor to the Self Winding Clock Company, New York, N.Y. Filed Mar. 21, 1889. Serial No. 304,111. (No model.)

Claim.—1. The combination of a clock-train, a mainspring for actuating the same, an electro-magnet, an armature therefor, said armature being arranged to turn upon an axis parallel with the pivots of the clock-train, a lever attached to said armature and engaging with the wheel connected with said mainspring, the segment or lever m^2, the springs *s* and *s'*, the extra wheel S^2 upon the main shaft of said train, and the lever D, operated by said wheel S^2.

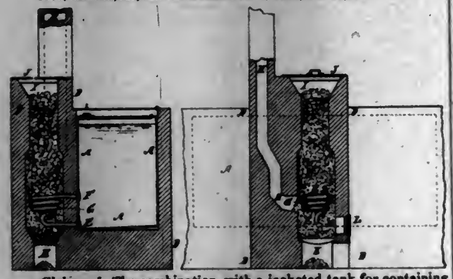
2. The combination, with the clock-train having a mainspring for driving the same, of the electro-magnet M, having curved pole-pieces, the armature *m*, with its face curved to correspond with said pole-pieces, the sector *m'*, the springs *s* and *s'*, having the circuit-closing points s^3, the wheel S^2 upon the main shaft of the clock-train, the lever D engaging therewith, and the dogs D^1 and D^2.



3. The combination, with the clock-train having a mainspring for driving the same, of the electro-magnet M, having curved pole-pieces, the armature *m*, with its face curved to correspond with said pole-pieces, the sector *m'*, the springs *s* and *s'*, insulated from each other and from the train, having the circuit-closing points s^3, the wheel S^2, upon the main shaft of the clock-train, the lever D engaging therewith, the pins *p p*, which control the positions of the springs *s* and *s'*, and the dogs D^1 and D^2.

405,090. **MACHINE FOR MAKING STAPLES.** WILLIAM HALEYARD, Providence, R. I. Filed Oct. 9, 1888. Serial No. 287,656. (No model.)

Claim.—1. In a machine for making staples, the combination, with a main driving-shaft, of a stock-feeding device, a cutting-plunger provided with the convex projection, a swaging-plunger, a discharge-plunger located within the swaging-plunger, a reciprocating carrier provided with a circular hole and constructed to form the lower die for swaging the prongs, and mechanism for driving the same, as described.

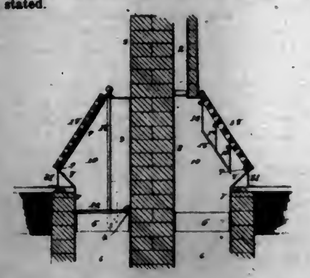


2. In a machine for making staples, the combination, with the plunger 32, of the adjustable swaging-die 34, having the screw-nut 36, for adjusting the die and for receiving the thrust of the plunger, as and for the purpose set forth.

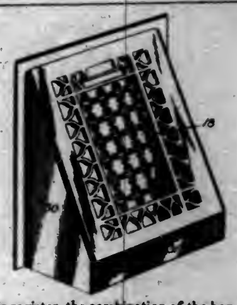
405,090.

3. The combination, with the reciprocating plunger 32, of the swaging-die 34, the carrier 30, provided with a hole through which the staple is drawn, and the discharge-plunger 37, constructed to force the staple-blank through the hole in the carrier to bend the prongs, as and for the purpose described.

405,091. APPARATUS FOR STEEPING FLAX. THOMAS L. HEELY, London, England. Filed Jan. 17, 1888. Serial No. 261,000. (No model.) Patented in England Oct. 27, 1885, No. 12,923; in Italy May 7, 1886, XX, 19,982; in Belgium May 15, 1886, No. 72,891; in France Sept. 1, 1886, No. 175,746, and in Canada Feb. 1, 1887, No. 25,899.



Claim.—1. The combination, with a jacketed tank for containing flax and liquor for steeping the same, of a stove or like heating apparatus, a pipe opening at both ends into the tank and having a portion arranged in the stove, said pipe being wholly inclosed and nowhere exposed to atmospheric air, substantially as specified.

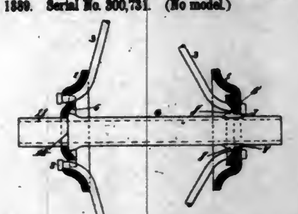


2. The combination, with a jacketed tank for containing flax and liquor for steeping the same, of a stove or like heating apparatus, a pipe opening at both ends into the tank and having a portion arranged in the stove, said pipe being wholly inclosed and nowhere exposed to atmospheric air, and said stove or like apparatus being provided with a flue for conveying away the products of combustion, having an opening approximately on a level with the portion of said pipe within the stove or like apparatus, substantially as specified.

405,092. SIDE-WALL HOT-AIR REGISTER. CYRUS S. HOOD, Corning, N. Y. Filed Nov. 7, 1887. Serial No. 254,506. (No model.)

Claim.—1. A hot-air-register box or casing constructed with a projecting inclined open front 9, terminating in an under inclined flange part 8, joining the flue-neck 7, substantially as described, for the purpose stated.

405,092.

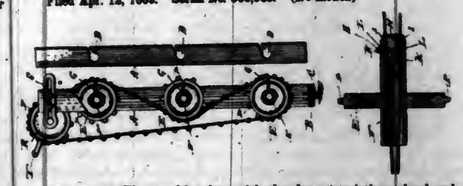


2. In a hot-air register, the combination of the box or casing constructed with a projecting inclined open front 9, terminating in an under inclined flange part 8, joining the flue-neck 7, with a register-face having sides 30 and a front flange part 31, adapted to envelop the said projecting part of the box or casing and to rest upon the floor, substantially as described, for the purpose specified.

3. A register face-plate having an open front 18, terminating in a foot-flange 31, and having closed sides 30, adapted to fit over and envelop a register-box projecting front, substantially as described.

4. In a hot-air register, the box or casing constructed with a projecting inclined open front 9, terminating in an under inclined flange part 8, joining the flue-neck 7, in combination with a register-plate having an inclined face terminating in a closed flange 31 and having closed sides and adapted to envelop the projecting inclined open front of the box or casing, substantially as described.

5. A hot-air-register box consisting of the casing 10, constructed with a projecting inclined open front 9, terminating in an under inclined flange part 8, a bottom neck or flue part 7, and a top neck or flue part 11, combined with a register face-plate having closed sides and a front flange adapted to envelop the projecting inclined open front of the box or casing and to rest upon the floor, substantially as described.



405,093. WHEEL. GEORGE W. HOWELL, Covington, Ky. Filed Feb. 21, 1889. Serial No. 300,731. (No model.)

Claim.—1. The combination, in a vehicle-wheel, of the rim, the spokes, the disks having central orifices, the edge of one of which is provided with notches, the axle, and the sleeve on the axle abutting a disk at one end and having adjacent to its other end the lateral shoulders adapted to pass through the said notches in the other disks, so that when the sleeve is turned the shoulders engage the edge of the opening in the notched disk, substantially as described.

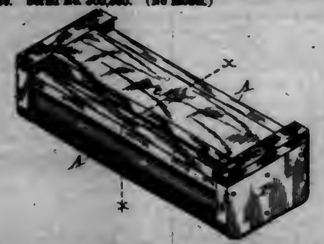
2. A wheel composed of disks 1, having the spokes 3, engaging with the rim 4 at one end and with notches 2 of the disks at the opposite end, the axle 11, and the tube or sleeve 6, provided with lugs 7, having shoulders 8, which seat in the notches 10, substantially as described.

405,094. WIRE-FENCE MACHINE. EZRA HUTSON, Fairport, N.Y. Filed Apr. 12, 1889. Serial No. 306,963. (No model.)

Claim.—1. The combination, with the slotted twisting-wheel and its longitudinally-slotted shaft, of the flanged plug having diametrically-opposite slots in the flange and longitudinal grooves leading from said flange to the end of the plug, the plug being adapted to fit in one end of the hollow shaft and receive the wires for the purpose of twisting the same, substantially as specified.

2. The combination, with the supporting-frame having bearings and lateral slots leading thereto, of the slotted shafts, the slotted sprocket-wheels, their longitudinally-slotted hollow shafts and the longitudinally-grooved plugs, the sprocket-chain, and the adjustable sprocketed driving-wheel, the whole arranged to operate substantially as specified.

3. The combination, with the frame of the machine and the twisting-wheels and plugs, of the lever fulcrumed to the frame and provided with a wheel at one end, which may be brought to bear against one edge of the rail to force the same into the angle of the diverging wires, substantially as specified.

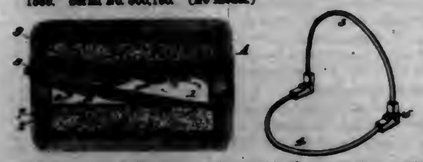


4. The combination of the frame having laterally-slotted side bars, the driver R, adjustable brackets S, and carriage B, with the slotted sprocket twisting-wheels E, their longitudinally-slotted hollow shafts F, the plugs H, and the lever V', all as and for the purpose set forth.

405,095. FASTENER FOR MEETING-RAILS OF SASHES. LOUIS K. JOHNSON, Brooklyn, N. Y. Filed Mar. 18, 1889. Serial No. 303,664. (No model.)

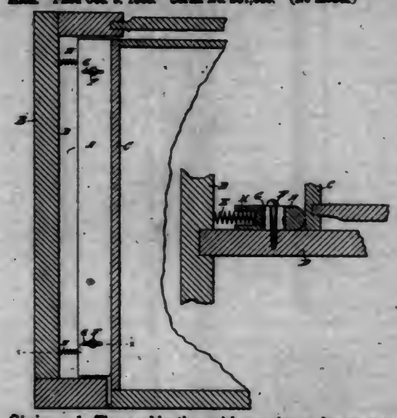
Claim.—In a window-sash lock substantially such as described, the combination of a horizontally-swinging arm C, attached to one sash, the horizontal pin E, attached to the opposite sash, and the vertically-swinging catch D, formed with the hook d' concentric with the pivot d^3, and with cam-surface d^5 eccentric to the said pivot d^3, the whole arranged and operating substantially in the manner and for the purpose set forth.

405,096. BLACKBOARD-ERASER. WALTER F. JOHNS, Parish, assignor of one-half to Charles W. Burdeen, Syracuse, N. Y. Filed Mar. 30, 1889. Serial No. 305,305. (No model.)



Claim.—1. As an improved article of manufacture, the blackboard-eraser frame consisting of a block of wood composed of a single piece having in its rubber-carrying face dust-collecting grooves extending throughout the length thereof, and plates attached to the ends of said block and closing the ends of the aforesaid grooves, as set forth and shown.

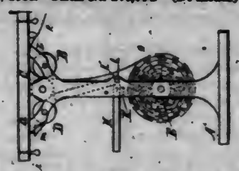
2. The improved blackboard-eraser frame consisting of a block of wood composed of a single piece having in its rubber-carrying face grooves extending throughout the length thereof, and cross-channels cut through the base of the intermediate rib at the ends thereof, and plates attached to the ends of said block and closing the ends of the longitudinal grooves, substantially as described and shown.



3. A blackboard-eraser frame consisting of an elongated block of wood composed of a single piece having in its rubber-carrying face longitudinal grooves extending throughout the length thereof and undercut at the sides of the intermediate rib, and plates attached to the ends of said block and closing the ends of the longitudinal grooves, substantially as described and shown.

405,097. MUFF. OTTO KAEMLEIN, Philadelphia, Pa. Filed Feb. 16, 1889. Serial No. 300,180. (No model.)

Claim.—A muff having a pocket within the same, the mouth of the pocket being provided with a hinged jaw consisting of the semicircular or carved pieces hinged at their ends within the pocket and extending toward the end of the muff, and having their outer ends at the ends of the opening in the muff, the said outer ends having coverings integral with the coverings of the end of the muff, and the hinge of the said jaws having a spring adapted to retain the jaws in position as desired, said parts being combined substantially as described.

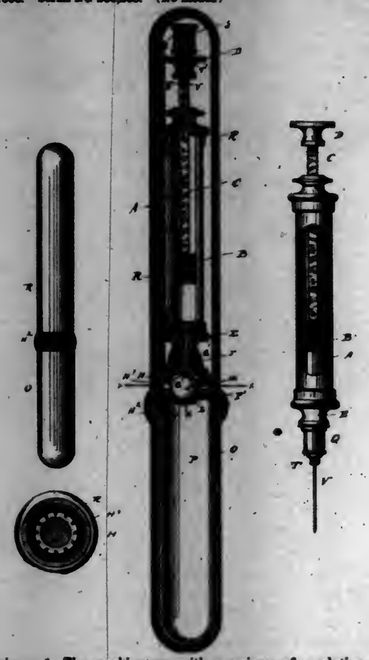


405,098. DRAWER-GUIDE. DAVID W. KENDALL, Grand Rapids, Mich. Filed Oct. 9, 1888. Serial No. 287,662. (No model.)

Claim.—1. The combination, with a casing, a drawer-support, springs, and a drawer, of a drawer-guide formed with transverse slots, and pins or screws passed through said slots and into said drawer-support for regulating the lateral play or pressure of said drawer-guide upon said drawer, substantially as described.

2. The combination, with a casing, a drawer-support, and a drawer, of a yielding drawer-guide formed with annular recesses in its back edge, and also with transverse slots, pins or screws passing through said slots and provided with heads of larger diameter than the same, and spiral springs having their inner ends fitted in said recesses and their outer ends bearing against the side of said casing, substantially as and for the purpose described.

405,099. PRINTING-MACHINE. FRANCIS KIESEL, St. Louis, Mo. Filed June 13, 1888. Serial No. 276,914. (No model.)



Claim.—1. An automatic printer consisting of a frame having inwardly-projecting shoulders to support in operative position a shelf hinged to said frame, a paper-roller journaled in the frame beneath the said shelf, a cushioned roller, a die-roller, and an inking-roller journaled in the frame above the shelf, a top piece having vertical corner screws, secured to the frame above the rollers, and having on its front edge a horizontal blade, and on its under side a guide near its front edge and an ink-reservoir near its back edge, arranged substantially as herein set forth.

2. In an automatic printer having a frame and a top provided with vertical corner screws, the combination of the ink-reservoir, the rollers B, C, and D, and the guide L, with reference to the shelf H and paper-roller E, attached to said frame, substantially as herein described.

3. A combined automatic printer and table formed of a vertical frame having a supporting-base, two inwardly-projecting shoulders, a top piece covering said frame, provided with vertical corner screws, a knife along the front edge of said top, having a lower cutting-edge and a short upright blade covered by a blunted protector, a horizontal guide beneath the top, back of and parallel to the said knife, an ink-reservoir, a cushioned roller, a die-roller, and an inking-roller journaled in the frame beneath the said top piece, a hinged shelf beneath the said rollers, and a paper-roller journaled in the frame beneath the shelf, substantially as herein described.

405,100. SYRINGE. OTTO KLOPFE, New York, N. Y. Filed Oct. 27, 1888. Serial No. 289,205. (No model.)

Claim.—1. The combination, with a syringe, of a solution-receptacle held on the head of the syringe, and a valve for closing said receptacle when the syringe is disconnected therefrom, substantially as set forth.

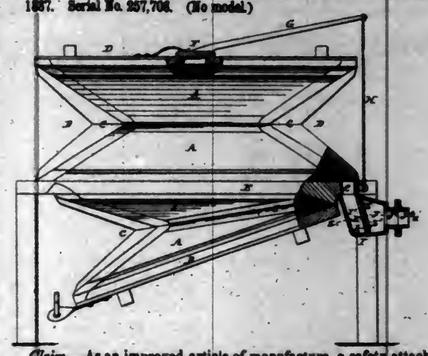
2. The combination, with a syringe, of a cap screwed on the head of the same, a solution-receptacle screwed on said cap, and a casing for covering the syringe screwed on said cap, substantially as set forth.

3. The combination, with a cap having a recess or cavity, of a ball-valve in said recess, an elastic diaphragm acting on said ball-valve, and a solution-receptacle screwed on said cap, substantially as set forth.

4. The combination, with a syringe, of a cap screwed on the head of the same, which cap is provided in its under side with a recess, a groove communicating with said recess, and apertures extending from the groove to the under side of the cap, a ball-valve in said recess or cavity, an elastic diaphragm for holding said ball-valve in place, and a solution-receptacle screwed on said cap, substantially as set forth.

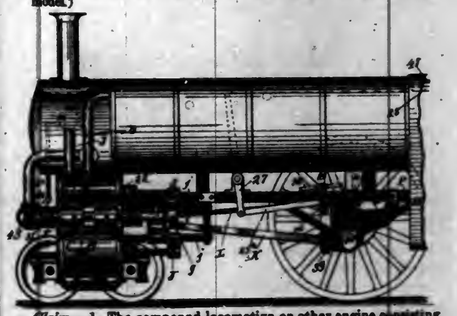
5. The combination, with a syringe-cylinder having a screw-threaded head and a piston-rod provided with a longitudinal bore in its outer end, of a handle attached to the end of the piston-rod and provided with a screw-threaded recess, a screw-nozzle having an externally-threaded neck, and a tubular needle secured to the nozzle, said nozzle being adapted to be applied to the head or to the piston-rod of the syringe, substantially as set forth.

405,101. SASH-HOLDER. CHARLES A. KRAFFT, Philadelphia, Pa. Filed June 14, 1888. Serial No. 277,079. (No model.)



Claim.—A sash-fastener consisting of the face-plate A, with opening *a* therein, the casing *a'*, secured to said face-plate, the plate B, having the opening *b*, and pivoted at one end to the face-plate, the wheel C, journaled in plate B, a screw with its head bearing on the outer side of plate B, and having a securing and adjusting nut thereon, and a coiled spring on said screw between the plate B and the casing, said parts being combined substantially as described.

405,102. PENCIL-TIP. SAMUEL KRAMB, New York, N. Y., assignor to the Eagle Pencil Company, same place. Filed Apr. 2, 1888. Serial No. 269,705. (No model.)



Claim.—A sheet-metal tip for lead-pencils, consisting of a ring or ferrule *b*, which fits upon the end of the pencil, and an ornamented head A, the struck-up halves or sections *a* of which are inserted and secured in the ring.

405,103. BELLOWS. OTTO KELLEOM, Avondale, Ill. Filed Dec. 12, 1887. Serial No. 257,706. (No model.)

Claim.—As an improved article of manufacture, a safety attachment for bellows, consisting of a valve-casing adapted to be attached beneath the fixed partition of the bellows and having a vertical inlet-chamber I, open at top, an inclined valve-seat or partition K, valve L, and outlet-chamber J, having a horizontal outlet-passage J', as described, and for the purpose set forth.

405,104. LOCOMOTIVE OR OTHER ENGINE. JOSEPH LEWIS, South Evanston, Ill. Filed Jan. 30, 1888. Serial No. 262,360. (No model.)

Claim.—1. The compound locomotive or other engine consisting of two high-pressure and two low-pressure cylinders arranged side by side and parallel with each other, the piston of each of the high-pressure cylinders being connected by a cross-head with the piston of one of the low-pressure cylinders, so the two move together, and a rotary valve supplying steam to both ends of all said cylinders, substantially as set forth.

2. The combination, with the two high and two low pressure cylinders, of the valve consisting of four heads or sets of ports and having a supply chamber or passage 20 and a central bore, the two central heads receiving steam at passage 20 and controlling the high-pressure cylinders, and the two end heads receiving exhaust-steam from the high-pressure cylinders through the central bore and controlling the low-pressure cylinders, substantially as set forth.

3. The combination, with the parallel high and low pressure cylinders of a compound engine, of a rotary multiple valve having passages 21, 22, 23, and 24, a central bore, and a feed-passage 20, substantially as set forth.

4. The combination, with the cylinders of a compound engine, of a rotary multiple valve having passages 21, 22, 23, and 24, a central bore, a feed-passage 20, and a final discharge H, substantially as set forth.

5. The combination, with the cylinders of a compound engine, of

a rotary multiple valve feeding and exhausting from both sides of the cylinder-pistons, said valve having a central bore or chamber into which the high-pressure ports of the valve exhaust and from which the low-pressure ports feed, substantially as set forth.

6. In a locomotive or other compound engine having a rotary valve for controlling all the cylinders, the combination, with said valve and the low-pressure cylinders, of a steam-supply duct connected to said valve and supplying said low-pressure cylinders with live steam when desired, substantially as specified.

7. In a locomotive or other compound engine having a rotary valve controlling the cylinders and provided with a central chamber or bore, the combination, with said valve and the low-pressure cylinder or cylinders, of a steam-supply pipe admitting live steam to said central chamber of the valve when desired, substantially as set forth.

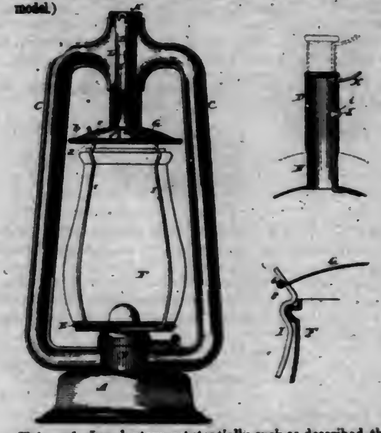
8. In a locomotive having a rotating valve driven from the axle, the combination, with such valve, of the bar supporting the valve-shaft, and the brackets supporting the bar, said bar having globular bearings in the brackets, substantially as specified.

405,105. REGISTERING-LOCK. JACOB LOEWENTHAL, Chicago, Ill. Filed Dec. 10, 1888. Serial No. 293,149. (No model.)

Claim.—1. In a register, in combination with a register-case, a shaft fixed rigidly in said case, a plurality of crown-gears constituting register-wheels journaled on said shaft and having the register characters on their peripheries, such crown-gears being continuously cogged upon one edge, and each, except the last, having a single cog upon the opposite edge, a pinion intermediate each two consecutive gears having its axis fixed with respect to the shaft and meshing with the continuously-cogged rim of one gear, and adapted to be engaged by the single cog of the other, a dog associated with each of the crown-gears which have the single tooth, and having its pivot fixed with respect to the shaft, said dog being adapted to engage the pinion, and a cam actuated by the crown-gear and controlling the dog to protrude it into engagement with the pinion, except when the single tooth of the crown-gear engages the pinion, substantially as set forth.

2. In a register, in combination with a register-case, a shaft fixed rigidly in said case, a plurality of crown-gears constituting register-wheels journaled on said shaft and having the register-characters on their peripheries, such crown-gears being continuously cogged upon one edge, and each, except the last, having a single cog upon the opposite edge, a pinion intermediate each two consecutive gears, having its axis fixed with respect to said shaft and meshing with the continuously-cogged rim of one gear, and adapted to be engaged by the single cog of the other, a dog associated with each of the crown-gears which have the single tooth and pivoted upon the shaft, and located between the shaft and the crown-gear with which it is associated, and having one end adapted to engage the pinion, and the cam actuated by the crown-gear and controlling the dog to protrude it into engagement with the pinion, except where the single tooth of the crown-gear engages said pinion, substantially as set forth.

3. In a registering mechanism, in combination with a fixed shaft and crown-gear, registering-wheels journaled thereon, intermediate pinions communicating motion from each crown-gear to the succeeding one, a dog associated with each gear to lock the pinion which such gear actuates, a cam, which controls said dog, located interiorly to the crown-gear and secured thereto, and a groove in the bearing of said crown-gear to receive the cam, whereby such cam serves the double purpose of controlling the pinion and securing the crown-gear in proper position longitudinally with respect to the shaft, substantially as set forth.



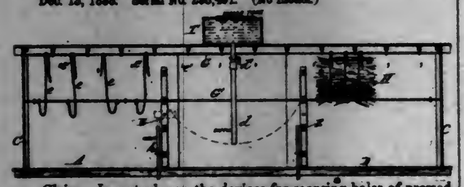
4. In a registering mechanism, in combination with the fixed shaft and the plurality of registering-wheels thereon, an annulus journaled on the shaft forward of the first register-wheel, a pinion journaled on such annulus, and a disk suitably pivoted, having a finger H' adapted to lock the pinion, the annulus having a stop to arrest the pinion-locking finger after it has withdrawn from the pinion, whereby such finger upon being rocked toward the pinion locks the same, and thereafter, by means thereof, rotates the annulus and first register-wheel, and upon being rocked in the reverse direction releases the pinion, and afterward, colliding with the stop, rotates the annulus while the pinion is rotated on its own axis by its engagement with the register-wheel without rotating the latter, substantially as set forth.

5. In a registering mechanism, in combination with the fixed shaft and plurality of registering-wheels thereon, an annulus on the shaft forward of the first register-wheel, a pinion journaled thereon and meshing with the first register-wheel, a stop projecting from the annulus at a short distance from the pinion in one direction, a dog having its pivot fixed with respect to the shaft and adapted to engage the register-wheel, a stop on the annulus to engage the dog and force it into engagement with the register-wheel, and a suitably-pivoted disk having a finger adapted to lock the pinion when rocked in one direction, and to collide with the first-mentioned stop when rocked in the other direction out of engagement with the pinion, the stop which engages said dog being so located as to collide therewith when the finger has been rocked after locking the pinion an angular distance equal to the angular distance between two consecutive teeth on the register-wheel, all substantially as and for the purpose set forth.

6. In combination, substantially as set forth, the fixed shaft, the plurality of register-wheels thereon, the annulus K on the shaft forward of the first register-wheel having the stops k' and k^2 protruding therefrom, the pinion E', journaled on said annulus between said stops and meshing with the register-wheel, the disk H, pivoted on the shaft and having the finger H' protruding between the pinion and the stop k', and adapted to lock the pinion, and having the radial projection H^3, and the dog M, having its pivot fixed with respect to the shaft and adapted at one end to engage the register-wheel and at the other to be engaged by the stud k^2, and having the edge *m* in the plane of the surface of the disk H when the dog is engaged with the register-wheel, the projection M^3 being so located on the disk H that it laps and abuts against the edge *m* when the finger H is against the stop k', and is clear of the dog M when said finger is meshed with the pinion.

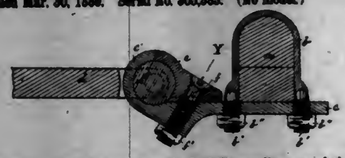
7. In combination with a padlock, a registering mechanism comprising a plurality of register-wheels on a common shaft, and mechanism which communicates the rotary motion of each wheel to the next succeeding, such shaft having its axis at right angles to the pivot of said hasp, the disk H, pivoted at the end of the shaft and operating the registering mechanism and having the cam-recess H^3, and the hub of the hasp having the projection k', engaging in said cam-recess, substantially as described, whereby it rocks the disk back and forth as the hasp is opened and closed, substantially as set forth.

405,106. LANTERN. HENRY A. MATTHEWS and DAVID M. IRELAND, Waterbury, Conn. Filed May 31, 1888. Serial No. 275,061. (No model.)



Claim.—1. In a lantern substantially such as described, the combination of the perforated plate E, adapted to rest on the burner below, the cap G above, constructed with a notch *d* in its edge, the edge of the cap adjacent to the said notch made tubular, a bolt arranged in said tubular edge of the cap and adapted to be moved across said notch to open or close the same, the globe F, seated upon the plate E and below the cap G, two or more guard-wires extending from the plate below outside the globe to the cap above and rigidly secured by their respective ends to the said plate and cap, and a guard-wire hinged to the said plate below extending upward, its upper end adapted to enter said notch in the cap and to be engaged therein by the said bolt, substantially as described.

2. In a lantern substantially such as described, the combination of the perforated plate E, adapted to rest on the burner, the cap G above, the globe F, seated upon said plate E and below said cap G, two or more guard-wires extending from the said plate below the globe to the cap above and united by their respective ends to the said plate and cap, the tubes C C, united at their upper ends by a vertical tube D over the cap, said tubes C opening into said vertical tube, the said cap constructed with a central vertical tube H, extending up

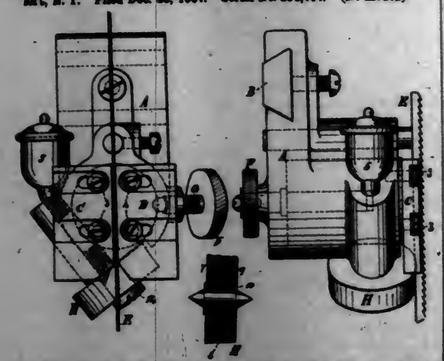


through said vertical tube D, the said vertical tube D forming a guide for said cap-tube H, and within which said cap-tube H is vertically movable, and a spring-latch J within said cap-tube H, attached thereto so as to move with the said cap and tube, the said latch having a handle projecting therefrom above the tube D, said latch constructed with a nose projecting through the said tube H and adapted to engage a corresponding notch in the surrounding tube, substantially as and for the purpose described.

405,107. STOCK-CAR. MARTIN D. MOORE, Wakonda, Dak. Filed Dec. 13, 1888. Serial No. 293,491. (No model.)

Claim.—In a stock-car, the devices for securing bales of pressed hay in place against the car sides, consisting of the longitudinal rods G and G', secured to the roof and sides of the car, the chains or ropes *e*, passing around said rods, and the hooks *d* in the side of the car, to which the free ends of the chains or ropes may be secured, all combined and arranged substantially as and for the purpose set forth.

405,108. THILL-COUPLING. CORTHELL C. MONROE, Boston, Mass. Filed Mar. 30, 1889. Serial No. 305,383. (No model.)



Claim.—The herein-described thill-coupling, consisting of the yoke *c*, secured to the carriage-axle and having the ball-bearing *d* and guide-ribs *c' c''*, as described, combined with the adjustable cap *e*, the inclined fastening-bolt *f*, and the forked shaft-iron having the ball *d''*, substantially as and for the purpose set forth.

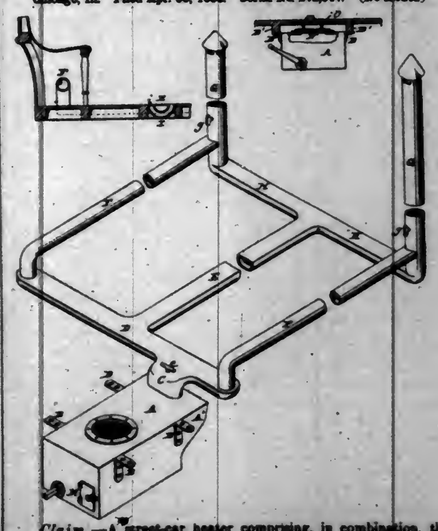
405,109. THILL-COUPLING. DANIEL MURRAY, Salem, Mass. Filed Jan. 7, 1889. Serial No. 295,610. (No model.)

Claim.—A thill-coupling consisting of the stationary polygonal pin *A*, the hub *g*, mounted and stationary on the pin, the shaft-iron having the cylindrical eye *d'*, the sleeve *f*, fitted in the eye concentric to and turning with the shaft-iron on the hub, and the set-screw *i*, passing laterally through the eye of the shaft-iron and engaging the sleeve to hold the latter stationary relatively to the said eye, substantially as described.

405,110. GUIDE FOR BAND-SAWS. REUBEN MCCREERY, Frankfort, N. Y. Filed Dec. 23, 1887. Serial No. 258,797. (No model.)

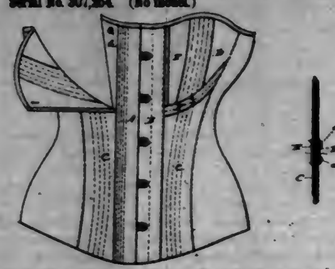
Claim.—The combination, with the adjustable side guides, of the guide-wheel adjacent to the side guides and between the same and the work, such guide-wheel having a slightly-concave surface and placed so that the plane in which the saw moves intersects the axis of the wheel near the middle of the wheel, whereby the pressure of the back of the saw is greatest near the middle portion of the concave surface of the guide-wheel, substantially as specified.

405,111. CASH-REGISTER. WILLIAM G. MCGILL, Washington, D. C. Filed Jan. 31, 1887. Serial No. 226,060. (No model.)



Claim.—1. The combination, with a cash receptacle or casing, of an exterior dial, an indicator-disk having a series of numbers arranged on both its faces corresponding with the numbers on the exterior dial, the shaft upon which said dial and disk are mounted, said shaft carrying a register-drum upon its inner end, and an operating-handle adapted to operate said shaft, and thereby the said dial, disk, and drum, substantially as and for the purpose set forth.

2. The combination, with the spring-actuated drawer, of the exterior dials, the shafts having the indicator-hands, and having the fixed disks formed with the annular series of perforations, and having the spring-pawls, the loosely-mounted gear-wheels, the sliding key having the cog-wheel affixed on its inner end, and the spring-actuated locking-plate centrally secured to it, and the retaining-plate formed with the beveled ends, substantially as and for the purpose described.



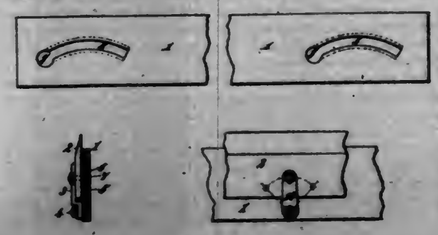
3. The combination, with the spring-actuated drawer, of the exterior dials, the shafts carrying the indicator-hands, the gear-wheels and registering-drums loosely mounted on said shafts, and the indicator-disks rigidly mounted upon the said shafts, having the spring-pawls, and having marked upon them the series of numbers corresponding with those of the exterior dials, and the perforated disks having the spring-pawls, the spring-actuated locking-plate having centrally secured to it the transverse plate formed with the beveled ends, and the sliding key having the cog-wheel affixed to its inner end.

405,112. CAR-HEATING APPARATUS. PATRICK L. MCGOVERN, Chicago, Ill. Filed Apr. 30, 1888. Serial No. 272,367. (No model.)

Claim.—A street-car heater comprising, in combination, the stove A, suspended underneath the car-platform, outlet-flue C, cross-flue D, trough I, extending longitudinally along the center of the car, longitudinal central flue E, located in the trough I, and having its upper surface flush with the floor of the car, side flues F F, located under the car-seats, and uptake-pipes G G, located at the end of the longitudinal flues, opposite to that at which they connect with the stove, essentially as herein described.

405,113. CORSET. ALBERT D. MASON, Springfield, assignor of one-half to Chauncey L. Olmstead, West Brookfield, Mass. Filed Apr. 15, 1889. Serial No. 307,254. (No model.)

Claim.—1. A corset having the swell of the breast portions detached from the clasp portions at the front edge, the stiffening material between the breast portions and the portion of the breast-section below detached on a diagonal line running from the lower end of the detached edge of the said breast portions upward and backward to the rear edge of the said breast portions, and whereby a diagonal hinge is formed between the said breast portions and the portion of the breast-section below, substantially as described.

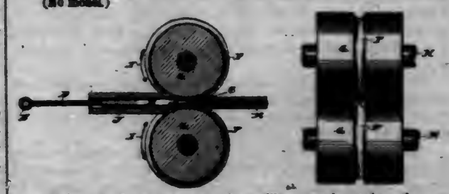


2. A corset having the swell of the breast portions detached from the clasp portions at the front edge, with a re-enforcing strip extending from the lower end of the detached edge of the said breast portions diagonally upward and rearward to the rear edge of the breast-section, the stiffening of the swell portion of the breast and of that portion of the breast-section below detached at the said diagonal line, and whereby a hinge is formed on said diagonal line, upon which the said breast portion may swing downward and backward in opening, substantially as described.

3. A corset having the swell portion of the breast detached from the clasp portions at the front edge, an overlay F extending from the lower end of the detached edge of the breast portion diagonally upward to the rear of the breast portion, the said overlay forming pockets to receive stays on the said diagonal line, the stiffening of the swell portion of the breast and that portion of the breast-section below detached, substantially as described.

405,114. FILE-CUTTING APPARATUS FOR DOUBLE-FILE-FABRIC LOOMS. JAMES OSWALD, Harpurhey, near Manchester, County of Lancaster, England. Filed June 18, 1888. Serial No. 277,457. (No model.) Patented in England May 19, 1887, No. 7,301, and in Germany Jan. 6, 1888. No. 44,569.

Claim.—1. The combination of a rigid support extending from side to side of the loom and having curved dovetailed slots formed in its face, with an enlarged opening at one end of each of said slots, a flat straight-edged knife reciprocating on the rigid support and provided on its back face with studs, on which are journaled friction-rolls that engage the curved slots in the support, brackets for holding the knife to its support, and means for reciprocating the knife, substantially as described.



2. The combination, with a rigid supporting-plate having curved dovetailed slots cut in but not through its face and having an enlarged opening at one end of each of said slots, of a knife having friction-rolls journaled on studs projecting from the back face of said knife and running in said slots, brackets mounted on the supporting-plate and holding the knife closely against the same, a pitman for reciprocating said knife in the direction of its length, and a crank for operating the pitman, substantially as described.

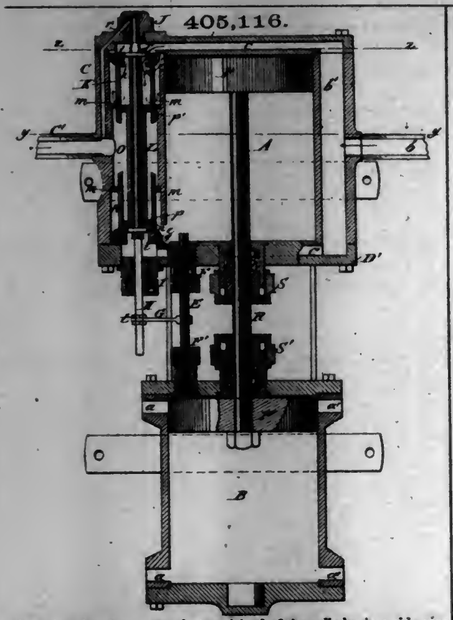
405,114.

405,115. APPARATUS FOR MAKING SEAMLESS TUBES. IRVING G. PLATT, Waterbury, Conn. Filed Mar. 1, 1889. Serial No. 301,640. (No model.)

Claim.—1. In an apparatus for rolling seamless tubes, the combination, with two or more grooved rolls, of a mandrel adapted at one end to support an ingot and made smaller at the other end, which is extended between the rolls to the point where they break contact with the work, whereby a drop is formed in that portion of the mandrel over which the ingot is broken down by the rolls, which are rotated away from the larger end of the mandrel.

2. In an apparatus for rolling seamless tubes, the combination, with two or more grooved rolls, of a mandrel having a breaking-down taper or bevel between its ends, such bevel being virtually included between the two points where the rolls make contact with the ingot and break contact with the tube and the rolls being rotated from the larger end of the mandrel.

405,116. STEAM-PUMP. NATHANIEL J. PRITCHARD, Milton, assignor to the Pritchard Brake Company, Roanoke, Va. Filed Sept. 8, 1888. Serial No. 284,718. (No model.)



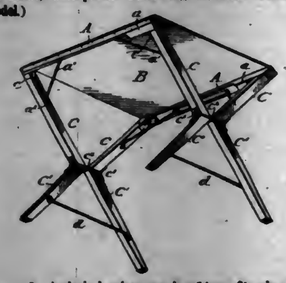
Claim.—1. As an improvement in the valve-operating mechanism of steam pumps or compressors, the combination, with the pistons of the power and pump cylinders, of a valve-actuating rod passing through the heads of said cylinders and moved alternately in opposite directions by contact with the said pistons, the valves secured on said rod, and the valve-chambers having an opening to receive the valves and flanges to guide the same, substantially as set forth.

2. In a valve mechanism for steam pumps or compressors, the valve-actuating mechanism, as described, in combination with the valve-rod, the valves secured thereto, the reciprocating sleeves and pistons mounted upon and guided by said rod, and the valve-chambers having an opening to receive the valves and flanges and to guide the same, substantially as described.

3. As an improvement in valves for steam-engines, the valve-rod provided with valves attached thereto, as described, and the reciprocating sleeve guided by said rod, in combination with the radially-pierced valve-chambers placed at opposite ends of the power-cylinder, as set forth.

4. As an improvement in the valve mechanism of steam-engines,

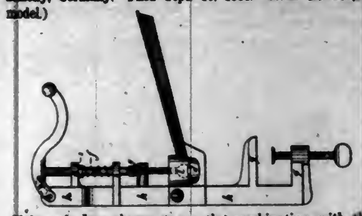
405,116.



the valve-chambers secured at each end of the cylinder in a side pipe and provided with a valve-opening at one end, a series of perforations surrounding the same for the passage of steam near the opposite end, and a single perforation near the valve-opening to allow the passage of a sufficient amount of steam to cushion the stroke of the piston, as set forth.

5. In a valve mechanism for steam-engines, the combination of the valve-rod and valves secured thereon with the valve-chambers having an opening to receive the valves and flanges to guide the same, substantially as specified.

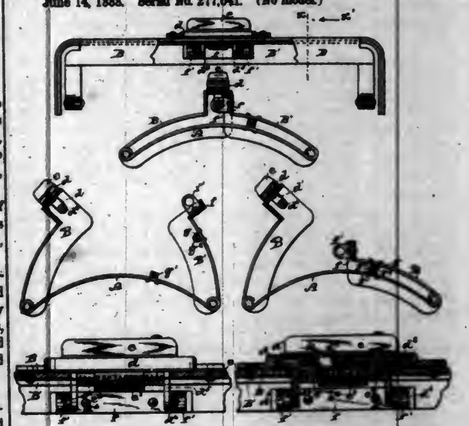
6. As an improvement in steam-pumps or compressors, the combination of the power-cylinder, the pump-cylinder, the pistons of said cylinder, the rod connecting said pistons, the valve-rod operated by the same, the valves attached to said rod, the sliding sleeve and pistons, the valve-chambers, and the side pipe inclosing said chambers and forming the steam and exhaust chambers, all constructed and arranged for joint operation, substantially as shown and described.



405,117. FOLDING CHAIR. JOHN R. PURDY and DANIEL A. SADEWAR, Washington, D. C., assignors of one-half to James R. Wilder and John J. Goode, same place. Filed Aug. 27, 1888. Serial No. 283,832. (No model.)

Claim.—1. A chair having a pair of bars forming a seat-frame and a flexible seat, a pair of legs hinged to the seat-frame at each end, so as to fold longitudinally up against it, each leg being jointed in the middle, so that the lower half may fold up against the upper half, and the legs being hinged together in the middle, substantially as described.

2. In a folding chair, the combination, with the parallel bars forming a seat-frame and with the flexible seat, of a pair of two-part legs hinged to each end of the seat-frame, so as to fold up against it, each pair of legs forming an X-shaped support connected at the intersection, and hinge-joints, substantially as described, which permit the two parts of each leg to fold together, and the upper parts of the X-shaped supports to fold together in one direction and up against the seat-frame at right angles to said direction, substantially as set forth.



405,118. CHERRY-STONER. PAUL H. REINISCH, Dresden-Plauen, Saxony, Germany. Filed Sept. 18, 1888. Serial No. 285,670. (No model.)

Claim.—1. In a cherry-stoner, the combination, with the reciprocating piston provided with prongs for piercing the cherry, of the apertured support for the cherry, the stripper, the pusher, the outlet-spout arranged opposite to said pusher, and the contracted feed-trough, leading to said apertured support, as set forth.

2. In a cherry-stoner, the combination, with the reciprocating piston provided with prongs for piercing the cherry, and the apertured support R, arranged in the path of said prongs, of the stripper and the pusher, which knocks the stoned cherry off from its support, said pusher consisting of a pivotally-mounted elbow-lever g l, one arm of which is coupled operatively to said piston, as set forth.

405,119. BAG-LOCK. CHARLES REINISCH, Newark, N. J. Filed June 14, 1888. Serial No. 277,041. (No model.)

Claim.—1. A bag-frame consisting of end pieces A, to which are pivoted hinged sections B and B', substantially as shown, having arranged on said end pieces A centering devices g, and on the frame-section B' similar devices g', said devices fitting one within the other when the bag-frame is closed to prevent the side movement of the frame-sections of the bag, substantially as and for the purposes set forth.

2. A bag-frame consisting of end pieces A, to which are pivoted the hinged sections B and B', substantially as shown, having arranged on said end pieces A centering devices g and on the frame-section B' similar devices g', said device g being provided with a concave surface g^3, and the other device g' having a convex surface g^3, said surfaces fitting one upon the other to prevent any side movement of the frame-sections of the bag, as and for the purposes set forth.

3. In a bag-lock, the combination, with a sliding casing c, of a chambered plate d and a fastening device consisting of a pinion and toothed plates, said plates being provided with arms projecting downwardly within the bag through the frame-section and provided with oppositely-projecting bolts which engage with loops on a hasp-plate, for the purposes set forth.

4. In a bag-fastening, the combination, with catching-bolts and catching-loops, of a bolt-operating device consisting of a sliding casing moving reciprocally on a chambered plate, a pinion therein, toothed plates meshing with said pinion, said plates having arms projecting downwardly within the bag through the frame-section and having bolts thereon provided with beveled surfaces which engage with inclined surfaces on the loops on the hasp-plate, and means to cause the return of said bolts to their normal position, substantially as described.

5. In a bag-fastening, the combination, with catching-bolts and catching-loops, of a bolt-operating device consisting of a chambered plate having arranged therein toothed plates to which said bolts are connected, a pinion meshing with said toothed plates, a longitudinally-sliding finger-piece arranged on the top of said chambered plate and connected with one of the toothed plates in said chambered plate and operating in relation to said catching-bolts to cause their disengagement from the catching-loops, and a spring arranged to cause the return of said bolts to their normal positions, for the purposes set forth.

6. A bag-fastening consisting of a chambered plate d, a plate c, having a spring-receiving loop thereon, a pinion d^3, toothed plates d' and d^3, meshing with said pinion, arms d^4 and d^5, projecting downwardly from said toothed plates through said plate c and the bag-frame, oppositely-projecting bolts d^6, provided with beveled ends engaging with catching-loops having surfaces inclining toward each other, a spring arranged between said bolt-arms to cause the return of said bolts to their normal position within the loops, and a sliding piece c, arranged and operating in relation to said chambered plate d to cause the disengagement of said bolts from the catching-loops, for the purposes set forth.

7. A combined bag fastening and lock consisting of a chambered plate d, a sliding casing or finger-piece c, moving reciprocally on said plate, toothed plates d' and d^3, meshing with a pinion, all arranged and moving within the chambered plate, one of said toothed plates being secured to the sliding casing, substantially as indicated, arms d^4 and d^5, projecting downwardly from said toothed plates through slots c' and c^2 in the plate c and through the bag-frame, oppositely-projecting bolts secured to said arms, the inclined ends of which engage with inclined ends projecting toward each other on catching-loops on a loop-plate, a spring arranged within a loop on said plate c, projecting oppositely from each end thereof and engaging with the downwardly-projecting arms d^4 and d^5 to cause the return of said bolts to their normal position when caused to be withdrawn from the loops by the finger-piece, all of said parts being arranged substantially as and for the purposes set forth.

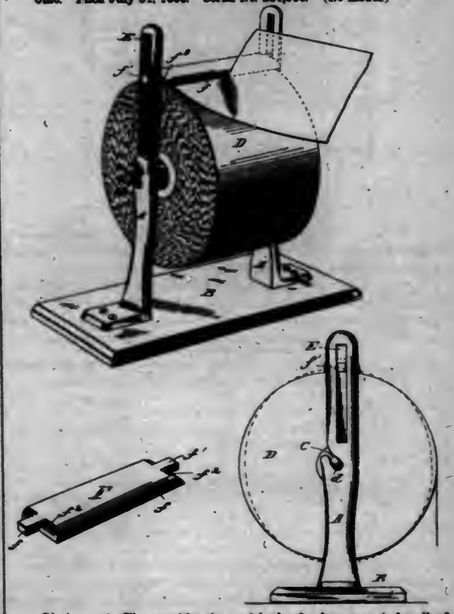
8. The combination, with a locking device, substantially as described, of the frame-sections B' and B, hinged to a rigid end piece A, the section B' being provided with a hasp-plate having loops, the inclined surfaces of which project toward each other, the other of said hinged sections B being provided with a fastening device adapted to engage with said hasp-plate, as and for the purposes set forth.

9. In a bag-fastening, the combination, with catching-bolts and hasp-loops, of a bolt-operating device consisting of toothed plates to which said bolts are connected, a pinion meshing with said toothed plates, and means operating with said plates to cause the same to operate the bolts, for the purposes set forth.

10. In a bag-fastening, the combination, with catching-bolts and catching-loops, of a bolt-operating device consisting of toothed plates provided with arms projecting down within the frame and to which arms said bolts are connected, said toothed plates being arranged within a chambered plate or casing, a pinion meshing with said toothed plates, and means operating with said plate to cause the same to operate the bolts and cause the locking engagement of said bolts with the hasp-loops, for the purposes set forth.

11. In a bag-fastening, the combination, with catching-bolts and catching-loops, of toothed bolt-plates having arms arranged at right angles on said plates, a pinion meshing with said bolt-plates, all of said parts being arranged in a chambered casing, a finger-piece secured to one of said bolt-plates, catching-bolts attached to and projecting at right angles from said projecting arms and moving longitudinally with said toothed plates and the finger-piece within the bag-frame and within the bolt-openings in the catching-loop, and a spring whereby said bolts are held normally within said catching-loops, said finger-piece moving reciprocally on the chambered casing and operating to cause the sliding longitudinal movement of the bolt-plates, for the purposes set forth.

12. In a bag-fastening, the combination, with catching-bolts and catching-loops, of a casing arranged on the top of a bag-frame, provided with means for operating said bolts, said bolts being concealed beneath the frame-section of the bag and moving longitudinally within the bolt-openings in the catching-loops, a spring whereby said bolts are normally held within said openings, and a finger-piece arranged on the casing on the outside of the bag-frame, the catching-loops being beveled and engaging with the beveled ends of the catching-bolts to receive the same in the perforations in said loops, substantially as and for the purposes set forth.



13. The combination, with a locking device, substantially as described, of the frame-sections B' and B, hinged to a rigid end piece A, the section B' being provided with a hasp-plate having loops the inclined surfaces of which project toward each other, the other of said hinged sections B being provided with a fastening device adapted to engage with said hasp-plate, and centering devices g and g', arranged on the end pieces A and the sections B', respectively, fitting one upon the other to prevent the side movement of the frame-sections of the bag when the same is closed, for the purposes set forth.

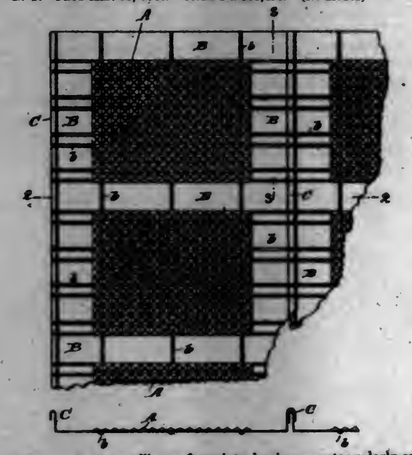
405,120. FENCE. JAMES D. ROGERS, Georgetown, Ky. Filed Dec. 24, 1888. Serial No. 294,700. (No model.)

Claim.—In a fence, the combination of the longitudinally-inclined converging stake E, the rails A B, arranged between and in contact with said stakes and having their meeting ends lapped and secured, respectively, to alternate stakes E, for the purpose set forth, the stakes C, arranged at right angles to the fence and having their upper ends crossed over the upper rails and secured together, and the riders having their lapped ends resting in the notches of the stakes E and secured thereto, the upper ends of said stake E being secured to the upper ends of the stakes C, substantially as described.

405,121. PAPER-ROLL HOLDER. ABBOTT Q. ROSE, Cincinnati, Ohio. Filed July 31, 1888. Serial No. 281,580. (No model.)

Claim.—1. The combination, with the freely-suspended roll of paper, of a floating weighted cutter-bar held by gravity alone against the periphery of said roll and having a cutting-edge removed from the point of contact between said bar and roll, whereby said cutter-bar is caused to act as a friction-brake to the roll to adapt itself automatically to the size and contour of the roll and to serve as means for severing the free end of the paper when the latter is pulled upward against it, substantially as described.

2. A paper-roll holder embodying supports in which to suspend a roll of paper, a weighted cutter-bar for bearing by gravity alone upon the suspended roll of paper and having a cutting-edge removed from its contact or bearing point, against which the paper is adapted to be separated by an upward draw upon it, and guides in which the cutter-bar works, substantially as described.

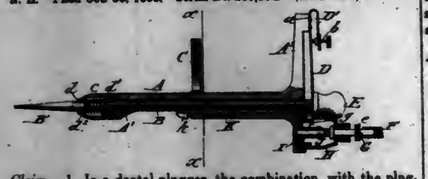


3. The combination of a paper roll, supports in which the same is journaled, a weighted cutter-bar bearing by gravity alone upon the

paper roll and having a cutting-edge at one of its lower corners removed from the bearing-point, and having, also, guiding and projections and slotted guides in which the projections on the end of the cutter-bar are free to play up and down, substantially as described.

4. In a paper-roll holder, the combination, with the slotted supports having bearing for receiving the journals of a paper roll, of the weighted cutter-bar provided with the cutting-edge at one of its lower corners and shouldered ends co-operating with slots in the supports, and having rounded or beveled portions which permit of the free independent vertical movement of its end, substantially as described.

5. The combination, with the slotted supports, of the roll of paper journaled therein and the weighted cutter-bar guided by the slots in the supports and bearing by gravity alone on the roll in a plane or planes substantially parallel to the plane of said guide-slots and having its front side beveled to constitute a tearing-edge that is removed from the bearing-point, substantially as described.

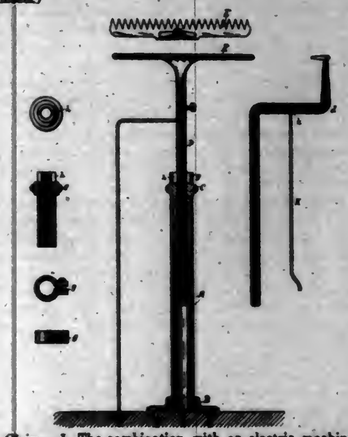


405,122. METALLIC ROOFING-PLATE. LOUDLEY L. SAGENDORPH, Cincinnati, Ohio, assignor of one-half to Charles H. Harder, Philmont, N. Y. Filed Mar. 15, 1889. Serial No. 303,456. (No model.)

Claim.—1. A metallic roofing-plate having a rectangularly-embossed figure at center and surrounded by a border having beaded grooves therein, substantially as set forth.

2. A metallic roofing-plate having the central pyramidically-embossed surface A, surrounded by a border B, having the beaded grooves *b* therein, and side flanges C, the grooves *b* from said side borders extending up and over said flanges, substantially as set forth.

405,123. DENTAL PLUGGER. ANDREW J. SAWYER, New Market N. H. Filed Oct. 30, 1888. Serial No. 289,504. (No model.)



Claim.—1. In a dental plugger, the combination, with the plugging-instrument, of a spring-hammer, the actuating-cam, and the stop device K, having end *k*, for stopping the hammer, substantially as described.

2. The combination of the casing A, cut away at A', the plugging-instrument B, arranged therein, the spring-hammer attached to the case, the thimble H, likewise secured to the case, the spindle G, journaled in the thimble, the cam I, arranged within the case and adapted to act upon the spring-hammer, and clutching mechanism for connecting the cam and the spindle, substantially as described.

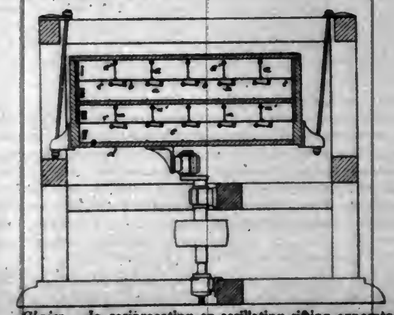
3. The combination, with the main casing, the plugging-instrument therein, and the cam for operating the spring-hammer, of said hammer, consisting of the spring D, secured at *a a* to the part A^3 of the case and carrying weight E, said spring D having the part *d'* curved back upon itself and carrying a set-screw *b*, for regulating the force of the blow of the hammer, substantially as described.

4. The combination of the case A, cut away at A', plugging-instrument B within said case, having point B', the spring *d*, arranged within the cap *c*, which is secured on the end of the case, as specified, the spring-hammer and its set-screw *b*, the cam for operating the hammer, the actuating means for the cam-spindle, the clutching mechanism between the spindle and the cam, and a stop device for the hammer, all substantially as described.

405,124. DISCHARGE DEVICE FOR ELECTRICAL MACHINES. ALBERT SCHMID, Allegheny, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Mar. 12, 1889. Serial No. 303,041. (No model.)

Claim.—1. The combination, with an electric machine, its belt-wheel and a belt applied thereto, of an adjustable discharge device consisting of a discharge-plate directed toward the belt-wheel, a support therefor, and means for adjusting the vertical position of such support.

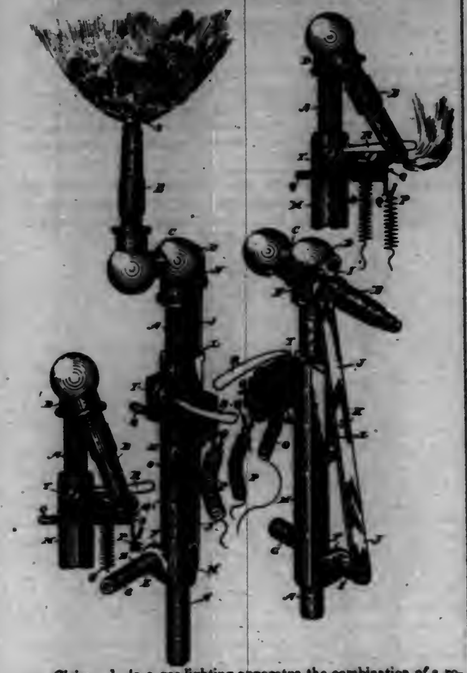
2. The combination, with an electric machine, of a driving belt-wheel and a discharge device consisting of a plate interposed between the body of the machine and the inner side of the belt-wheel.



3. The combination, with an electric machine, of a driving belt-wheel and a discharge device consisting of a plate interposed between the body of the machine and the inner side of the belt-wheel, and electrical connections from the discharge device with the earth.

4. A discharge device for belt-wheels, consisting of a stationary support, a discharge-plate placed between the belt-wheel and the body of the machine, and an arm carrying the plate adjustable in said support.

5. An electrical-discharge device consisting of a stationary support, a rod adjustable therein, a discharge-plate carried by the rod, an electrical connection from the plate, and means for holding the rod in any desired vertical position.



6. In an electrical-discharge device, the combination of the tabular support A, the washer C, carried thereby, having a resilient extension A, the vertically-adjustable rod D, the plate E, carried by the rod, and the collar *g* for compressing said extension.

405,125. MEANS FOR CLEANING SHAKING-SCREENS. HEINRICH SUCK, Dresden, Saxony, Germany. Filed Sept. 25, 1888. Serial No. 286,383. (No model.)

Claim.—In reciprocating or oscillating sifting apparatus, the combination of the frame or case *d* and sieve *c*, with flaps *e* pivoted by rods supported in walls of the frame or case and provided at their free ends with strikers *b*, substantially as and for the purpose set forth.

405,126. AUTOMATIC GAS LIGHTING AND EXTINGUISHING APPARATUS. NATHANIEL H. SHAW, Somerville, Mass., assignor to the American Automatic Gas Lighting Company, Portland, Me. Filed May 14, 1888. Serial No. 273,795. (No model.)

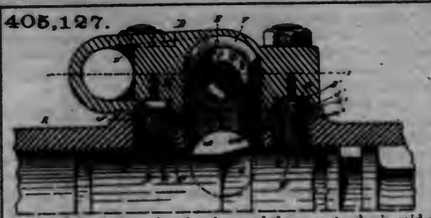
Claim.—1. In a gas-lighting apparatus, the combination of a rotary burner and gas-cock with electrodes adapted for engagement with said burner in its movement, for the purpose set forth.

2. In a gas-lighting apparatus, the combination of a rotary burner and gas-cock with yielding electrodes, said burner adapted in its rotation to make and break electrical connection through said electrodes, for the purpose set forth.

3. The combination of a rotary burner and gas-cock with a time mechanism adapted to automatically actuate them, and with two electrodes brought into circuit by said burner in its rotation, substantially as and for the purpose set forth.

4. The combination of a rotary burner and gas-cock and a time mechanism for actuating them with a rotating shaft connected to the time mechanism and a pivoted pitman uniting said shaft and cock for simultaneous movement, substantially as set forth.

5. The combination of a rotary burner and gas-cock and a time mechanism adapted to actuate them at predetermined times with a rotating shaft located below said cock, a pivoted pitman connecting said shaft and cock, and a movable fulcrum for said pitman working in grooved ways, substantially as set forth.



6. The combination of a rotary burner and gas-cock, a rotary shaft parallel to their axes, and a time mechanism for actuating them, with a pivoted pitman having midway of its length a sliding fulcrum and at one end a short connecting-link, for the purpose set forth.

7. The combination of a rotary burner and gas-cock, a rotary shaft in a lower plane, and mechanism for moving them simultaneously, as described, with a sleeve or bar attached to the gas-pipe as a support for said shaft, and with two electrodes, also mounted upon said sleeve or bar, substantially as and for the purpose set forth.

405,127. STEAM ROCK-DRILL. ABRAHAM J. STEPHEN, Iron Mountain, Mo. Filed Mar. 9, 1888. Serial No. 266,771. (No model.)

Claim.—1. In a steam rock-drill, the combination of a main valve, the valve-chamber having inlet and outlet ports, and sub ports or passages at or near each end and extending to the exhaust-port, and a puppet-valve in said sub ports or passages and operated by the piston, substantially as described.

2. In a steam rock-drill, the combination of the valve-chamber B^2, having the supply and exhaust ports b^2, b^4, and b^3, and the sub-ports or passages extending to the exhaust-port, a valve having the collars b^5 b^6 b^7 b^8, the steam-supply port B', having the passages communicating with the valve-chamber, and the puppet-valve in said sub ports or passages *c c'* and operated by the piston, substantially as described.

3. In a steam rock-drill, the combination of the cylinder, the puppet-valves having beveled lower ends and annular grooves, the piston having the inverted inclines to operate said puppet-valves, the chamber inclosing the cones, and passages connecting the cone-chamber with the valve-chamber, and a passage connecting the annular grooves with the exhaust-port, substantially as described.

4. In a steam rock-drill, the combination of the cylinder having the bushings provided with external annular grooves connected by passages with the exhaust-port and the interior of the bushing, the puppet-valves having beveled lower ends and annular grooves and resting upon the bushing, the piston having the inverted inclines to operate said puppet-valves, the chamber inclosing the cone of the puppet-valves, and connected by passages with the ends of the valve-chamber, substantially as described.

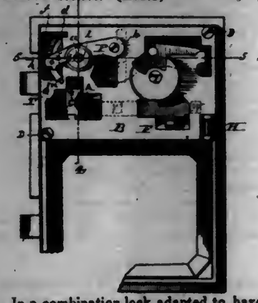
405,128. EXERCISING-BAR. SAMUEL P. STOCKBURGER, Canton, Ohio. Filed Jan. 4, 1889. Serial No. 295,257. (No model.)

Claim.—The combination of the bar A, formed of spring material and of such a length to be grasped by both hands, the removable weights B, and means for attaching said weights, substantially as and for the purpose specified.

405,129. GAGE-COCK. JOHN P. STEARNS, Philadelphia, Pa. Filed Sept. 15, 1888. Serial No. 285,496. (No model.)

Claim.—1. A cock consisting of the shell A, provided with inclined ports at one end opening into the bore thereof, a valve having its seat on one end of the shell and provided with a stem having its end portions turning in the bore of the shell, its central portion being of reduced diameter, the said valve having ports coinciding with the ports of the shell, and a nozzle leading from said bore, said parts being combined substantially as described.

2. A cock consisting of a shell provided with inclined ports leading into the bore thereof, a valve with ports coinciding with the ports of the shell and provided with a stem having end portions of greater diameter than its central portion, and a nozzle leading from the bore of the shell between the end portions of the stem, the end portions of the stem turning in the bore of the shell and the ports of the shell leading into the bore between the said ends, the said bore being of substantially uniform diameter, said parts being combined substantially as and for the purpose set forth.

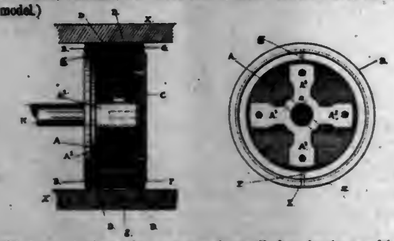


405,130. MOUNT FOR PHOTOGRAPHS. RICHARD H. L. TALCOTT, Boston, Mass. Filed Nov. 14, 1888. Serial No. 290,797. (No model.)

Claim.—1. A mount for photographs, consisting of the glass front *a*, the card or pasteboard back *b*, and the strips *g*, overlapping and secured to said front and back at all but one of their edges to form an envelope, and the sealing-flap *h*, secured at the unbound edge of said envelope, substantially as described.

2. As a new article of manufacture, a mount for photographs, consisting of the glass front *a*, the card or pasteboard back *b*, and the strips *g*, overlapping and secured to said front and back at all but one of their edges, to form an envelope, the overlapping flap *h*, secured at the unbound edge of said envelope, and the sheet *l*, of flexible material, overlying the back *b* and the rear edges of said strips *g* thereon, and secured thereto for the greater area of said back, but unsecured toward the flap end of the envelope, all substantially as shown and described, for the purposes set forth.

405,131. LOCK. WARREN H. TAYLOR, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Dec. 10, 1888. Serial No. 293,093. (Model.)

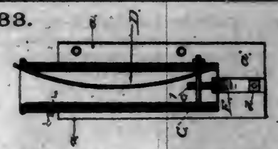


Claim.—1. In a combination-lock adapted to have its combinations changed by the use of a key, the combination of the tumblers in two separable parts, the movable frame carrying the circular parts of the tumblers, and the catch *i*, engaging with the pivot-post *a* to fasten the said parts of the tumblers together, substantially as set forth.

2. The combination of the movable frame, with its pivot-post *a* extending through the cap-plate of the lock, the catch *i*, and the thumb-nut *b*, serving as a handle and as a fastener for the said catch, substantially as set forth.

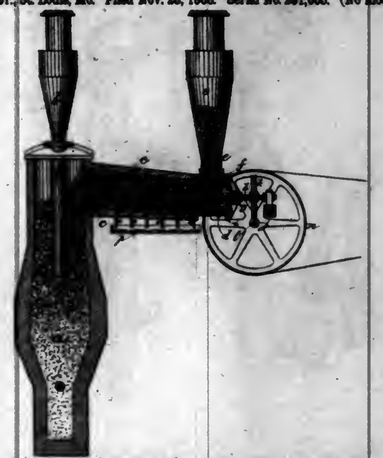
3. The combination of the movable frame, the circular parts of the tumblers carried thereby and the other parts of the tumblers pivoted to the case, the catch *i*, and the pivoted spring-stop *e*, provided with the stud *h*, substantially as set forth.

405,132. BALANCED PISTON FOR STEAM-ENGINES. WILLIAM J. THOMAS, Sausalito, Cal. Filed Nov. 7, 1888. Serial No. 290,252. (No model.)



Claim.—A piston for steam-engine cylinders, having packing-rings set obliquely and divergently, as described, and the recess E, formed between them at the part of greatest divergence, in combination with ports or passages, as *g* F, which are adapted to connect the said recess E with the steam-space of the cylinder outside the piston, as set forth.

405,133. COMBINED WHIP-SOCKET AND REIN-HOLDER. ADDISON THOMPSON, Clear Lake, Iowa. Filed Jan. 7, 1889. Serial No. 295,852. (No model.)



Claim.—An improved whip-socket and rein-holder, consisting of a case or socket having a slot in one side of its lower portion, and provided at the opposite side with a securing-plate having an extension *a'* below the case or socket, a lever B at one side of the case or

socket having a lug projecting through said slot and provided with a short arm or extension *c*, a spring within the socket, a bolt passing through said case or socket, spring, and inwardly-projecting lug, whereby these parts are secured together, and a second spring between the extending portions of the securing-plate and pivoted lever, substantially as herein described.

405,134. APPARATUS FOR CONDENSING ZINC VAPORS AND COLLECTING THE METALLIC ZINC THEREFROM. EDWARD WALSH, Jr., St. Louis, Mo. Filed Nov. 23, 1888. Serial No. 291,665. (No model.)

Claim.—1. A condenser for condensing zinc vapors into molten zinc, said condenser having a vapor-inlet for the admission of zinc vapors, a feed mechanism for feeding a condensing medium—such as solid carbon—through the condenser in the direction of the vapor-inlet, and outlets for the uncondensed gases and the condensed molten zinc, substantially as and for the purposes specified.

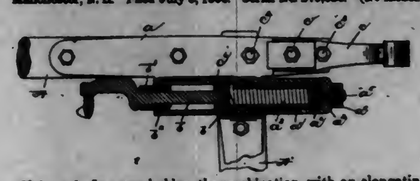
2. A condenser for condensing zinc vapors into molten zinc, said condenser having a vapor-inlet, a feed-chute distant from the vapor-inlet, feed mechanism for feeding a condensing medium—such as carbon—through the condenser, and outlets for the condensed molten zinc and uncondensed vapors, substantially as and for the purposes specified.

3. The combination, with a stack or furnace for reducing zinc ore, of a condenser arranged at the upper part thereof and connected therewith, said condenser having outlets for the escape of non-condensed gases and condensed molten zinc, a feed-chute at the distant end of the condenser, and feed mechanism for feeding a carbonaceous material through the condenser into the furnace, substantially as and for the purposes specified.

4. The combination, with a stack or furnace for reducing zinc ores, of a condensing-tunnel connected with the upper part thereof and slightly inclined therefrom, outlets at the bottom of said tunnel for the escape of condensed molten zinc, and feed mechanism for feeding a solid carbon through the tunnel and into the stack, substantially as and for the purposes specified.

5. The combination, with a stack or furnace for reducing zinc ores, said stack having a chute for charging the furnace with mixed ores and fuel, of a condensing-tunnel connected with the top of the stack, said tunnel provided with a chute for introducing carbon, feed device for feeding the carbon through the tunnel into the stack, and outlets for the escape of condensed molten zinc and non-condensed gases, substantially as and for the purposes specified.

405,135. APPARATUS FOR DRAWING EFFERVESCING FLUIDS. JOSEPH H. WALTON, Philadelphia, Pa. Filed Dec. 27, 1886. Serial No. 223,718. (No model.)



Claim.—In combination with an apparatus for drawing effervescing fluids from casks, the bushing B, the extension B^2, having the smooth-bored portion B^3, the stop-cock G, having the groove G^3, the hollow valve-guide F^3, having apertures F^4, and the valve F, all con-

405,135.

structed and adapted to afford an unobstructed central channel, substantially as described and shown.

405,136. TUG-HOLDER FOR VEHICLES. ALBERT B. WEBSTER, Manchester, N. H. Filed July 5, 1888. Serial No. 279,092. (No model.)

Claim.—1. In a tug-holder, the combination, with an elongating spring having one end fastened to a stationary part of the vehicle, of a draw-bar extended through a bearing and connected to the said spring, whereby the said spring is elongated when the draw-bar is drawn upon, substantially as described.

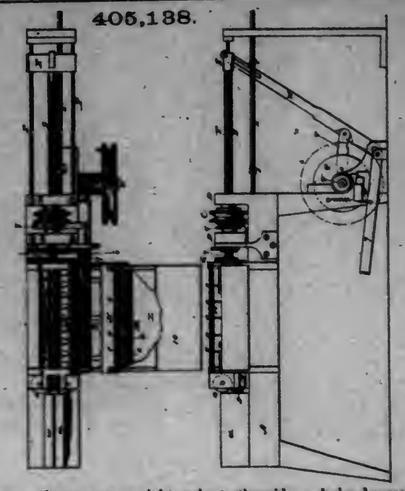
2. The combination, with a tube, of a spring located therein and firmly secured at one end, a draw-bar secured to the opposite end of the spring, and a cylinder-head through which the said draw-bar is extended, the said cylinder-head forming a long bearing for the draw-bar to prevent rattle, substantially as described.

3. The combination, in a tug-holder, of a tube, an elongated spring having one end fixed within the said tube, a cylinder-head, and a draw-bar extended through the said cylinder-head and connected to the said spring, substantially as described.

4. The combination, with a shaft-iron having a tube *a'*, closed at one end and cast integral therewith, an elongated spring located in said tube, and a draw-bar secured to said spring, of a sweep-piece *c*, bolted to the shaft-iron, substantially as described.

5. The combination, with a shaft-iron, a tube cast integral therewith, an elongating spring located therein, a cross-head, to which one end of the said spring is secured, a cylinder-head, and a draw-bar extended through said cylinder-head and secured to the said spring, substantially as described.

405,137. VETERINARY SYRINGE. JOHN W. WHITLOCK, Roanoke, Va. Filed Apr. 29, 1889. Serial No. 309,121. (No model.)



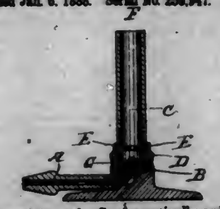
Claim.—An animal-drenching device consisting of a syringe having a curved discharge-tube secured to an enlarged egg-shaped perforated bulb inclosing a wire screen and sponge, substantially as shown and described.

405,138. MACHINE FOR ROLLING PAPER TUBES. HARRY O. WHITNEY, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed June 25, 1888. Serial No. 278,194. (No model.)

Claim.—1. In a machine for making paper tubes for cartridge-shells, the combination of the revolving and longitudinally-reciprocating mandrel, several rollers arranged around said mandrel and parallel therewith, mechanism, substantially such as described, to impart longitudinal reciprocating movement to said mandrel, and a pasting and feeding mechanism, substantially such as described, in rear of said mandrel, the combination being substantially as specified, and whereby a sheet of paper is coated with adhesive material upon one side, advanced toward and wound into a tube upon said mandrel between it and the surrounding rollers, and then the mandrel with the tube thereon moved longitudinally out from between the rollers for the discharge of the tube.

2. The combination of the revolving and longitudinally-reciprocating mandrel B, several rollers, as I J K, arranged in stationary bearings around said mandrel and parallel therewith, a pasting and feeding device, substantially such as described, to coat and deliver the sheet of paper to said mandrel and rollers, two or more wheels *n r s*,

405,138.



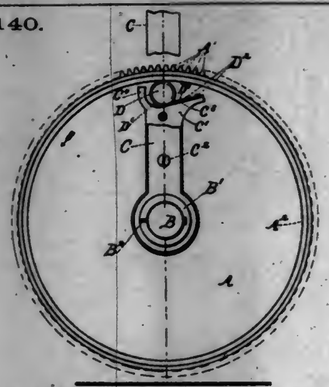
arranged upon axes at right angles to the said mandrel and surrounding the same, the periphery of the said wheels grooved corresponding to the mandrel, and between which wheels the said mandrel passes in its longitudinal reciprocation, substantially as and for the purpose described.

3. The combination of the longitudinally reciprocating and revolving mandrel B, several rollers, as I J K, arranged in stationary bearings around said mandrel and parallel therewith, a pasting and feeding device, substantially such as described, adapted to coat and deliver the paper to said mandrel and its surrounding rollers, a pair of grippers in the path of said mandrel in its longitudinal movement, and adapted to grasp the tube formed upon the mandrel, substantially as specified.

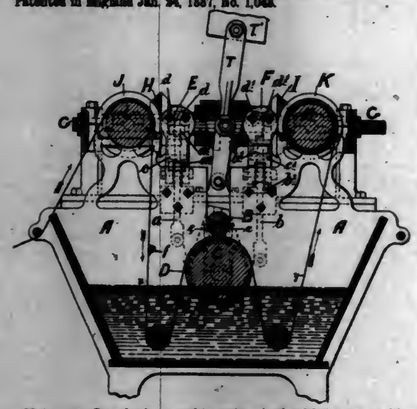
4. The combination of the longitudinally reciprocating and revolving mandrel B, several rollers, as I J K, arranged in stationary bearings around said mandrel and parallel therewith, the said rollers constructed with annular grooves *i*, stationary guard-fingers *l*, lying in said grooves, with a pasting-and feeding mechanism, substantially such as described, adapted to coat and deliver the paper between the said mandrel and its surrounding rollers, substantially as specified.

5. The combination of the longitudinally reciprocating and revolving mandrel B, several rollers, as I J K, supported in stationary bearings around said mandrel and parallel therewith, wheels, as *n r s*, arranged upon axes at right angles to the axis of the mandrel and in the longitudinal path of the mandrel, the said wheels grooved corresponding to the surface of the mandrel, and a pair of grippers *w w*, arranged beyond the said wheels and adapted to grasp the tube which has been formed on the mandrel, substantially as and for the purpose described.

405,139. HEATING-GAS BURNER. S. LLOYD WIEGAND, Philadelphia, Pa. Filed Jan. 6, 1888. Serial No. 259,947. (No model.)



Claim.—The mixing-tube C, of practically uniform diameter and having an inwardly-projecting rim or flange E at its entrance, in combination with the jet-tube B, located in the same axial line therewith and attached thereto, substantially as described and set forth.



405,140. INTERMITTENT GRIP DEVICE. WILLIAM H. WILD, Valatie, N. Y. Filed Feb. 20, 1888. Serial No. 300,607. (No model.)

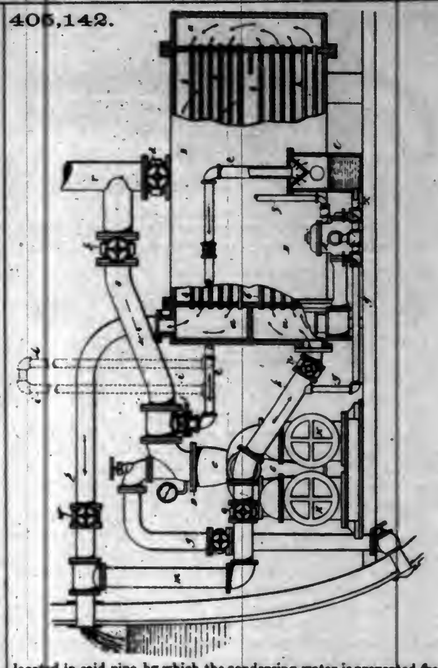
Claim.—In an intermittent grip device, a shaft and drive-wheel provided with a roll-engaging flange, in combination with a friction-roll, a roll-carrier having an inclined roll-track, carrier-operating lever fulcrumed upon the shaft, and roll-controlling spring D', having one end fixed to the carrier and the other end coiled around the roll, substantially as described.

405,140.

405,141. DYEING APPARATUS. ELIAS WOOD, Leeds, County of York, England. Filed Jan. 24, 1888. Serial No. 261,807. (No model.) Patented in England Jan. 24, 1857, No. 1,048.

Claim.—1. In a dyeing-machine wherein the fabric is passed back and forth between winding-on rollers, the combination, with said rollers, of a shifter for connecting said rollers alternately with the driver, and a controller consisting of a bar or strip borne by the fabric for controlling the shifter automatically at the proper time.

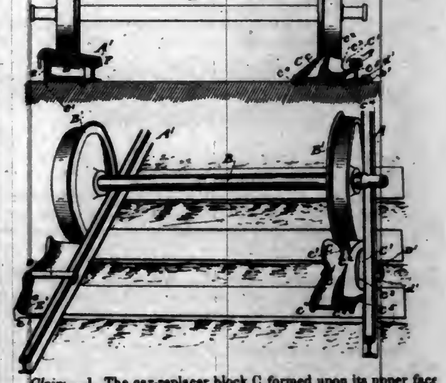
2. In a dyeing-machine wherein the fabric is passed back and forth between winding-on rollers, the combination, with said rollers and their gears and the splined clutch provided with cams, of the two hinged arms provided with anti-friction rollers, against which the cams act, the rods which actuate the said arms connected, respectively, to opposite sides of the friction-strap $D^{\times}$, the said friction-strap, its wheel D, secured to the journal of the lower nipping-roller, the upper lifting-roller mounted as set forth and its journal engaging a fork on the strap $D^{\times}$, and lifters carried by the fabric which passes between the said nipping-rollers, whereby when one of said lifters enters between said rollers and raises the journal of the upper roller out of said fork the friction-strap $D^{\times}$ will be released, as set forth.



405,142. CONDENSING APPARATUS. CHARLES C. WORTHINGTON, Irvington, N. Y. Filed Dec. 10, 1888. Serial No. 293,129. (No model.)

Claim.—1. The combination, with a surface condenser and an injection or jet condenser, of the pipe *r* and branch *s*, having valves *d f*, for delivering the steam to either condenser; and a pump communicating with the jet condenser to withdraw the condensing-water therefrom, and with the surface condenser to circulate the water therein, substantially as described.

2. The combination, with a surface condenser, of an injection or jet condenser communicating with the surface condenser to withdraw the air and vapor therefrom, and a pump communicating with the injection or jet condenser to withdraw the condensing-water therefrom, and with the surface condenser to circulate the water therein, and the pipe *r* and branch *s*, having the valves *d f*, for delivering the steam to either condenser, substantially as described.

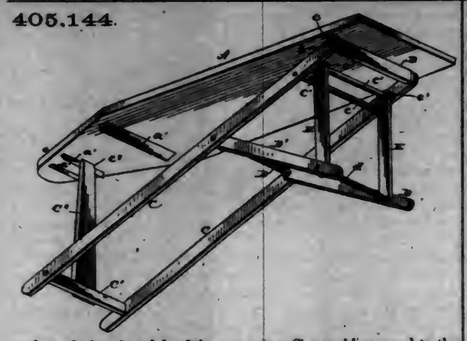


3. The combination, with a surface condenser, of an injection or jet condenser, a pipe connecting the two, by which the air and vapor are exhausted from the former by the latter, and a water-check

405,142.

located in said pipe, by which the condensing-water is prevented from entering the surface condenser, substantially as described.

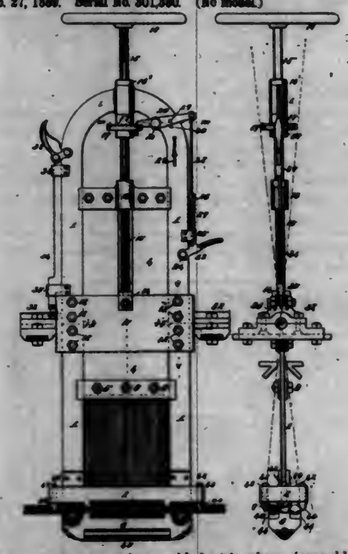
405,143. CAR-REPLACER. ROBERT W. AFRICA, Huntingdon, Pa., assignor of one-half to Orlando Gibson, same place. Filed Mar. 7, 1889. Serial No. 302,275. (No model.)



Claim.—1. The car-replacer block C, formed upon its upper face with the inclined grooves *c* and *c'*, extending from opposite ends toward the center, and upon its edge concaved, substantially as shown and described, and for the purpose specified.

2. The combination, with the rails A and A', of the block C, formed with concaved edge, and upon its upper face with the longitudinal grooves *c* and *c'*, and the block D, secured to the outside of the rail A' and formed upon its upper face with the two inclines extending from the ends toward the center and toward the inner edge, substantially as shown and described.

405,144. IRONING-TABLE. WILLIAM I. CARR, Greenwood, Nebr. Filed Jan. 24, 1889. Serial No. 297,366. (No model.)



Claim.—In an adjustable ironing-table, the combination of the board A, of the retaining-strips *a' a' a'*, of the cross-piece B, provided with the bearings *b b*, of the legs C C, pivotally secured at their inner

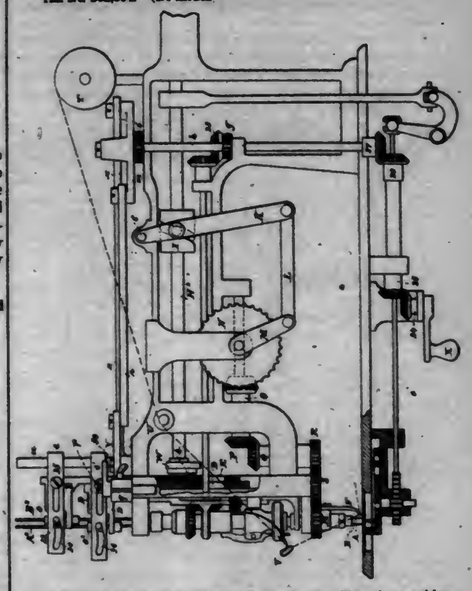
405,144.

ends to the bearings *b b*, of the cross-piece C, movably secured to the outer ends of the legs C C, of the tongue $C^{\times}$, secured to said movable cross-piece, of the short legs D' D', movably working upon the middle round D, secured to the legs C C, and having their outer ends secured together by the round *d*, of the notched supporting-pieces E E, movably secured to the round *d* and connected at their outer ends by round *e*, and of the rounds *c' c'*, secured to the legs C C, substantially as herein shown, and for the purpose set forth.

405,145. CABLE-GRIP. GEORGE A. CARRERAS, St. Louis, Mo. Filed Feb. 27, 1889. Serial No. 301,360. (No model.)

Claim.—1. A cable-grip provided with arbors, journal-boxes in which the arbors fit, and a dog and notched plate for holding the grip in a vertical position, but permitting it to be swung on a horizontal plane, substantially as and for the purpose set forth.

2. In a cable-grip, the combination of the frame 1, upper jaw secured to the frame, plates 3 4, and lower jaw secured to the plate 3, the frame 1 being divided and connected by a cross-head and bolts, substantially as and for the purpose set forth.



3. In a cable-grip, the combination, with the frame and the upper jaw secured to said frame, of the sliding plates, the lower jaw carried by said plates, a cross-head attached to said plates, and an upright screw stepped in said cross-head for raising and lowering said lower jaw, substantially as set forth.

4. In a cable-grip, the combination of the frame, an upper jaw carried by the frame, sliding plates, lower jaw carried by the plates, a screw for operating the plates, a ratchet secured to the screw, and a spring-pawl for engaging the ratchet, substantially as and for the purpose set forth.

5. In a cable-grip, the combination of the frame, upper jaw secured to the frame, sliding plates, and lower jaw secured to the plates, a screw for raising and lowering the plates, ratchet-wheel secured to the screw, pawl engaging the ratchet-wheel, a rod secured to the pawl, a lever pivoted to the frame and to which the lower end of the rod is secured, a spring 27, for forcing the pawl into engagement with the ratchet, and a pin 28, for holding the pawl out of engagement with the ratchet and against the action of the spring, substantially as and for the purpose set forth.

6. In a cable-grip, the combination of the upper and lower jaws, rollers 40 and 41, secured to the upper jaw, and rollers 44, secured to the lower jaw, substantially as and for the purpose set forth.

405,146. EMBROIDERING AND EDGING MACHINE. ESTIER CORNELY and ROBERT CORNELY, Paris, France. Filed Dec. 1, 1888. Serial No. 292,294. (No model.)

Claim.—1. In an embroidering or edging machine, the combination of two parallel needles supported and actuated independently of each other, a thread-carrier for interlacing a thread between the two needles, and operating mechanism for said parts, substantially as described.

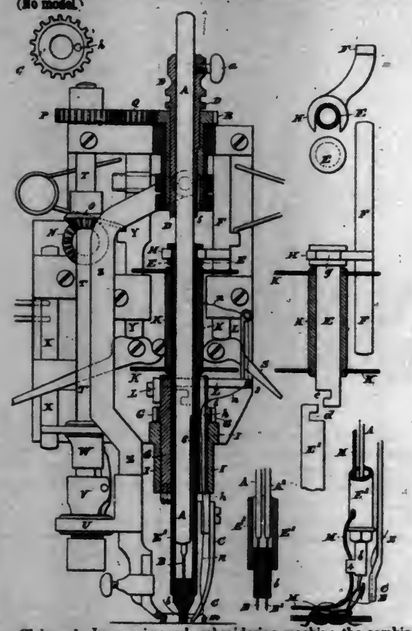
2. The combination of the parallel needles and co-operating stitch-forming mechanism for making separate parallel seams, needle-bars, one for each needle, needle-slides, one for each needle, mechanism for reciprocating said slides, and a thread-carrier, substantially as described.

3. The combination of needles and co-operating stitch-forming mechanism for making separate parallel seams, needle-bars, one for each needle, an oscillatory thread-carrier for laying a thread between said needles, a separate slide for each needle-bar, each slide having a cam, and a moving part acting on said cams for reciprocating said slides, said cams being arranged relatively to each other, as specified, whereby one needle completes its stroke in advance of the other, substantially as described.

4. The combination, with the feed-bar, feed-slide for actuating the same, and the governing-handle of a universal feed, of an adjustable stop arranged in the path of a projection of said slide so as to limit its stroke, said stop and handle being connected together, so that the motion of the latter to change the direction of the feed raises or lowers said stop, substantially as described.

5. The combination, with the feed-slide and governing-handle of a universal feed, of a stop for limiting the stroke of said slide, a cam for changing the position of said stop to vary the stroke of said slide, and connections, as specified, between said cam and handle, the acting face of said cam being disposed, as herein set forth, to move said stop in the direction to lengthen the stroke of the feed-slide when the direction of the feed is changed to work from the center of an arc toward the angle, substantially as described.

6. The combination, with a reciprocatory needle-bar and the universal feed mechanism, including a governing-crank-handle, of a cam and connections for varying the length of stroke of said needle-bar, said cam being connected with and operated by said crank-handle, substantially as described.



7. The combination of a needle-bar, universal feed mechanism, including a feed-slide and governing crank-handle, and mechanism, as

specified, controlled by said handle for varying the length of feed, said needle-bar being connected with said handle, whereby the stroke of the former is varied in accordance with the variations in the length of stitch, so as to draw more or less thread for the needle, substantially as described.

8. The combination, with variable universal feed mechanism, including a governing-handle for varying the length of feed in changing its direction, of a tension comprising tension-disks, between which the thread passes, and an adjustable stud or pin for regulating the pressure of said disks, said stud or pin being connected with and adjusted by said handle in accordance with the variations of the feed, substantially as described.

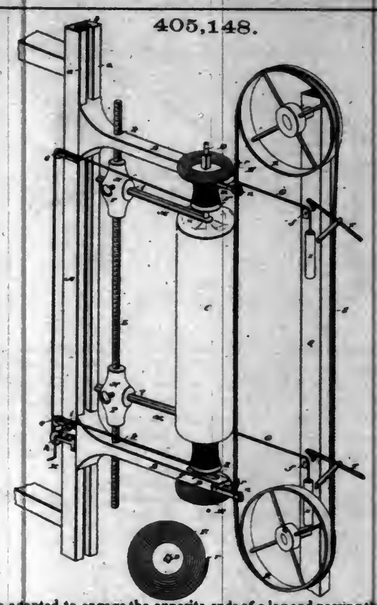
9. The combination, with hook-needles and the variable universal feed mechanism, including a governing-handle, of a sliding blade for pushing thread between said needles, said blade being connected by devices, such as herein specified, through which the motions of said handle are transmitted to said blade, substantially as described.

405,147. EMBROIDERING-MACHINE. EMIL CORNELY and ROBERT CORNELY, Paris, France. Filed Dec. 13, 1888. Serial No. 293,479. (No model.)

Claim.—1. In a sewing and embroidering machine, the combination, with stitch-forming devices and a rotating thread-carrier for winding a second thread around the needle-thread, of a spool for said second thread, and a pinion carrying the thread-carrier and having an opening or passage for the thread from said spool to said thread-carrier, substantially as described.

2. In a sewing and embroidering machine of the character described, a nipple-tube in two parts rigidly fastened together by a detachable connection, substantially as set forth.

3. The combination, with stitch-forming devices and means for winding a second thread around the sewing-thread, of a nipple-tube in two detachable parts, and a spool for supplying the winding-thread, said spool surrounding one part of said tube, substantially as described.

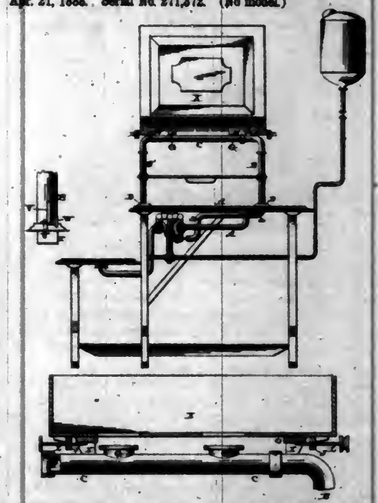


405,148. MACHINE FOR MAKING BARREL-STAVES. MADISON DALLAS, New Orleans, La. Filed Sept. 6, 1888. Serial No. 284,718. (No model.)

Claim.—1. In a machine for sawing logs into a continuous sheet or strip, the combination, with a band-saw, of a rotative log-holder carrying a spool and a spiral gage for the said saw, substantially as specified.

2. In a machine for the purpose described, the combination, with a band-saw, of a rotative log-holder carrying a spiral gage for the said saw, substantially as specified.

3. In a machine for the purpose described, the combination, with a slotted upright, of brackets adjustably supported therein, a threaded rod bearing in the said brackets, threaded nuts or blocks on the said rod, arms adjustably supported in the nuts or bearings, rotative spin-

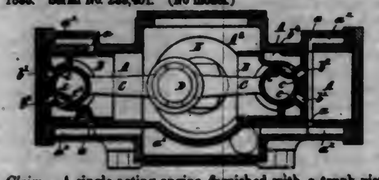


405,148.

dles adapted to engage the opposite ends of a log and passing through the brackets and also the adjustable arms, spools fixed to the spindles, weighted cords wound upon the said spools, and a spiral gage also secured to the spindles, substantially as specified.

A. In a machine substantially as described, the combination, with an upright slotted frame, of brackets adjustably supported therein, spindles arranged in the outer ends of the brackets and adapted to engage the opposite ends of a log, spools fixed to the said spindles, and cords or ropes leading from a drum, passing around the said spools, and having weights secured at their opposite ends, substantially as specified.

405,149. VAPOR-STOVE. ZEBULON DAVIS, Cleveland, Ohio. Filed Apr. 21, 1888. Serial No. 271,372. (No model.)

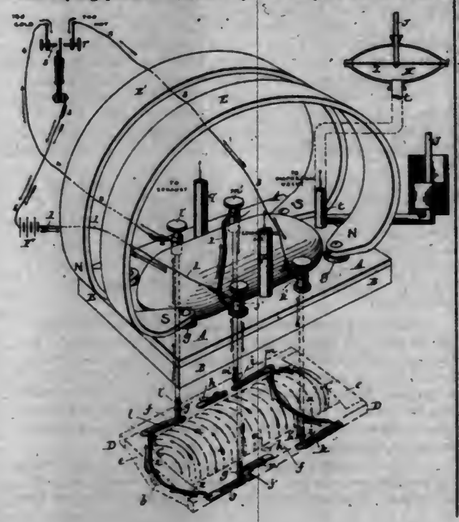


Claim.—1. The combination of a vapor-burner stove-top, with the pipes connected to its top for supporting the oven, the oven, and the cross-pipe provided with burners for heating the oven, the cross-pipe being connected to one of the supporting-pipes and receiving vapor therefrom, substantially as shown.

2. The combination of a vapor-burner stove-top, the pipes connected to the top for supporting the oven, the oven, the burner, and the pipe leading from the burner and making connection with the lower end of one of the supporting-pipes, cross-pipe C, which connects the upper ends of the supporting-pipes together, burners upon the cross-pipe for heating the oven, the supports I, secured to the supporting-pipes, the oven provided with vertical flanges, and the set-screws L, which pass through the flanges and catch against the supports, substantially as described.

3. The combination of a vapor-burner stove-stop, pipes connected to the top for supporting the oven, a burner, a pipe leading from the burner and making connection with one of the supporting-pipes which serves as a conductor for the vapor, a cross-pipe which connects the upper ends of the supporting-pipes together, the burners G, placed upon the cross-pipe for holding the oven, the brackets secured to the upper ends of the pipe, and a movable oven placed upon the brackets, substantially as set forth.

4. The combination of a vapor-burner stove-stop, the supporting-pipes connected thereto, one of which serves as a conductor for the vapor, the cross-pipe which connects the upper ends of the supporting-pipes together, the burners placed upon this cross-pipe, the brackets secured to the tops of the pipes, and the oven which is placed thereon, substantially as specified.



405,150. SINGLE-ACTING STEAM-ENGINE. FRANK W. DODD, Osborne Road, Forest Gate, County of Essex, England. Filed Oct. 17, 1888. Serial No. 288,401. (No model.)

Claim.—A single-acting engine furnished with a trunk-piston in the walls of which are supply and exhaust passages which are opened and closed by the motion of the piston, the one passage receiving steam or other fluid from a port in the cylinder and transmitting the same to the working-face of the piston, and the other conducting the spent steam to the exhaust-port in the wall of the cylinder, such trunk-piston having a seat for the reception of the head of a connecting-rod so formed as to close and open alternately by its oscillation the supply and exhaust passages in the piston, for the purpose above set forth.

405,151. ELECTRIC TEMPERATURE-REGULATOR. LOUIES F. EASTON, La Crosse, Wis. Filed Apr. 18, 1888. Serial No. 271,008. (No model.)

Claim.—1. The herein-described apparatus for regulating temperature, consisting of a chamber containing a diaphragm or piston, the latter connected with a controlling-valve or damper, box A B, provided with air-supply tube *p*, exhaust-tube *q*, and tube *t*, communicating with the chamber containing the diaphragm or piston, permanent magnets E E', having their poles reversed and extended into the box, rocking frame D, composed of core *b*, helix or coil *a*, and side bars *f*, contact-springs *j k* and *l m*, carried by said bars *f*, valves *n* and *o*, also

405,151.

carried by said bars, binding-posts *j' k'* and *l' m'*, extending into holes in the side bars *f*, a battery or electric generator, a thermostatic circuit-closer, line, or conductor with the helix 1, connecting the positive pole of the generator with posts *j' m'*, conductor 2, connecting springs *j* and *l* with helix *a*, conductor 3, connecting binding-post *k'* with contact-point *r* of the circuit-closer G, conductor 4, connecting post *l'* with contact-point *s* of said circuit-closer, and conductor 5, connecting said circuit-closer with the negative pole of the battery.

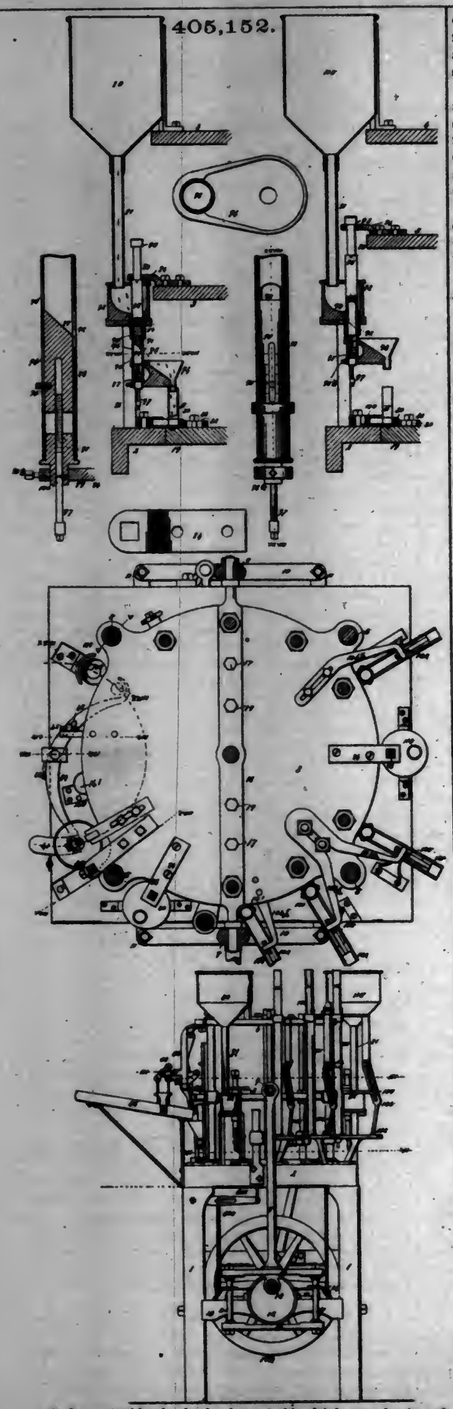
2. In combination with box or chamber A B, provided with tubes *p*, *q*, and *t*, permanent magnets E E', oscillating frame D, consisting of core *b*, coil *a*, and side bars *f f*, contact-springs *j k* and *l m*, carried by said bars, valve plates or strips *n o*, also carried thereby, binding-posts *j' k'* and *l' m'*, a battery or electric generator, a thermostatic circuit-closer, and electric conductors connecting one pole of the battery with posts *j' m'*, and connecting the other pole with the thermostatic circuit-closer, and other conductors connecting the contact-points of the thermostatic closer with the binding-posts *k'* and *l'*, respectively.

3. In a temperature-regulator substantially such as described, the combination of permanent magnets E E', a battery or generator, and an armature for said magnets provided with a helix, and contact-springs movable with said armature and arranged, substantially as described and shown, to reverse the flow of the electric current through the helix.

4. In a temperature-regulator, the combination, with a close chamber containing a diaphragm or piston, of a second close chamber communicating therewith, a valve controlling communication between said chambers, an electro-magnetic armature carrying said valve and having its poles placed opposite the poles of reversed permanent magnets, and contact-springs actuated by the armature and serving to reverse the flow of the electric current through the armature-helix when the armature changes its position.

5. In a temperature-regulator, the combination of a close box or casing, an inlet-pipe communicating with a pressure-tank, an exhaust-pipe communicating with a vacuum-tank, a pipe opening from the box or chamber into a chamber containing a piston or diaphragm, permanent magnets having their poles reversed and extended into the interior of the box or chamber, an oscillating electro-magnetic armature placed within the box and having its poles opposed to those of the permanent magnets, a battery, a thermostatic circuit-closer, and contacts and circuit-connections, substantially such as described and shown, adapted to cause a flow of electricity through the helix of the armature in one or the other direction as the circuit-closer makes contact with one or the other of its two contact-points.

6. In a temperature-regulator, the combination of permanent magnets and an oscillating electro-magnetic armature provided with perforated insulating-bars, contact-springs carried by said bars, and binding-posts connected with the poles of a generator and extending into the perforations of the bars, whereby they are caused to alternately make and break contact with the contact-springs, and thus to change the direction of the current through the helix of the armature.



7. In a temperature-regulator, the combination, with permanent magnets, of an oscillating electro-magnetic armature, a perforated bar carried thereby, a valve-plate carried by said bar and overlapping the perforations therein, and a tube or pipe extending into the perforation and adapted to be sealed by the valve when the armature moves toward the tube and to be unsealed thereby when the armature moves in the opposite direction.

405,152. CARTRIDGE-LOADER. ALEXANDER BUSTON, St. Louis, Mo. Filed July 27, 1888. Serial No. 281,211. (No model.)

Claim.—1. In a cartridge-loader, the combination of a table having a fixed portion and a movable portion and mechanism for rotating the movable portion, consisting of a ratchet-wheel 21 secured thereto, a pawl 23, engaging the ratchet-wheel 21, pivoted lever 24, to which the pawl is secured, a vertical pivoted lever 25, having a forked upper end engaging the arm, and a cam 27, engaging the lower end of the lever for moving the same, substantially as and for the purpose set forth.

2. In a cartridge-loader, the combination of a table having a fixed and movable portion, charging devices above the same, adjustable holders secured to the movable portion, a lever operated by suitable mechanism and moving the shells laterally off of the fixed portion onto the movable portion of the table, and guards 150, provided with friction-rollers and mounted on the fixed portion beneath the respective charging devices in proximity to the holders for confining the shell at each stage of the operation, substantially as set forth.

405,152.

3. In a cartridge-loader having suitable driving mechanism, the combination of a table, a funnel for delivering the cartridge vertically onto the table, a horizontally-swinging arm 39, moving under said funnel and having the tail 41, and a lever connected with the swinging arm and having working connection with the driving mechanism, substantially as and for the purpose set forth.

4. In an automatic cartridge-loader having suitable driving mechanism, the combination, with a table, of mechanism for delivering the shells onto the table, consisting of a tube or funnel normally distant from the table less than the length of a shell and a vertically-reciprocating arm connected to the funnel and actuated by the driving mechanism for lifting the funnel, substantially as and for the purposes set forth.

5. In a cartridge-loader having suitable driving mechanism, the combination of a supporting-table and a wadding device consisting, essentially, of a plunger, means for moving the wads beneath the plunger, a guard for protecting the mouths of the shells, consisting of an adjustable arm having a cylindrical opening slotted to receive the shells, and means for automatically moving the guard, consisting of a rod, a lever connected to the rod, and a cam carried by said driving mechanism and adapted to lift the lever, all substantially as and for the purpose set forth.

6. In a cartridge-loader, the combination of a table and mechanism for delivering the shells onto the table, consisting of a funnel, an inclined holder for receiving a number of the shells, and two reciprocating gates extending into the passage and operated alternately up and down, substantially as and for the purpose set forth.

7. In a cartridge-loader, the combination of the table and mechanism for moving the shells onto the table, consisting of a funnel, a holder, vertically-reciprocating gates projecting into the holder, bar to which the gates are secured, and means for alternately moving the bar to raise and lower the gates automatically, substantially as and for the purpose set forth.

8. In a cartridge-loader, the combination of the table, a funnel located over the table, and means for delivering the shells into the funnel, consisting of a holder 56, vertically-movable gates 60 61, bar 63, to which the gates are secured, link 70, connected to the bar at one end, pivoted lever 67, to which the link is connected at the other end, and a movable disk 3, for operating said lever, substantially as and for the purpose set forth.

9. In a cartridge-loader, the combination of the table, a funnel located over the table, and mechanism for delivering the shells one at a time into the funnel, consisting of a holder having an inclined end 59 and slide 59¼, for retarding one end, and the opposite inclined depression 58, for dropping the other, substantially as and for the purpose set forth.

10. In a cartridge-loader, the combination of the table and funnel for delivering the shells onto the table, and an oscillating lever having an end for embracing the shell, and a rearwardly-extending ring 41, for closing the funnel-orifice, substantially as and for the purpose set forth.

11. In a cartridge-loader, the combination of a table, a funnel for delivering the shells onto the table normally distant from the table less than the length of the shell, whereby the shell is not wholly released, and a reciprocating disk 3, to which the funnel is connected for lifting it a short distance after each shell has been deposited, substantially as and for the purpose set forth.

12. In a cartridge-loader, the combination of a table for supporting the shells and a powder or shot charging device, the latter consisting, essentially, of a receiver or canister, a cylinder into which the canister discharges, a hollow movable plunger having perforations to receive and discharge the powder or shot, and a funnel for transferring the powder or shot from the plunger to the shells, said funnel being mounted on a vertically-movable rod, whereby it enters and is withdrawn from the shell, substantially as and for the purpose set forth.

13. In a cartridge-loader, the combination of a table and the powder or shot charging device consisting, essentially, of a cylinder into which the powder or shot is deposited, a hollow vertically-movable plunger having perforations to receive and discharge the powder or shot, connection between the plunger and disk 3 for raising and lowering said plunger, and a funnel for transferring the powder or shot from the plunger to the shell, substantially as and for the purpose set forth.

14. In a cartridge-loader, the combination of a table for supporting the shells and a powder or shot charging device consisting, essentially, of a cylinder into which the powder or shot is deposited, a hollow plunger located within the cylinder and having perforations to receive and discharge the powder or shot, and a funnel for transferring the powder or shot from the plunger into the shell, said plunger being connected to and operated by a movable disk 3, substantially as and for the purpose set forth.

15. In a cartridge-loader, the combination of a table for supporting the shells and a powder or shot mechanism consisting, essentially, of a cylinder, a hollow plunger located within the cylinder and having perforations to receive and discharge the powder or shot, a funnel for transferring the powder or shot from the plunger to the shells, and an adjustable bottom in the plunger, consisting of a plug and a screw-threaded rod entering the plug from the bottom and having a projecting end for turning, for raising and lowering the plug, substantially as and for the purpose set forth.

16. In a cartridge-loader, the combination of a table for receiving the shells and a shot or powder charging mechanism consisting, essentially, of a cylinder, a hollow plunger located within the cylinder and having receiving and discharging openings at different elevations, a tube secured to the cylinder and through which the plunger passes, and a funnel for transferring the powder or shot from the plunger to the shells, said plunger passing through an arm 93 on the disk 3, substantially as set forth.

17. In a cartridge-loader, the combination of a table for receiving the shells and a powder or shot charging mechanism consisting, essentially, of a cylinder, a hollow plunger located within the cylinder and having receiving and discharging openings, a movable bottom in said plunger, a longitudinal rod screwing into said bottom for regulating it, and a pin in said bottom fitting in a graduated slot of the plunger for preventing the bottom from turning and for indicating its location, substantially as and for the purpose set forth.

18. In a cartridge-loader, the combination of a table for supporting the shells and a powder or shot charging mechanism consisting, essentially, of a cylinder, a hollow plunger located within the cylinder and having openings for receiving and discharging the powder or shot, a funnel for transferring the powder or shot from the plunger to the shells, and means for raising and lowering the plunger, consisting of a vibrating disk 3 and arms or brackets 84 mounted thereon, substantially as and for the purpose set forth.

19. In a cartridge-loader, the combination of a table for supporting the shells and a powder or shot charging mechanism having a funnel for transferring the powder or shot to the shells, said funnel being normally distant from the table less than the length of the shell and connected to a vertically-vibrating disk 3, whereby it enters the shells while the powder or shot is being transferred, and then rises out of the shells to permit the latter to be moved away, substantially as and for the purpose set forth.

20. In a cartridge-loader, the combination of a table for holding the shells and a powder or shot charging mechanism consisting, essentially, of a supply-cylinder, a vertically-movable charging-plunger moving in said cylinder, and a funnel secured to and beneath the plunger, so as to be raised and lowered thereby, substantially as and for the purpose set forth.

21. In a cartridge-loader, the combination of the intermittently-moving supporting-table and crimping mechanism consisting of reciprocating rods 120 and 124 and the flared dies 121 and 125 on the respective rods by which the shell is successively treated, the former contracting the shell and the latter having a projection 126 for turning in the edge, substantially as and for the purpose set forth.

22. In a cartridge-loader, the combination of the intermittently-moving supporting-table and a crimping device consisting of the rods 120 and 124, vertically-reciprocating disk 3, with which the rods have screw-threaded connection, and dies on the lower ends of the respective rods by which the shell is successively treated, the die on the former having a projection 122 and being formed to contract the shell around said projection, and the latter having a projection 126 of larger diameter than the former projection, whereby it engages the contracted portion and turns it in, substantially as and for the purpose set forth.

23. In a cartridge-loader, the combination of the supporting-table and a printing device consisting, essentially, of a movable rod, a printing-roller, an adjustable inking-pad, and mechanism for moving the printing-roller automatically against the pad and over the face of the printing-die, substantially as and for the purpose set forth.

24. In a cartridge-loader, the combination of the supporting-table and a printing device consisting of a movable adjustable rod, a pivoted lever, a die secured to the lower end of the rod, a roller secured to the lower end of the lever for inking the face of the die, and mechanism for operating the roller, consisting of a stationary slotted arm having an inclined groove in which fits a pin on said lever, substantially as and for the purpose set forth.

25. In a cartridge-loader, the combination of the supporting-table and a printing mechanism consisting of a movable rod, a printing-die on the end of the rod, and an inking mechanism consisting of a pivoted lever, a slotted stationary arm with which the lever is connected by a pin, a roller secured to the lever, and a pad 140, substantially as and for the purpose set forth.

26. In a cartridge-loader, the combination of a rotating supporting-table and mechanism for moving the shells onto and from the table, consisting of a pivoted lever 37, having ends 39 and 50 moving alternately over said table, substantially as and for the purpose set forth.

27. In a cartridge-loader, the combination of the supporting-table 2, a movable disk 3 over the table, and means for moving the shells onto and from the table, consisting of a pivoted lever 37, having shell-engaging ends 39 and 50, a slotted lever 42, pivoted to a fixed part of the machine and engaging the lever 37 with its free end, and an arm 49, carried by the disk 3 and having a pin 48 engaging the slot in lever 42, substantially as and for the purpose set forth.

28. In a cartridge-loader, the combination of a table having a stationary perforated part 2 and a moving center 19, a lever 37, for moving the shells off the moving part, a tube 146, secured to the stationary part beneath the perforation, and a bracket 147 at the perforation and in the path of the lever for stopping the shells in a vertical position and allowing them to pass into the tube, substantially as and for the purpose set forth.

29. In a cartridge-loader, the combination, with a table having a stationary part, a turning center, and suitable loading devices disposed at intervals above said table, of laterally-opening shell-holders 30, secured to the turning center, and adjustable holders 150 opposite to said holders 30 and secured to the stationary part beneath the respective loading devices, substantially as and for the purpose set forth.

30. In a cartridge-loader, the combination of a shell-supporting table having a stationary outer part and a turning center, shell-holders 30, secured to the turning center, clearing-finger 160, secured to the stationary part and extending over the movable part and entering said holders, and a perforation 161 adjacent to the finger, for outlet of the material collected, substantially as and for the purpose set forth.

31. In a cartridge-loader, the combination of a shell-supporting table having a stationary outer part and a turning center, mechanism for moving the center intermittently, and a stop mechanism consisting of a rod fitting in perforations in the two parts of the table, a pivoted lever to which the rod is secured, and means for operating the lever, substantially as and for the purpose set forth.

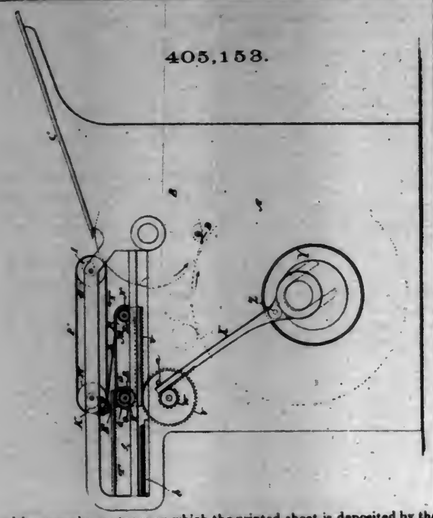
32. In a cartridge-loader, the combination of a shell-supporting table having a stationary pivoted part and a turning center, mechanism for giving the table an intermittent movement, and mechanism for stopping the table, consisting of a rod 303, fitting in perforations in the table, pivoted lever to which the rod is secured, and which has a depression 307, spring-rod 309, and a movable roller 306, all substantially as and for the purpose set forth.

33. In combination with a suitable table and a reciprocating part above the same in a cartridge-holder, a crimping device consisting of two dies carried by the vibrating part, and to the action of which the shell is successively subjected, the former having a contracted bore with a central core and the latter having a straight bore with a central core, the core of the latter being of greater diameter than the former, whereby the portion of a shell contracted by the former is turned in by the latter, substantially as shown and described.

34. In a cartridge-loader, the combination, with a fixed table and a movable table for substantially the purposes explained, of a brush or sweep secured to the fixed table and projecting over the movable one, substantially as and for the purpose set forth

35. In a cartridge-loader, the combination, with a fixed table and a movable table, of an arm on the fixed table overhanging the movable table in close proximity thereto, said fixed table having an outlet at or near the arm for allowing the material gathered by said arm to pass off, all substantially as shown and described.

405,153. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. GEORGE P. FERRIS, New London, Conn. Filed Sept. 20, 1888. Serial No. 285,878. (No model.)

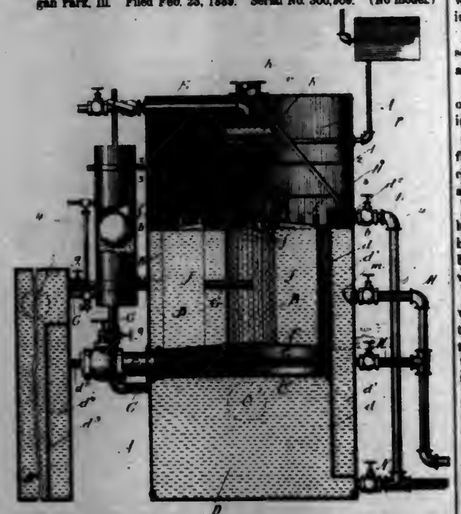


Claim.—1. The combination, with an impression-cylinder, a delivery apparatus, and a receiving-table, of a reciprocating carriage located under and moving independent of the delivery apparatus, and on which the printed sheet is deposited by the delivery apparatus, and mechanism, substantially as described, for positively moving said carriage in both directions, substantially as described.

2. The combination, with an impression-cylinder, a delivery apparatus, and a receiving-table, of a reciprocating carriage located under and moving independent of the delivery apparatus, and on which the printed sheet is deposited by the delivery apparatus, and a cam or its equivalent for actuating said carriage, said cam being arranged to allow the carriage to be at rest while a sheet is being deposited on said carriage, substantially as described.

3. The combination, with an impression-cylinder, a delivery apparatus, and a receiving-table, of a reciprocating carriage provided with a traveler or tapes on which the printed sheet is deposited by the delivery apparatus, said tapes having a progressive movement during the return movement of the carriage, and rack, gear, and cam mechanism, substantially as described, for positively moving the carriage in both directions, substantially as described.

4. The combination, with an impression-cylinder, a delivery apparatus, and a receiving-table, of a reciprocating carriage provided



405,153.

with a traveler or tapes on which the printed sheet is deposited by the delivery apparatus, a rack and clutch-connection for imparting to the tapes a progressive movement during the return movement of the carriage, and a rack, gear, and cam mechanism, substantially as described, for positively moving the carriage in both directions, substantially as described.

5. The combination, with an impression-cylinder, a delivery apparatus, and a receiving-table, of a reciprocating carriage provided with a traveler or tapes on which the printed sheet is deposited by the delivery apparatus, said tapes having a progressive movement during the return movement of the carriage, but being motionless during the forward movement of the carriage, a rack on the carriage, a gear engaging the rack, a cam, and a connecting rack-bar between the cam and gear, substantially as described, for positively moving the carriage in both directions, substantially as described.

405,154. FEED-WATER HEATER. CHARLES E. FERREIRA, Morgan Park, Ill. Filed Feb. 23, 1889. Serial No. 300,909. (No model.)

Claim.—1. In a feed-water heater, the combination of a water-chamber provided with a water-inlet, a steam-chamber under the water-chamber, provided with a steam-inlet, a hollow chamber communicating with the steam-chamber and integral with its top, extending upwardly in the water-chamber for heating the water, and an outlet for drawing off the water, substantially as described.

2. In a feed-water heater, the combination of a water-chamber provided with a water-inlet, a steam-chamber under the water-chamber, provided with a steam-inlet, a hollow chamber communicating with the steam-chamber forned integral with its top, extending upwardly to a point above the water-level, and having a nozzle at its upper extremity for the escape of steam and an outlet for drawing off the water, substantially as described.

3. In a feed-water heater, the combination of a water-chamber provided with a water-inlet, a steam-chamber under the water-chamber, provided with a steam-inlet, a hollow chamber communicating with the steam-chamber and extending upwardly in the water-chamber for heating the water, a settling-chamber, a pipe communicating between the water-chamber and settling-chambers away from the steam-chamber and from a point above to a point below and under the same, and an outlet for drawing off the water, substantially as described.

4. In a feed-water heater, the combination of a water-chamber provided with a water-inlet, a steam-chamber under the water-chamber, provided with a steam-inlet, a hollow chamber communicating with the steam-chamber and extending upwardly in the water-chamber for heating the water, a settling-chamber at the side of the shell, a pipe communicating between the water-chamber and settling-chamber, and an outlet for drawing off the water, substantially as described.

5. In a feed-water heater, the combination of a water-chamber provided with a water-inlet, a steam-chamber provided with a steam-inlet, a hollow chamber communicating with the steam-chamber integral with its top, extending upwardly to a point above the water-level, and having a nozzle at its upper extremity for the escape of steam, a perforated diaphragm above the water-level and nozzle of the hollow chamber, and an outlet for drawing off the water, substantially as described.

6. In a feed-water heater, the combination of a water-chamber provided with a water-inlet, a steam-chamber provided with a steam-inlet, means for conducting steam through the water-chamber and permitting it to escape above the water-level, a horizontal diaphragm H above the water-level, open in its center, a horizontal diaphragm I above the diaphragm H, closed in its center, and an outlet for drawing off the water, substantially as described.

7. In a feed-water heater, the combination of a water-chamber provided with a water-inlet, a steam-chamber provided with a steam-inlet, means for conducting steam through the water-chamber and permitting it to escape above the water-level, a horizontal diaphragm H above the water-level, open in its center, perforated around its center, and solid in its outer part, a horizontal diaphragm I above the diaphragm H, closed in its center and perforated in its outer part, and an outlet for drawing off the water, substantially as described.

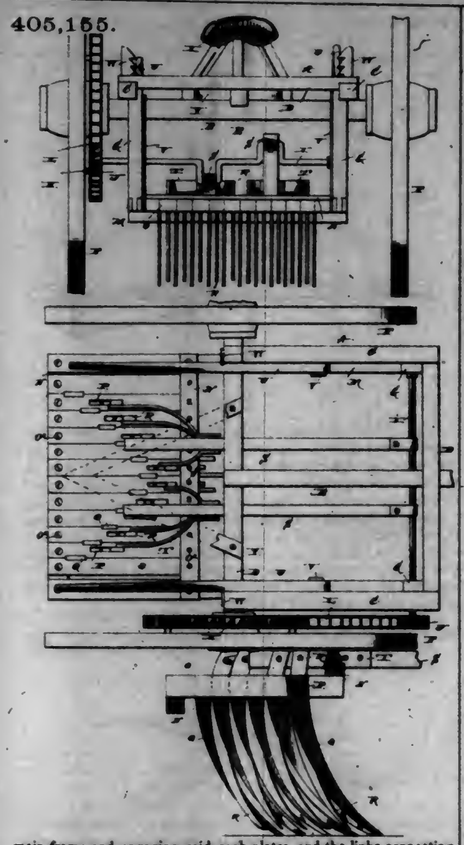
8. In a feed-water heater, a horizontal diaphragm above the water-level, open in its center, perforated around its center, and solid in its outer part, substantially as described.

9. In a feed-water heater, a vapor-chamber above the water-level separated from the steam-dome and an outlet therefrom, substantially as described.

10. In a feed-water heater, a cap or apron in front of the water-outlet extending inwardly and upwardly, over which the water flows in its outward passage, substantially as described.

11. In a feed-water heater, the combination of a cap or apron in front of the water-outlet extending inwardly and upwardly, a vapor-chamber above the water-level separated from the steam-dome, and an outlet from the vapor-chamber, substantially as described.

12. In combination with the water-chamber of a feed-water heater, a pipe for drawing off water extending into the water-chamber horizontally to a central point laterally between the surface and bottom of the water and substantially below the surface, whereby the water may flow from such points sidewise, substantially as described.

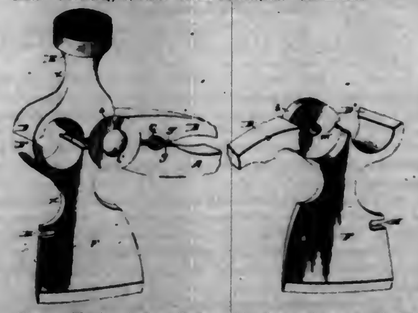


13. In combination with a feed-water heater, a trap for catching water formed by condensation of steam, and a pipe connecting the trap with the steam-dome of the heater, perforated at its end inside the dome under the sprinkler, whereby water formed by condensation of steam may be conducted into the heater for feed purposes, substantially as described.

405,155. POTATO-DIGGER. JOHN H. FIEHLE, Appleton, Wis., assignor of one-half to Elias B. Clark, same place. Filed Jan. 26, 1889. Serial No. 297,612. (No model.)

Claim.—1. The combination of the main frame, the supplemental frame arranged below the main frame and supported thereby, the plows secured to the supplemental frame, the cleaners pivotally mounted on the supplemental frame and each adapted to vibrate between two adjacent plows, and mechanism for vibrating the cleaners, as set forth.

2. The combination of the main frame, the hangers G, depending therefrom, the supplemental frame pivoted at its front end to said hangers, the plows and cleaners carried by the supplemental frame, the rack-plates W on the main frame, the levers fulcrumed on the



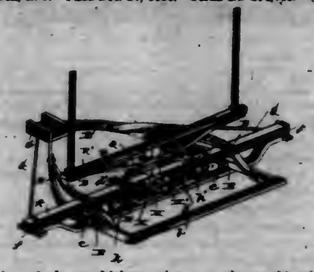
405,155.

main frame and engaging said rack-plates, and the links connecting said levers with the supplemental frame, as set forth.

3. The combination of the main frame, the hangers secured thereto, the supplemental frame pivoted to said hangers, the longitudinally-slotted bars at the rear end of the supplemental frame, the plows secured to said bars, the cleaners pivoted within the slots of said bars, the crank-shaft journaled in the hangers, the pitmen having their front ends mounted on said shaft and their rear ends connected to the cleaners, mechanism for rotating the crank-shaft, and mechanism for raising and lowering the supplemental frame, as set forth.

405,156. COMBINATION-TOOL. AUGUST PRÖHNING, Hanover, Kans. Filed Aug. 8, 1888. Serial No. 282,201. (No model.)

Claim.—The herein-described combination-tool, composed of the levers A and B, having the recessed hubs *a* and *b*, which hubs are pivoted together and have oblique grooves to form a wire-cutting device, the outer ends of the levers being curved to form the jaws D and D′, and the inner portions of the levers bordering on the hubs being brought close together to form the jaws *g* and *g*′, the lever A having the blade F, which is provided with the saw-cut H, and the lever B having the pole or hammer E, substantially as described, for the purpose specified.



405,157. MOUNTING FOR EAR-RINGS. VALENTINE GEITNER, Jr., Buffalo, N. Y. Filed Sept. 24, 1888. Serial No. 286,260. (No model.)

Claim.—1. The combination, with an ear-mount provided with a curved slot across which is secured a spherical bearing-surface, of a setting having a loop adapted to rest upon the spherical bearing-surface.

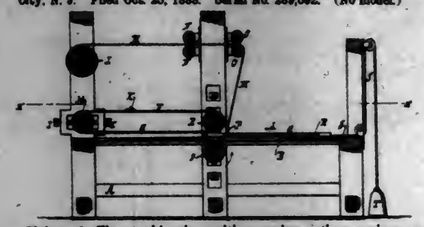
2. The ear-mount *a a*′, having the curved slot *a*², across which is secured the ball *b*, which forms a bearing-surface for the loop *c*′ of the setting *c*.

405,158. VEHICLE RUNNING-GEAR. FERDINAND A. GOFFRAY, Sewell, N. J. Filed Dec. 27, 1888. Serial No. 294,736. (No model.)

Claim.—1. In a vehicle running-gear, the combination, with the axle, of the hounds bearing at intermediate points against the under side of the axle and connected together at their front and rear ends, the straps D, connected at their ends to the hounds in front and rear of the axle and bearing at intermediate points on the upper side of the axle, the vertical bolts *e e*, arranged adjacent to the front and rear sides of the axle and engaging registering-perforations in the hounds and straps, and the braces G G, extending from the axle to the front ends of the hounds, substantially as set forth.

2. In a vehicle running-gear, the combination, with the axle A, of the hounds B, extending under the axle and connected at their ends, the straps D, connected at their ends to the hounds, bearing intermediately upon the upper side of the axle and bolted to the hounds at points adjacent to the front and rear faces of the axle, and an axle-brace, as F, clipped at its ends against the lower face of the axle and downwardly bowed between said ends, said hounds being clamped between the lower face of the axle and the upper face of the axle-brace within said downwardly-bowed portion, as and for the purpose set forth.

3. In a vehicle, the combination, with the front axle, of the hounds arranged under the axle, the straps secured to the hounds and extending over the axle, the downwardly-bowed axle-brace secured at its ends to the axle and extending under the hounds, the plate H, arranged under the axle and provided with lateral apertured ears *h*′ and a rearwardly-extending arm H′, to which the perch is pivoted, the downwardly-bowed brace-plate K, connecting the center of the front axle-brace to the axle and provided with lateral apertured ears *k k*, the bearing-plate Q on the upper side of the axle provided with lateral apertured ears *q q*, the vertical bolts S S, engaging the apertures in the ears *h*′ *k q* and passing on opposite sides of the axle, and the bolster mounted on the plate Q, substantially as specified.



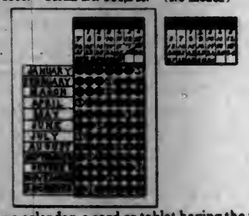
4. In a vehicle, the combination, with the front axle, of the plate H, arranged on its under side and provided with lateral apertured ears *h*′, extending beyond the front and rear sides of the axle, the perch pivoted to the said plate, and bearing-plate Q on the upper side of the axle provided with corresponding apertured ears *q q*, the apertures of which register with the apertures in the ears *h*′, the bolts S S, engaging the said registering-apertures and passing on opposite sides of the axle, and the bolster mounted on the plate Q, substantially as specified.

5. In a vehicle, the combination, with the rear axle, of the downwardly-bowed brace L, provided at its center with the shoulders or ears *l l*, between which the rear end of the perch fits, and provided at its ends with the lateral ears L′ L′, the top bar on the upper side of the said axle having the bolster-standards secured thereto and provided at its ends with lateral ears O′ O′, and the vertical bolts passing

on opposite sides of the axle and engaging registering-apertures in the ears L' and O', substantially as specified.

6. In a vehicle, the combination, with the rear axle, of the downwardly-bowed brace arranged thereunder and provided at its center with shoulders or ears *l l*, the top bar O, arranged on the upper side of the axle, carrying the bolster-standards and bolted to the said brace by bolts passing on opposite sides of the axle, the rear hounds attached at their rear ends to the said brace and connected at their front ends by a box or guide N, the perch fitting in the said box or guide and passing between the shoulders or ears *l l* beneath the axle, and the pin *n*, engaging registering-apertures in the box or guide and perch, substantially as specified.

405,159. PRINTING-MACHINE. FREDERICK H. GROTE, Jersey City, N. J. Filed Oct. 25, 1888. Serial No. 289,092. (No model.)



Claim.—1. The combination, with a reciprocating carriage and an endless apron fixed to said carriage, of supporting and presser rollers for said apron and carriage, substantially as described.

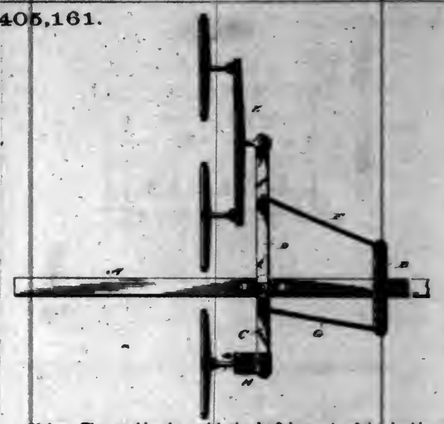
2. The combination, with a reciprocating carriage and a reciprocating apron provided with a cutter, of supporting and presser rollers for said apron and carriage, substantially as described.

3. The combination, with a reciprocating apron provided with a cutter, of a reciprocating carriage provided with a bearing-cushion for said cutter, and supporting and presser rollers for said apron and carriage, substantially as described.

4. The combination, with the reciprocating carriage having points or prongs for holding the fabric to be printed, of supporting and presser rollers for said carriage, and smoothing-rollers for said fabric, substantially as described.

405,160. CALENDAR. CHARLES K. HAMILTON, Jr., Brooklyn, N. Y. Filed Feb. 26, 1889. Serial No. 301,240. (No model.)

Claim.—1. In a calendar, a card or tablet having the year or years and month-days printed or otherwise inscribed upon it, in combination with another card or tablet having the months and week-days inscribed thereon, as shown and described.



2. A calendar having one portion containing the years and month-days, in combination with another part having the months and week-days, one of said parts being adjustable relatively to the other, as shown and described.

3. The calendar, constructed substantially as hereinbefore described, consisting of one part having the month-days or years on one part and the months and week-days on another part, the parts being relatively adjustable one to the other, or both parts being adjustable in any of the manners and forms herein shown.

4. A calendar which consists of the combination of the following elements, to wit: a table of week-days in seven columns whose initial letter corresponds with the first week-days of each respective month, a column of months to one side of and corresponding to said week-day table, and a pad of which each sheet is inscribed with one or more year-groups that commence with the same week-days, and a table of month-days whose ordinals correspond to the week-days for the inscribed years, as and for the purposes set forth.

5. A calendar having the year or years and month-days associated together and printed thereon in one portion and the months and week-days associated together on another portion, substantially as and for the purposes set forth.

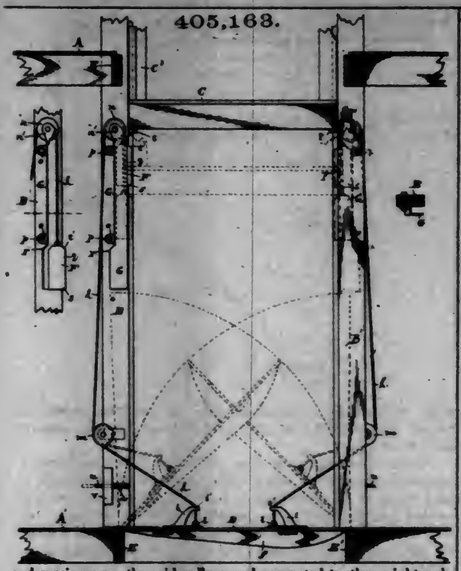
405,161. DRAFT-EQUALIZER. LEWIS C. HARRIS, Catalossa, Iowa. Filed Feb. 26, 1889. Serial No. 301,014. (No model.)

Claim.—The combination, with the draft-beam A, of the doubletree B, pivoted midway of its length directly to the draft-beam and without any intermediate device, the short lever C, pivoted at its inner end to the draft-beam and carrying the swivel H at its outer end for the attachment of the singletree, the rod G, connecting said lever C near its pivotal point with one end of the doubletree, the long lever D, pivoted at its inner end to the draft-beam and carrying at its outer end a clip for the attachment of the whiffletree, and the straight rod F, pivotally connecting one end of the doubletree B with the lever D, and near the outer end of the latter, so that both levers will have unequal arms, substantially as specified.

405,162. DRAFT-SPRING. EDWARD L. HILDEBRAND, HENRY ROST, and CHARLES L. DAVIS, Sullivan, Ind. Filed Apr. 9, 1889. Serial No. 306,586. (No model.)

Claim.—1. The combination, in a draft-evener, of the sleeve designed to be secured to a shaft and provided at its front end with a rectangular opening, a draft-bar rectangular in cross-section, terminating at its front end in a trace-hook which is bent laterally at an angle to the shank, and a spring interposed between the front of the sleeve and the rear end of the shaft, substantially as and for the purpose described.

2. A draft-evener comprising the base-plate, the sleeve secured thereto and provided at its front end with a rectangular opening, the draft-bar rectangular in cross-section, and having a trace-hook *c* at its front end and extending out at right angles to said bar, and provided back of said trace-hook with an annular flange, and a spring interposed between the rear end of the draft-bar and the front of the sleeve, substantially as described.



405,163. ELEVATOR-HATCHWAY. FRANCIS X. HOOPER and CHRISTIAN PETERSEN, Baltimore, Md. Filed Aug. 7, 1888. Serial No. 282,140. (No model.)

Claim.—1. The combination, with the cage moving between the vertical guides B B' of an elevator, of the doors having inclined abutting edges hinged to opposite sides of the hatchway, the curved bars *f*, secured to the under side of each door, and the rollers *g* and curved plates *h*, connected to the bar C' of the cage, whereby the said doors are elevated when the cage is elevated, substantially as specified.

2. The combination, with the cage and the guide B, having a vertical box G, with an offset *r*, of the projecting counterbalance-weight F, having a beveled upper portion *f'*, the door D, the pulleys *m n*, and the chain or cord *k*, engaging said pulleys and connected to said door and weight, all arranged to operate in the manner as shown and described.

3. The combination, with the cage and the hinged door provided with a bracket-arm *i*, having a bearing *i'*, of the vertical guide B, having a box G, with an open side and offset *r*, the projecting counterbalance-weight F, with a beveled upper portion *f'*, the pulleys *m n*, mounted in bearings on the box and guide, and the chain or cord *k*, secured at *l* to the door, and engaging the bearing *i'* of the bracket,

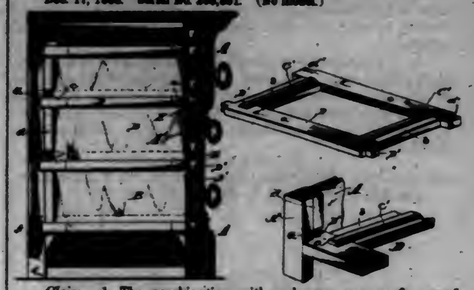
405,163.

and passing over the said pulleys and connected to the weight, substantially as and for the purpose specified.

405,164. DOMINO. CHARLES M. HYATT, Albany, N. Y., assignor to the Embossing Company, same place. Filed Mar. 6, 1889. Serial No. 302,076. (No model.)

Claim.—1. A domino having formed across its face a raised bar having a continuous unbroken surface throughout its length, but higher at the center than at the other parts, and tapering from the center toward its ends, substantially as shown and described.

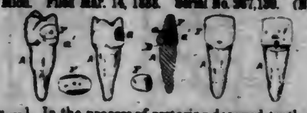
2. A domino having formed across its face a raised bar having a continuous unbroken surface throughout its length, but higher at the center than at the other parts, substantially as described.



405,165. COMBINED CULTIVATOR AND COTTON-CHOPPER. ANDREW H. JOHNSON, Tryon, Miss. Filed Mar. 15, 1889. Serial No. 303,430. (No model.)

Claim.—1. The combination of the beam having a cultivator or scraper secured thereto with the standards, the wheel journaled thereon, the pitmen operated by the wheel, a gear-wheel provided with cranks and operated by the pitmen, a pinion which meshes with the wheel provided with a crank at one end of its shaft, a pitman N, a beveled gear-wheel provided with a crank upon its shaft, a beveled gear-wheel Q, the partially-rotating shaft R, the pronged support S, secured to the rear end of the shaft, the hoe connected to the support, and an operating-lever for raising the hoe, substantially as shown.

2. The combination, with the beam, an operating mechanism which is operated by or from the wheel E, the partially-rotating shaft R, journaled upon the beam, a pronged support secured to the rear end of the shaft, the handle T of the hoe, pivoted to one prong of the support and passing through a slot in the other, the pivoted lever V, the connecting-rod U, attached to the inner end of the lever, and a hook secured to the outer end of the lever for catching under the hoe-handle, and a lever Y Z, for raising the hoe above the ground, substantially as described.

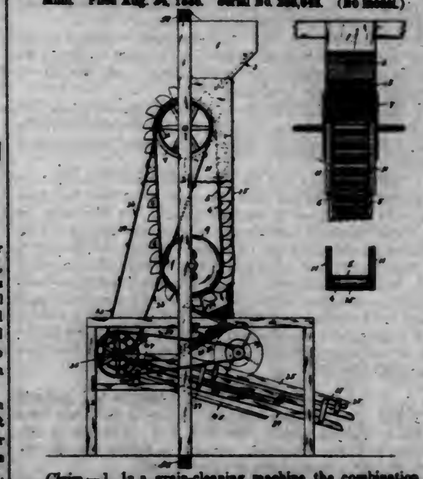


405,166. BUREAU OR SIMILAR ARTICLE OF MANUFACTURE. CHARLES W. KATZENBAH and REUBEN FOLK, Williamsport, Pa. Filed Dec. 17, 1888. Serial No. 293,691. (No model.)

Claim.—1. The combination, with a bureau case or frame, of movable drawer-supports and springs exerting vertical pressure upon the said supports, substantially as described.

2. The combination of a bureau case or frame having recesses formed in the sides thereof, drawer-supports having tongues moving in said recesses, and springs in the recesses for exerting vertical pressure on the said tongues, substantially as described.

405,167. ARTIFICIAL TOOTH-CROWN. CHARLES H. LAND, Detroit, Mich. Filed Mar. 14, 1888. Serial No. 267,130. (No model.)

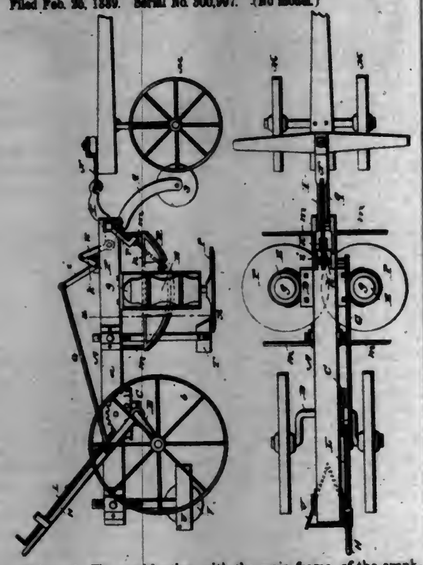


Claim.—1. In the process of restoring decayed teeth, embedding an anchoring-nut in filling material within the tooth-cavity, and engaging a tooth crown or section thereon by means of a screw, and uniting said crown or section with said nut, substantially as set forth.

2. In the process of restoring decayed teeth, embedding an anchoring-nut in filling material within the tooth-cavity, applying to the surface of the filling material a fluid-tight protecting-coat, and engaging a tooth crown or section thereupon by means of a screw uniting said crown or section with said nut, substantially as set forth.

3. In the process of restoring decayed teeth, embedding an anchoring-nut in filling material within the tooth-cavity, applying to the surface of the filling material a fluid-tight protecting-coat, surmounting said coat by a plate, and engaging the tooth crown or section thereupon by means of a screw uniting said crown or section with said nut, substantially as set forth.

405,168. GRAIN-CLEANING MACHINE. JOSEPH LEARNS, Wheaton, Minn. Filed Aug. 24, 1888. Serial No. 283,642. (No model.)



Claim.—1. In a grain-cleaning machine, the combination, with the cleaning mechanism, of the grain delivering and operating mechanism, comprising the tapering spout or passage formed of the sides 11, provided with grooves in their inner surfaces, the flexible apron 15, forming the front of said spout, and the endless belt 5, provided

with a series of buckets 6, arranged in said spout and having its edges guided by the grooves in the sides 11, substantially as described.

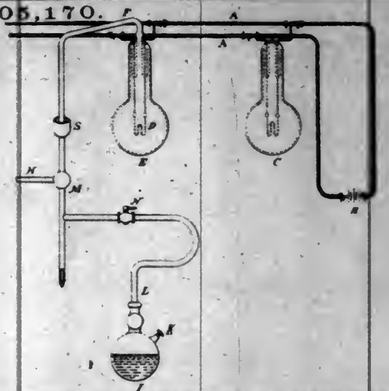
2. The combination, in a grain-cleaning machine with a suitable sieve, of the inclined spreading-wheels 21, provided with the series of buckets arranged upon their upper surfaces, as and for the purpose specified.

3. In a grain-cleaning machine, the combination, with a suitable sieve, of the wheels 21, provided with the buckets 19 and arranged to discharge the grain across said sieve, and the endless band provided with a series of buckets adapted to be moved by the falling grain and to deliver the grain to the buckets upon said wheel, substantially as described.

405,169. STUBBLE-SHAVER. JAMES MALLON, New Orleans, La. Filed Feb. 26, 1889. Serial No. 300,997. (No model.)

Claim.—1. The combination, with the main frame, of the crank-axle carrying supporting-wheels, the segmental rack secured to said frame, the crank-axle journaled in the forward end of said frame, the hand-lever fixed to the axle, the link connecting the forward end of the frame with the truck-frame, the rod connecting the hand-lever with the forward crank-axle, and the link connecting the pivoting-link with said crank-axle, substantially as specified.

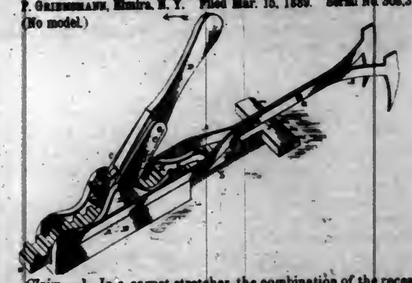
2. The combination, with the main frame, supported as described, of the lubricating journal-boxes, the brackets supporting the same, and the horizontal cutters having vertical shafts journaled in said boxes, substantially as specified.



3. The combination with the main frame, of the lubricating journal-boxes constructed as described, the brackets securing said boxes to the main frame, and the shields for the boxes, substantially as specified.

4. The combination, with the main frame, of the truck-frame, the pivoted link connecting the same, the double-crank rock-shaft journaled in the forward end of the main frame, a link connecting one arm of said crank-shaft with the rear end of the connecting-link I, the hand-lever secured to the rear crank-shaft, and the rod connecting an arm of the rock-shaft to the said hand-lever, substantially as specified.

5. The combination, with the main frame adapted to be vertically adjustable, as described, of the horizontal rotary cutters, the scraper adapted to be vertically adjustable, and arranged in rear of said cutters, a rotary trash-cutter arranged in advance of the stubble-cutters, and a vertically adjustable clearer arranged at the rear of the frame, substantially as specified.

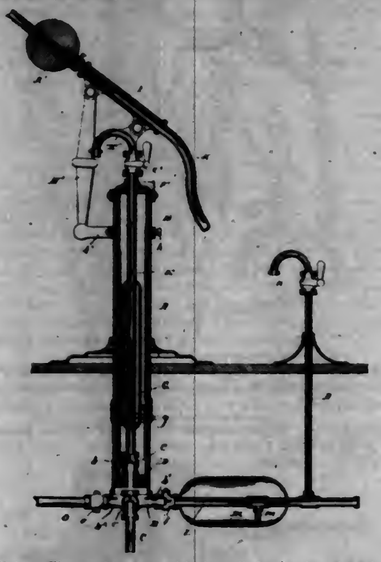


405,170. MANUFACTURE OF FILAMENTS FOR ELECTRIC LAMPS. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed Jan. 14, 1881. Serial No. 34,001. (No model.) Patented in England Feb. 15, 1881, No. 699, and in Germany Feb. 21, 1881, No. 15,201.

Claim.—1. The above-described improvement in the art of equalizing the illuminating-power of the carbonized conductors of incandescent lamps, which consists in electrically heating the said conductors in the presence of a hydrocarbon or equivalent vapor until their electrical resistance and illuminating-power for a definite intensity of current have been brought to a predetermined standard, substantially as set forth.

2. The above-described mode of heating the carbonized conductors for incandescent lamps, which consists in subjecting them in the presence of a hydrocarbon or equivalent vapor to the action of an electric current until by the decomposition of the said vapor their illuminating-power is brought to the same intensity as that of a standard lamp included in the same circuit or in a branch thereof, as described.

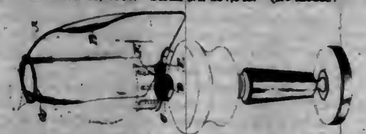
405,171. CARPET-STRETCHER. BRYAN W. MOYLAN and HENRY P. GRIESEMANN, Elmira, N. Y. Filed Mar. 15, 1889. Serial No. 303,371. (No model.)



Claim.—1. In a carpet-stretcher, the combination of the recessed base-block, a rack-bar sliding therein, a cog-wheel pivoted in the base-block and engaging the rack-bar, a handle which engages the cog-wheel and causes it to revolve, a holder pivoted to the rear end of the base-block and provided with points which are driven in the floor, and the shaft which passes through the cog-wheel and extends out over the inner ends of the holder A in front of the point at which they are pivoted to the base-block, for the purpose substantially as shown.

2. The combination of the recessed base-block, a holder pivoted thereto at one end and its other end formed into points adapted to be driven into the floor, a cog-wheel pivoted in the base-block, a handle for operating the cog-wheel pivoted between links which have their lower ends pivoted upon the journal of the cog-wheel, a rack-bar sliding in the base-block with which the cog-wheel engages, and provided with teeth at its forward end for catching into the carpet, and a pawl pivoted in the front end of the base-block above the rack-bar for engaging its upper serrated surface, the upper end of the pawl projecting a suitable distance, whereby, when the handle is pressed forward, it is made to engage the upper end of the pawl, and thus disengage its lower end from the rack-bar, for the purpose substantially as described.

3. The combination of the base-block, the holder pivoted thereto, the rack-bar sliding therein, the latch pivoted in the forward end of the base-block above the rack-bar, the cog-wheel pivoted in the base-block which engages the rack-bar, the rack-bar having teeth for catching in the carpet, the links C, pivoted upon the shaft of the cog-wheel, the handle D, pivoted between their outer ends, provided with a slot J at its lower end, and a pin which passes through the links and the slot, whereby the lower end of the handle engages the cog-wheel when forced backward but is disengaged from the cogs when forced forward, substantially as set forth.

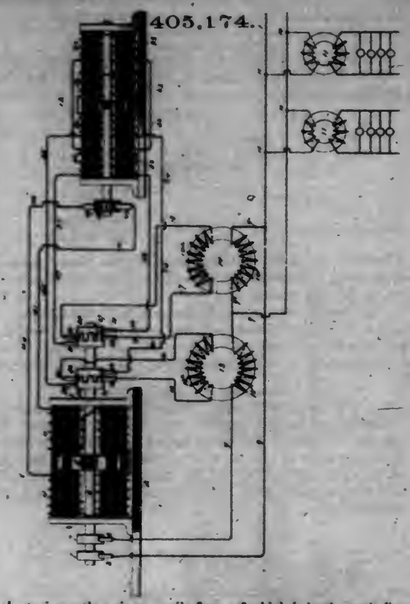


4. The combination of the base-block, the holder, the rack-bar, the cog-wheel pivoted in the base-block, the handle for operating the cog-wheel, the pawl pivoted in the forward end of the base-block which engages the rack-bar, the rack-bar which slides in the recess of the base-block and having teeth at its front end to catch in the carpet, and a spring secured to the forward end of the rack-bar and to the base-block, for the purpose substantially as shown and described.

405,172. PUMP. ELIJAH NEFF, Rochester, Ind., assignor of one-half to Alonzo L. Reynolds, same place. Filed Oct. 10, 1888. Serial No. 287,782. (No model.)

Claim.—The combination, with the cylinder having the tubular piston and piston-rod equipped with a check-valve and a stop-cock at the upper end of the tubular piston-rod, of the cap at the lower end of the cylinder, said cap being provided with a valve-chamber connected with the suction-pipe and having an upwardly-opening valve, and with laterally-extending chambers connected with the interior of the cylinder and with service-pipes having stop-cocks, and in which valves opening outwardly are arranged, substantially as set forth.

405,173. LAMP-REFLECTOR. GEORGE W. PELTON, Muscatine, Iowa. Filed Dec. 10, 1887. Serial No. 257,546. (No model.)

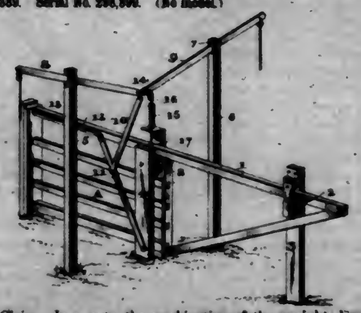


Claim.—The improved reflector herein described and shown, consisting of the flat polished plate A, having its upper corners rounded and bent forward, the flat metal spring-bracket C, comprising the split ring D, and the spring-arms E, formed integral with said ring and extended from the ends of the same and having their extremities secured to the lower edge of the plate A, the split ring being adapted to encircle the collar of a lamp, and the wire loop G, secured to the upper edge of the plate A and projecting forward therefrom and adapted to encircle the upper portion of a lamp-chimney, substantially as specified.

405,174. REGULATION OF ALTERNATING ELECTRICAL CURRENT GENERATORS. GUSTAV PFANHAUSER, Cleveland, Ohio, assignor to the Brush Electric Company, same place. Filed Nov. 30, 1887. Serial No. 256,513. (No model.)

Claim.—1. In a system of electrical distribution, the combination, with an alternating-current dynamo and a separate exciter, including the field-magnet coils of the alternating-current generator and provided with two separate sets of field-magnet coils, of induction apparatus included in the main line of the alternating-current generator and in a branch from the same for energizing the separate sets of coils on the field-magnets of the exciter, substantially as set forth.

2. In a system of electrical distribution, the combination of an alternating-current dynamo and a separate exciting-dynamo for energizing the field of force of the alternating-current dynamo, of two



inductoriums, the primary coil of one of which is in the main line and the primary coil of the other in a branch of the main line, said inductoriums being alternately connected with separate sets of coils on the field-magnets of the exciter and adapted to energize the same, substantially as set forth.

3. In a system of electrical distribution, the combination, with an alternating-current generator and a separate exciting-dynamo, the latter having two distinct sets of field-coils, of inductoriums for transforming the current of the alternating-current generator into secondary currents for energizing the two sets of field-coils of the exciter, substantially as set forth.

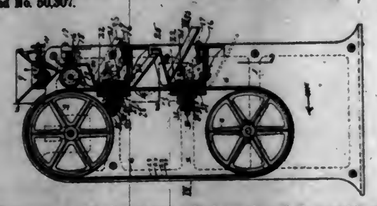
4. In a system of electrical distribution, the combination, with an alternating-current dynamo and a separate exciting-dynamo provided with separate sets of field-magnet coils, of inductoriums constructed to transform and reduce the tension of the current of the alternating-current dynamo and connections for utilizing such secondary currents for energizing separate sets of field-magnet coils of the exciting-dynamo, substantially as set forth.

5. In a system of electrical distribution, the combination, with an alternating-current dynamo and a separate exciting-dynamo provided with separate sets of field-magnet coils, of inductoriums included in the main line of the alternating-current dynamo and in a branch of the same and commutators whereby separate sets of field-magnet coils of the exciter are energized by the secondary currents of the inductoriums, substantially as set forth.

405,175. GATE. HIRAM H. PHILLIPS, Boulder, Colo. Filed Feb. 6, 1889. Serial No. 298,890. (No model.)

Claim.—In a gate, the combination of the uprights having the rollers journaled therein, the gate mounted on said rollers having an opening 17 in the top rail thereof, the rods 10, 11, and 12, and the operating-levers for sliding the gate, the tube 15, and rod 16, adapted

to enter the opening 17 in the top rail of the gate and retain the same in closed position, substantially as described.



405,176. ELECTRODE FOR ELECTRO-THERAPEUTIC BODY-WEAR. HARRY P. PRATT, Chicago, Ill. Filed Mar. 12, 1889. Serial No. 302,950. (No model.)

Claim.—1. An electrode comprising a metallic plate enveloped in a close-fitting cover of flexible absorbent material, substantially as and for the purpose set forth.

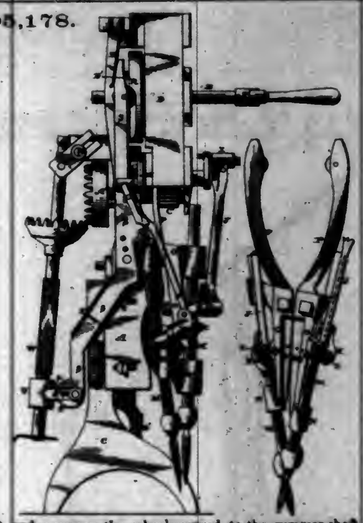
2. An electrode comprising, in combination, a metallic disk *r*, having an eye *q* extending from one side, and a pocket *p*, of soft absorbent material, enveloping the disk and readily removable therefrom and adjustable thereon, substantially as and for the purpose set forth.

405,177. GRINDING-MILL. FRANÇOIS GUINDRON, and ACHILLE VANSTEENKISTE, Brussels, Belgium. Filed May 23, 1887. Serial No. 239,153. (No model.) Patented in Belgium Mar. 18, 1887, No. 76,744; in England June 13, 1887, No. 8,492; in Germany June 16, 1887, No. 42,784; in France June 30, 1887, No. 184,836; in Italy Dec. 31, 1887, XIV, 209, XXI, 22,427, and in Austria-Hungary May 1, 1888, No. 11,104, and No. 50,307.

Claim.—1. A grinding device which consists of the combination of the perpendicularly-arranged series of elements, to wit: the feeding and cracking mechanism containing the hoppers 9, roller 10, and adjustable gate or valve 11, the vertically-descending grinding-band 6, and a series of coacting grinding-plates 22, adjustable toward and from said band and each having a separating-sieve 20, said band having opposite each grinding-plate an elastic and adjustable support or abutment 27, substantially as set forth.

2. The combination, with the vertically-descending grinding-band and coacting grinding-plates in front of same, of the provision in rear of said band of the elastic and adjustable support or abutment 27, having the telescoping cylindrical parts 29 30, the former secured to the plate and the latter fixed on the frame and the two being normally forced asunder by spiral spring 32, as set forth.

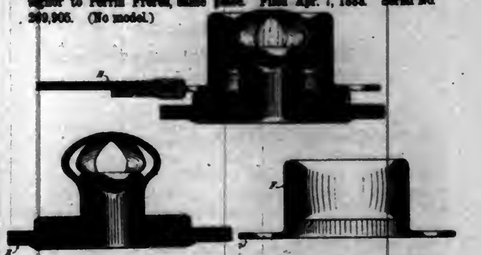
405,178. SAW SHARPENING AND GUMMING MACHINE. JOSEPH F. GUIBE, Trousdale, Tenn. Filed Feb. 15, 1889. Serial No. 300,048. (No model.)



Claim.—1. The combination of the operating-shaft, a cam R, placed thereon, a spring-actuated lever S, which is operated by the cam, the bearing U, secured to its lower end, the gummer-shaft W, which passes through the bearing and is provided with an operating-wheel Z, and a shaft provided with a wheel A', for meshing with the wheel upon the gummer-shaft, and a pinion C', for meshing with the driving-wheel F, substantially as described.

2. The combination of the operating wheel and shaft, a cam secured to the shaft, a spring-actuated lever S, provided with a socket in its lower end, an adjustable block placed in the socket, a bearing connected to the block, the gummer-shaft having the gummer attached to its lower end, an operating-wheel secured to the shaft, and the shaft B', provided with a wheel for operating the gummer-shaft, and a pinion for receiving motion from the driving-wheel, substantially as described.

3. The combination of an operating shaft and wheel, the spring-actuated lever S, jointed below its pivot and its two parts connected together by a spring X, the bearing for the gummer-shaft connected to the lower end of the lever, the gummer-shaft and the gummer attached to its lower end, and a mechanism for causing the gummer to revolve, substantially as set forth.



4. The combination of the spring-actuated lever S, a cam for operating it, a sliding block connected to the lower end of the lever, a bearing for the gummer-shaft attached to the block, the gummer-

405,178.

shaft and gummer, the wheel secured to the gummer-shaft, and an operating mechanism for causing the shaft to revolve with the swivel Y, and adjustable bearing for the swivel, substantially as specified.

405,179. BUTTON. PIERRE A. RAYBOUD, Grenoble, France, assignor to Perrin Frères, same place. Filed Apr. 7, 1888. Serial No. 269,905. (No model.)

Claim.—1. The combination, with an embracing-button attached to one part of a fabric, of a spring-stud attached to the opposite part and adapted to engage the said button, the stud being composed of a depressed dome or support forming an annular riveting-surface and an exterior engaging-spring, and being fastened to the fabric by an eyelet adapted to enter the back of the dome or support and be riveted over by contact with said depression.

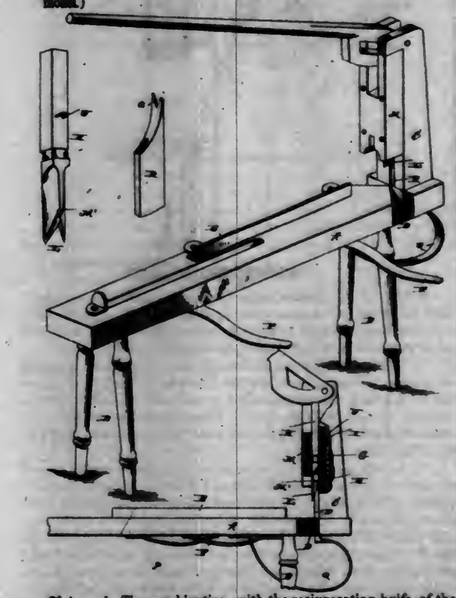
2. A spring-stud adapted to engage with a receiving-button, consisting of a depressed dome or support forming an annular riveting-surface and a spring having a series of radial arms with their extremities attached to the base of the said dome, the stud being attached to the fabric by an eyelet adapted to enter and be riveted over by contact with said depression.

3. A spring-stud for engagement with a receiving button or socket, consisting of a depressed dome or support forming an annular riveting-surface and an exterior engaging spring, combined with a fastening-eyelet, the eyelet being adapted to enter from behind and be riveted over by contact with the said depression, and the dome having a flange extending beyond the spring, by which it is held while the eyelet is forced into position.

4. The combination, with a spring-stud having a rigid dome or support for attachment to the fabric and an external engaging spring, of a receiving-socket therefor, consisting of a sheet-metal cylinder having its upper part turned over to avoid sharp edges and provided with a lateral attaching loop, the whole forming a substantially rigid socket with which the stud has a spring engagement.

405,180. SASH-HOLDER. HUGH REED, St. Louis, Mo., assignor of one-half to Isidore Simon, same place. Filed Mar. 7, 1889. Serial No. 302,285. (Model.)

Claim.—1. In a sash-fastener, the combination of the upper stationary stop-bead sections, the lower adjustable stop-bead sections, and the metal boxing that houses the junction ends of said sections, substantially as described, and for the purpose set forth.

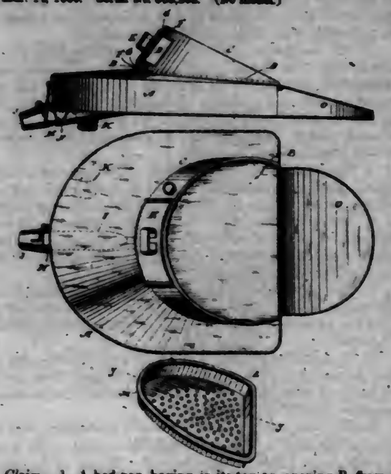


405,180.

2. In a sash-fastener, the combination of the stationary sections of the stop-beads, the adjustable sections of the stop-beads, the pivoted angle-plates 14, the screws 15, by which said plates are secured to the side pieces of the frame in countersunk boxings provided in said frame, and the thumb-screws 19, that pass through perforations in the adjustable sections of the stops and engage in the threaded screw-holes 18 in the pivoted angle-plates 14, to tighten the stop to or relax it from the window-sash, substantially as described, and for the purpose set forth.

3. In a sash-fastener, the combination of the stationary sections of the stop-beads, the adjustable sections of the stop-beads, the tenons 21 on top of said adjustable sections, the metal boxings 10, provided with a recessed chamber 22, that house the lower ends of said stationary sections of the stops, and also house the tenons that surmount the adjustable sections of said stops, the angle-plates 14, the pivot-screws that secure the attached ends of said plates in the countersunk boxings 17, that are provided in the sides of the window-frame, and the thumb-screws 19, that pass through perforations in said stops and engage in the threaded screw-holes 18 in the angle-plates to respectively tighten and loosen the stops to and from the sash, the heads of said thumb-screws being provided with perforations in which rings or their equivalents may be seated, by which to turn the screws, substantially as described, and for the purpose set forth.

405,181. MACHINE FOR POINTING FENCE-PICKETS. CHARLES B. RICE, New Market, Va. Filed Jan. 8, 1889. Serial No. 295,743. (No model.)

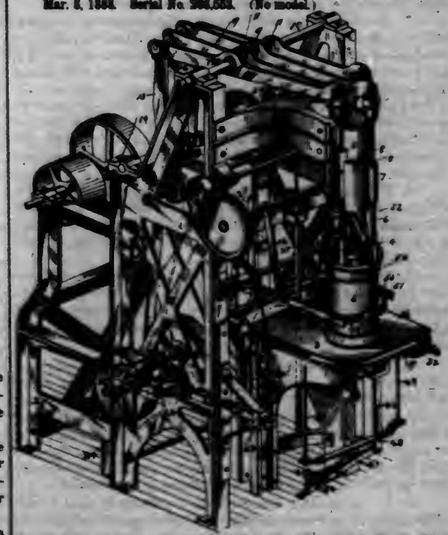


Claim.—1. The combination, with the reciprocating knife, of the vertically-disposed movable guide arranged below the knife and having its upper end adapted to engage the lower end of the knife, the said guide being pressed upward by a spring, as set forth.

2. The combination, with the table and the standard, of the reciprocating knife supported by the standard and having the lip or spur on its rear side at its lower end, the moving guide or stop provided at its upper end with a notch adapted to engage said lip or spur, and mechanism for reciprocating the knife, as set forth.

3. The combination of the table provided in its upper side with the recesses having flared bases, the standard rising from the table adjacent to said recesses, the reciprocating knife supported by the standard, mechanism for reciprocating the knife, and the guide or stop moving through the table, having its upper end engaging the lower end of the knife, and having its lower end formed into a spring, the extremity of which is secured to the under side of the table, as set forth.

4. The combination of the reciprocating knife L and the moving guide or stop P, against which the end of the picket is placed, said guide or stop having its lower end bent to form a leaf-spring Q, the extremity of which is secured to the table, as set forth.



405,182. BED-PAN. MARGARETTA RIEBE, New York, N. Y. Filed Mar. 14, 1888. Serial No. 303,262. (No model.)

Claim.—1. A bed-pan having in its top an opening B, from the edge of which rises a flange C, provided directly in its front with an orifice D, over which is fitted a movable door E, for opening and closing said orifice, substantially as and for the purposes described.

2. A bed-pan provided with the pipe H and at its top with the opening B, and, upwardly-projecting flange C about the opening, in combination with the removable pan I, having a perforated bottom and adapted to set in the top opening of the bed-pan, substantially as and for the purposes described.

405,183. TILE-MACHINE. WILLIS D. SHERMAN, Omaha, Nebr., assignor to the Union Hydraulic Drain Tile Company, same place. Filed Mar. 8, 1888. Serial No. 266,553. (No model.)

Claim.—1. The combination, with the frame of a tile-machine, of a vertically-moving table, a rack for operating the table, a double sheave-wheel journaled at the inside of the frame, one part of which is concentric and the other part eccentric, a counterpoise, and chains secured to the top of the rack and to the counterpoise, substantially as described.

2. The combination, with the frame of a tile-machine, of a verti-

cally-moving table, a cross-bar suspended from the table, a vertically-moving rack at the rear of the table, and an arm secured to the lower end of the rack, the outer end of which is adapted to engage with the cross-bar, substantially as described.

3. The combination, with the frame of a tile-machine, of a vertically-moving table, a rack at the rear of the table, an arm secured to the lower end of the rack, and an upright secured to the arm, the upper end of which is adapted to come in contact with a plate upon the under side of the table, substantially as described.

4. The combination, with the frame of a tile-machine, of a vertically-moving table having a bearing or hole at its rear portion, a vertical-shaft journaled to the frame at its upper end and passed through the hole in the table at its lower end, a rack at the rear of the table, an arm secured to the lower end of the rack having a bent or curved portion registering with the shaft, and a plate secured to the arm, substantially as described.

5. The combination, with the frame of a tile-machine, of a vertically-moving table, a cam-guide, a series of clutch-levers, and a bar connecting with the cam and clutch-levers, substantially as described.

6. The combination, with the frame of a tile-machine, of a vertically-moving table, a slotted support, a cam-guide on the support, a series of clutch-levers, and a bar connecting the cam-guide and clutch-levers, substantially as described.

7. The combination, with the frame of a tile-machine, of a vertically-moving table, a channeled cam-guide, a brace, a bar, and a pin on the bar for engaging the channels in the cam-guide, substantially as described.

8. The combination, with the frame of a tile-machine, of a vertically-moving table, a cam-guide, a series of clutch-levers pivotally secured to the frame, and a bar connecting with the clutch-levers and cam-guide, substantially as described.

9. The combination, with the frame of a tile-machine, of a vertically-moving table, a bent arm adjustably secured to the front of the machine, and a lever pivotally secured to the side of the machine and adapted to be operated by the bent arm, substantially as described.

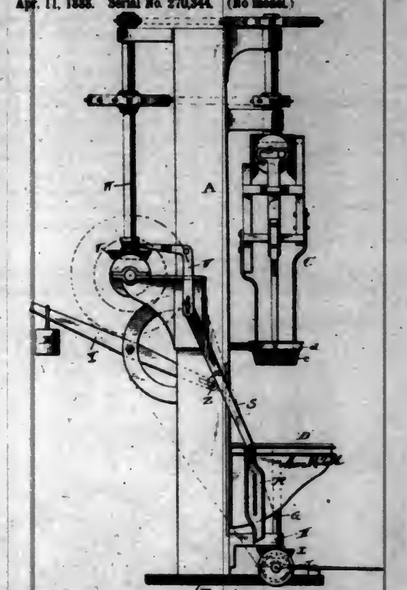
10. The combination, with the frame of a tile-machine, of a vertically-moving table, a bent arm pivotally secured to the front of the machine, a lever pivotally secured to the side of the frame and adapted to be operated by the bent arm, and a keeper secured to the frame having catches upon its inner edge, substantially as described.

11. The combination, with the frame of a tile-machine, of a vertically-moving table, a bent arm pivotally secured to the front of the frame, an adjusting-screw in the upper end of the arm, a lever pivotally secured to the side of the frame adapted to be operated by the arm, and a keeper secured to the frame having catches upon its inner edge, one of which is beveled, substantially as described.

12. The combination, with the frame of a tile-machine, of a vertically-moving table, a lever pivotally secured to the lower portion of the frame, a rack at the rear of the table, the lower end of which is provided with an arm, said arm being adapted to engage with the end of the lever, a keeper secured to the frame having a hole in its lower end, a push-rod secured to the other end of said lever, having its upper end within the hole in the keeper, and a lever pivotally secured to one side of the machine, having its end within the keeper and adapted to be operated by the end of the push-rod, substantially as described.

13. The combination, with the frame of a tile-machine, of a vertically-moving table, two forwardly-projecting arms above the table, braces secured thereto, a funnel at the ends of the arms, a shell upon the table, and tamping-bars projecting through the funnel, substantially as described.

14. The combination, with the frame of a tile-machine, of a vertically-moving table, two forwardly-projecting arms above the table, a semicircular ring pivotally secured at the end of each arm, a funnel upon said rings, a shell upon the table, and tamping-bars projecting through the funnel, substantially as described.



15. The combination, with the frame of a tile-machine, of a vertically-moving table, a rack at the rear of the table, an arm at the lower end of the rack, an upright and a support secured to the arm, a core upon the support, a cross-bar suspended below the table, and a shell upon the table, said upright, support, and cross-bar being so arranged in relation to each other that the table is not moved upward until the core has been placed in position, nor downward by the rack until the core has been withdrawn, substantially as described.

16. The combination, with the frame of a tile-machine, of a vertically-moving table, a block secured to the lower portion of the front of the frame, a lever pivotally secured to said block, a pin in the block above the end of the lever, a rack at the rear of the table, an arm secured to the lower end of the rack adapted to engage with the end of the lever, a keeper secured to the frame having a hole in its lower end, a lever pivotally secured to the side of the machine having one end within the keeper, and a push-rod secured to the outer end of the lever at the bottom of the machine, the upper end of which passes through the hole in the bottom of the keeper and engages with the end of the lever secured to the side of the frame, substantially as described.

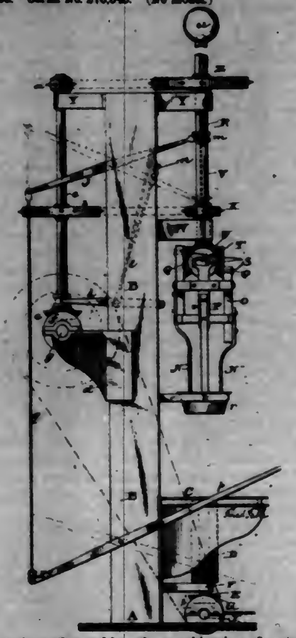
17. In a contractible core for tile-machines, the combination of a series of ribs cut in halves, a piece of sheet-steel secured to each of the sets of halves, the edges of which are beveled, a cap, and a tapering support adapted to be forced between the two sets of halves of the ribs, substantially as described.

18. In a tile-machine, the combination of a support, a face-plate secured to the lower portion of the support, a table the sides of which are provided with clips which engage with the plate, a core through the table, and tamping-bars above it.

405,184. TILE-MACHINE. WILLIS D. SHERMAN, Omaha, Nebr., assignor to the Union Hydraulic Drain Tile Company, same place. Filed Apr. 11, 1888. Serial No. 270,344. (No model.)

Claim.—1. In a tile-machine, the combination of a support, a table movably secured to its lower portion, a core through the table, the lower end of which is provided with a divided nut, a vertical screw-threaded shaft, and tamping-bars above the table.

2. In a tile-machine, the combination of a support, a table secured to its lower portion, a core through the table, a plate in the lower end of the core having dovetailed grooves in its upper surface, a divided nut upon the plate having dovetailed flanges upon its lower side, a vertical screw-threaded shaft below the core, and tamping-bars above the table.



3. In a tile-machine, the combination of a support, a table secured to its lower portion, a core through the table, two plates in the lower portion of the core, one of which is stationary and the other is movable, radial slots in the stationary plate and curved slots in the movable plate, one end of each of the curved slots being nearer the center of the plate than the other end, a bolt in each half of the divided nut passing down through the slots in the two plates, nuts upon the lower ends of the bolts, a vertical shaft below the core, and tamping-bars above the table.

4. In a tile-machine, the combination of a support, a table secured upon the lower portion of the support, a core through the table, a divided nut in the lower portion of the core, a vertical shaft below the core, screw-threaded throughout, except at its lower end, and tamping-bars above the table.

5. In a tile-machine, the combination of a support, a table secured thereto, a cam guide upon one side of the table, a vertical shaft at the rear of the machine, a bevel-wheel upon the lower portion of said shaft, two levers pivotally secured upon the side of the support, one end of one of which engages with the cam-guide, and the opposite end of the other lever engages with the bevel-wheel upon the shaft, and tamping-bars above the table.

6. In a tile-machine, the combination of a support, a table movably secured to its lower portion, a lever pivoted to the support, the inner end of which is slotted, a pin upon the table, which engages with the slotted end of the lever, a weight upon the outer end of the lever, and tamping-bars above the table.

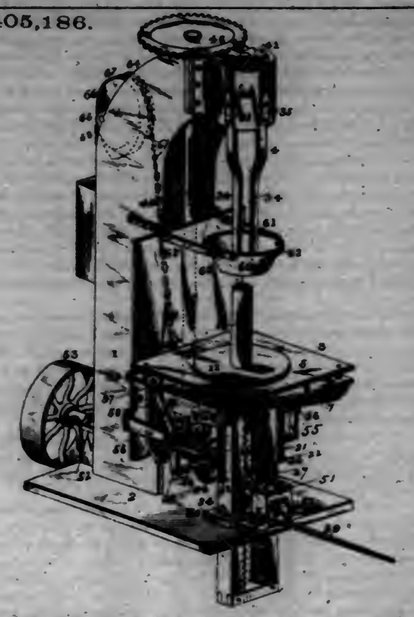
405,185. TILE-MACHINE. WILLIS D. SHERMAN, Omaha, Nebr., assignor to the Union Hydraulic Drain Tile Company, same place. Filed Apr. 11, 1888. Serial No. 270,345. (No model.)

Claim.—1. In a tile-machine, the combination of a stationary table, a vertically-movable shaft, a frame upon the lower end of the shaft, bevel-wheels upon the sides of the frame, a pin upon the outer face of each of the wheels, blocks upon the sides of the frame, the upper end of each of which is provided with a slot, and tamping-bars secured to the blocks.

2. In a tile-machine, the combination of a stationary table, a vertically-movable shaft, a frame upon the lower end of the shaft, bevel-wheels upon the sides of the frame, blocks upon the sides of the shaft, the upper ends of which engage with the wheels, tamping-bars upon the blocks, a sleeve upon the lower end of the shaft, a bevel-wheel upon the lower end of the sleeve and a sprocket-wheel upon the upper end, a sprocket-wheel upon the upper end of the shaft, a vertical operating-shaft and two sprocket-wheels upon the shaft, and chains for operating the sprocket-wheels.

3. In a tile-machine, the combination of a stationary table, a vertically-movable shaft, a weight upon the upper end of the shaft, and tamping-bars upon the lower end.

4. In a tile-machine, the combination of a vertical support, a table secured to its lower portion, and two vertical shafts journaled in bearings at its upper portion, one of said shafts being longitudinally movable, tamping-bars upon the lower end of the movable shaft, a bevel-wheel movably secured upon the lower end of the other shaft, and levers for connecting the movable shaft with the movable wheel.



5. In a tile-machine, the combination of a vertical support, a table secured to its lower portion, two shafts journaled in bearings at the upper portion of the support, one of which is movable vertically, tamping-bars upon the lower end of said shaft, a collar rigidly secured upon the upper portion of said shaft, a bevel-wheel movably mounted upon the other shaft, two levers pivotally secured upon the support, the opposite ends of which engage with the collar upon one shaft and the wheel upon the other shaft, and a link secured at its ends to said levers, the upper end of which is provided with a slot.

6. In a tile-machine, the combination of a stationary table, a revolving frame above the table adapted to be moved vertically, and a series of tamping-bars movably secured upon the frame.

405,186. TILE-MACHINE. WILLIS D. SHERMAN, Omaha, Nebr., assignor to the Union Hydraulic Drain Tile Company, same place. Filed Apr. 23, 1888. Serial No. 271,976. (No model.)

Claim.—1. In a tile-machine, the combination of a support, a table secured to its lower portion and a cylinder at its upper portion,

405,186.

a drum within the cylinder having a cam-groove or worm, blocks upon the cylinder, pins in the blocks engaging the grooves, and tamping-bars upon the blocks.

2. In a tile-machine, the combination of a support, a table secured to its lower portion and a cylinder to its upper portion, vertical slots in the sides of the cylinder, blocks upon the sides of the cylinder, each of which is provided with a pin, a drum within the cylinder having a cam-groove, and tamping-bars secured to the blocks.

3. In a tile-machine, the combination of a support, a table secured to its lower portion and a cylinder to its upper portion, a spider within the cylinder, a shaft journaled in the spider, a drum upon the lower portion of the shaft within the cylinder and a spur-gear upon its upper portion, blocks upon the sides of the cylinder, pins in the blocks engaging the grooves, and a series of tamping-bars secured to the blocks.

4. In a tile-machine, the combination of a support, a table secured to its lower portion and a cylinder to its upper portion, a drum within the cylinder having a cam-groove around its circumference, blocks upon the sides of the cylinder, a pin upon each block projecting into the cam-groove, a friction-roller upon each pin, and tamping-bars upon the blocks.

5. In a tile-machine, the combination of a support, a table secured to the lower portion of the support, a contractible core through the table, the central piece of which is wedge-shaped and provided with dovetail flanges or ribs, and the outside pieces are provided with dovetail recesses, a slot in the central piece, a pin in the side pieces and through the slot in the central piece, a rack secured to the lower end of the central piece, and tamping-bars above the table.

6. In a tile-machine, the combination of a support, a table secured to the lower portion of the support, a rack below the table, the upper end piece of which is slotted, a core through the table, the lower end of which is swiveled in the slot, and tamping-bars above the table.

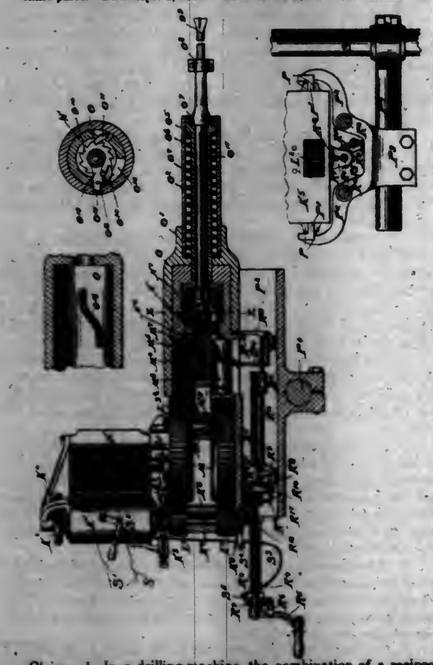
7. In a tile-machine, the combination of a support, a table secured to the lower portion of the support, a rack below the table, the side pieces of which are provided with cogs, the cogs at the upper end of one side piece of the rack and at the lower end of the other side piece being only partly cut, a shaft between the side pieces, a cog-wheel upon the shaft, a core secured to the upper end of the rack, and tamping-bars above the table.

8. In a tile-machine, the combination of a support, a table secured to the lower portion of the support, a core through the table, a rack secured to the lower end of the core, a yoke around the rack, a lever pivotally secured in front of the rack, a wheel for operating the rack, and tamping-bars above the table.

9. In a tile-machine, the combination of a support, a table secured to the lower portion of the support, a core through the table, a rack secured to the lower end of the core, a yoke around the rack, a lever

pivotally secured in front of the yoke, catches upon the under side of the lever, a coiled spring upon the top of the lever at its pivotal point, a wheel for operating the rack, and tamping-bars above the table.

10. In a tile-machine, the combination of a support, a table secured to the lower portion of the support, a shaft below the table, a bevel-wheel upon the shaft, a lever in engagement with the wheel, cam-guides upon the sides of the table in engagement with the ends of the lever, a vertical shaft, and tamping-bars above the table.



11. In a tile-machine, the combination of a support, a table secured to the lower portion of the support, a shaft below the table, a bevel-wheel movably secured upon the shaft, the hub of which is provided with a groove, brackets secured to the support behind the table, a lever pivoted to the ends of the brackets, the ends of which are provided with pins and the middle portion engages with the groove in the hub of the wheel, cam-guides upon the sides of the table in engagement with the pins, a vertical shaft, and tamping-bars above the table.

12. In a tile-machine, the combination, with a base-piece, of vertical columns secured thereto, a table upon the base, a tamping-frame between the columns, consisting of a hollow cylinder secured to the columns, a spirally-grooved drum, blocks upon the outer side of the hollow cylinder, pins secured to the blocks, the inner ends of which project through the cylinder and engage with the spiral groove, and tamping-bars secured to the blocks.

13. In a tile-machine, the combination of a support, a vertically-movable table secured thereto, a sheave journaled at the top of the support, a counterpoise, means for connecting the table and counterpoise with the sheave, and tamping-bars above the table.

14. In a tile-machine, the combination, with a base-piece, of vertical columns secured to the base, a revolving table upon the base, a tamping-frame between the columns, a drum within the frame, a cam-wheel within the drum, tamping-bars upon the outside of the drum, a cross-piece secured at its ends to the top of the columns, a bearing in the cross-piece through which the shaft of the cam-wheel projects, said shaft being provided with a groove, a cog-wheel upon the shaft above the cross-piece, having a fin, an idle-wheel upon the cross-piece, a vertical shaft, and a cog-wheel upon each end of the shaft, the upper one of which engages with the idle-wheel and the lower one with the table.

405,187. ELECTRIC DRILLING-MACHINE. ELMER A. SPERRY, Chicago, Ill., assignor to the Sperry Electric Mining Machine Company, same place. Filed Apr. 1, 1889. Serial No. 305,584. (No model.)

Claim.—1. In a drilling-machine, the combination of a reciprocating drill with a rotator operating upon said drill in the middle of its retraction only.

2. In a drilling-machine, the combination of a reciprocating drill and a driving-crank therefor, and a rotator for such drill operating only in the middle of the retraction of such drill.

3. In a mining-machine, the combination of a reciprocating drill, driving-crank therefor, and a rotator containing a pin and a cam, the latter so shaped as only to operate upon the drill in the middle of its retraction.

4. In a drilling-machine, the combination of a drill-rod with an inclosing-sleeve, a driving-spring about the same, and a guide-cylinder inclosing the whole with suitable end-bearing surfaces for said spring, so that the driving-spring is inclosed and supported internally and externally.

5. In a drilling-machine, the combination of a fixed frame with a frame movable thereon, a drill, an electric motor therefor supported on said movable frame, a switch to control such motor, said switch connected with such frames so as to affect the operation of the motor at any predetermined point in the excursion of the moving frame.

6. In a drilling-machine, the combination of a fixed frame with a frame movable thereon, a drill, an electric motor therefor on said movable frame, and a switch to control such motor, said switch secured on one frame and its handle connected with the other frame, so that it is operated to affect the motor responsive to the variations in the relative positions of the two frames.

7. In a drilling-machine, the combination of a fixed frame, a movable frame supported thereon and carrying the operative parts, a screw-rod connecting the two frames, a crank thereon, a movable nut on such screw-rod, and a ratchet and dog, said dog connected with the drill, so that the movement of the latter causes the rotation of such nut to move the operative part on such fixed frame.

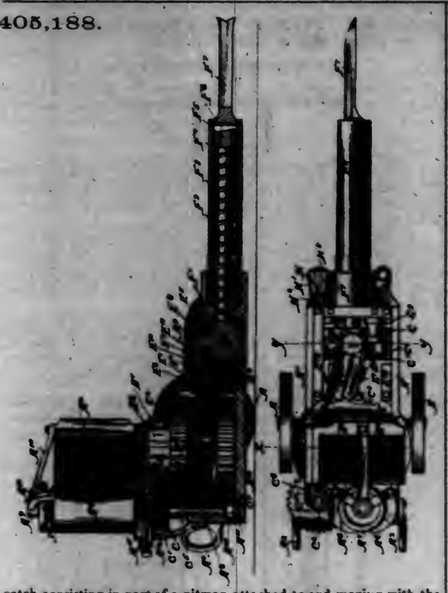
8. In a drilling-machine, the combination of the fixed frame, a movable frame supported thereon and carrying the operative parts, a screw-rod connecting the two frames, a movable nut on said screw-rod, and a ratchet and dog, said dog connected with the drill, so that the movement of the latter causes the rotation of such nut to move the operative parts on the fixed frame.

9. In a drilling-machine, the combination of a fixed frame, a movable frame supported thereon and carrying the operative parts, a screw-rod connecting the two frames, a crank thereon, a locking device for said crank, a movable nut on such screw-rod, and a ratchet and dog, said dog connected with the drill, so that the movement of the latter causes the rotation of such nut to move the operative parts on the fixed frame.

10. In a drilling-machine, the combination of a fixed frame, a movable frame supported thereon and carrying the operative parts, a screw-rod connecting the two frames and a crank thereon, a locking device for said crank, a movable nut on said screw-rod, a locking device for said nut, and a ratchet and dog, said dog connected with the drill, so that the movement of the latter causes the rotation of such nut to move the operative parts on the fixed frame.

11. In a drilling-machine, the combination of a fixed frame with a moving frame supported thereon and carrying the operative parts, a screw-rod connecting the same, a nut and ratchet-wheel thereon, a dog to operate such ratchet-wheel, and a latch to hold such dog out of operative position.

405,188. ELECTRIC MINING-MACHINE. ELMER A. SPERRY, Chicago, Ill., assignor to the Sperry Electric Mining Machine Company, same place. Filed Apr. 1, 1889. Serial No. 305,585. (No model.)



Claim.—1. In a mining-machine, the combination of a suitable supporting-frame with a drill, a driving-motor for said drill, an electric motor to energize said driving-motor, and an intermittently and irregularly operating catch consisting in part of a pitman attached to and moving with the drill or drill-rod, said catch adapted to intermittently connect the two motors, so that their re-engagement is dependent upon the length or duration of the effective stroke of the drill.

2. In a mining-machine, the combination of a suitable supporting-frame with a drill, a driving-motor for said drill, an electric motor to energize said driving-motor, and an intermittently and irregularly operating catch consisting in part of a slotted pitman attached to and moving with the drill or drill-rod, said catch adapted to intermittently connect the two motors, so that their re-engagement is dependent upon the length or duration of the effective stroke of the drill.

3. In a mining-machine, the combination of a suitable supporting-frame with a drill, a driving-spring for said drill, an electric motor to energize said spring, and an intermittently and irregularly operating catch consisting in part of a slotted pitman attached to and moving with the drill or drill-rod, said catch adapted to intermittently connect the spring and motors, so that their re-engagement is dependent upon the length or duration of the effective stroke of the drill.

4. In a mining-machine, the combination of a suitable supporting-frame with a drill, a driving-motor for said drill, a motor to energize said driving-motor, and an intermittently and irregularly operating

405,188.

catch consisting in part of a pitman attached to and moving with the drill or drill-rod, said catch adapted to intermittently connect the two motors, so that their re-engagement is dependent upon the length or duration of the effective stroke of the drill.

5. In a drilling-machine, the combination of a drill with a rod to which it is secured, a spring encircling said rod, and a free collar on the end of such rod bearing against the end of the drill proper, said spring bearing at its end, respectively, against such collar and the fixed portion of the machine.

6. In a drilling-machine, the combination of a drill, a rod to which it is secured, a spring encircling such rod, a free collar on the end of such rod bearing against the end of the drill proper, said spring bearing at its end, respectively, against such collar and a fixed portion of the machine, and a spring inclosing and protecting cylinder.

7. In a drilling-machine, the combination of the drill with a rod to which it is secured, a spring encircling such rod, a cylinder inclosing such spring and rod, and a guiding-collar about such rod within such cylinder and bearing on one side against the end of the drill proper and on the other against the end of the spring.

8. In a drilling-machine, the combination of a drill with a reciprocating pitman therefor, two driving gear-wheels on opposite sides of said pitman, a clutch to connect said pitman and gear-wheels, an actuating-motor for said gear-wheels, and a frame to support such parts in operative position.

9. In a drilling-machine, the combination of a drill with a reciprocating pitman therefor, two driving gear-wheels on opposite sides of said pitman, a clutch to connect said pitman and gear-wheels, an actuating electric motor for said gear-wheels, and a frame to support such parts in operative position.

10. In a drilling-machine, the combination of a drill with a reciprocating pitman therefor, two crank-plates connected with said pitman and on opposite sides thereof, a clutch whereby the pitman and plates are connected, an actuating-motor to drive such plates, and a frame to support such parts in operative position.

11. In a drilling-machine, the combination of a drill with a pitman, crank-plates on opposite sides thereof, a clutch to connect the pitman and plates, an actuating electric motor to drive such plates, and a frame to support such parts in operative position.

12. In a drilling-machine, the combination of a drill with a pitman, a crank plate and pin, a driving-wheel, a motor to actuate the same, and a clutch between such crank-plate and driving-wheel on each side of the pin.

13. In a drilling-machine, the combination of a drill with a pitman, a crank plate and pin, a driving-wheel, a motor to actuate the same, and a release between such crank-plate and driving-wheel on each side of the pin.

14. In a drilling-machine, the combination of the drill-actuating mechanism with a frame on which the same is supported, a spring which encircles and drives the drill, an outwardly open-ended inclosing-cylinder therefor secured to such frame, and a removable drill-guide within such cylinder.

15. In a drilling-machine, the combination of a drill with a driving-spring, a pitman connected with such drill at one end and provided with a long slot at the other end, a crank whose pin engages such slot, a driving-shaft to which such crank is attached, and means for driving the same so that the pitman may move independent of the crank during a portion of its stroke.

16. In a drilling-machine, the combination of a drill with a spring adapted to force the drill forward, a pitman connected with such drill at one end and provided with a long slot at the other, a crank whose pin engages such slot, a driving-shaft to which such crank is attached, means for driving the same, and a clutch connecting said crank to said shaft so as to lock them together when one moves faster than the other and release them when their relative speed tendency changes.

17. In a drilling-machine, the combination of a suitable supporting-frame with a drill, means for driving the same, including the shaft, a crank on said shaft connected to other parts of the driving mechanism, and a clutch which locks the shaft and the crank together when one moves faster than the other and releases them when their relative speed tendencies change.

18. In a drilling-machine, the combination of a drill with an electric motor for driving the same, an electric-current indicator consisting of two elements, one adapted to be read in the light and the other in the dark, and a suitable supporting-frame on which the parts are secured.

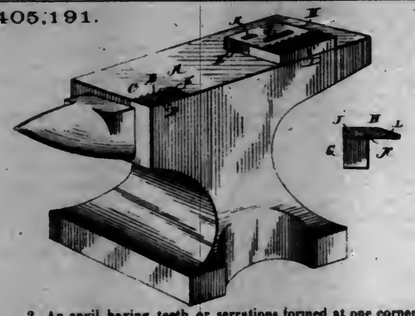
405,189. STORM-SASH VENTILATOR. FREDERIC STRAUB, Surprise, Nebr. Filed Nov. 3, 1888. Serial No. 289,932. (No model.)

Claim.—1. The combination, with the storm-sash having an opening for ventilation, and the movable sash, as B, of the damper for closing the opening in the storm-sash, and an arm extending from the damper and engaged by and operated from the sash B, substantially as and for the purpose described.

2. The combination, with the frame, the storm-sash having an opening for ventilation, and the damper for closing the said opening, of the movable sash having a bail or keeper, and the arm projecting from the damper and engaged by the said keeper, substantially as described.

3. The combination of the frame, the storm-sash having openings in its rail, the damper pivoted to the rail midway of its ends, the arm projecting from the damper, the movable sash, and the bail or keeper secured to and projecting from the lower edge of the said movable sash and engaged with the said arm to move the damper when the said sash is raised and lowered, substantially as and for the purpose described.

405,190. RACK FOR HAY-WAGONS. ERWIN J. TRACY, Sioux Falls, Dak. Filed Sept. 24, 1888. Serial No. 286,217. (No model.)



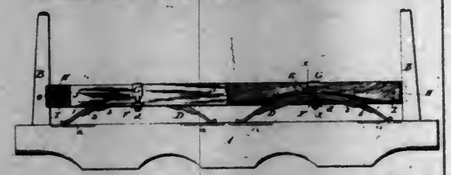
Claim.—In a folding hay-rack, the combination of the cross-pieces, the slotted standards secured thereto, the ends having the uprights d' pivoted in the standards, the hinged and jointed supporting-braces hinged or pivoted to the said uprights and to the wagon-body B, the longitudinal rails secured to the cross-pieces, the slotted standards on the rails, the sides having the uprights c^2 pivoted in the said slotted standards, the standards d on the cross-pieces, and the braces having one end pivoted to the uprights c^2 and the other end provided with a hook to engage an opening in the standards d, all arranged and operated substantially as and for the purpose specified.

405,191. ANVIL AND SWAGE. JOHN H. UHRICH, Norton, Kans. Filed Mar. 16, 1889. Serial No. 303,607. (No model.)

Claim.—1. An anvil having teeth or serrations formed upon a portion of its face, substantially as set forth.

405,191.

2. An anvil having teeth or serrations formed at one corner of its face, substantially as set forth.



3. An anvil attachment the face of which is provided with teeth or serrations, substantially as and for the purpose set forth.

4. The combination, with an anvil, of a swage provided with teeth or serrations along its outer edge, and having recesses or dies formed in the face thereof adapted to form the heel and toe calks of horseshoes, substantially as set forth.

5. A swage or anvil attachment having a toothed or serrated beveled face, substantially as set forth.

6. A swage or anvil attachment having the toothed or serrated beveled outer edge, and provided on its face with guides or recesses to form the heel and toe calks of horseshoes, substantially as set forth.

405,192. BOLSTER-SPRING. HENRY VAN ARSDALE, Racine, Wis. Filed Mar. 7, 1889. Serial No. 302,311. (No model.)

Claim.—1. In combination with bar C, a semi-elliptic spring D, a socket or recess formed in the under side of the bar and of a width to receive the spring, a U-shaped clip G, applied to the upper side of the bar, and a clip-plate F, extending transversely across the under side of the bar in contact with the spring and adapted to receive the ends of the clip, the socket or recess being provided with side walls to prevent lateral displacement of the spring, all substantially as shown, whereby perforation of the spring is obviated.

2. In combination with bar C, provided with a socket or recess in its under side, spring D, seated in said socket or recess, a staple E, a plate F, bearing upon the body of the staple, and a clip G, applied to the bar, all substantially as shown.

3. In combination with bar C, provided with a socket or recess a spring D, seated in said socket or recess, a staple E, a plate F, provided with a socket *e* to receive the staple, a clip G, and nuts *d*, all substantially as shown.

4. In combination with bar C, provided with a socket or recess, spring D, mounted in said socket and notched on its edges, as shown, staple E, passing into the bar from its under side and engaging with said notches and a clip G, and a plate applied to the bar, substantially as shown, and for the purpose set forth.

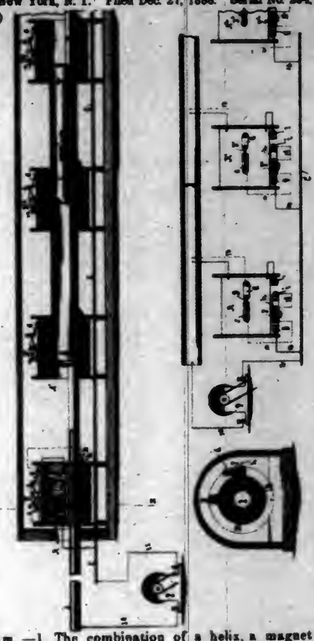
5. In combination with bolster A, bar C, and a spring D, applied to said bar, and composed of two or more leaves 1 2 3, normally curved in the same general direction, but having different degrees of curvature, the said leaves being rigidly affixed to the bar in contact with each other.

6. In combination with bolster A, and bar C, spring D, composed of two or more leaves 1 2 3, of different lengths, normally curved in the same general direction, the longer leaf having a greater curvature than the shorter leaf, and the said leaves being clamped together so as to be in contact throughout the greater part of their length.

7. In combination with the bolster A, standards B, and spring-bars C, cap H, provided with guiding webs or flanges *e e*, and clips J, adapted to be applied to one of the webs or flanges *e*, as and for the purpose set forth.

8. In combination with bolster A and standards B, the spring bar C, cap H, provided with guiding webs or flanges *e e*, and clip J, provided with a U-shaped body and with a lug or ear, by which it is attached to the cap of the spring-bar.

405,193. CART-SPRING. LARS E. WALBERG, Hollister, Cal. Filed Apr. 3, 1889. Serial No. 305,836. (No model.)



Claim.—1. The combination, with the axle and shaft of a cart, of a spring on the top of the axle, a plate pivoted to the spring and secured to the shaft, and a spring interposed between the said other spring and plate, substantially as described.

2. The combination, with the axle and shaft, of the spring D, having ears extending therefrom, the plate B, pivoted on the ears, the spring C between the said other spring and plate, and a spring below spring D and the axle, having its ends resting against the outer ends of the spring D, substantially as described.

3. The combination of the spring D, having clip F on its under side and ears *d* on its upper side, the plate B, pivoted on the ears, the spring C between the plate and spring D, and the spring G below the axle and secured to said spring D, substantially as described.

405,194. ELECTRO-MAGNETIC TRANSMITTER. JOHN T. WILLIAMS, Mount Vernon, assignor to the International Portelectric Company, New York, N. Y. Filed Dec. 27, 1888. Serial No. 294,761. (No model.)

Claim.—1. The combination of a helix, a magnet arranged lengthwise with said helix and constructed to close the circuit through said helix, and a magnetic carriage constructed to pass through said helix and to actuate said magnet, substantially as shown and described.

2. The combination of a helix, a pivoted magnet arranged lengthwise with said helix and having one of its arms weighted, and a magnetic carriage constructed to pass through said helix and to actuate said magnet to close the circuit, substantially as shown and described.

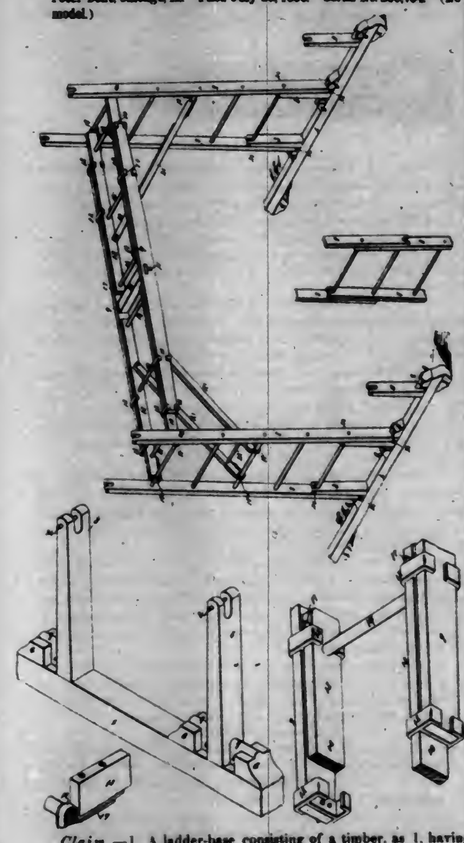
3. The combination, with a series of helices and a track, of a carriage, a circuit-closer for each helix, a supplementary circuit-closer, and a shunt-circuit, in connection with the primary circuit-closer, operating the supplementary circuit-closer, substantially as shown and described.

4. The combination, with a series of helices and a track, of a carriage, a magnetic circuit-closer for each helix actuated by the magnetic influence of the carriage, and a supplementary circuit-closer containing an electro-magnet which is vitalized by the closing of the shunt-circuit, substantially as shown and described.

5. The combination, with a series of helices and a track, of a magnetic carriage, pivoted magnets arranged lengthwise with the helices and actuated by the carriage to close the circuit, an electro-magnet, a supplementary circuit-closer, and a shunt-circuit passing through the bobbins of the electro-magnet, substantially as shown and described.

6. The combination, with the helices and the track, of contact-pieces *c*, having the carbon contacts *c'*, and the swinging magnets D, having contacts *p*, of metal—such as platinum—to make and break the circuit, substantially as described.

7. The combination, with the helices and a track, of a primary circuit-closer, a shunt-circuit, and a secondary or supplemental circuit-closer for the helices, substantially as described.



8. The combination, with a helix and a track extending through the same, of a bracket having one part attached to the end of the helix and another part attached to the track, substantially as described.

9. The combination, with a helix and a track extending through said helix, of a bracket attached to the helix and having a slotted portion for the passage of a bolt into the track, substantially as described.

10. The combination, with a helix and a track extending through said helix, of a fastening device for attaching the track to the helix, said device being provided with means for attaching a wire from the helix thereto, substantially as described.

11. The combination, with the helix, the stationary contact I, an electro-magnet, and its armature, of the lever H, having its longer arm provided with a contact and its shorter arm connected with the armature, substantially as described.

405,195. SCAFFOLD. HOBART AYERS, St. Louis, Mo., assignor to Peter Bent, Chicago, Ill. Filed July 23, 1888. Serial No. 280,754. (No model.)

Claim.—1. A ladder-base consisting of a timber, as 1, having notched uprights extending therefrom, and a ladder resting upon said timber, the rung of which is adapted to engage the notches in the uprights.

2. A ladder-base consisting of a timber, as 1, having notched uprights, as 3, 4, and 5, extending therefrom along its length, and a ladder resting upon said timber, the rung of which is adapted to engage the notches in two of the adjacent uprights.

3. The combination of a timber 1, notched uprights 3 4 5, extending therefrom, and blocks 6, having central portions 7 abutting against said uprights in the manner described, and a ladder having the ends of the side rails notched.

4. The combination, to form a scaffolding, of two timbers, as 1 1, notched uprights 3, 4, and 5, extending from each of said timbers, ladders resting upon said timbers, the rungs of which engage the notches in two adjacent uprights on each timber, and a platform between said ladders.

5. The combination, to form a scaffolding, of ladder-bases, as 1 1, each having notched uprights 3, 4, and 5 extending therefrom, ladders resting upon said bases, the rungs of which engage the notches in two adjacent uprights on each ladder-base, and an extensible platform between said ladders, for the purpose described.

6. A ladder-base consisting of a timber, as 1, uprights extending therefrom, and blocks 6, having central portions 7 abutting against said uprights in the manner described, and a ladder having the ends of its side rails notched and adapted to engage the central portions 7 of the blocks 6, as described.

7. The combination of a ladder-base, as 1, the uprights 3 4 5, extending therefrom, having blocks 6, with cut-away portions 7 abutting against said uprights, a ladder having notches in its side rails adapted to engage the uprights 3 4 or 4 5, as the case may be, and an extensible platform adjustably secured to said ladder and to a similar structure at the other side thereof.

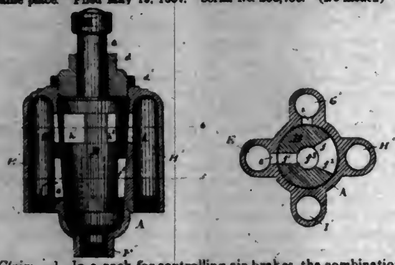
8. An extensible platform for ladder-scaffolding, consisting of a fixed section 9, joined together by cross-piece 10, a sliding section at each side of said cross-piece 10, struts extending from said movable sections, and hooks secured to each of said struts and to each rail of the movable sections, adapted to engage the rungs of ladders at each side thereof.

9. The combination, as hereinbefore described, to form a ladder-scaffolding, of a base 1, having uprights 3, 4, and 5 notched at their upper ends, blocks 6, having cut-away portions 7 abutting against said uprights and arranged in the manner described, a ladder 8, having notches and adapted to be secured to said uprights, as described, a similar structure arranged at some distance therefrom, and an extensible platform between the two, consisting of a fixed section 9, having therein two sliding sections 13, adapted to be hooked to the rungs of said ladders, and struts 21, pivoted to said sliding sections, and also adapted to be hooked to the rungs of said ladders, in the manner described.

10. The combination, with a ladder-support, of an extensible platform consisting of a fixed section 9, two or more double T-irons secured to said fixed section in the manner described, two sliding sections, the rails of which are embraced by said T-irons, struts pivoted to the rails of said movable section, and hooks secured to the rails of said sliding sections, adapted to embrace the rungs of the ladder, and a slide or lock to secure said hooks to the rungs of said ladders, as and for the purpose described.

11. The combination of the ladder-base 1, notched uprights 3 4 5, extending therefrom, blocks 6, having cut-away portions 7 abutting against said uprights and arranged in the manner described, a ladder 8, having notches and secured to said uprights, as set forth, a similar structure suitably arranged with reference to the former, and an adjustable platform between the two, consisting of the fixed section 9, joined together by the cross-piece 10, the double T-irons 12 12, fastened to the rails of said fixed section, sections 13, sliding in said double T-irons in the manner described, struts 21, pivoted to the rails of said movable sections, and hooks 18, secured to the rails of said movable sections and to the struts, adapted to embrace the rungs of the ladders and having a slide 19, for locking said hooks to the ladders, substantially as and for the purpose described.

405,196. GALVANIC BATTERY. JOHN A. BARRETT, Brooklyn, N. Y., assignor to the John A. Barrett Battery Company, Baltimore, Md. Filed Apr. 5, 1889. Serial No. 306,109. (No model.)

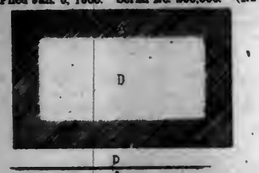


Claim.—1. In a chloride-of-silver battery, substantially such as described, a solution of sulphate of zinc.

2. The electric battery comprising a containing-vessel, electrodes.

respectively, of chloride of silver and metallic zinc, and a solution of zinc sulphate.

3. In a chloride-of-silver battery, zinc and silver elements formed in thin sheets rolled in a close spiral with interposed sheets of textile fabric impregnated with sulphate of zinc in a dry state.



405,197. ENGINEER'S COCK FOR AIR-BRAKES. GEORGE A. BOYDEN, Baltimore, Md., assignor to The Boyden Power Brake Company, same place. Filed May 19, 1887. Serial No. 238,738. (No model.)

Claim.—1. In a cock for controlling air-brakes, the combination, with the barrel A, having a central valve-seat, of a series of vertical passages E' G' H' I', at equal distances around the seat, and ports g, e, i, and k, and the plug-valve B, having side ports k', k^2, and f^3, and a central port f^3, connecting with the port F', leading from the central seat of the valve, substantially as and for the purposes specified.

2. The combination, with the valve-barrel having a central seat, side passages, and connecting-ports, and the plug-valve having corresponding ports arranged as described, of the spring-lever C, attached to the plug-spindle a, adapted to engage the stop-notches c to c^3 on the barrel, whereby the respective ports of the plug and barrel are retained in proper position when the valve is shifted, substantially as specified.

405,198. DIAPHRAGM TO BE USED IN STENCIL-PRINTING. Melos J. D. CARTER, New York, N. Y., assignor to Augustus D. Klaber, same place. Filed Jan. 6, 1888. Serial No. 260,006. (No model.)

Claim.—The combination, with a printing-stencil, of a porous diaphragm having a portion thereof coated with an impermeable substance, substantially as described, and for the purposes set forth.

405,199. WELL-SINKING APPARATUS. THOMAS G. CHAPMAN, Chicago, Ill., assignor to Frederick C. Austin, same place. Filed Apr. 9, 1888. Serial No. 270,119. (No model.)

Claim.—1. In a well-boring device, the strainer-tube having its bore permanently divided into a couple of passages which are within the circumference of the cylindric tube, one of said passages being adapted to direct a downflowing stream of water to a drilling-tool and the other being adapted to constitute the main strainer-passage for an upflowing current of well-water, substantially as set forth.

2. In a well-boring device, the strainer-tube having its bore permanently divided into a plurality of passages which are within the circumference of the cylindric tube, one or more of said passages being adapted to constitute the main strainer passage or passages for an upflowing current or currents of well-water, and the other passage or passages being adapted to direct a dowuflowing current or currents of water to a drilling-tool, substantially as set forth.

3. The combination, substantially as hereinbefore set forth, with a suitable drilling-tool, of the strainer-tube having its bore divided longitudinally by a web or partition, so as to provide the passage through which water is supplied to the drill and the main strainer-passage for the well-water.

4. The combination, substantially as hereinbefore set forth, with a suitable drilling-tool, of the strainer-tube contracted at its lower end and having its bore divided longitudinally to provide a main strainer-passage for the well-water and a passage a', through which water may be supplied to the drill.

5. The combination, substantially as hereinbefore set forth, with the strainer-tube having its bore divided longitudinally into a strainer-passage for the well-water and one or more passages through which water can be supplied to the drill, said passages being arranged within the circumference of the cylindric tube, of a stopper adapted to temporarily close the main strainer-passage, for the purpose set forth.

6. The combination, substantially as hereinbefore set forth, with the strainer-tube containing within its cylindric bore a main strainer-passage for the well-water and one or more passages for conducting water to the drill, of one or more stoppers detachably held in place above the upper entrances to the passage or passages through which water is to be conducted to the drill, for the purpose described.

7. The combination, substantially as hereinbefore set forth, with the strainer-tube containing within its cylindric bore two or more passages, for the purpose described, of the stoppers D and E, adapted for application, substantially as and for the purpose set forth.

8. The combination, substantially as hereinbefore set forth, with a suitable drill, of the strainer-tube containing the main strainer-passage for the well-water and a separate passage adapted for conducting water to the drill and having its discharge end portion divided to provide it with separate outlets, for the purpose described.

405,200. WELL-SINKING APPARATUS. THOMAS G. CHAPMAN, Chicago, Ill., assignor to Frederick C. Austin, same place. Filed Apr. 9, 1888. Serial No. 270,120. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with the strainer-tube, of a smaller tube arranged within and at its lower end, permanently and rigidly secured to the strainer-tube as a part thereof, and adapted for conducting a supply of water to a drilling-tool below the strainer-tube, and a removable stopper arranged to close the space between said smaller tube and the inner wall of the strainer-tube at a point adjacent to the upper end of the smaller tube, for the purpose described.

2. The strainer-tube provided with an internally and centrally arranged smaller tube detached from the strainer-tube, except at its lowest end, and adapted for conducting a supply of water to a drill below the strainer-tube, substantially as set forth.

3. The combination, substantially as hereinbefore set forth, with the strainer-tube having a contracted lower end portion, of the smaller tube C, arranged within and separated from the inner wall of the strainer-tube, except at its lower end, which said end of said smaller tube opens at the contracted portion of the strainer-tube, for the purpose described.

4. The combination, substantially as hereinbefore set forth, with the strainer-tube, of a smaller tube arranged within and separated from the strainer-tube, and a stopper temporarily suspended within the strainer-tube at a point over the upper end of the said smaller tube, for the purpose described.

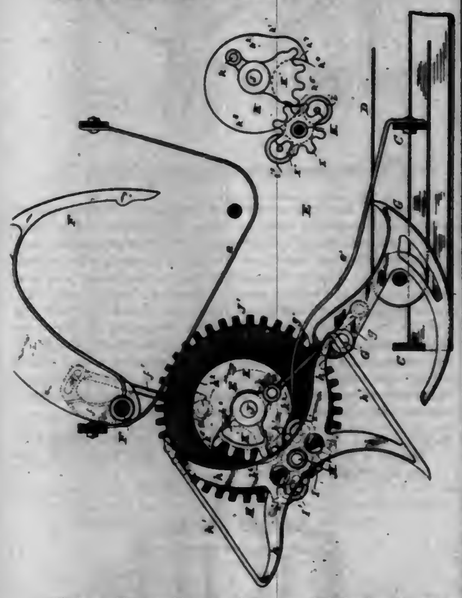
5. The combination, substantially as hereinbefore set forth, with the strainer-tube, of an inclosed smaller tube arranged centrally within the strainer-tube, for the purpose described, a stopper temporarily suspended over the upper end of said smaller tube, and a stopper E, adapted to fit within the space between the smaller tube and the inner wall of the strainer-tube.

6. The combination, substantially as hereinbefore described, with the strainer-tube and the smaller tube arranged centrally therein, for the purpose described, of the stopper D, temporarily held over the upper end of the smaller tube by one or more strips d.

405,201. PROCESS OF TREATING ASBESTUS. ROSEVAL E. CHURCH, London, assignor to John Devrance & Co., Lambeth, England. Filed Apr. 1, 1889. Serial No. 305,541. (No specimens.) Patented in England Oct. 23, 1888, No. 15,236.

Claim.—1. The herein-described process of treating asbestus, which consists in mixing broken asbestus with a solution of rubber and naphtha, the particles of which are mechanically distended by water which has been forced thereinto, substantially as specified.

2. The herein-described process of treating asbestus, which consists in first mixing the broken asbestus with a solution of rubber and naphtha which has been mechanically distended by globules of water, then removing the water by pressure, and then forming the mass into the desired shape by heat and pressure, substantially as specified.

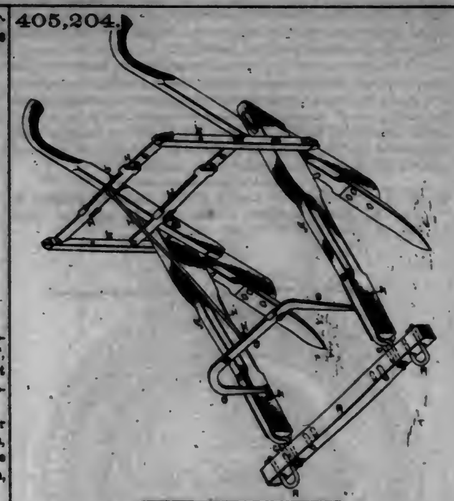


405,202. ROLLER FOR SLIDING DOORS. NORMAN CLARK, Sterling, Ill., assignor to John H. Lawrence and Edwin F. Lawrence, same place. Filed Mar. 19, 1889. Serial No. 303,893. (No model.)

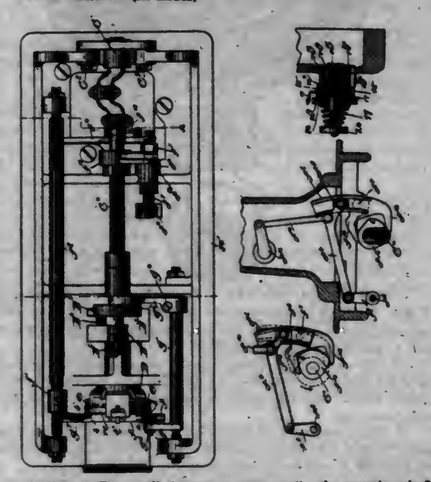
Claim.—1. The combination of the plates A A, provided, respectively, with concavities C and convexities D and the fastenings F, whereby said plates form mutual braces from their point of contact outward and inward, substantially as shown, and for the purpose described.

2. The combination of the plates A, mutually attached at two or more points intermediate their bearing-centers and their peripheries, and the axle E, provided with peripheral enlargements between the bearing-surfaces of said plates on said axle, substantially as shown, and for the purpose described.

405,203. GRAIN-BINDER. JOHN S. DAVIS, Cleveland, Ohio, assignor to the Davis Platform Binder Company, same place. Filed Oct. 19, 1887. Serial No. 252,796. (No model.)



Claim.—The combination of the cam-disk having its surface notched or cut away, as shown, and the rack coincident with the notch in the cam, with the retainer-arm shaft, the pinion I, and the arm I' and its anti-friction rollers, both of which lie in close proximity to the periphery of the disk to insure the proper engagement of the rack and pinion, substantially as hereinbefore set forth.



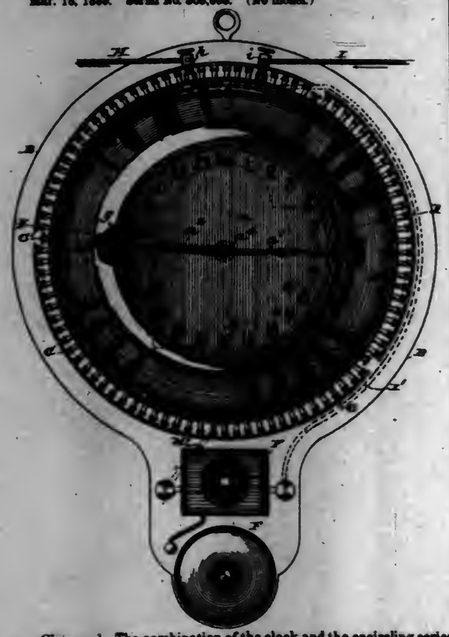
405,204. CULTIVATOR. MARTIN V. DE WITT, Paris, Tex. Filed Feb. 13, 1889. Serial No. 299,772. (No model.)

Claim.—The combination of the two cultivators, a draft-bar to which both of the cultivators are attached, a connecting-rod H, placed between the front ends of the beams, standards secured to the rear ends of the beams, connecting-rods for connecting the upper ends of the standards together, and a connecting-rod I, which extends parallel with the beams and connects the cross-bars together, substantially as shown and described.

405,204.

405,205. SEWING-MACHINE. WILBUR F. DIAL, AURELIUS STEWARD, and GEORGE H. DIMOCK, Bridgeport, Conn., assignors to The Wheeler & Wilson Manufacturing Company, same place. Filed Mar. 9, 1887. Serial No. 230,170. (No model.)

Claim.—1. The needle-bar to carry a needle, the rotating shaft B, provided with quartering-cranks, the rotating shaft C^x located below the bed-plate parallel to the shaft B, an adjustable bearing to enable the centers of the said shafts to be varied with relation to each other, and two connecting-rods embracing the wrists of the said cranks, whereby the shaft B imparts rotation to the shaft C^x, combined with a rotating loop-taker, a short shaft B^x, and means, substantially as described, to rotate the shaft B^x from the shaft C^x, but at a different speed, as and for the purposes set forth.



2. The feed-bar, the rock-shaft f^7, to move it forward and backward positively, and the rotating shaft C^x and its attached cam f^{16}, combined with the rock-shaft f^7, having the segmental arm f^{15} and the forked arm provided with toes to embrace the said cam, and with the arm f^{13} and radius-bar f^{14} and stud to engage the said segmental arm, the center of rotation of the said rock-shaft and the shaft C^x being in different planes, whereby the said cam is enabled to move the rock-shaft f^7 at a speed faster while the feed-bar is moving the material forward than when the said feed-bar is moving backward under the said material, substantially as described.

3. The feed-bar, the rock-shaft f^7, having an arm to support the free end of the feed-bar, and the forked arm f^9, having a slotted hub, and clamping-screw f^{10}, to clamp the said arm adjustably to the said rock-shaft, combined with the shaft C^x and cam thereon to raise the

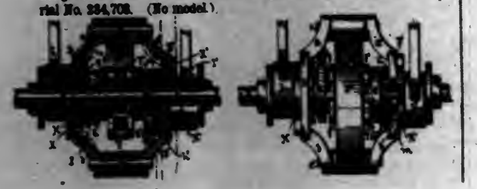
said feed-bar, the adjustment of the arm g^3 on the rock-shaft g' enabling the feed-points of the feed-bar to be raised more or less above the throat-plate, substantially as described.

4. The bed-plate, the face-plate, the stud n^{19}, the presser-foot, the presser-bar, the slack-thread-controlling spring, and the pin or projection 26, made movable vertically with the presser-bar, combined with the notch-gear n^{21}, the segmental gear n^{20} engaged by it, the arm n^{16}, and stop for the controlling-spring, the position of the said stop being changed by the position of the presser-foot resting upon the stock under it and the take-up, substantially as described.

405,206. ELECTRIC ALARM-CLOCK. BENJAMIN DOMINICI, St. Louis, Mo., assignor of one-half to Charles P. Budd, same place. Filed Mar. 18, 1889. Serial No. 303,662. (No model.)

Claim.—1. The combination of the clock and the encircling series of pins, said clock having an arm rotating with its hour-hand shaft, and said pins being adjustable into and out of the path of said rotating arm, as and for the purpose described.

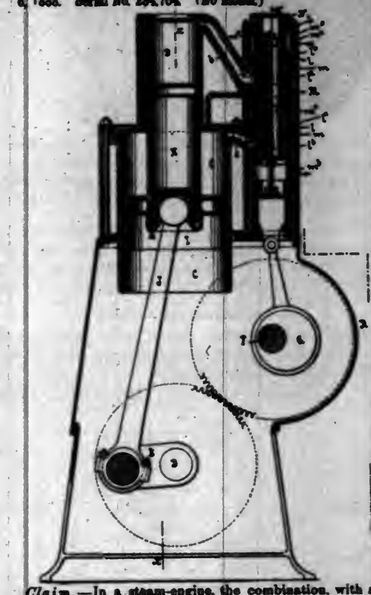
2. The combination of the clock, the arm rotating with its hour-hand, the frame, and the series of adjustable pins, said series being in a plane parallel with the clock-face, substantially as and for the purpose described.



3. The combination of the clock, the arm rotating with its hour-hand, the frame, the series of adjustable pins, the wires, and the alarm, substantially as and for the purpose described.

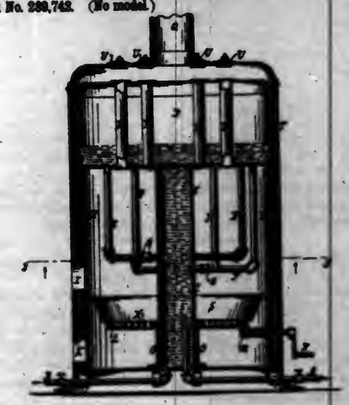
4. The combination of the frame, the pin C, the pin-bearings, and the spring, said spring bearing upon said pin and also against said frame, substantially as described, and for the purpose set forth.

5. The combination of the clock having its graduation with the frame having its graduation, and the series of pins, substantially as and for the purpose described.



6. The combination of the clock having its graduation, the encircling frame having its graduation, the series of adjustable pins, the arm moving with the shaft a^4, and the electric alarm, substantially as described.

405,207. VALVE-GEAR. FREDERICK A. GARDNER, Catskill, N. Y., assignor to F. A. Gardner & Co., same place. Filed Sept. 6, 1888. Serial No. 284,703. (No model.)



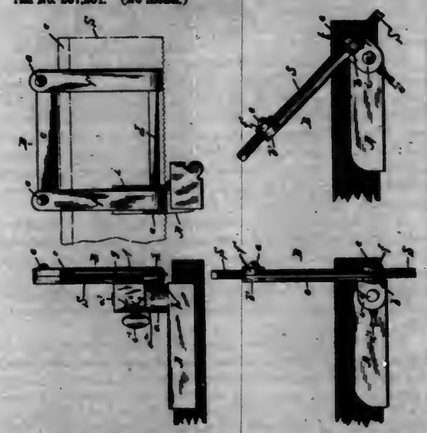
Claim.—The combination, with the shaft A, of two disks B B', pins $c c'$, mounted in said disks, weights D D', mounted on said pins, a transmitting-sleeve E', situated on the inside of the disk B' and connected to the weights by pins $i i'$, an eccentric disk g', formed on the transmitting-sleeve, a ring or strap N', fitted on this eccentric disk, the hollow eccentric H', connected to the disk B' by the pivot l', and the pin l', connecting the ring N' with the hollow eccentric H', substantially as described.

405,208. COMPOUND STEAM-ENGINE. FREDERICK A. GARDNER, Catskill, N. Y., assignor to F. A. Gardner & Co., same place. Filed Sept. 6, 1888. Serial No. 284,704. (No model.)

Claim.—In a steam-engine, the combination, with a series of primary and secondary steam-cylinders, their pistons, and a valve-chamber for each pair of cylinders, said valve-chamber provided with two ports leading one into the primary and the other into the secondary cylinder, of a casing surrounding each valve-chamber and provided with inlet and exhaust ports, a live-steam chamber and a storage-steam chamber formed in each of said casings and communicating with the inclosed valve-chamber, channels connecting the live-steam chambers and the storage-steam chambers of the several valve-chamber casings, and a valve located in the valve-chamber of each pair of primary and secondary cylinders for controlling communication between said cylinders and the live-steam chamber, storage-steam chamber, and exhaust-port, substantially as described.

405,209. STEAM-BOILER. FREDERICK A. GARDNER, Catskill, N. Y., assignor to F. A. Gardner & Co., same place. Filed Nov. 1, 1888. Serial No. 289,742. (No model.)

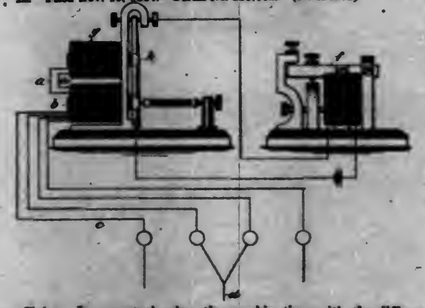
Claim.—1. In a steam-boiler, the combination, with a stand-pipe C, having a feed-pipe entering its lower end, of the drum D, arranged above and having the stand-pipe entering its bottom, the circulating-pipes of elbow shape, leading from the stand-pipe to said drum, and the flues P traversing said drum, substantially as described.



2. In a steam-boiler, the drum D, the stand-pipe entering its bottom, the elbow-shaped circulating-pipes E F, leading from the stand-pipe to the drum, and the flues P traversing the latter, substantially as described.

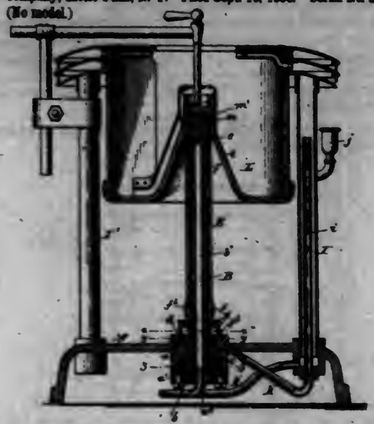
3. A steam-boiler composed of the shell T, the drum D, arranged above the stand-pipe C, the upper end of which communicates with the drum, the circulating-pipes leading from the stand-pipe into the drum, the fire-place H, the fire-flues P, extending through the drum D, and smoke-stack Q, leading from shell T, substantially as described.

4. The combination, with the shell T, the drum D, and the stand-pipe C, of the grate H, provided with a sleeve which fits the stand-pipe, the fuel-magazine S, and means, substantially as described, for imparting to the grate a revolving motion.



5. A steam-boiler composed of the drum D, arranged above the stand-pipe C, the upper end of which enters the drum D, the circulating-pipes leading from the stand-pipe into the drum, the fire-place H, the fire-flues P, extending through the drum D, the shell T, having hand-holes for the flues, and smoke-stack Q, leading from the shell T, substantially as described.

405,210. SAW-GUIDE. ALFRED GOULDING, Worcester, Mass., assignor of one-half to George C. Taft, same place. Filed Oct. 4, 1888. Serial No. 287,201. (No model.)



Claim.—In a saw-guide, the combination of a bed-plate having a depending flange with a lug and pin at one end, on which the saw-supporting frame is hinged, said supporting-frame consisting of the plates $b\ b'$ and plates $f\ f'$, the plate b provided with a hub adapted to turn on the pin a', the lug and hub provided, one with angle-marks and the other with a pointer to register with the angle-marks, and secured by a thumb-screw in the position desired, substantially as shown and described, and for the purpose set forth.

405,211. QUADRUPLEX TELEGRAPHY. CHARLES D. HASKINS, Brooklyn, N. Y., assignor to the Western Electric Company, Chicago, Ill. Filed Nov. 19, 1887. Serial No. 255,602. (No model.)

Claim.—In a neutral relay, the combination, with the differentially-wound electro-magnet, of an extra coil upon said electro-magnet and an extra electro-magnet included in circuit with said extra coil, said differentially-wound electro-magnet and said extra electro-magnet each being provided with a separate armature and said armatures being mounted upon the same lever, whereby currents induced in the extra coil energize the electro-magnet included in its circuit to prevent the armature of the said relay from falling away or kicking.

405,212. MEANS FOR LUBRICATING CENTRIFUGAL SEPARATORS. FREDERICK HANT, Poughkeepsie, assignor to D. H. Burrell & Company, Little Falls, N. Y. Filed Sept. 10, 1888. Serial No. 284,978. (No model.)

Claim.—1. The combination, with the drum, of a supporting-standard provided with an ascending oil-duct, a hollow spindle surrounding the standard, and an elevated oil-reservoir connected with the lower end of the oil-duct of the standard, substantially as set forth.

2. The combination, with the drum, of a supporting-standard provided with an ascending oil-duct, a hollow spindle surrounding the standard, a base provided with an oil-receiver below the lower end of the spindle, an elevated oil-reservoir, and pipes connecting said reservoir with the oil-duct of the standard and with the oil-receiver below the spindle, substantially as set forth.

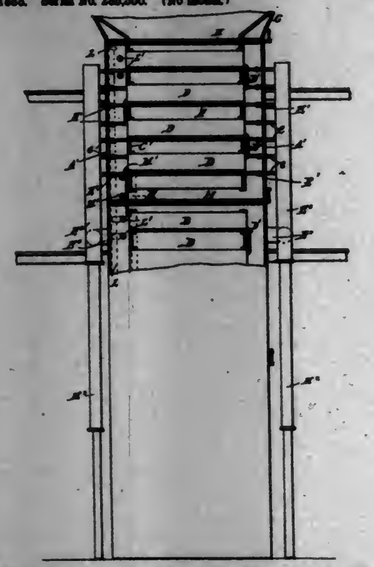
3. The combination, with the base provided with an oil-receiver g, of a hollow supporting-standard B, a hollow spindle E, surrounding said standard, a hollow post I, provided with an upright oil-pipe i, arranged within the post, a pipe k, connecting the receiver g with the lower end of the pipe i, and a pipe k', connecting the lower end of the cavity of the post with the lower end of the hollow standard, substantially as set forth.

4. The combination, with the base provided with an oil-receiver g, of a standard B, provided with an oil-duct, a hollow spindle E, surrounding said standard and provided with an outwardly-projecting flange within the receiver g, an elevated oil-reservoir, and oil-circulating pipes connecting the oil-reservoir with the receiver g and the oil-duct of the standard, substantially as set forth.

5. The combination, with the drum, of a supporting-standard provided with an oil-duct, a hollow spindle surrounding the standard, a base provided with an oil-receiver below the lower end of the spindle and with a receptacle for the surplus oil above said oil-receiver, an elevated oil-reservoir, and circulating-pipes connecting the oil-reservoir with the oil-receiver and the oil-duct of the standard, substantially as set forth

6. The combination, with the drum, of a base provided with an annular oil-receiver g, a standard E, provided with an oil-duct, a hollow spindle surrounding the standard, an elevated oil-reservoir, circulating-pipes connecting said reservoir with the oil-duct of the standard and with the oil-receiver, and an annular receptacle H for the surplus oil, secured to the base above the oil-receiver g, substantially as set forth.

405,218. SECONDARY BATTERY. THOMAS H. HICKS, Detroit, Mich., assignor to the Hicks Induction-Light and Motor Company, of Michigan. Filed Aug. 2, 1888. Serial No. 281,770. (No model.)



Claim.—1. A storage-battery comprising a containing-vessel, a

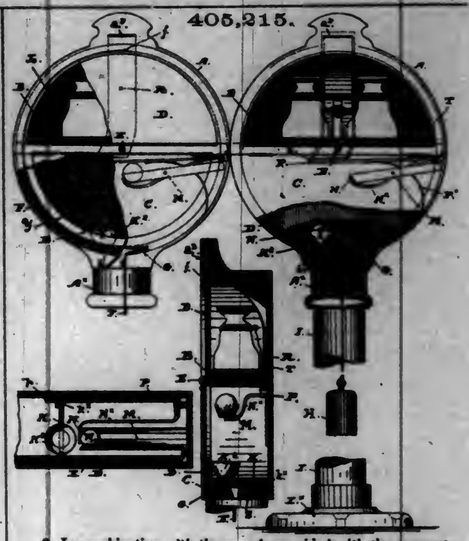
series of perforate carbon electrodes in said vessel, and a series of lead electrodes, each consisting of a mass of spongy lead inclosed on one side by a perforate, on the other side by an imperforate, wall, the imperforate wall being placed against one side of a carbon element and the perforate wall opposing the other side of the next carbon element, and a suitable conducting-liquid.

2. A storage-battery consisting of two dissimilar bodies, one consisting of a perforate and an imperforate lead plate inclosing a body of spongy lead between them, and the other consisting of carbon or its described equivalents, substantially as described.

3. A storage-battery comprising a series of like cells arranged in a common vessel, each cell consisting of a lead and carbon element, a conducting-liquid consisting of a mixture of dilute sulphuric acid and sal-ammoniac, said cells being separated from each other by a water-tight packing applied to the edges of one of the elements, substantially as described.

405,214. GRAIN-DRIER. JAMES HILL, Newark, N. J. Filed Aug. 21, 1888. Serial No. 283,350. (No model.)

Claim.—1. The combination, in a grain-drier, of a series of heating-cells extending across a closed drying-chamber and arranged in horizontal rows, a perforated pipe arranged under each heating-cell, and a main exhaust-pipe arranged outside of the drying-chamber and connected to each of the perforated pipes, substantially as described.



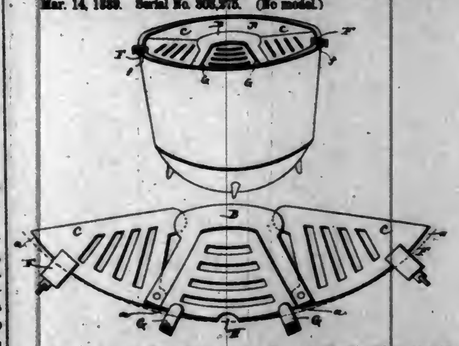
2. The combination, in a grain-drier, of a series of heating-cells extending across a closed drying-chamber and arranged in horizontal rows, the cells of alternate rows being arranged in different vertical planes, a perforated pipe arranged below each cell, a main exhaust-pipe arranged outside of the drying-chamber, and pipes leading from each of the perforated pipes to the exhaust-pipe, substantially as herein shown and described.

3. In a grain-drier, the combination, with a drying-chamber, of a series of heating-cells arranged in horizontal rows across the drying-chamber, each cell being of triangular shape in cross-section, with rounded under sides, and the cells of alternate rows being in different vertical planes and connected together, a perforated pipe arranged below each cell, a main exhaust-pipe outside of the drying-chamber, and pipes connecting each of the perforated pipes with the exhaust-pipe, substantially as herein shown and described.

405,215. COIN-ACTUATED RECEPTACLE. EDWARD C. JONES, San Francisco, Cal., assignor of one-half to William J. Gleason, same place. Filed Mar. 15, 1888. Serial No. 268,468. (No model.)

Claim.—1. The combination of a suitable case having the compartments X Y, the revolving shutter-disk composed of a solid portion, and an aperture in the part that is on the opposite side of the pivot to said solid portion of suitable size to afford access to the compartment X when brought in line therewith, the cord and weight as a means of turning said disk on its pivot to bring said aperture into position, a locking-lever arranged to hold the disk against the action of the weight, and mechanism adapted to be actuated by the weight of a coin of given denomination to move said locking-lever and release the shutter-disk, substantially as described.

405,215.



2. In combination with the case A, provided with the compartments X Y, the pivoted shutter-disk having an aperture of semicircular shape on one side of its pivot to correspond with the compartment X and afford access thereto, and a solid portion to close the front of said compartment when turned across such portion of the case, the weight and cord G H, locking-lever K, adapted to engage and hold the shutter-disk, the coin-chute, tripping-lever, ball-trough, gate-lever, and springs P S, applied to return the lever K to position, substantially as herein described, for operation as set forth.

3. The herein-described receptacle for opera-glasses, consisting of the case A, mounted on the pedestal and containing compartment X for the glass and compartment Y for the mechanism, the coin slit and chute delivering into the lower compartment, the revolving shutter-disk D, weight and cord G H, locking-lever K, tripping-lever, ball-holding trough, gate-actuating lever, and springs, substantially as set forth.

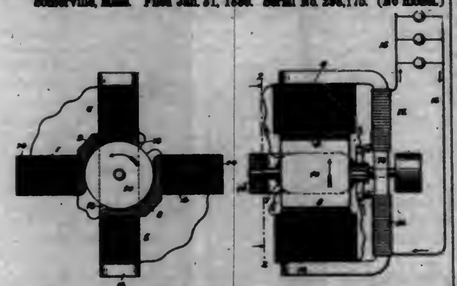
4. In combination with a suitable receptacle to receive an opera-glass for use at the chair or seat in a place of amusement and adapted to be fixed in position convenient thereto, a revolving shutter arranged to close the opening in the said receptacle, through which the glass may be removed or by its revolution to uncover said opening, the weight and cord as a means of moving said revolving shutter, a locking-lever holding said shutter closed across the opening, suitable mechanism arranged to be set in motion by the weight of a coin introduced into the receptacle, and through the action thereof to move the locking-lever and release the shutter, and a chain or cord attached to the glass and to the said receptacle, substantially as herein described, for operation as set forth.

405,216. STRAINER FOR KETTLES, &c. WILLIAM P. KENDRICK, Winfield, Iowa, assignor of one-half to H. L. Glass, same place. Filed Mar. 14, 1889. Serial No. 303,275. (No model.)

Claim.—1. An adjustable strainer for pots, kettles, &c., consisting of a series of sector-shaped sections, substantially as specified.

2. In a strainer, the combination of a central section and the side sections pivoted near their peripheries to the central section, the adjacent edges of the said sections overlapping each other, substantially as specified.

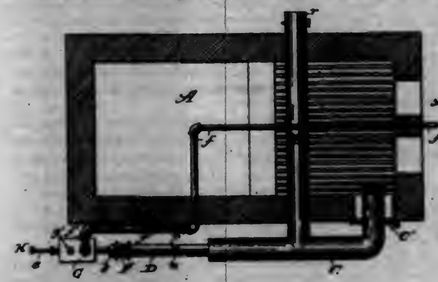
3. In a strainer, the combination of the central section provided on its under side with shoulders *b b*, and the side sections pivoted to the central section and sliding at their side edges under the adjacent side edges of the latter, substantially as specified.



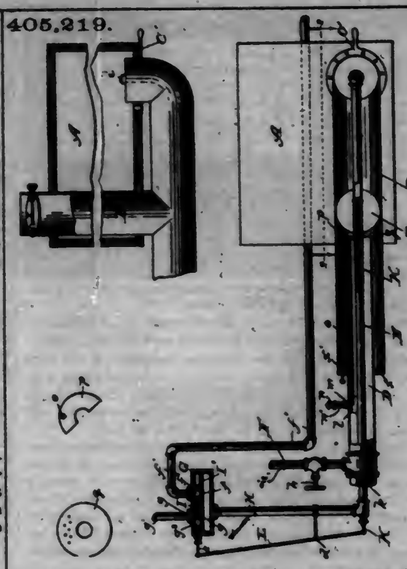
4. In a strainer, the combination of a central section provided with angular supporting-arms G G to bear on the upper edge of a vessel, and the side sections pivoted to the central section and provided with the clamps F F to fit over the edge of the vessel and engage the same, substantially as specified.

405,217. COMBINED RULER AND BLOTTER. RHODES LOCKWOOD, Boston, Mass., assignor to R. & P. C. Lockwood, same place. Filed Apr. 27, 1888. Serial No. 163,600. (No model.)

Claim.—As an improved article of manufacture, the within-described combined ruler and blotter, consisting of the thin sheet or shell of hard rubber or equivalent rigid material, having the bent ruling-edges *b b*, grooves or channels 2 2, the longitudinal depression *a* between the ruling-edges forming a trough for the travel of the user's fingers, and the blotting-paper *c*, substantially as set forth.



405,218. DYNAMO-ELECTRIC MACHINE. OSCAR P. LOOMIS, Somerville, Mass. Filed Jan. 31, 1889. Serial No. 298,175. (No model.)



Claim.—1. A dynamo-electric machine consisting of two sets of shunt-magnets diametrically opposite, like poles being connected to a common pole-piece and having the outer ends of the opposite magnets of each set connected together by yokes, and series coils wound upon said yoke or yokes so as to generate a counterbalancing field of force and prevent the polar line from shifting.

2. The combination, in a dynamo-electric machine, of two sets of oppositely-arranged shunt-magnets 4 5 and 6 7, joined, respectively, to common pole-pieces 8 and 9, those of each set being of equal strength, yokes 13 and 14, connecting the outer magnet ends of the magnets 5 6 and 4 7 together, respectively, and serving as bearings for the armature, and series coils 11 and 12, wound upon said yoke or yokes, substantially as set forth, so as to set up a counterbalancing field of force to prevent the shifting of the polar line.

405,219. HYDROCARBON-OIL BURNER. FRANK W. MINSHALL, Marietta, Ohio. Filed Sept. 28, 1888. Serial No. 286,643. (No model.)

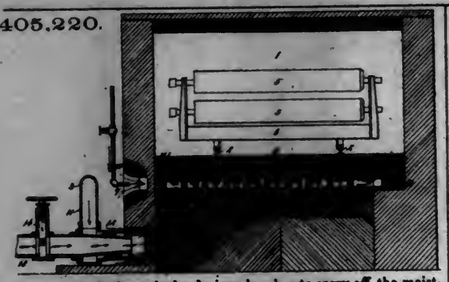
405,219.

Claim.—1. In a hydrocarbon-oil burner, the combination, with a fire-chamber, of a vaporizing-chamber C, having one end at which it leads into the fire-chamber entirely open, thereby affording an unobstructed discharge-orifice, an oil-pipe D, extending part way through the chamber C longitudinally thereof and opening into the latter, and a steam-pipe E, extending through the oil-pipe and vaporizing-chamber to near the discharge end of the latter, substantially as described.

2. In a hydrocarbon-oil burner, the combination, with a fire-chamber, of a vaporizing-chamber C, communicating with the fire-chamber, an oil-pipe D, extending part way through the chamber C longitudinally thereof and opening into the latter, a hot-air pipe B, leading into the vaporizing-chamber near the discharge end of the oil-pipe, and a steam-pipe E, extending through the oil-pipe and vaporizing-chamber to near the discharge end of the latter, substantially as described.

3. In a hydrocarbon-oil burner, the combination, with a fire-chamber, of a vaporizing-chamber C, an oil-pipe D, leading into the vaporizing-chamber and provided with perforations at its discharge end, a revoluble plate *p*, means for rotating the plate *p*, and a steam-pipe E, extending through the oil-pipe and chamber C and terminating in a jet *i* near the entrance of the fire-chamber, substantially as described.

4. In a hydrocarbon-oil burner, the combination, with a fire-chamber, of a vaporizing-chamber C, an oil-pipe D, leading into the vaporizing-chamber, a steam-pipe E, extending through the oil-pipe and chamber C, a valve I in the steam-passage, and a thermostat connected with the valve, substantially as and for the purpose set forth.



5. In a hydrocarbon-oil burner, the combination, with a fire-chamber, of a vaporizing-chamber C, an oil-pipe D, leading into the vaporizing-chamber, a steam-pipe E, extending through the oil-pipe and chamber C, a metal rod K, supported in the steam-pipe, and a valve I in the steam-passage connected with and actuated by the expansion and contraction of the rod K, substantially as and for the purpose set forth.

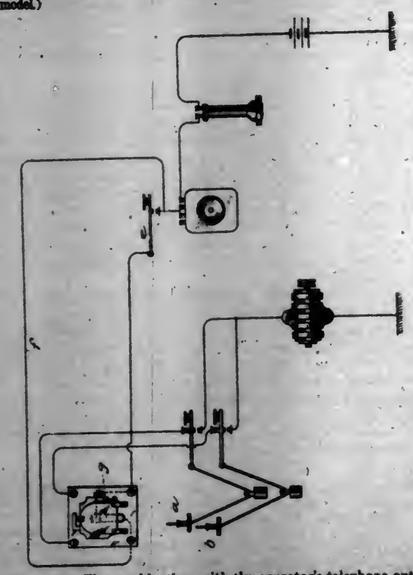
6. In a hydrocarbon-oil burner, the combination, with a fire-chamber, of a vaporizing-chamber C, communicating with the fire-chamber, an air-pipe B, leading through the fire-chamber into the vaporizing-chamber, an oil-pipe D, leading into the vaporizing-chamber, a steam-pipe E, extending through the oil-pipe and chamber C and leading into the fire-chamber, a metal rod K, supported in the steam-pipe, a steam-box G, communicating with the pipe E and provided with a valve I, connected with the rod K, a steam-pipe *f'*, passing through the fire-chamber, and a steam-pipe *f*, both steam-pipes *f'* and *f* leading into the box G, substantially as described.

405,220. DRYING-OVEN. PETER MCARTHUR, St. Louis, Mo., assignor to the Stickle, Harrison & Howard Iron Company, same place. Filed June 26, 1888. Serial No. 278,219. (No model.)

Claim.—1. In an oven for drying corn, &c., the combination of a drying-chamber, a combustion-chamber located beneath the drying-chamber with a communication between them, air and gas pipe discharging into the combustion-chamber, and a force-pipe which creates

405,220.

an upward draft through the drying-chamber to carry off the moisture from the cores, substantially as set forth.



2. In an oven for drying cores, &c., the combination of the drying-chamber, combustion-chamber located beneath the drying-chamber, perforated arch between the chambers, combined air and force pipe arranged within the drying-chamber around the perforated arch, and a gas-pipe having an injector at one end to force a flame into the combustion-chamber, said air and steam pipe having connection with said injector, substantially as and for the purpose set forth.

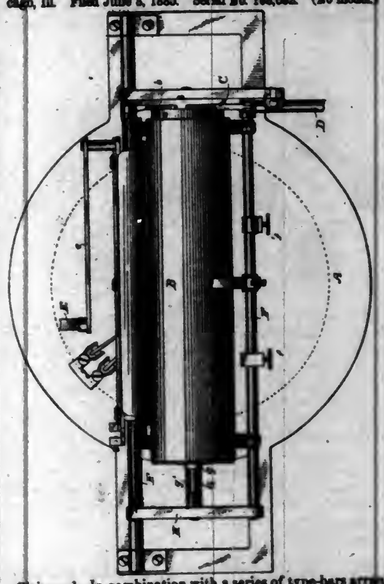
3. In a drying-oven, the combination of the drying-chamber, combustion-chamber arranged beneath the drying-chamber, perforated arch between the chambers, combined air and steam pipe having a flaring end 9 and arranged at the bottom of the drying-chamber, steam-pipe 10, arranged in the mouth of the combined air and steam pipe, extension 11 on the combined air and steam pipe, injector 12, and gas-pipe 13, provided with a regulating-valve, all substantially as and for the purpose set forth.

4. In a drying-oven for cores, &c., the combination of the drying-chamber, perforated arch, combustion-chamber beneath the arch, combined air and steam pipe surrounding the perforated arch, injector with which the combined air and steam pipe communicates, and a gas-pipe communicating with said injector, substantially as and for the purpose set forth.

5. In a drying-oven for cores, &c., the combination of the drying-chamber, perforated arch, combustion-chamber beneath the arch, combined air and steam pipe surrounding the arch, and the apex of the arch extending up above the pipe, injector with which the combined air and steam pipe communicates, and a gas-pipe communicating with said injector, substantially as and for the purpose set forth.

405,221. TESTING APPARATUS FOR SWITCH-BOARDS. WILLIAM E. MCKINNEY, St. Paul, Minn., assignor to the Western Electric Company, Chicago, Ill. Filed Dec. 18, 1888. Serial No. 293,963. (No model.)

Claim.—1. The combination, with the operator's telephone outfit, of the key *e* in a circuit connecting with a pair of cords, the clearing-out annunciator, and the circuit-closer operated by the shutter of the drop and the branch circuit *f* around the key *e*, whereby the operator may at will connect with the pair of cords, while either of two subscribers connected through the cords may close the circuit of branch *f* at the annunciator, substantially as and for the purpose specified.



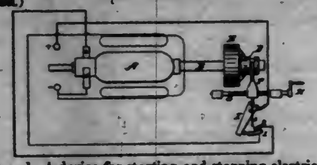
2. The combination, with the pair of cords, including a clearing-out annunciator, of a telephone-circuit, including a battery and a circuit-closer operated by said annunciator-drop to connect together the circuit containing the telephone and the pair of cords.

3. The combination, with the pair of cords, including a clearing-out annunciator, of a telephone-circuit, including a test-battery, a circuit-closer operated by said annunciator-drop to connect together the branch circuit, containing a telephone and battery, and the conductor between the plugs, substantially as and for the purpose specified.

4. The combination, with a normally-open telephone-circuit extending from the clearing-out annunciator to earth and including a battery, of a circuit-closer included in the conductor connecting a pair of plugs and a branch circuit, including a key *e*, said branch being connected with the flexible conducting-cords of said pair of plugs, substantially as and for the purpose specified.

5. The combination, with the annunciator, of a circuit-closer operated by the falling of the annunciator, a pair of cords and their terminal plugs, including the clearing-out annunciator, a telephone and battery included in a ground-circuit branched through the circuit-closer of the clearing-out annunciator, the conductor between the plugs, and the switches upon the switch-board, whereby on connecting either plug with a switch upon the switch-board the battery will be closed through the telephone to said switch, substantially as and for the purpose specified.

405,222. TYPE-WRITING MACHINE. JOSEPH G. PARKINSON, Chicago, Ill. Filed June 3, 1885. Serial No. 168,092. (No model.)

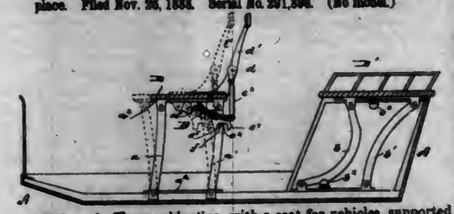


Claim.—1. In combination with a series of type-bars arranged to strike at a common point, a paper-carriage movable relatively to said point, and a feed-roll or roller-platen mounted in said carriage, the carriage being extended or elongated considerably in excess of the length of travel of the carriage, and the excess being mainly at the left-hand end of the carriage, whereby space is afforded between the initial printing-point and the end of the carriage for the blank margin of the sheet to be printed.

2. The combination, substantially as hereinbefore set forth, in a type-writer, of the feed-roll, its carriage having the side bars thereof extended a considerable distance beyond the end of the feed-roll at the left hand, the axle of the feed-roll elongated at the left hand, and the cross-bar uniting said side bars and affording a journal for the axle in such a manner as to leave an uninterrupted space for the passage of the blank margin of the sheet of paper that is being printed.

3. The combination, substantially as hereinbefore set forth, in a type-writer, of the feed-roll and traversing carriage therefor, the side bars of the carriage elongated beyond the left-hand end of the feed-roll, the axle of the feed-roll correspondingly elongated, the cross-bar uniting the side bars and having a bearing for the axle, and the sleeve interposed between the cross-bar and the feed-roll to prevent endwise movement thereof.

405,223. ELECTRIC MOTOR STARTING AND STOPPING DEVICE. FRANK A. PERRET, Brooklyn, N. Y., assignor to the Electron Manufacturing Company, of New York. Filed Feb. 6, 1889. Serial No. 298,845. (No model.)



Claim.—1. A device for starting and stopping electric motors, consisting of a movable lever or handle mechanically controlling the power-transmitting mechanism and electrically controlling the admission of current to the armature and field-magnet circuits of the motor, the arrangement being such that the movement of said lever or handle in one direction operates first to admit current to the field and armature circuits and then to gradually throw on the load, and its movement in the opposite direction operates first to throw off the load and then to open the said circuits.

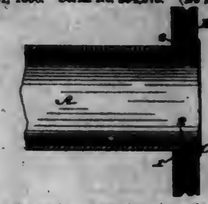
2. The combination of an electric motor, a shaft or pulley driven thereby, and an interposed power-transmitting mechanism—such as a clutch or belt-shifter—adapted to mechanically connect said motor and transmitting mechanism into operative engagement with an electric switch dependent upon the movement of said transmitting mechanism into or out of engagement and arranged to close the motor-circuits before complete engagement of the power-transmitting mechanism.

3. The combination of an electric motor, a shaft or pulley driven thereby, and a power-transmitting mechanism—such as a clutch or belt-shifter—adapted to mechanically connect said motor and transmitting mechanism into operative engagement, with an electric switch dependent upon the movement of said transmitting mechanism into or out of engagement and arranged to close first the field-circuit of the motor and then its armature-circuit before complete engagement of the power-transmitting mechanism.

4. The combination, with an electric motor and its power-transmitting mechanism—such as a shaft or pulley—of an interposed mechanical connection, means for operating said mechanical connection and for opening the motor-circuit, and an electro-magnet in the motor-circuit controlling the said mechanical connection and adapted for operation upon the passage of an abnormal current in the motor-circuit.

405,224. SHIFTING SEAT FOR VEHICLES. FRANK RISSINGER, Springfield, Ohio, assignor of one-half to Charles C. Adelsperger, same place. Filed Nov. 26, 1888. Serial No. 291,894. (No model.)

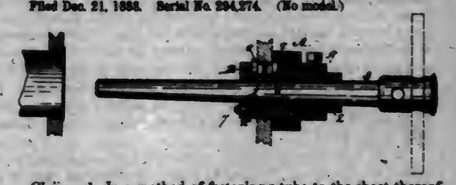
Claim.—1. The combination, with a seat for vehicles, supported on pivoted legs and adapted to fold, as described, of a pivoted locking-arm connected to one of the moving parts of said seat and a stop projection on one of the other moving parts, a hinged lazy-back on said seat, and a direct connection from the hinged portion of said lazy-back to the pivoted arm, substantially as and for the purpose set forth.



2. The combination, with a folding seat supported on pivoted legs, as described, of a locking-arm pivoted to said seat and provided with a stop projection, a lug or projection on one of the legs adapted to engage with said stop projection, a hinged lazy-back on said seat, and a connecting-arm adapted to form a direct connection between the hinged portion of said lazy-back and the pivoted locking-arm, substantially as described.

3. The combination, with a folding seat supported on pivoted legs, as described, of a pivoted locking-lever having the straight arm *e* and the laterally-curved arm *e'*, a stop projection on the said straight arm adapted to come in contact with a projection on one of the supporting-legs, a hinged lazy-back on the said seat, provided with laterally and downwardly-extending arm, which passes below the pivoted point thereof, and a connecting-rod from the said arm to the curved arm *e'* of said pivoted lever, substantially as specified.

4. The combination, with a folding seat pivoted on supporting-legs, as described, of a pivoted locking-lever connected to said seat and adapted to engage with a stop projection on one of said legs and hold the said seat against movement in one direction, a hinged lazy-back on said seat, a connecting-arm attached to the hinged portion of said lazy-back at a point removed from the pivotal center thereof and at the other end to the pivoted locking-lever, and a positive stop for said seat in the other direction, substantially as specified.



5. The combination, with a folding seat supported on pivoted legs, as described, of a locking-arm D, pivoted to said seat and provided with a projecting arm *e*, having a stop projection e^2, a curved arm *e'*, a connecting-rod e^3, a lazy-back having a hinged portion *d'*, and an extending arm d^2, said connecting-arm being connected to said arm d^2, substantially as and for the purpose set forth.

405,225. BOILER-TUBE FASTENING. HENRY SCHAUBEL, Philadelphia, Pa., assignor of one-half to Henry W. Miller, Jr., same place. Filed Dec. 21, 1888. Serial No. 294,273. (No model.)

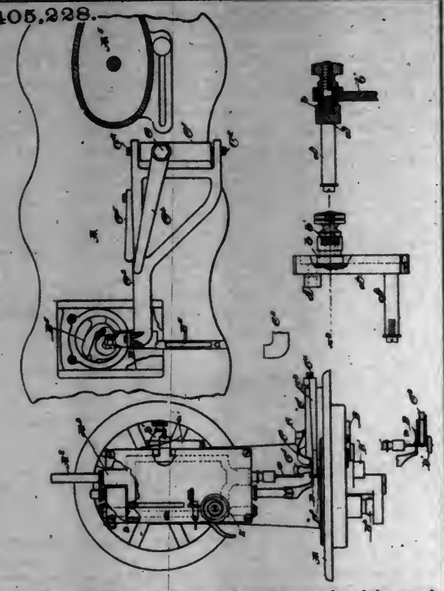
Claim.—A tube with a swaged tongue thereon, in combination with a tube-sheet, the opening whereof having in its wall a swaged groove which receives said swaged tongue, forming an improvement in tube-fastenings, as stated.

405,226. FASTENING BOILER-TUBES. HENRY SCHAUBEL, Philadelphia, Pa., assignor of one-half to Henry W. Miller, Jr., same place. Filed Dec. 21, 1888. Serial No. 294,274. (No model.)

Claim.—1. In a method of fastening a tube to the sheet thereof, the herein-described method of forming a groove in the wall of the opening of the tube-sheet, consisting in swaging said wall to form a groove for receiving the tongue on the tube, substantially as described.

2. The herein-described method of fastening a tube to the sheet thereof, consisting in swaging a groove in the wall of the opening of the tube-sheet, inserting a tube into said opening, and then swaging said tube to form an exterior tongue which enters said swaged groove in the tube-sheet, substantially as described.

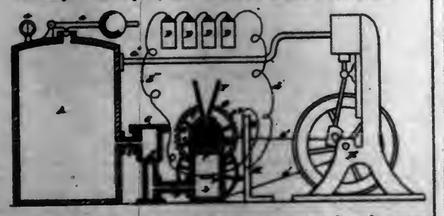
405,227. BOILER-STAY. HENRY SCHAUBEL, Philadelphia, Pa., assignor of one-half to Henry W. Miller, Jr., same place. Filed Jan. 24, 1889. Serial No. 297,376. (No model.)



Claim.—1. A boiler-stay consisting of a tube, tube-sheet, bolt, and nut, the tube having a tongue and shoulders on its periphery, and the walls of the openings of the sheet being grooved, said tongue entering the groove in the tube-sheet and said shoulders embracing opposite sides of the sheet, the parts named being combined substantially as described.

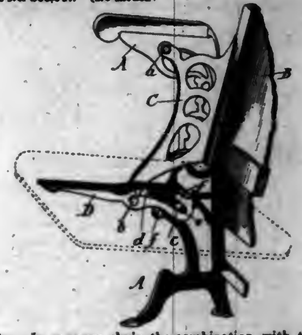
2. A boiler-stay consisting of a tube, bolt, and nut, substantially as described, the head of the bolt and the nut having grooves on their inner faces, as stated.

405,228. SEWING-MACHINE FOR SECURING STAY-CORDS AND THRUM ENDS. ALBERT SHEA, Boston, Mass., assignor to John Rosco, same place. Filed Apr. 11, 1888. Serial No. 270,338. (No model.)



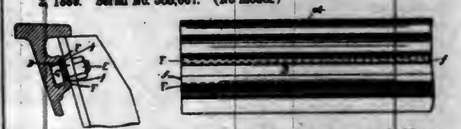
405,228.

Claim.—1. In a machine for stitching stay-cords and thrum ends, stitch-forming mechanism and feeding mechanism to produce an over-seaming-stitch, the feeding-bar having its teeth formed to move the material toward the toe of the presser-foot, combined with a presser D and thrum-gathering surfaces, and with the bar or guide C^2 interposed between the feed and presser-foot and over which the material to be stitched is bent, as described, whereby the needle at one descent is made to enter and emerge from the same side of the material at one side of the stay-cord and thrum ends, and at its next descent to enter and emerge from the same side of the material, but at the opposite side of the said stay-cord and thrum ends, to operate substantially as described.



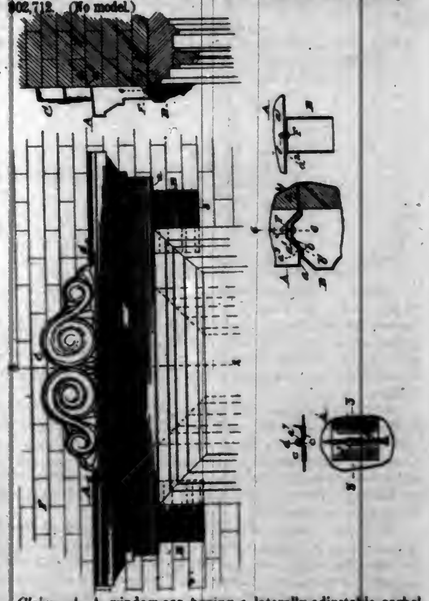
2. In a sewing-machine for securing the stay-cord and thrum ends in the stitching of button-hole pieces, the following instrumentalities, viz: an eye-pointed thread-carrying needle and complemental stitch forming and feeding mechanism to produce an overseaming-stitch as desired, means to collect the thrum ends parallel to and about the stay-cord, a guide or bar having its effective end at right angles to the direction of the feed of the material, the needle in its operation entering the material and emerging therefrom at one and the same side thereof, and at one side of the collected stay-cord and thrum ends, and at its next descent entering said material in like manner, but at the other side of the collected stay-cord and thrum ends, the combination being and operating substantially as described.

405,229. POWDER-GAS BOILER FOR ENGINES. OTTO SCHNEIDER, Louisville, Ky., and HEINRICH SCHNEIDER, Oberstein-on-the-Nahe Germany. Filed Sept. 7, 1888. Serial No. 284,833. (No model.)



Claim.—A powder-gas boiler for engines, consisting of a strong boiler provided with pressure-gage, safety-valve, and exit-pipe, in combination with a feeder or generator consisting of a strong casting with a circular cell through it, a cylinder with a recess in it fitting closely in the cell, an explosion-chamber in the casting below the cell, a valved passage-way connecting the explosion-chamber with the boiler, a funnel on the casting, a shaft or hole through the casting from the pipe of the funnel to the cell, a shaft or opening from the cell to the explosion-chamber, a wheel turning on the same axle as the cylinder and furnished with a projecting thumb to close the electric circuit, and an electric battery to explode the powder, substantially as described, and for the purpose specified.

405,230. OPERA-CHAIR. DANIEL SCHUSTER, Chicago, Ill., assignor to the A. H. Andrews & Company, same place. Filed July 23, 1888. Serial No. 280,847. (No model.)



Claim.—In an opera-chair, the combination, with the standards A, each provided with pins *c*, wings C, pivoted at *a* to the standards, and back B, secured to said wings, of the seat-arms D, each provided with a curved slot *d*, which slots extend rearwardly and downwardly and engage the pins *c*, said seat-arms being pivoted to the wings C at a point in front of the slots *d*, substantially as described.

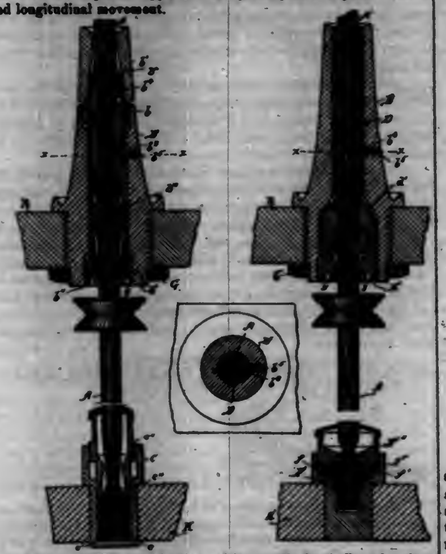
405,231. SLOT-RAIL FOR CABLE ROADS. MAX. M. SUTTER, Johnstown, Pa., assignor to the Johnson Company, of Kentucky. Filed Apr. 2, 1888. Serial No. 305,667. (No model.)

Claim.—A slot-rail provided with a channel adapted to hold bolts by means of which to secure said rail in its roadway.

405,232. WINDOW-CAP. HERBERT SYMONDS, St. Louis, Mo., assignor to Mosher & Bro., same place. Filed Mar. 9, 1889. Serial No. 302,712. (No model.)

Claim.—1. A window-cap having a laterally-adjustable corbel, for the purpose described.

2. A window-cap having the removable top portion C, substantially as and for the purpose described.



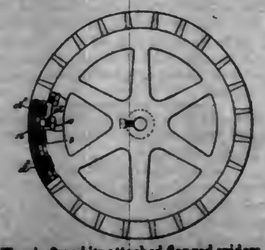
3. The cap grooved at *a'*, in combination with the corbel having the tongue and the bolt F, substantially as described.

4. The combination of the wall, the cap, the corbel, and the bolt, said corbel having the part *b'* and said cap having the part a^3, whereby the corbel as it is drawn upward is tightened against the wall, as described.

5. The combination of the cap having the eyelet, the portion C, having the perforated lug, and the key, as described.

405,233. SUPPORT FOR SPINNING-SPINDLES. ROLLIN WHITE, Lowell, assignor to William F. Draper, Hopedale, Mass. Filed Apr. 26, 1888. Serial No. 271,949. (No model.)

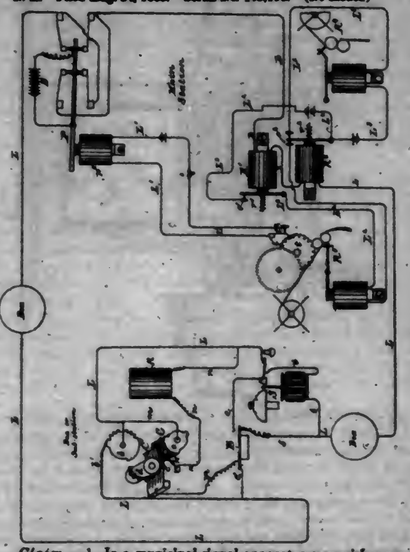
Brief.—The object of the invention is to provide an improved construction of spindle-support, whereby the spindle may have lateral and longitudinal movement.



Claim.—1. The combination, with a vertical spindle, a bearing-case, a loose lateral bearing having a tapering exterior surface, and a yielding or flexible packing interposed between the said case and bearing, of a plug having a tapering seat to act upon and more or less compress the said packing between the tapered portions of the plug and bearing, thereby more or less limiting the freedom of motion of the bearing in the said case, substantially as described.

2. A vertical spindle, a bearing-case, a loose lateral bearing therein having a tapering exterior surface, a yielding packing interposed between the said case and bearing, and means to restrain the rotation of the said lateral bearing, combined with a plug having a tapering seat to act on the said packing and compress it to limit the extent of lateral movement of the said bearing, substantially as described.

405,234. CYLINDER FOR CARDING-MACHINES, &c. GEORGE O. WHEELER, Lawrence, assignor to the Davis & Furber Machine Company, North Andover, Mass. Filed July 30, 1888. Serial No. 281,396. (No model.)



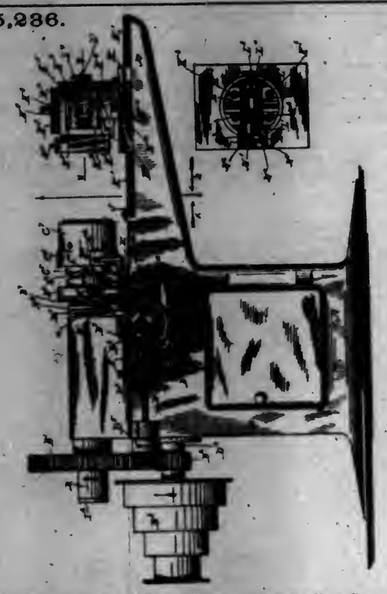
Brief.—The object of the invention is to provide a cylinder of great strength and durability and at the same time to reduce the weight thereof.

Claim.—1. The shaft and its attached flanged spiders, having projections 3 and openings 4, combined with the hollow metallic lags shaped to embrace the said projections, and having pockets, and with bolts to confine the said lags to the said flanges, substantially as described.

2. The spiders, the metallic lags having tapered or beveled sides, and means to connect the lags to the spiders, combined with wedge-shaped nail-holding strips inserted in spaces between the sides of the adjacent lags, and held therein by the said beveled sides of the lags, substantially as described.

405,235. MUNICIPAL SIGNAL APPARATUS. JOHN C. WILSON, Boston, Mass., assignor to the Municipal Signal Company, Portsmouth, N. H. Filed Aug. 24, 1885. Serial No. 175,186. (No model.)

Claim.—1. In a municipal signal apparatus comprising a main station and one or more sub-stations connected by an electric circuit, a multiple signal-transmitting apparatus and a signal-receiving instrument at the sub-station, and a signal-receiving instrument and a signal-transmitting apparatus at the main station, combined with an electro-magnet for effecting the operation of said signal-transmitting apparatus at the main station, a circuit-wheel, as *t*, for changing the condition of the circuit of said electro-magnet, and a circuit-controlling switch also included in said circuit, substantially as described.



2. In a municipal signal apparatus comprising a main station and one or more sub-stations connected by an electric circuit, a multiple signal-transmitting apparatus and a signal-receiving instrument at the sub-station, and a signal-receiving instrument and a signal-transmitting apparatus at the main station, combined with an electro-magnet for effecting the operation of said signal-transmitting apparatus at the main station, a circuit-wheel, as *t*, for changing the condition of the circuit of said electro-magnet, motor mechanism for revolving said circuit-wheel set in operation by the magnet of the signal-receiving instrument at the main station, and a circuit-controlling switch also included in said circuit, substantially as described.

3. In a municipal signal apparatus comprising a main station and one or more sub-stations connected by an electric circuit, a multiple signal-transmitting apparatus and a polarized signal-receiving instrument at the sub-station, and a signal-receiving instrument as a register, and pole-changing key at the main station, combined with an electro-magnet for operating said pole-changing key, a circuit-wheel, as *t*, for changing the condition of the circuit of said electro-magnet, said circuit-wheel being mounted on one of the shafts of the said signal-receiving instrument at the main station to be rotated thereby, substantially as described.

405,236. BOLT-THREADING MACHINE. ASAHEL WOOD, Worcester, Mass., assignor to Cornelius Gray, same place. Filed Jan. 21, 1886. Serial No. 261,540. (No model.)

Claim.—1. The combination, with a hollow revolving spindle and a die-carrying spindle held concentrically in said hollow spindle, of a rack having a sliding motion, and so connected with said die-carrying spindle as to impart a longitudinal sliding motion thereto, a shaft journaled transversely to said sliding rack, a pinion on said transverse shaft engaging said rack, a rotating driving-shaft and connections and clutching mechanism, substantially as described, whereby the transverse shaft and the rotating driving-shaft are connected and disconnected at will, as and for the purpose set forth.

405,286.

2. The combination, with a hollow revolving spindle, a die-carrying spindle held concentrically within said hollow spindle, a transverse shaft carrying a pinion and a bevel-gear, and a sliding rack engaged by the pinion on said transverse shaft, said rack being so connected with said die-carrying spindle as to impart a sliding motion thereto, of a bevel-gear journaled by its hub and engaging the bevel-gear on said transverse shaft, a shaft passing loosely through the journaled hub of said bevel-gear, and a clutching device by which said shaft is connected or disconnected with the hub of said bevel-gear, substantially as described.

3. The combination, with a sliding plate connected with the die-holding mechanism and provided with a toothed rack, and a transverse shaft having a pinion engaging said toothed rack, of a driving-shaft connected with said transverse shaft through a clutch-connection, a lever pivoted on the frame of the machine, a sliding bar carrying a forked arm and connected with said pivoted lever, and a retractile spring applied to said sliding bar to disengage said clutch-connection, substantially as described.

4. The combination, with a sliding rack connected with the die-holding mechanism, a transverse shaft carrying a pinion engaging said rack and connected with the driving-power through a clutch-connection, and a clutch-operating mechanism consisting of the lever D^{10}, bar D^{11}, forked arm D^{14}, and retractile spring D^{16}, of the bent latch G, arranged to engage said lever D^{10} and hold it against the tension of the retractile spring, spring G', and bent rod H, attached to the sliding rack, whereby the sliding motion of the rack is limited in one direction by disengaging the clutch-connection of the transverse shaft, substantially as described.

5. The combination, with the radially-moving die-blocks C C, wedge-shaped actuating-blocks C^3, bars C^4, carrying cam-rolls C^5, and sleeve B^2, having a cam-slot B^3, of the pockets N, as and for the purpose set forth.

6. The combination, with the radially-moving die-blocks and connected operating mechanism, substantially as described, of the detachable screw-cutting plates *e*, attached to and inserted in the sides of said die-blocks, and attaching-screws *f*, substantially as described.

7. The combination of a hollow revolving spindle, a sliding spindle held concentrically in said hollow spindle and receiving rotary motion therefrom, and a hollow core held concentrically in said sliding spindle and so attached to said outer hollow revolving spindle as to be held from longitudinal movement, substantially as described.

8. The combination of hollow spindle B, sliding spindle B^4, hollow core I, collar I^3, attached to the spindle B, and connecting-tube I^2, as and for the purpose set forth.

9. The combination of screw-cutting dies inclosed within a sleeve C^7, having wing-shaped projections, sleeve B^2, having a cam-slot B^3 and provided with ratchet-shaped teeth B^{11}, said cam-slot actuating said sleeve C^7 to open and close the cutting-dies, substantially as described, spindle F, levers F^2 and F^3, spring F^4, and latch F^5, all arranged and operating as and for the purpose set forth.

10. The combination, with the die-holding mechanism having a longitudinal sliding movement, whereby the cutting-dies are fed to the work, and with mechanism for opening and closing said cutting-dies, substantially as described, of a spring by which said opening and closing mechanism is set in operation, a spring latch for retaining the opening and closing mechanism, and a stop attached to the framework of the machine in the path of said retaining-latch, whereby said opening and closing mechanism is set in operation to open the dies, substantially as described.

11. The combination, with mechanism for rotating the screw-cutting dies and for imparting a longitudinal feeding motion to said dies, substantially as described, of the plate K, adjustably attached to the stand A, rotatable turret mounted on said plate and carrying the three sets of bolt-gripping jaws K^2, K^4, and M M', and a sliding center L, substantially as described.

12. The combination, with mechanism for rotating the screw-cutting dies and for imparting a longitudinal feeding motion to said dies, substantially as described, of a rotatable turret carrying a center and devices for dogging the bolt and preventing its rotation, substantially as described.

13. The combination, with mechanism for rotating the screw-cutting dies and for imparting a longitudinal feeding motion to said dies, substantially as described, of a rotatable turret, a pair of jaws for gripping the bolt, and a center which is adjustable with reference to said cutting-dies, substantially as described.

14. The combination of plate K, rotatable turret K^3, jaws K^2 K^4, spindles having right and left hand screw-threads K^6 K^6, and gears K^7, and intermediate actuating-pinions K^8, substantially as described.

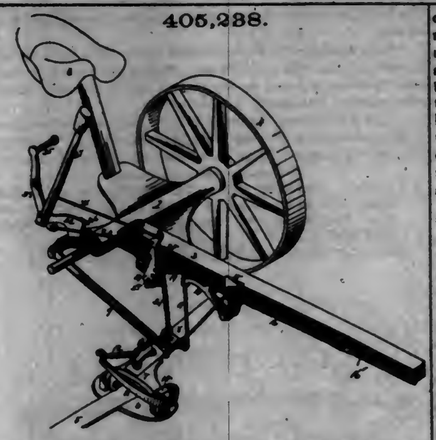
15. The combination, with screw-cutting dies and with the mechanism for rotating the same and imparting a longitudinal feeding motion to said dies, substantially as described, of the plate K, capable of being adjustably attached to the supporting-stand A, rotatable turret K^3, jaws K^2 K^4, spindles having right and left hand screw-threads K^6 K^6, gears K^7, intermediate actuating-pinions K^8, and a spring-actuated bolt K^{10}, by which said turret is held from rotation, substantially as described.

405,287. FODDER-BINDER. HERMAN R. FAIRCHILD, Diller, Nebr. Filed Feb. 13, 1889. Serial No. 299,774. (No model.)

Claim.—1. The combination of the two levers A, provided with cutting-edges or shears, holes through which the binding-wire is passed, and a projection on one of the levers to which one end of the wire is fastened, substantially as shown.

2. A shock-binder composed of the two pivoted levers provided with holes through which the wire is passed, grooves extending from these openings to the ends of the jaws and in which the wire is made to catch, a projection D upon one of the jaws, and cutting-edges or shears for severing the wire or cord after it has been twisted around the shock, substantially as set forth.

3. In a shock-binder, the combination of two pivoted levers provided with shears or cutters, and holes through which the wire is passed, with a spool for holding the binding-wire mounted on one of the levers, and a gravity-dog mounted in the same lever for holding the spool while the wire is being twisted, and adapted to be thrown into an engagement with the spool when the levers are closed, substantially as shown.



4. The combination of the two pivoted levers provided with holes through which the binding wire or cord is passed, grooves extending from the holes to the ends of the jaws for the wire to catch in, and cutting-edges or shears upon the levers, a spool for holding the wire, and a locking device for holding the spool from revolving while the wire is being tightened around the shock, substantially as described.

5. In a shock-binder, the combination of two pivoted levers provided with holes through which the wire is passed and a projection upon one of the levers and around which the end of the wire is fastened, a spool upon which the wire is wound, and a device for preventing the spool from unwinding while the wire is being twisted, substantially as set forth.

405,288. MOWER. JAMES H. JOHNS, Rockford, Ill., assignor to The Emerson, Talcott & Company, same place. Filed July 7, 1887. Serial No. 243,643. (No model.)

Claim.—1. In a mowing-machine, the combination, with the coupling-bar portion of a cutting apparatus and the finger-bar portion of the cutting apparatus hinged thereto, of a counterbalance spring arm or rod and a link, the free ends of the link and spring arm or rod being connected together, and the said spring arm or rod and link being connected at their opposite ends, the former with the finger-bar portion of the cutting apparatus and the other with the coupling-bar portion of the cutting apparatus, whereby the free end of the finger-bar portion of the cutting apparatus is counterbalanced, substantially as set forth.

405,288.

2. In a mowing-machine, the combination, with the coupling-bar portion of the cutting apparatus and the finger-bar portion of the cutting apparatus hinged thereto, of a curved counterbalance spring arm or rod for the free end of the finger-bar portion of the cutting apparatus, the said spring arm or rod being secured at one end to the finger-bar portion of the cutting apparatus, and a link connecting its other end to the coupling-bar portion of the cutting apparatus, substantially as set forth.

3. The combination, with the coupling-bar portion of the cutting apparatus and the finger-bar portion of the cutting apparatus hinged thereto, of a curved counterbalance spring arm or rod fixed to the finger-bar portion of the cutting apparatus, and a link connecting the free end of the spring arm or rod to the coupling-bar portion of the cutting apparatus, the said link being made adjustable in its connection with the coupling-bar portion of the cutting apparatus, substantially as set forth.

4. The combination, with a coupling-bar portion of the cutting apparatus and a finger-bar portion of the cutting apparatus hinged to the coupling-bar portion of the cutting apparatus, of a support rising from the finger-bar portion of the cutting apparatus, a counterbalance-spring fixed to the support, and a link connecting the free end of the spring with the coupling-bar portion of the cutting apparatus said link made adjustable in its connection with the coupling-bar portion of the cutting apparatus, substantially as set forth.

5. The combination, with the main frame, the finger-bar portion of the cutting apparatus, and the rising and falling coupling-bar portion of the cutting apparatus connecting the finger-bar portion of the cutting apparatus with the main frame, of a compensating counterbalance spring and lever connecting the coupling-bar portion only of the cutting apparatus with the main frame, substantially as set forth.

6. The combination of a main frame, a rising and falling cutting apparatus connected at one end to the main frame, a counterbalance-spring for the free end of the finger-bar portion of the said cutting apparatus, and a compensating counterbalance lever and spring connecting the coupling-bar portion of the cutting apparatus and the main frame, substantially as set forth.

7. The combination, with a main frame, a rising and falling cutting apparatus connected at one end to the main frame, a counterbalance-spring for the free end of the finger-bar portion of the said cutting apparatus, a lever and spring compensating counter-balance connecting the main frame and coupling-bar portion of the cutting apparatus, a hand-lever pivotally secured to the main frame, an intermediate lever pivotally secured to the main frame, a link-connection between the intermediate lever and coupling-bar portion of the cutting apparatus, and a link-connection between the intermediate lever and hand-lever, substantially as set forth.

8. The combination of a main frame, an operating hand-lever pivoted to the main frame, a rising and falling cutting apparatus connected at one end to the main frame, a bracket-support secured to the main frame intermediate of the hand-lever and cutting apparatus, an intermediate lever pivoted to the bracket-support, a stop on the intermediate lever in position to engage the bracket-support to limit the forward throw of said lever, and a link-connection between the hand-lever and intermediate lever and between the intermediate lever and cutting apparatus, substantially as set forth.

9. The combination of a main frame, an operating hand-lever pivoted to the main frame, the rising and falling cutting apparatus connected at one end to the main frame, a bracket-support for the intermediate lever fixed to the main frame intermediate of the hand-lever and the cutting apparatus, the intermediate lever pivoted to the bracket-support, a stop carried by the intermediate lever in position to engage the bracket-support to limit the forward throw of the said lever, said stop being made adjustable in its connection with said intermediate lever to vary the amount of throw of said lever, a link-connection between the operating-lever and intermediate lever and between the intermediate lever and the cutting apparatus, substantially as set forth.

10. The combination, with the main frame and the rising and falling cutting apparatus connected at one end thereto, of a curved spring arm or rod having one of its ends secured to the finger-bar portion of the cutting apparatus and its opposite end link-connected to the coupling-bar portion of the cutting apparatus, the said spring arm or rod forming a counter-balance for the free end of the finger-bar portion of the cutting apparatus, and a counterbalance-spring connecting the main frame and the coupling-bar portion of the cutting apparatus, substantially as set forth.

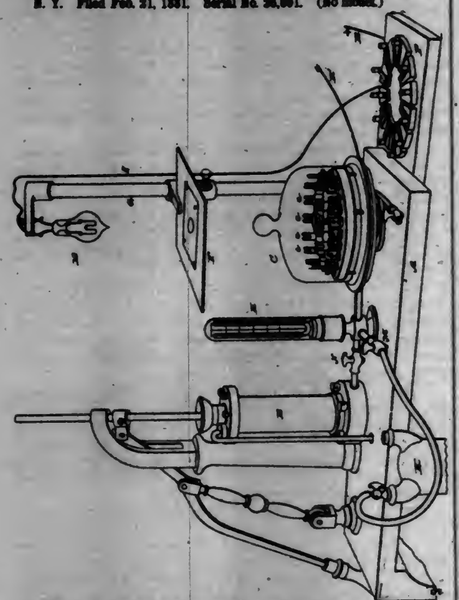
11. The combination, with the main frame, a foot-lever pivoted to the main frame, and the cutting apparatus, of an intermediate lever pivotally secured to the main frame and located between the foot-lever and the cutting apparatus, a link-connection between the foot-lever and intermediate lever and between the foot-lever and the cutting apparatus, and a detent fixed to the main frame in position to receive the foot-lever and retain it when it is thrown forward, substantially as set forth.

12. The combination, with the main frame, cutting apparatus, and intermediate lever pivotally secured to the main frame, of a hand-lever and a foot-lever, each pivotally secured to the main frame, and each having an independent link-connection with said intermediate lever, and a link-connection between the intermediate lever and the cutting apparatus, substantially as set forth.

13. The combination, with the main frame and with an intermediate lever pivotally secured to the main frame, of a foot-lever and a hand-lever pivoted to the main frame to oscillate on the same axial center, and independent links to connect the foot and hand levers, respectively, with the intermediate lever on the main frame, a cutting apparatus, and a link connection between the intermediate lever and the cutting apparatus, substantially as set forth.

14. The combination of a main frame, a rising and falling cutting apparatus connected at one end to the main frame, a counterbalance-spring to the cutting apparatus as a whole, a foot-lever pivotally secured to the main frame, and a connection between the cutting apparatus and foot-lever, consisting of an intermediate lever pivotally secured to the main frame, and links connecting the intermediate lever with the cutting apparatus and foot-lever, substantially as set forth.

15. The combination of a main frame, a rising and falling cutting apparatus connected at one end to the main frame, a counterbalance-spring to the cutting apparatus as a whole, a foot-lever pivotally secured to the main frame, a hand-lever pivotally secured to the main frame, and connections between the hand and foot levers and the cutting apparatus, consisting, essentially, of an intermediate lever pivotally secured to the main frame, links connecting the intermediate lever with the hand and foot levers, and a link-connection between the intermediate lever and the cutting apparatus, substantially as set forth.



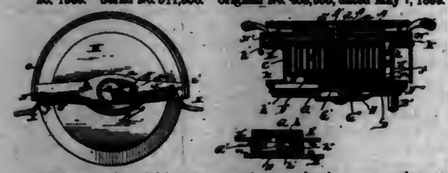
16. The combination of a main frame, a rising and falling cutting apparatus connected at one end to the main frame, a counterbalance-spring for the free end of the finger-bar portion of the cutting apparatus, said spring connecting the finger-bar portion of the cutting apparatus with the coupling-bar portion, a counterbalance-spring for the cutting apparatus as a whole, connecting the main frame and coupling-bar portion of the cutting apparatus, a foot-lever pivotally secured to the main frame, an intermediate lever pivotally secured to the main frame between the foot-lever and the cutting apparatus, and links connecting the intermediate lever with the foot-lever and the cutting apparatus, substantially as set forth.

17. The combination of a main frame, a cutting apparatus, a counterbalance-spring for the free end of the finger-bar portion of the cutting apparatus, a counterbalance-spring for the cutting apparatus as a whole, a hand-lever pivotally secured to the main frame, an intermediate lever pivotally secured to the main frame, and links connecting the intermediate lever with the hand-lever and with the cutting apparatus, substantially as set forth.

18. The combination of a main frame, a cutting apparatus, a counterbalance-spring for the free end of the finger-bar portion of the cutting apparatus, a counterbalance-spring for the cutting apparatus as a whole, a hand-lever and a foot-lever, each pivotally secured to the main frame to oscillate on the same axial center, an intermediate lever pivotally secured to the main frame, and independent links connecting the intermediate lever with the hand and foot levers and the cutting apparatus, substantially as set forth.

19. The combination of the main frame, a rising and falling cutting apparatus connected at one end to the main frame, a hand-lever and a foot-lever, each pivotally secured to the main frame, an intermediate lever pivotally secured to the main frame, links connecting the intermediate lever with the hand and foot levers on opposite sides of their pivotal connection with the main frame, whereby an opposite movement of the hand and foot levers will effect the same movement of the intermediate lever, and a link-connection between the intermediate lever and the cutting apparatus, substantially as set forth.

405,289. APPARATUS FOR THE MANUFACTURE OF FILAMENTS FOR INCANDESCENT LAMPS. HIRAM S. MAXIM, Brooklyn, N. Y. Filed Feb. 21, 1881. Serial No. 26,091. (No model.)



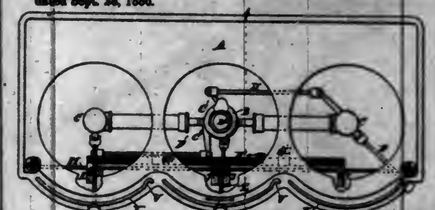
Claim.—1. In combination with an electric circuit and an air-pump, two or more carbon holders or clips arranged under a common receiver suitably supplied with a hydrocarbon or equivalent gas, substantially as and for the purpose set forth.

2. In combination with an electric circuit and an air-pump, a receiver adapted to be supplied with a hydrocarbon or equivalent gas and containing two or more carbon holders or clips, each of which is provided with a switch controlling its connection with the circuit, substantially as and for the purpose set forth.

3. The combination of an electric circuit, a carbon-holder, a receiver for inclosing such holder and arranged to be provided with an atmosphere of hydrocarbon or equivalent gas for building up the carbon and changing its resistance, a standard light, and a photometer, substantially as and for the purpose set forth.

REISSUES.

11,006. FISHING-REEL. FRANK CAREY, Penn Yan, N. Y. Filed May 20, 1889. Serial No. 311,350. Original No. 403,063, dated May 7, 1889.



Claim.—1. In a fishing-reel, a spring-case having corrugations on the inner side of the rim, and a coiled spring in said case having its inner end detachably secured to a sleeve upon which said case is journaled and having its outer end curved or hooked to engage with the corrugations in the rim, substantially as described.

2. In a fishing-reel, the double brake consisting of levers I I', connected by the rod J, pivoted at the opposite ends of the arms on the rod-plate, to operate the same above or below the reel, in combination with the exterior surface of the reel-case, substantially as described.

3. In a fishing-reel, the combination of the crank B and reel-case K, each provided with a ratchet and a shifting-pawl H and spring k', whereby either rack may be engaged and held by the pawl and the other released, substantially as described.

4. In a fishing-reel, the combination of the ratchet-wheel d, pawl d', and check-lever m, whereby the shaft D is controlled by holding or releasing the ratchet d on the end thereof, substantially as described.

11,007. GASOLINE-STOVE ATTACHMENT. CHARLES A. STOCKSTROM, St. Louis, Mo., assignor of one-half to Louis Stockstrom, same place. Filed May 23, 1887. Serial No. 238,141. Original No. 370,094, dated Sept. 20, 1886.

Claim.—1. The combination of a gasoline-stove frame, a generator, a side burner having a pipe into which vapor passes from the generator, a main valve controlling the supply of gasoline to the generator, a valve controlling the flow of vapor to the side burner, a lever or its equivalent operating the generator-valve, and a connection between the generator and side-burner valves, permitting the opening of the main or generator valve independently, but preventing the closure thereof while the side-burner valve remains open, as explained.

2. The combination of a gasoline-stove frame, a generator, a side burner having a pipe into which vapor enters from said generator, a main valve controlling the supply of vapor to the generator-burner, a valve controlling the flow of vapor to the side burner, and levers or their equivalents connected to said valves, in combination with a lock and a movable device engaging the main-burner-valve lever or its equivalent, whereby when the main valve is closed the main-burner-valve lever or its equivalent is held in position by the lock, substantially as and for the purpose set forth.

3. The combination of a gasoline-stove frame, a generator having a jet-orifice, a side burner having a pipe into which the vapor enters from said jet-orifice, a main valve controlling the supply of vapor to the generator-burner, a valve controlling the flow of vapor to the side burner, levers or their equivalents connected with said valves, and a device connected to the main-valve lever and engaging the same upon one side, whereby the side-burner valve will be closed when the main valve is closed and the main valve opened without opening the side-burner valve.

4. The combination of a gasoline-stove frame, a generator having a jet-orifice, a side burner having a pipe into which the vapor enters from said jet-orifice, a main valve controlling the supply of vapor to the generator-burner, a valve controlling the flow of vapor to the side burner, levers or their equivalents connected with said valves, a slide-plate having guides, and arms or projections on the slide-plate with which the valve-levers engage.

5. The combination of a gasoline-stove frame, a generator having a jet-orifice, a side burner having a pipe into which the vapor enters from said jet-orifice, a main valve controlling the supply of vapor to the generator-burner, a valve controlling the flow of vapor to the side burner, levers or their equivalents connected with said valves, the sliding plate having arms or projections engaged by the valve-levers, and a guide-rod passing through the arms or projections, substantially as and for the purpose set forth.

6. The combination of a gasoline-stove frame, a generator having a jet-orifice, a side burner having a pipe into which the vapor enters from said jet-orifice, a main valve-controlling the supply of vapor to the generator-burner, a valve controlling the flow of vapor to the side burner, levers or their equivalents connected with said valves, the sliding plate having arms or projections engaged by the valve-levers, guide-brackets secured to the frame, and a guide-rod passing through the arms, substantially as and for the purpose set forth.

7. The combination of a gasoline-stove frame, a generator having a jet-orifice, a side burner having a pipe into which the vapor enters from said jet-orifice, a main valve controlling the supply of vapor to the generator-burner, valve controlling the flow of vapor to the side burner, levers or their equivalents connected with all of said valves, a sliding plate having guides, lugs J J, one on each side of the main-valve lever, and lugs I, engaging the side-burner-valve levers, substantially as and for the purpose set forth.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Northern District of New York.

J. B. BREWSTER & CO. *v.* SHULER. SAME *v.* D. W. SHULER, W. S. SHULER, AND WATERLOO WAGON WORKS. SAME *v.* CORTLANDT WAGON WORKS *et al.*

Decided February 25, 1889.

1. WOOD—CARRIAGE-SPRINGS—REISSUE VOID.
Reissued Letters Patent No. 6,018, granted to Thomas H. Wood August 18, 1874, for an improvement in carriage-springs, *Held* void, not only because it is for an invention not disclosed or suggested in the original, but also because, as in the case of *Coon et al. v. Wilson*, (30 O. G., 889; 113 U. S., 268,) there was no defective or insufficient specification, and no mistake inadvertently committed in the wording of the claim of the original.

2. PRIOR PUBLIC USE.
The defense of prior public use also established.

Mr. M. L. Stover, Messrs. Witter & Kenyon, and *Mr. Causten Browne* for the defendants.

Mr. Livingston Gifford and *Mr. B. F. Thurston,* for the complainants.

WALLACE, *J.:*

This suit is brought to restrain infringement of reissued Letters Patent granted August 18, 1874, to Thomas H. Wood for an improvement in carriage-springs. The defendants rely upon the invalidity of the patent as a reissue of the original, and upon prior public use by others of the subject of the invention, among other defenses to the suit.

The original patent to Wood was granted May 27, 1873. The invention is described therein as follows:

This invention relates to an improved arrangement of transverse springs on light wagons, and has for its object to combine, in a wagon supported on single transverse springs and side bars, the advantage of elasticity, double elliptic transverse springs, and of the deep setting of the body obtained at present by using the single springs. Light carriages supported on double elliptic springs raise the bodies too high for convenience, and are moreover more expensive than those having single springs. On the other side such carriages as are at present supported on single transverse springs, whose ends connect with side bars rigidly secured to the wagon-bodies, are not sufficiently elastic and yielding to suit the rapid motion to which they are frequently subjected. The invention consists in the improvement of light vehicles, as hereinafter described and pointed out in the claim.

In the accompanying drawing, the letter A represents the body of a light carriage of suitable style. B and C are the axles of the carriage, and D D the wheels. Upon the axles are fastened the middle portions of transverse springs E E, whose ends are secured to side bars F F. These side bars are made of hickory wood or other material, and aid, with whatever elasticity they may possess, in making the support of the body A yielding. To the under side of the carriage-body A are secured transverse springs G G, whose ends connect, by suitable couplings, with the side bars F F, as is clearly shown in the drawing. The springs G G and E E can be made of metal or wood or other material, and are semi-elliptic or flat springs in contradistinction to the full elliptic spring heretofore used as direct supports for carriage-bodies on their axles.

The claim of the original patent is as follows:

A frame, consisting of the longitudinal side bars F F, downwardly-bowed end springs E E, and upwardly-bowed middle springs G G, constructed, arranged, and applied as and for the purpose described.

The description in the reissued patent is as follows:

This invention has for its object to improve the manner of connecting the bodies of light carriages with the side bars, whereby they are supported; and consists in interposing a pair of semi-elliptic springs between said side bars and the wagon-body.

In the accompanying drawing, the letter A represents the body of a light carriage of suitable style. B and C are the axles of the carriage, and D D the wheels. The axles are connected by springs E E or otherwise, with the side bars F F. These side bars are made of hickory wood or other material. To the under side of the carriage-body A are secured transverse springs G G, whose ends connect, by suitable couplings, with the side bars F F, as is clearly shown in the drawing. These springs G G can be made of metal or other material, and are semi-elliptic or flat springs, in contradistinction to the full elliptic springs heretofore used as direct supports for carriage-bodies on their axles.

The claim of the reissue is—

The semi-elliptic springs G G, interposed between the side bars F F and the wagon-body, all combined substantially as specified.

It is obvious that the invention of the patentee, as explained in the original patent, consisted in altering a side-bar buggy having downwardly-curved transverse springs over the axle in which the ends of the side bars rest on the ends of the springs by putting in upwardly-curved springs transversely between the side bars and the body of the buggy. The conception and aim of the patentee was to employ additional half-elliptic springs in a side-bar buggy having half-elliptic springs, so arranged in reference to each other that the body would be practically mounted on full-elliptic springs for purposes of elasticity and on half-elliptic springs for purposes of elevation above the axle. The description fully and clearly, without ambiguity or obscurity, sets forth the exact invention made by the patentee, and the claim fully and precisely specifies it, and from both it is perfectly evident what invention the patentee intended to describe and sought to secure. So ample and exact are the specification and claim that it cannot be doubted he knew accurately the scope and limitations of his invention, and intended to describe and claim it as nothing more or less than an improvement upon a specific type of side-bar buggies, which consisted in interposing supplementary half-elliptic springs between the body and the side bars to re-enforce and co-operate with the half-elliptic springs theretofore employed between the side bars and the axles in the existing buggy. What the patentee did was to put two springs adapted to do that work into a buggy of that type. He might have

put transverse semi-elliptic springs between the body and the side bars of a buggy of a different type; but he did not do it or think of doing it. Apparently he subsequently discovered that it would be desirable to do this, and concluded to get a patent for doing it, and he was probably advised that such a patent would give him a larger monopoly than he had secured originally, and would enable him to hold as infringers all those who should use the transverse semi-elliptic springs between the side bars and the body of a buggy, whether in a buggy with or without semi-elliptic springs, or any springs, between the side bar and the axle.

The reissued patent is for an invention which apparently did not exist in the mind of the patentee when the original was obtained, and which also is of more doubtful inventive novelty than that in the original. The original is for a combination of half-springs with other half-springs in reverse in a side-bar buggy in which the parts co-operate to produce a given result. The reissue is for a combination of which half-springs in reverse are not a part and from which the essential characteristics of the original invention are eliminated. The use of the combination of parts claimed in the reissue would not be an infringement of the original patent.

It must be held that the reissue is void not only because it is for an invention not disclosed or suggested in the original, but also because, as in the case of *Coon v. Wilson*, (113 U. S., 268,) there was no defective or insufficient specification, and no mistake inadvertently committed in the wording of the claim of the original.

The defense of prior public use which rests on the use of the springs in the Roberts-Pierce buggy is fully established and is fatal to the validity of the patent. The fact of the use of semi-elliptic springs in that buggy interposed between the side bars and the body at a date sufficiently early to defeat the patent is not contested; but it is contended for the complainants that these springs were not the semi-elliptic springs of the patent. They were semi-elliptic springs of the class known as scroll-ended springs. This was a well-known class, used in carriages, and sold by dealers as semi-elliptic springs previously to the date of the patent, as sufficiently appears by reference to the patent to George Groot of July 13, 1869, for an improvement in carriage-springs, without reference to the other testimony or exhibits in the case. That patent relates to the fastening of semi-elliptic springs transversely under the body of the carriage to side springs by means of saddle-clips. The drawings show a scroll-ended half-elliptic spring, substantially such as was used in the Roberts-Pierce buggy, and the specification points out that the saddle-clips are to be adjusted according as the ends of the semi-elliptic springs "are made with or without scrolls." Another class of semi-elliptic springs were without scrolls at the ends, and it is contended for the complainants that it is to this class, and this class only, that the claim of the patent relates. The drawings in the patents show springs of this class. It appears by the testimony that the object of scrolling the ends of half-springs is to get a somewhat greater length of spring between bearings a given distance apart, and thereby somewhat more elasticity and motion; and that the use of square-ended or scroll-ended springs is dictated by the degree of elasticity desired in a particular carriage-spring. It is obvious, however, that the degree of elasticity depends largely upon the amount of material used in the spring, and that a scroll-ended spring may be practically as stiff as one without a scroll end and one without a scroll end may be practically as elastic as one with a scroll end. It is probably true that as between springs of the two classes, when each has the same degree of elasticity as the other, the scroll-ended spring would lend a freer lateral movement to a carriage or buggy body than the other; and an ingenious argument has been advanced by counsel and by the experts for the complainants to show that in the class of carriages to which the patent relates it is desirable that there be practically no sidewise movement to the carriage-body. If there were anything in the specification to suggest this, the somewhat shadowy difference of function between the two springs might be apprehended and emphasized to denote that one should not be treated as the equivalent of the other. But it could be urged with equal force that the semi-elliptic spring of the claim is one of either class, and that the use of scroll-ended springs when interposed between the side bars and the wagon-body would be an infringement of the claim. Indeed, in a former suit brought upon this patent the alleged infringing springs were scroll-ended half-elliptic springs, but the ends did not extend appreciably beyond the outside line of the side bars; and the complainant's expert gives it as his opinion that the use of such scroll-ended springs between the side bars of the wagon-body would be an infringement of the patent. In the absence of any language to indicate that a semi-elliptic spring of a special form is an element of the claim it must be held that the claim specifies one of any well-known form adapted to be interposed between the side bars and the wagon-body; consequently such springs as were used in the Roberts-Pierce buggy are the springs of the patent, and the defense of prior public use is established.

The bill is dismissed, with costs.

U. S. Circuit Court—Southern District of New York.

EDISON *et al. v.* KLABER.

Decided April 5, 1889.

1. EDISON—AUTOGRAPHIC PRINTING.

Letters Patent No. 180,857, for an improvement in autographic printing, granted to Thomas A. Edison August 8, 1876, cannot be regarded as a pioneer patent in this art. There could be no broad claim for printing with a paper stencil, semi-liquid ink, and a roller. Neither could there be a broad claim for a puncturing device. Both were old.

2. SAME—CLAIM 2 CONSTRUED AND RESTRICTED.

The prior state of the art and the express language of the specification combine to restrict the claim to the use of a stencil made by the electric pen.

3. INFRINGEMENT.

Thus construed it is not infringed by the defendant's device. The "cyclostyle" of the defendant shows another step in the art. It is as much an improvement on Edison's method as that was an improvement on what preceded it.

Mr. John C. Tomlinson and *Mr. Richard N. Dyer* for the complainants.

Messrs. Price & Steuart for the defendant.

COXE, *J.*:

This is an action of infringement founded upon Letters Patent No. 180,857, dated August 8, 1876, granted to Thomas A. Edison, for an improvement in autographic printing. The inventor states:

> My improvement relates, first, to the instrument employed for puncturing the paper, whereby such instrument can be used by hand in the same manner as a drawing or writing pen; second, to the method of printing by direct transfer in permanent semi-liquid ink from the perforated sheet; and third, to the press for holding such transfer-sheet, and the paper to be impressed.
>
> * * * * * * *
>
> The pen which I make use of consists of a tube, *a*, tapering to a small point, *b*, and a needle, *c*, within that tube, which needle is reciprocated with great rapidity; and when the needle-point *c* is projected it is sufficiently long to reach through the paper upon which the tube of the pen rests, and when retracted the needle is drawn within the tube, so that the small end thereof is free to be moved from place to place.
>
> The great rapidity in the movement of the needle-point produces the punctures in the paper sufficiently close together to form lines when the pen is manipulated in writing or drawing; and, as nothing is removed from the paper, its strength is not materially injured by the punctures or perforations; and it will be apparent that any suitable device may be employed for reciprocating the perforating-needle. * * *
>
> * * * * * * *
>
> The mode of printing from the perforated sheet is to fill the holes with ink by means of a roller applied to the right side of the perforated sheet; and then when said ink is well worked into the holes to place beneath such perforated sheet the paper upon which the impression is to be made, and then pass over the perforated sheet a roller that presses the ink through the perforations to the surface of the sheet below.
>
> * * * * * * *
>
> Various forms of electro-magnetic motors may be employed to revolve the shaft that reciprocates the puncturing-needle, and the movement of a vibrating armature might be transferred directly to the needle, if desired.

The second claim only is involved. It is for—

> 2. The method herein specified of printing in permanent semi-fluid ink by puncturing a sheet of paper, or similar material, with numerous small holes, filling such holes with a semi-liquid ink, and pressing the same upon the surface to be printed, substantially as set forth.

The defenses are lack of novelty and invention and non-infringement.

The prior art shows many structures and methods closely approximating those of the patentee. An Italian named Zuccato discovered in 1874 a method by which an autographic stencil is produced by writing with an ordinary pen and caustic ink upon a varnished paper. The printing is done with a permanent semi-liquid ink by means of pressure. In 1873 a patent was granted to Charles Bordas for a method of transferring embroidery-patterns from a perforated original stencil to sheets of paper by forcing powder or a liquid through the holes. Letters and figures were printed by this method. In 1869 George V. Metzel substituted for the brush previously used a roller covered with plush, velvet, or carpeting, which was impregnated with ink and pressed over the stencil-plate. Henry W. Rudolf, in 1870, received a patent which shows a method of printing by means of a paper stencil and an inked roller similar to the ordinary type-roller. In the same year a patent was granted to Robert Boyd for an improvement in machinery for tracing embroidery-patterns. It describes a pen containing a reciprocating perforating needle or a stabber. So far as the pen proper and the work done by it are concerned, it is almost the exact counterpart of the Edison device. The motor is more cumbersome, the machine is not so readily manipulated; but it would be difficult to distinguish a stencil made by it from one made by the electric pen. A machine similarly constructed was in operation in the establishment of Mrs. McDonald, in New York city, prior to the spring of 1878, and specimens of the work done thereon have been introduced in evidence. Patterns, monograms, figures, and autographic writing can be and have been made by it. Printing from these stencils was done with powder or with ink. In 1866 Samuel Huffman obtained a patent for a new puncturing-machine for making patterns, which is the exact counterpart of the Edison pen, except that it is lighter and less awkward in handling and the reciprocating needle is operated by clock-work instead of an electro-magnet. Other references show stencils made by hand-guided implements in which a small toothed wheel punctures the paper. In others still stencils are made by writing with a pointed stylus on a hard corrugated surface like a file or rasp. Mr. Edison himself recognized the superior advantages in simplicity and cheapness of the latter method, and in 1880 procured a patent in which the stencil is formed by writing with a blunt stylus upon a slab containing numerous fine perforating-points. The electric pen has been superseded by the mimeograph. It will be seen, therefore, that in August, 1876, the field was extensively occupied. A pioneer patent was out of the question in this art. There could be no broad claim for printing with a paper stencil, semi-liquid ink, and a roller. Neither could there be a broad claim for a puncturing device. Both were old. There was room for the invention of a practical instrument which could be used to adapt known methods to the reproduction of autographic writing; but the discovery of this instrument does not enable the inventor to levy tribute upon the entire art. Mr. Edison invented the electric pen. For this, though it is too expensive and complicated to be of great practical utility, he is entitled to credit. The invention was not, however, of such a character as to block all further progress. Other inventors could improve on him, as he had improved on Huffman and Zuccato. The described method was not practiced, because no convenient practical means of making a stencil was at hand. It was not because the world was ignorant of the fact that ink would go through holes in paper when rolled with a printer's type-roller. The patentee made a new stencil and printed from it by the old method. He now seeks to prevent others who also invent new stencils from using the same old method. The prior art and the express language of the specification combine to restrict the claim to the use of a stencil made by the electric pen. Unless so restricted, the claim is invalid; if so restricted, the defendant does not infringe. Eliminate the electric pen and very little is left. There was nothing new in the method of printing considered apart from the ingeniously-formed stencil. Edison could not have had a patent in 1876 for a new method of printing if the stencil used had been made by a Boyd or Huffman pen or a common metallic pin. The words and sentences stabbed out by the McDonald machine might be duplicated by passing an inked roller—Metzel's, for instance—over the paper without infringing the patent. It would have required no exercise of the inventive faculties to do this in 1876. The old method would have been slightly changed to meet the new condi-

tions; but this is all. The process of printing is the same, whether the type used is Old English, German text, brevier, or long primer. If a stencil is used, the process is the same whether the ink goes through holes which represent written letters or holes which represent Roman letters or embroidery-patterns. The method is the same no matter what is copied. But it is said that if the patent is first expanded so as to include any instrument capable of making a stencil, and then narrowed so as to exclude all but autographic stencils, the defendant may be held as an infringer. The claim does not use the word "autographic," and it would seem that the inventor did not intend so to restrict his invention. The construction contended for by the complainants would enable a person to escape infringement by printing Roman characters upon his stencil, instead of writing thereon in his own proper handwriting. Indeed, it would make the apparatus, when used without license, an infringing or non-infringing one, according to the use to which it is put. A person who copied a letter on it would infringe the claim, but if he copied a design he would not infringe. The name of defendant's machine could lawfully be copied in this form, Cyclostyle but not in this, Cyclostyle The words "The method herein specified" and "substantially as set forth" should not be ignored. The only method described by which the sheet of paper is punctured with numerous small holes is by the use of the electric pen. To permit any puncturing method to be substituted in place of the electric pen would be to give the claim a construction which invalidates it and which is not warranted by the proof. The claim, when properly construed, is not infringed by the defendant. His method is as follows: Bamboo-fiber paper prepared with a layer of wax or paraffine is laid upon a zinc plate. On this paper, so placed, autographic writing or any design may be produced, not by an electric pen, for the hard bed would destroy the reciprocating needle, but by a little instrument like a pen-holder, to the end of which is attached a diminutive wheel provided with microscopic corrugations which cut little slits in the paper as it rolls, being forced along by the hand of the writer. For this instrument and for the transfer-paper patents were granted to David Gestetner, dated, respectively, November 28, 1882, and December 22, 1885. The printing from the stencil thus formed is done in the well-known manner. The "Cyclostyle" of the defendant shows another step in the art. It is simple and comparatively inexpensive. It is as much an improvement on Edison's method as that was an improvement on what preceded it.

The bill is dismissed.

U. S. Circuit Court—Eastern District of Pennsylvania.

MARTHA WASHINGTON CREAMERY BUTTERED FLOUR COMPANY OF THE UNITED STATES, (LIMITED,) *v.* MARTIEN.

Decided February 15, 1889.

INJUNCTION—RIGHTS OF PURCHASER OF PATENTED MACHINE.

The purchaser of a patented machine has the right to use the machine until worn out in the manufacture of the product it is designed to make, and sell the same in the market, and to designate it by label or otherwise as the product of the invention.

SUR motion for preliminary injunction.

Mr. Walter D. Edmunds for the complainants.
Mr. Horace Pettit for the defendants.

BUTLER, *J.*:

In disposing of motions for preliminary injunctions it is not usual to assign reasons where the motion is disallowed. To avoid misunderstanding, however, in this case it is proper to say that the unanswered allegation of the respondent, (found in his deposition,) that he purchased machines of the complainant's predecessor, Thorpe, at large expense, designed for the manufacture of the flour referred to in the bill and suited to no other purpose, stands in the way of allowing the motion, without reference to other important questions raised by the record and presented on the argument. It does not appear that the purchase of these machines had any connection with the contract of license referred to in the bill, nor that their use was subject to restriction or revocation. On the contrary, judging by what is before me, the purchase was entirely independent of this contract, and conferred the same rights on the respondent that he would have taken had no such contract existed. These rights are the use of the machines, until worn out, in the manufacture of flour, which they are designed to make, and to sell the same in the market. This flour the respondent may lawfully represent to be the flour described in the bill, by the use of the labels and otherwise. In so doing he imposes on no one and transgresses no one's rights. The privilege of using the label originally adopted by Thorpe, the inventor, extends to every one who acquires his right to manufacture and vend the flour. These labels were not intended to designate the flour manufactured by the inventor personally or any particular individuals to whom he transfers rights, but the especial kind and quality of flour covered by his invention. To allow the motion would, therefore, be improper.

At final hearing the case may present an entirely different aspect. As at present presented, the complainant might possibly be entitled to an injunction so limited and confined as to avoid the difficulty above stated. This, however, I have not felt called upon to consider in disposing of the motion before me. I would suggest the propriety of preparing the case, as well as the two others pending, intimately connected with it, speedily, for final hearing, when the court may enter a decree with the full knowledge of all facts involved.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1887, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Issue of June 18, 1889.

DESIGNS.

19,157.—COLLAR.—*William Barker*, Watervliet, N. Y. Application filed March 18, 1889. Serial No. 303,781. Term of patent 7 years.

19,158.—CLOTH FOR CLOAKING, &c.—*Morris Fatman*, New York, N. Y. Application filed May 24, 1889. Serial No. 312,008. Term of patent 3½ years.

19,159.—CLOTH FOR CLOAKING, &c.—*Morris Fatman*, New York, N. Y. Application filed May 16, 1889. Serial No. 311,075. Term of patent 3½ years.

19,160.—MADE-UP SCARF.—*Thomas J. Flagg*, New York, N. Y. Application filed May 24, 1889. Serial No. 312,004. Term of patent 3½ years.

19,161.—BAG.—*Solomon Henry Howe*, New York, N. Y. Application filed May 9, 1889. Serial No. 310,146. Term of patent 14 years.

19,162.—TUMBLER, &c.—*William C. King*, Pittsburg, Pa. Application filed March 11, 1889. Serial No. 302,904. Term of patent 7 years.

19,163.—COLLAR.—*William H. McFadden*, Green Island, assignor to *George B. Cluett, Bro. & Co.*, Troy, N. Y. Application filed December 29, 1888. Serial No. 294,982. Term of patent 7 years.

19,164.—WATER-CLOSET.—*Frederic G. Moore*, Bergen Point, N. J. Application filed May 17, 1889. Serial No. 311,170. Term of patent 14 years.

19,165.—ORNAMENTATION OF PITCHERS, &c.—*Solon O. Richardson, Jr.*, Toledo, Ohio, assignor to *The W. L. Libbey & Son Company*, same place. Application filed April 6, 1889. Serial No. 306,268. Term of patent 3½ years.

19,166.—EMBROIDERY FOR MITTS, &c.—*Edward Schwalbach, Jr.*, Brooklyn, N. Y., assignor to *A. G. Jennings*, same place. Application filed May 16, 1889. Serial No. 311,074. Term of patent 7 years.

19,167.—FABRIC.—*Emil Stumpf*, Elberfeld, Germany. Application filed May 23, 1889. Serial No. 311,882. Term of patent 3½ years.

19,168.—JAWS OF A PIPE-WRENCH.—*John H. Vinton*, Boston, Mass., assignor to *The Trimont Manufacturing Company*, Portland, Me. Application filed December 26, 1888. Serial No. 294,099. Term of patent 14 years.

19,169.—HAT AND COAT RACK.—*John H. Whissemore*, Youngstown, Ohio. Application filed December 12, 1888. Serial No. 293,413. Term of patent 7 years.

19,170.—SASH HOOK OR LIFT.—*William Alex. Williamson*, Newark, N. J. Application filed May 20, 1889. Serial No. 311,474. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 4,191 and upward are registered under the act of March 3, 1881.]

16,728.—PLUG CHEWING-TOBACCO.—*Arnold, Carlton & McCord*, Atlanta, Ga. Application filed March 8, 1889. Used since January, 1887.
"The words 'RED FOX.'"

16,729.—CHEWING-TOBACCO.—*Billing & Hay*, Winston, N. C. Application filed May 8, 1889. Used since February 6, 1889.
"The words 'FAT POSSUM.'"

16,730.—COCOA AND COCOA-BUTTER.—*J. & C. Blooker*, Amsterdam, Holland, and New York, N. Y. Application filed February 26, 1889. Used since 1877.
"The representation of two hands clasped as in the act of shaking hands, showing cuffs and some of the sleeves, together with the word 'GEDEPONEERD' and the fac-simile signature 'J. & C. BLOOKER.'"

16,731.—EFFERVESCENT POWDER FOR BEVERAGES.—*The Berwick Manufacturing Co.*, New York, N. Y. Application filed April 6, 1889. Used since April 1, 1889.
"The words 'LIME JUICE KALINE.'"

16,732.—TEA.—*George C. Buell & Co.*, Rochester, N. Y. Application filed May 18, 1889. Used since July, 1887.
"The representation of an eagle and the words 'THE EAGLE CHOP.'"

16,733.—CANNED OYSTERS.—*Fait & Winebrenner*, Baltimore, Md. Application filed May 15, 1889. Used since December, 1888.
"The words 'BLACK SWAN,' or a pictorial representation of a black swan."

16,734.—WHISKY.—*John Osborn Son & Co.*, New York, N. Y., and Philadelphia, Pa. Application filed December 19, 1888. Used since 1886.
"The word 'ANTEDILUVIAN.'"

16,735.—WHISKY.—*John Osborn Son & Co.*, New York, N. Y., and Philadelphia, Pa. Application filed December 19, 1888. Used since December, 1888.
"The word 'ANTEMUNDANE.'"

16,736.—COTTON LININGS, SILESIAS, SATEENS, CAMBRICS, AND TWILLS.—*Frank L. St. John*, New York, N. Y. Application filed February 18, 1889. Used since January 2, 1869.
"The word 'DUNDEE.'"

16,737.—ALTERATIVE SIRUPS.—*Fred D. Stevens & Co.*, Detroit, Mich. Application filed March 16, 1889. Used since March 1, 1889.
"The letters 'DRIW' and 'FDS, CO,' and the word 'AND,' forming two monograms."

16,738.—CURATIVE LOTION USED EXTERNALLY FOR SKIN DISEASES.—*Emeline C. Summerhayes*, Somerville, Mass. Application filed April 6, 1889. Used since July, 1888.
"The word 'PSUGMA.'"

16,739.—TOILET-PAPER.—*George W. Thompson*, New York, N. Y. Application filed March 28, 1889. Used since January 1, 1873.
"The word 'BROMO.'"

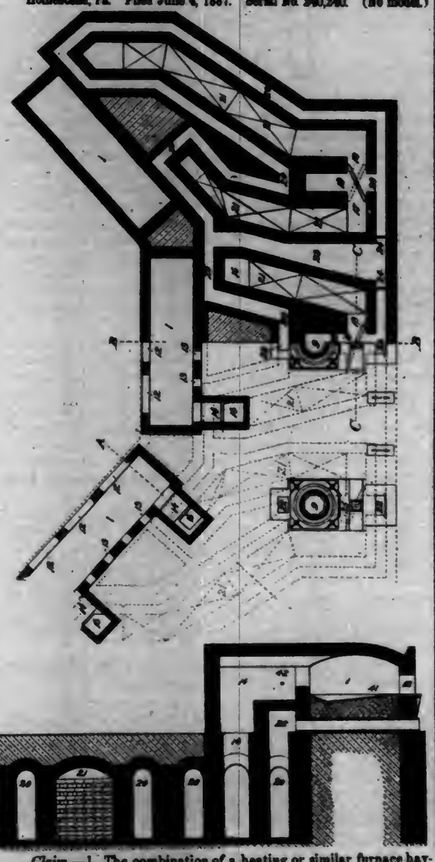
LABELS.

5,943.—Title: "J & C. BLOOKER'S DUTCH COCOA."—*J. & C. Blooker*, Amsterdam, Holland, and New York, N. Y. Application filed February 26, 1889.

5,944.—Title: "GERSTLE'S FEMALE PANACEA."—*Leopold Gerstle*, Bluff City, Tenn. Application filed May 13, 1889.

5,945.—Title: "LEAVENS' LAXATIVE REMEDY."—*George Leavens*, Danielsonville, Conn. Application filed May 22, 1889.

5,946.—Title: "WERTHER'S DISINFECTANT."—*Francis Oscar Werther*, Pottstown, Pa. Application filed May 21, 1889.



5,947.—Title: "WERTHER'S DISINFECTANT."—*Francis Oscar Werther*, Pottstown, Pa. Application filed May 21, 1889.

5,948.—Title: "LANE'S FAMILY MEDICINE."—*Orator F. Woodward*, Le Roy, N. Y. Application filed May 21, 1889.

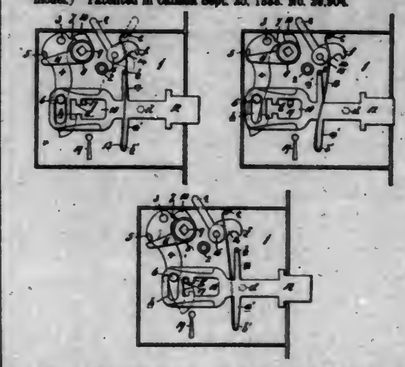
PATENTS

GRANTED JUNE 18, 1889.

405,240. REGENERATIVE HEATING-FURNACE. HENRY AIKEN, Homestead, Pa. Filed June 4, 1887. Serial No. 240,240. (No model.)

Claim.—1. The combination of a heating or similar furnace having several doors, with a pulpit having levers mounted thereon for operating the doors separately, and ropes connecting said levers with the doors, substantially as and for the purposes described.

2. The combination of a heating or similar furnace having a wide door, a lever for operating said door, situate at a distance from and at an angle to said door, a rope connecting said door to its operating-lever, said rope being divided and attached to the door at two separate points, and a rod or bar inserted between the branches of the rope at right angles to the rope, and suitable guides over which the rope passes, substantially as and for the purposes described.



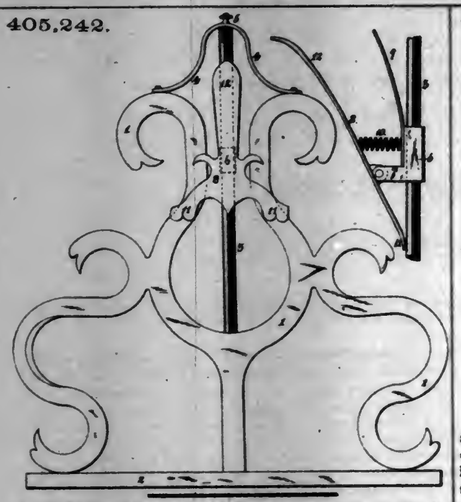
3. A heating-furnace having flues at the rear of each end for the entrance of the burning gases and the exit of the consumed products of combustion, said furnace having its charging and discharging side provided with closely-contiguous doors, whereby, practically, the whole side can be thrown open, substantially as and for the purposes described.

4. A heating-furnace having its charging and discharging side provided with closely-contiguous doors, whereby, practically, the whole side can be thrown open, end slag holes, and an inclined bottom, substantially as and for the purposes described.

5. The combination of several furnaces, each having horizontal regenerators, with a common air-flue extending around all the regenerators, and dampers in the air-flue between the several sets of regenerators, whereby each set can be cut off or connected with the other set or sets, substantially as and for the purposes described.

6. The combination of a heating-furnace with a rear chamber at each end, a reversing-valve, underground flues extending clear of the furnace-walls to the reversing-valve, upright flues connecting the said rear chambers with the underground flues, and regenerators arranged in the underground flues between the rear chambers and the reversing-valve, substantially as and for the purposes described.

405,241. LATCH AND LOCK COMBINED. JOHN AUSTIN, Pension Falls, Ontario, Canada. Filed Oct. 25, 1888. Serial No. 289,159. (No model.) Patented in Canada Sept. 25, 1888. No. 29,904.



Claim.—The combination, with the lock-case provided with posts 3, 15, and 17, of the pendulum 4, hung to post 3, and having posts 5 6, the spindle-tappet 8, having arms 10 11, engaging with the pendulum, the bolt 12, having a slot *h*, engaging with post 6 of the pendulum, and a slot 18, having a projection *g*, engaging post 17 of the lock-case, and provided with arms *a a'*, the dog 14, sleeved on post 15, and engaging one of said arms, and a spring 13, to move the bolt, substantially as set forth.

405,242. ADJUSTABLE LEAF-HOLDER. CHARLES BARBOUR, Verona, Pa. Filed Jan. 2, 1889. Serial No. 295,119. (No model.)

Claim.—1. The combination, in a leaf-holder, of a frame, a vertical rod carried thereby, a bracket freely sliding upon the rod, a clamp pivoted to the bracket and bearing directly upon the frame, and a spring upon the bracket, adapted to throw the clamp against the frame and at the same time to retain the bracket at any height upon the rod.

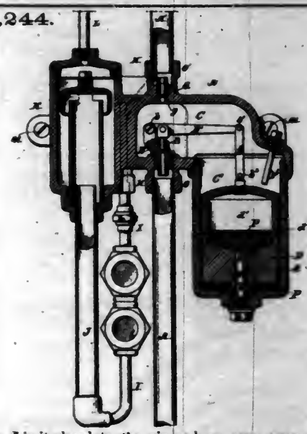
2. The combination, in a leaf-holder, of a frame, a rod carried thereby, a bracket sliding upon the rod, an arm or extension rigidly secured to the bracket, a clamp pivoted to the bracket, and a spring upon the bracket adapted to throw the clamp against the frame and at the same time to retain the bracket at any height upon the rod.

405,242.

405,243. BLOW-OFF DEVICE. JOHN D. BOWMAN, Altoona, Pa. Filed Nov. 6, 1888. Serial No. 290,076. (No model.)

Claim.—1. In combination with a safety-valve, consisting of a device in the nature of a U-pipe filled with mercury or other fluid, a blow-off chamber secured on the end of one arm of the U, and having secured in it a cup F, with its mouth toward the opening of the U-pipe, and a tube H, extending between the pipe and the cup, substantially as and for the purpose specified.

2. In combination with a safety-valve, consisting of a device in the nature of a U-pipe filled with mercury or other fluid, a blow-off chamber secured on the end of one arm of the U, and having secured in it a cup F, with its mouth toward the opening of the U-pipe, a tube H, extending between the pipe and the cup, and a perforated disk G, arranged across the chamber above the cup, all substantially as and for the purpose specified.



3. In combination with a safety-valve, consisting of a device in the nature of a U-pipe filled with mercury or other fluid, a blow-off chamber secured on the end of one arm of the U, a chamber J, formed between the bottom of the chamber and an extension of the U-pipe entering it, a cup F, secured in the blow-off chamber with its face toward the opening of the U-pipe, and a tube H, secured in the blow-off chamber so that its lower end will surround the extension of the U-pipe and lie in the chamber J and its upper end extend upward into or nearly into the cup F, all substantially as and for the purpose specified.

4. In combination with a safety-valve, consisting of a device in the nature of a U-pipe filled with mercury or other fluid, a blow-off chamber secured on the end of one arm of the U, a chamber J, formed between the bottom of the chamber and an extension of the U-pipe entering it, a cup F, secured in the blow-off chamber with its face toward the opening of the U-pipe, a tube H, secured in the blow-off chamber so that its lower end will surround the extension of the U-pipe and lie in the chamber J and its upper end extend upward into or nearly into the cup F, and a perforated diaphragm G, arranged across the blow-off chamber above the cup, all substantially as and for the purpose specified.

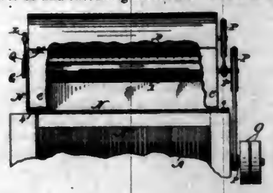
405,244. PRESSURE-REGULATOR FOR GAS-CONDUITS. JOHN D. BOWMAN, Altoona, Pa. Filed Jan. 12, 1889. Serial No. 296,203. (No model.)

Claim.—1. A pressure-regulator for gas-conduits, consisting of a regulating-valve interposed in the conduit, in combination with a chamber C, closed to the air and connected with the gas-conduit only and adapted to contain fluid, a float D, situated in said chamber, having

405,244.

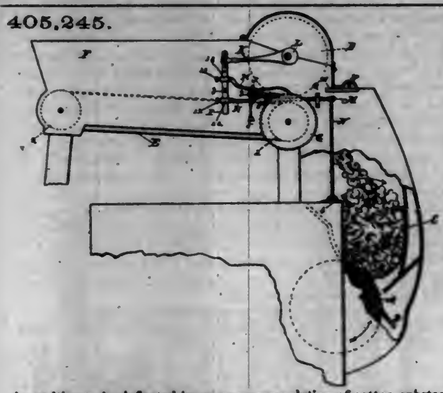
a hollow d' in it closed to the air, and an open passage d, leading downward from said hollow into chamber C, and mechanism connecting the valve and float, substantially as specified, and so as to move the valve to or from its seat as the float falls or rises.

2. A pressure-regulator for gas-conduits, consisting of a regulating-valve interposed in the conduit, in combination with a chamber C, closed to the air and connected with the gas-conduit only and adapted to contain fluid, a float D, situated in said chamber, having a hollow d' in it closed to the air, and an open passage d, leading downward from said hollow into chamber C, a guide F, to maintain the float in the center of the chamber, and mechanism connecting the valve and float, substantially as specified, and so as to move the valve to or from its seat as the float falls or rises.



3. A pressure-regulator for gas-conduits, consisting of a regulating-valve interposed in the conduit, in combination with a chamber C, closed to the air and connected with the gas-conduit only and adapted to contain fluid, a float D, situated in said chamber, having a hollow d' in it closed to the air, and an open passage d, leading downward from said hollow into chamber C, an adjustable stop F, arranged to prevent the float from rising above a determined point in the chamber, and mechanism connecting the valve and float, substantially as specified, and so as to move the valve to or from its seat as the float falls or rises.

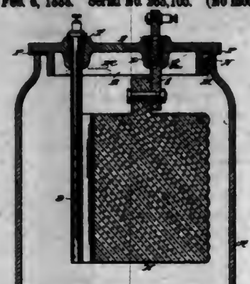
4. A pressure-regulator for gas-conduits, consisting of a regulating-valve interposed in the conduit, in combination with a chamber C, closed to the air and connected with the gas-conduit only and adapted to contain fluid, a float D, situated in said chamber, having a hollow d' in it closed to the air and with sloping bottom d^3, and an open passage d, leading downward from the lowest point of bottom d^3 into chamber C, and mechanism connecting the valve and float, substantially as specified, and so as to move the valve to or from its seat as the float falls or rises.



5. The casting N, containing valve-chamber C, blow-off chamber K, openings O O' for conduit-connections, and passage H, in combination with float-chamber C, U-pipe J I, connecting passage H with the blow-off chamber, float D, valve B, mechanism connecting said valve and float, as specified, and diaphragm G, secured in opening O' below the mouth of passage H, all substantially as and for the purpose specified.

405,245. FEED-REGULATOR FOR COTTON-GINS. ROBERT L. BRANDON, near Fort Adams, Miss. Filed Apr. 19, 1888. Serial No. 271,196. (No model.)

Claim.—1. In a cotton-gin, the combination, with a feed-ratchet and its operating pawl or pawls and means for actuating said pawls, of link J and lever M, on which said link is carried, and the cord N and roll-box or saw-chamber, the said cord being connected at one end to the lever M and extending across the roll-box or saw-chamber



405,245.

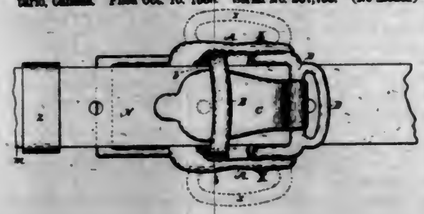
in position to be deflected by an overaccumulation of cotton, substantially as shown and described.

2. In a cotton-gin, the combination, with a feed-ratchet and its operating pawl or pawls and means for actuating said pawls, of link J and lever M, on which said link is carried, and a hinged breast-board C, provided with projection 11, whereby, when said breast-board is raised, the lever M is depressed and the feed is cut off, substantially as shown and described.

405,246. GALVANIC BATTERY. WILLIAM A. CHILDS, Englewood, N. J. Filed Feb. 6, 1888. Serial No. 263,105. (No model.)

Claim.—1. The detachable zinc or positive electrode supported in a tapered opening in the top plate of the battery, as and for the purpose described.

2. The detachable zinc or positive electrode supported in the tapered opening in the top plate and provided with an elastic washer adapted to enter said opening, as and for the purpose described.



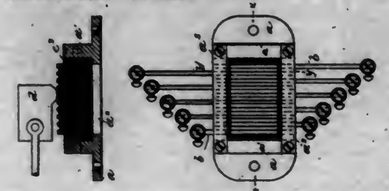
3. The combination, with the tapered supporting-conductor for the negative element, of a correspondingly-tapered opening in the top or cover plate, as and for the purpose described.

4. The combination, with the perforated cover or top plate, of the supporting-conductor having a taper formed at a point below the top edge of the perforation and engaging with a correspondingly-tapered portion of the latter.

5. In a galvanic battery, a carbon plate or rod forming an extension of the active carbon element, provided with a taper at the point where it passes through a perforation in the battery-cover.

6. In a galvanic battery, the carbon plate G, passing through the battery-cover and tapered at the point where it engages with said cover, as and for the purpose described.

405,247. TRACE-BUCKLE. VINCENT A. COLEMAN, Port Hope, Ontario, Canada. Filed Oct. 10, 1888. Serial No. 287,755. (No model.)



405,247.

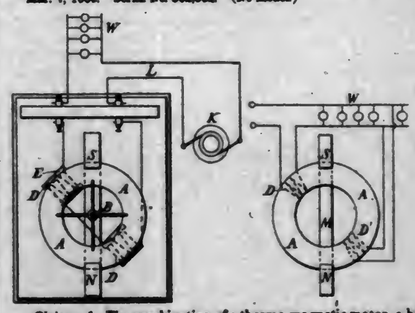
Claim.—1. In the herein-described buckle, the tongue-plate C, having its inner surface, which comes in contact with the trace, plane and hinged at its rear end to the bail D, in combination with the bail D, with its hooks or trunnions K K and the draw-links B, substantially as set forth.

2. The combination of the body of the buckle with its three cross-bars F, G, and H, forming a bed for the trace, between which and the tongue-plate C the trace is clamped, and the recesses in the side pieces A A, between the bars G and H, for the reception of the hooks K K of the bail, with the bail D and the draw-link B, substantially as described.

405,248. ELECTRIC SWITCH. OLOF DAHL, Brooklyn, assignor to the Cleveland Motor Company, New York, N. Y. Filed Oct. 10, 1888. Serial No. 287,716. (No model.)

Claim.—1. A skeleton frame of general rectangular shape having an opening at the top and bottom and single openings in two of its sides, in combination with a series of contact-plates located in a parallel position and extending through the openings in the sides, substantially as described.

2. In an electric switch, a series of plates having lateral extensions thereon, in combination with a skeleton frame, the extensions on said plates passing through openings in said frame to the outside thereof, the extensions being arranged alternately on opposite sides of the frame, for the purpose of making circuit-connections therewith.



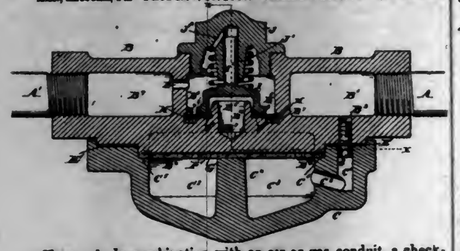
3. An electric switch consisting of a skeleton frame having its top and bottom open, in combination with a series of approximately-rectangular contact-plates suitably mounted on edge within said frame with their flat surfaces parallel to each other and with a space between each plate.

4. In an electric switch, the combination of the skeleton frame, the two movable side strips a^2 a^2, and a series of contact-plates secured within said frame by the said side strips, as described.

5. In an electric switch, a series of contact-plates mounted in parallel position with a space between each, mounted in a skeleton frame, the upper edges of the contact-plates being in the same plane and extending some distance above the frame, in combination with a sliding contact adapted to move into contact with any of said contact-plates.

6. In an electric switch, the combination, with a skeleton metallic frame having openings above and below, of a series of approximately-rectangular contact-plates in a vertical position parallel to each other, with an air-space between every two plates, said plates being insulated from the frame and from each other by strips of insulating material interposed between the frame and the plates, substantially as described.

405,249. ELECTRIC METER. OLOF DAHL, Brooklyn, N. Y. Filed Mar. 7, 1889. Serial No. 302,382. (No model.)



Claim.—1. The combination of a thermo-magnetic motor, a heating-conductor or heating-conductors heating, when traversed by elec-

tric currents, the armature of said motor in proper places to make it revolve, a retarding or loading device applied to the armature of said motor, and a device for counting or registering the revolutions of said armature.

2. The combination of a thermo-magnetic motor, a heating-conductor or heating-conductors heating, when traversed by electric currents, the armature of said motor in proper places to make it revolve, and a device for counting or registering the revolutions of said armature.

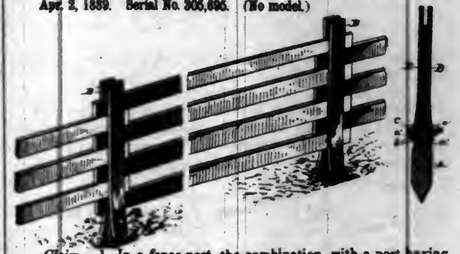
3. The combination of a thermo-magnetic motor deriving its source of heat from heating-conductors traversed by electric currents in direct proportions as the electric energy consumed, a retarding device applied to said motor, and a registering or indicating device actuated by the movements of the motor.

405,250. CHECK-VALVE. CHARLES B. DUDLEY and JOHN D. BOWMAN, Altoona, Pa. Filed Nov. 13, 1888. Serial No. 290,689. (No model.)

Claim.—1. In combination with an air or gas conduit, a check-valve chamber having its entrance-passage situated in its bottom and surrounded by an upwardly-extending annular projection, so as to form an annular chamber to contain liquid, a valve-seat formed on the bottom of said chamber around the upwardly-extending flange, a washer of leather or similar material resting on said seat, and a valve shaped to extend over the annular projection and seat itself on the washer aforesaid, all substantially as and for the purpose specified.

2. In combination with an air or gas conduit, a check-valve chamber having its entrance-passage situated in its bottom and surrounded by an upwardly-extending annular projection, so as to form an annular chamber to contain liquid, a valve-seat formed on the bottom of said chamber around the upwardly-extending flange, an annular groove extending around and below the valve-seat, a washer of leather or similar material resting on said seat and extending over the annular depressed groove, and a valve shaped to extend over the annular projection and seat itself on the washer aforesaid, all substantially as and for the purpose specified.

3. In combination with an air or gas conduit, a check-valve chamber having its entrance-passage situated in its bottom and surrounded by an upwardly-extending annular projection, so as to form an annular chamber to contain liquid, a valve-seat formed on the bottom of said chamber around the upwardly-extending flange, a washer of leather or similar material resting on said seat, and a valve shaped to extend over the annular projection and seat itself on the washer aforesaid, said valve having a bearing-face provided with serrations, all substantially as and for the purpose specified.



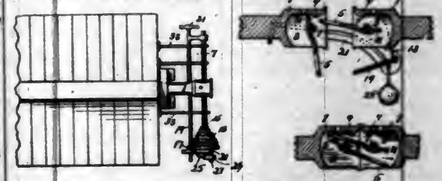
4. In combination with an air or gas conduit, a check-valve chamber having its entrance-passage situated in its bottom and surrounded by an upwardly-extending annular projection, so as to form an annular chamber to contain liquid, a valve-seat formed on the botton of said chamber around the upwardly-extending flange, an annular groove extending around and below the valve-seat, a washer of leather or similar material resting on said seat and extending over the annular depressed grooves, and a valve shaped to extend over the annular projection and seat itself on the washer aforesaid, said valve having a bearing-face provided with serrations, all substantially as and for the purpose specified.

5. In combination with an air or gas conduit, a dust-guard consisting of a disk or washer of felt and a similar disk of perforated metal arranged to support the felt secured across the conduit, and a check-valve situated in the conduit on the exit side of the dust-guard.

6. In combination with an air or gas conduit, a valve-chamber casting B, containing chambers B', B⁵, and B⁸ and having below chamber B⁸ an annular flange B⁴ and webs B⁵, a casting C, containing a chamber C⁸, and having an annular groove C⁹ and a central support C⁴, passages connecting chamber C⁸ with chambers B' and B⁵ and chamber B⁸ with B⁸, a felt washer G and perforated metal supporting-plate F, clamped between the flange and webs B⁴ B⁵ B⁸ and the groove and support C⁹ C⁴, a check-valve situated in chamber B⁸, and a cap J, forming a cover to said chamber B⁸, all substantially as and for the purpose specified.

7. In combination with an air or gas conduit, a valve-chamber casting B, containing chambers B', B⁵, and B⁸ and having below chamber B⁸ an annular flange B⁴ and webs B⁵, a casting C, containing a chamber C⁸ and having an annular groove C⁹ and a central support C⁴, passages connecting chamber C⁸ with chambers B' and B⁵ and chamber B⁸ with B⁸, a felt washer G and perforated metal supporting-plate F, clamped between the flange and webs B⁴ B⁵ B⁸ and the groove and support C⁹ C⁴, an annular projection B⁹, extending around the entrance of the passage connecting chamber C⁸ with chamber B⁸, so as to form a chamber at the bottom of chamber B⁸ to contain liquid, a valve-seat formed around flange B⁹, an annular depressed groove extending around said valve-seat, a washer H, covering the valve-seat and extending over the depressed groove, a valve I, formed to extend over the projection B⁹ and seat itself on washer H, a valve-stem I', extending up from said valve, a cap J, having a hollow internal projection J' to support and guide the stem I', and a passage J² leading from chamber B⁸ to the top of the hollow projection, all substantially as and for the purpose specified.

405,251. FENCE-POST. AARON P. ELSEY, Bardwell, Ky. Filed Apr. 2, 1889. Serial No. 305,695. (No model.)

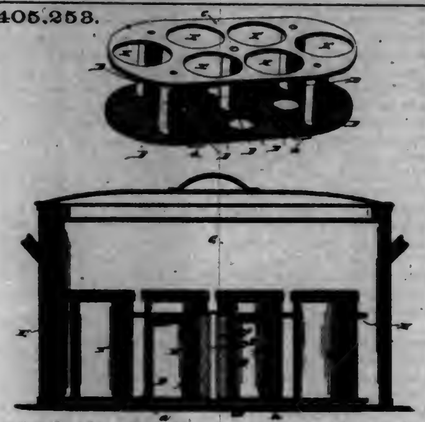


Claim.—1. In a fence-post, the combination, with a post having its inner and outer sides beveled, of the two corresponding strips secured to said beveled sides and forming a clamp adapted to bind the rails when disposed between said strips, substantially as set forth.

2. In a fence-post, the combination, with a post having its inner and outer sides beveled, of two corresponding strips secured to said beveled sides by a bolt, and a nut disposed upon the end of the bolt adapted to clamp the strips against the rails when disposed between the latter, substantially as set forth.

3. The herein-described fence-post, comprising the rigid post having a pointed lower end and beveled inner and outer sides, two corresponding strips disposed one at each of said beveled sides, a bolt passing transversely through the post and strips, and a nut disposed upon the end of the bolt for clamping and securing the strips, substantially as and for the purpose set forth.

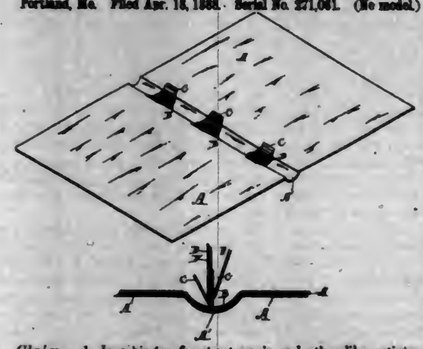
405,252. CAR-COUPLING. CLEMENT ENGEL, St. Paul, Minn., assignor of one-half to Ignase Pruneta, same place. Filed Feb. 4, 1889. Serial No. 298,546. (No model.)



Claim.—1. The combination, with a railway-car, of the coupler-head I, having the recess 3 and the stop 9, the rod 7, turning freely in said coupler-head and provided with the link 5, the helical spring 13, having its inner coil rigidly secured to said rod 7 and its outer coil engaging the rod 19, the slotted bar 21, adapted to slide and to turn on said rod 7 against the tension of said spring and provided with the slidable weight 25 and the spur 27, adapted to engage the stop 29, and the rod 19, joined rigidly at one end to the bar 21 and secured loosely at its other end to the rod 7, substantially as described.

2. In a car-coupler, the combination, with a coupler-head having the stop 9, of the coupling-link 5, having the solid end 11, pivotally secured in said head, and the rod 7, rigidly secured to said link and serving as its pivot, and having suitable handles, by means of which it may be turned in said coupler-head, so as to elevate or depress said link, and the slidable weight 25 to hold the link in such position, substantially as described.

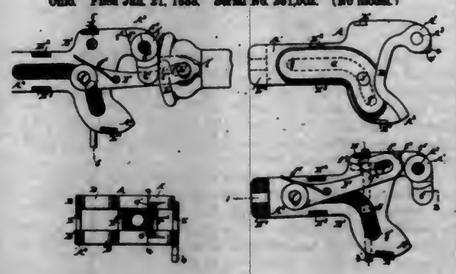
405,253. FRUIT OR VEGETABLE COOKER. FRANKLIN W. GAINES and ELLA GAINES, Colfax, Wash. Filed Oct. 20, 1888. Serial No. 288,691. (No model.)



Claim.—The combination, with the bottom plate A, provided with

405,253.

openings B, and upon its under surface with feet *a*, and intermediate its openings B with bolt-holes *d'*, of the superimposed plate C, having can-openings E, and intermediate bolt-holes *c*, registering with the openings *d'* in the lower plate, and the pillars D, longitudinally bored, as at D', to register with the openings *d'* and *c*, and the bolt D², inserted through the openings D', *d'*, and *c*, substantially as specified.



405,254. BINDER FOR SHEET-MUSIC, &c. GEORGE C. GOWEN, Portland, Me. Filed Apr. 18, 1888. Serial No. 271,061. (No model.)

Claim.—1. In a binder for sheet-music and other like articles, the combination of two outer covers united by a back piece of ordinary construction, a flexible strip secured by its ends to the adjacent edges of said cover, and a number of tabs or pieces of cloth or other like material secured to said strip and coated with adhesive material, said tabs being shorter than said back piece, whereby they may be passed through incisions in the edges of the leaves to be bound, substantially as and for the purpose set forth.

2. A book or volume composed of sheets in sets of two or more folded one inside of the other, a pair of covers united by a back piece, one or more flexible strips secured by their ends to the adjacent edges of said cover, tabs shorter than said back piece secured to said strips and to the inner sheet of each set, and apertures in the folded edges of said sheets to admit said tabs, substantially as shown.

405,255. CAR-COUPLING. SAMUEL H. HARRINGTON, Columbus, Ohio. Filed Jan. 21, 1888. Serial No. 261,502. (No model.)

Claim.—1. A coupling-head consisting of plates B B', of suitable form, in combination with stays situated on the outer edges of said plates and between the coupling-head proper and the end of its shank, substantially as and for the purpose specified.

2. A coupling-head consisting of plates B B' and of suitable form and provided with longitudinal corrugations, in combination with stays situated on the outer edges of said plates, securing them together and at a proper distance apart, so that the space between said plates may open freely and without obstruction in front.

3. A coupling-head consisting of plates B B' of suitable form, provided with longitudinal corrugations and with their front edges thickened externally, in combination with stays situated on the outer edges of said plates, securing them together and at a proper distance apart, so that the space between said plates may open freely and without obstruction in front.

4. In combination with a coupling-head consisting of plates B B', united by stays securing them together and at a proper distance apart, while leaving the space between said plates open in front of said head, a coupling nose or knuckle pivoted in one arm of the head, a latch for locking said nose, and a retractible supplemental coupling device secured between the plates B B', as specified, so as to normally lie inside the head and be capable of being drawn forward to engage with another coupler.

5. In combination with a coupling-head consisting of plates B B', secured together and at a suitable distance apart by stays which leave the space between the plates unobstructed in the front, a bifurcated coupling-nose made without vertical perforation pivoted in one arm of the head, a latch for locking said nose, and a retractible supplemental coupling device secured between the plates B B', as specified, so as to normally lie inside the head and be capable of being drawn forward to engage with another coupler.

6. In combination with a coupling-head consisting of plates B B', secured together and at a suitable distance apart by stays which leave the space between the plates unobstructed in the front, a coupling-nose pivoted in one arm of the head, a latch for locking said nose, and a retractible supplemental coupling device having its end formed into a hook secured between the plates B B', as specified, so as to normally lie inside the head and be capable of being drawn forward to engage with another coupler.

7. In combination with a coupling-head consisting of plates B B', united by stays which secure them together at a proper distance apart, while leaving the said space between said plates open in front of the said head, a coupling nose or knuckle pivoted in one arm of the head, a latch for locking said nose, guiding-grooves formed in the plates B B', and a retractible supplemental coupling device having pins *f* at its rear end, which said pins are engaged and slide in the guiding-grooves, whereby the supplemental coupling device is permitted to move forward to engage with another coupler without becoming disengaged from the head.

8. In combination with a coupling-head consisting of plates B B', having guiding-grooves G formed in them by bending the metal of the plates outward, and united by stays which secure them together and at a proper distance apart, while leaving the said space between said plates open in front of the said head, a coupling nose or knuckle pivoted in one arm of the head, a latch for locking said nose, and a retractible supplemental coupling device having pins *f* at its rear end, which said pins are engaged and slide in the grooves G, whereby the supplemental coupling device is permitted to move forward to engage with another coupler without becoming disengaged from the head.

9. In combination with a coupling-head consisting of plates B B', secured together and at a proper distance apart by stays which leave the space between the plates open in front, a coupling nose or knuckle pivoted in one arm of said coupling-head, a latch for locking said nose, a curved guiding-groove formed on the inside of the plates B B' along the center of their shanks and the center of the guard-arm of the coupler opposite to the arm holding the knuckle, and a retractible supplemental coupling device having a hooked end in front and its rear end provided with pins which engage with the guide-slots on the plates B B'.

10. In combination with a coupling-head consisting of plates B B' secured together and at a proper distance apart by stays which leave the space between the plates open in front, a coupling nose or knuckle pivoted in one arm of said coupling-head, a latch for locking said nose, a curved guiding-groove formed on the inside of the plates B B' along the center of their shanks and the center of the guard-arm of the coupler opposite to the arm holding the knuckle, a stop-pin J, adjustable in said guide-slot, and a retractible supplemental coupling device having a hooked and perforated end in front and its rear end provided with pins which engage with the guide-slots on the plates B B'.

11. In combination with a coupling-head consisting of plates B B', secured together and at a proper distance apart by stays which leave the space between the plates open in front, a bifurcated coupling nose

or knuckle pivoted in one arm of said coupling-head, a latch for locking said nose, a curved guiding-groove formed on the inside of the plates B B' along the center of their shanks and the center of the guard-arm of the coupler opposite to the arm holding the knuckle, a stop-pin J, adjustable in said guide-slot, a retractible supplemental coupling device having a hooked and perforated end in front and its rear end provided with pins which engage with the guide-slots on the plates B B', and a spring f^6, secured on the retractible coupling device so as to press against the stop-pin J when said device is drawn forward in the curved guiding-groove, substantially as and for the purpose specified.

12. In combination with a coupling-head A, having arms A' A^2, a coupling nose or knuckle C, pivoted in the arm A' and having a locking-arm extending from it in substantially the opposite direction to that of the knuckle proper, and a latch arranged to engage said arm and lock the nose in its closed position.

13. In combination with a coupling-head A, having arms A' A^2, square projecting corners a, formed on the inside of the ends of the plates composing the arm A', a coupling nose or knuckle pivoted in arm A' and having a locking-arm extending from it in a direction substantially opposite to the knuckle proper, and a latch arranged to engage said arm and lock the knuckle in its closed position.

14. In combination with a coupling head A, having arms A' A^2, a coupling nose or knuckle C, pivoted in the arm A' and having a locking-arm c^6 of less depth than the boss of the knuckle extending from it in substantially the opposite direction to that of the knuckle proper, a stop-lug c^5, and a verticallly-movable latch arranged when in its lowest position to engage said arm and lock the nose in its closed position and when elevated to allow arm c^6 to pass under it until said latch comes in contact with the stop-lug c^5, all substantially as and for the purpose specified.

15. In combination with the coupling-head A, having arms A' A^2, said head being made up of plates B B', secured together and at a proper distance apart by stays uniting their outer edges, so as to leave the space between the plates an unobstructed front opening, a coupling-nose C, pivoted in arm A' and having a locking-arm extending from it in a direction opposite to that of the knuckle proper, a latch adapted to engage said locking-arm, and a retractible supplementary coupling device secured in and extensible from the coupling-head, substantially as and for the purpose specified.

16. In combination with the coupling-head A, having arms A' A^2, said head being made up of plates B B', secured together and at a proper distance apart by stays uniting their outer edges, so as to leave the space between the plates an unobstructed front opening, a bifurcated coupling-nose C, pivoted in arm A' and having a locking-arm extending from it in a direction opposite to that of the knuckle proper, a latch adapted to engage said locking-arm, and a retractible supplemental coupling device having a hooked and perforated outer end secured in and extensible from the coupling-head, substantially as and for the purpose specified.

17. In combination with the coupling-head A, constructed so as to permit the space between its upper and lower plates to open freely in front, a bifurcated coupling-nose C, pivoted in one arm of the coupler and having a locking-arm c^6 extending from it, a latch to engage and lock said arm, guiding-grooves formed on the upper and lower plates of the head, a retractible supplemental coupling device F, having a hooked and perforated end at its front, bearing-pins f engaged in the guide-slots at its rear, and a pin f^5 extending down from the lower edge of its hook.

18. In combination with the coupling-head A, constructed, substantially as specified, so as to leave the space between the upper and lower plates open and unobstructed in front, a coupling-nose C, having locking-arm c^6, extending from its boss in a direction opposite to that of the knuckle proper, said arm being of less thickness than the boss, guiding-grooves formed in the upper and lower plates of the arm, and a retractible supplemental coupling device having pins f at its rear end engaged in the guiding-grooves and its length so proportioned that when in its rearmost position and with its head thrown into the arm of the coupler which carries the knuckle the said head will act as a latch in connection with the arm c^6 of the coupling-knuckle C, all substantially as and for the purpose specified.

19. In combination with the coupling-head A, constructed, substantially as specified, so as to leave the space between the upper and lower plates open and unobstructed in front, a coupling-nose C, having locking-arm c^6, extending from its boss in a direction opposite to that of the knuckle proper, said arm being of less thickness than the boss, guiding-grooves formed in the upper and lower plates of the coupler, a retractible supplemental coupling device having pins f at its rear end engaged in the guiding-grooves, and a hooked and perforated head, its length so proportioned that when in its rearmost position and with its head thrown into the arm of the coupler which carries the knuckle the said head will act as a latch in connection with the arm c^6 of the coupling-knuckle C, all substantially as and for the purpose specified.

20. In combination with the coupling-head A, constructed, substantially as specified, so as to leave the space between the upper and lower plates open and unobstructed in front, a coupling-nose C, having a locking-arm c^6, extending from its boss in a direction opposite to that of the knuckle proper, said arm being of less thickness than the boss, guiding-grooves formed in the upper and lower plates of the coupler, a retractible supplemental coupling device having pins f at its rear end engaged in the guiding-grooves, a hooked and perforated head, a pin f^5, extending from its under side and flush with the edge f^3 of the hook, said pin being of sufficient length to extend through and below a hole b in the lower plate of the coupling-head and its length so proportioned that when in its rearmost position and with its head thrown into the arm of the coupler which carries the knuckle the said head will act as a latch in connection with the arm c^6 of the coupling-knuckle C, and a cam H, secured below the hole b, so that when turned it will press against the pin f^5 and elevate the head of the retractible coupling device to unlatch the arm c^6, all substantially as and for the purpose specified.

21. In combination with the coupling-head A, constructed, substantially as specified, so as to leave the space between the upper and lower plates open and unobstructed in front, a coupling-nose C, having a locking-arm c^6, extending from its boss in a direction opposite to that of the knuckle proper, said arm being of less thickness than the boss, curved guiding-grooves formed in the upper and lower plates of the coupler, so as to extend along the shank and into the guard-arm, a retractible supplemental coupling device having pins f at its rear end engaged in the guiding-grooves, and a hooked and perforated head, its length so proportioned that when in its rearmost position and with its head thrown into the arm of the coupler which carries the knuckle the said head will act as a latch in connection with the arm c^6 of the coupling-knuckle C, all substantially as and for the purpose specified.

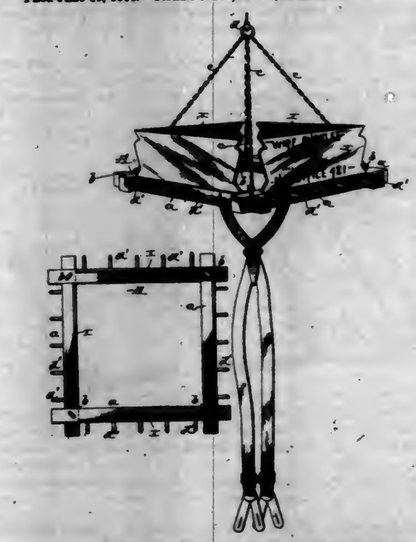
22. In combination with the coupling-head A, constructed, substantially as specified, so as to leave the space between the upper and lower plates open and unobstructed in front, a coupling-nose C, having a locking-arm c^6, extending from its boss in a direction opposite to that of the knuckle proper, said arm being of less thickness than the boss, guiding-grooves formed in the upper and lower plates of the coupler, a retractible supplemental coupling device having pins f at its rear end engaged in the guiding-grooves and its length so proportioned that when in its rearmost position and with its head thrown into the arm of the coupler which carries the knuckle the said head will act as a latch in connection with the arm c^6 of the coupling-knuckle C, and a stop-pin J, adjustable in the guiding-slots, all substantially as and for the purpose specified.

23. In combination with the coupling-head A, constructed, substantially as specified, so as to leave the space between the upper and lower plates open and unobstructed in front, a coupling-nose C, having a locking-arm c^6, extending from its boss in a direction opposite to that of the knuckle proper, said arm being of less thickness than the boss, curved guiding-grooves formed in the upper and lower plates of the coupling, so as to extend along the shank and into the guard-arm thereof, a retractible supplemental coupling device having pins f at its rear end engaged in the curved guiding-grooves and hooked and perforated front end, and its length so proportioned that when in its rearmost position and with its head thrown into the arm which carries the coupling-nose said head will act as a latch in connection with the arm c^6 of the knuckle C, a spring f^6, secured to the supplemental coupling device, and a stop-pin J, adjustable in the curved guiding-slot, all substantially as and for the purpose specified.

405,256. CAR-COUPLING. SAMUEL H. HARRINGTON, Columbus, Ohio. Filed Jan. 30, 1888. Renewed Dec. 1, 1888. Serial No. 292,439. (No model.)

Claim.—1. In combination with a coupling-head having a pivot-arm and a guard-arm, a coupling nose or knuckle pivoted in said pivot-arm and having a locking-arm extending from its hub or boss in a direction substantially opposite to the nose proper, a latch arranged to engage the locking-arm, and a spring-arm secured to the coupling-nose, so that it will extend into the space between the pivot and guard arms when said nose is open.

2. In combination with a coupling-head having a pivot-arm and a guard-arm, a coupling nose or knuckle pivoted in said pivot-arm and having a locking-arm extending from its hub or boss in a direction substantially opposite to the nose proper, a reversible double latch having arms of unequal length, either of which can be made to engage the locking-arm of the coupling-nose.

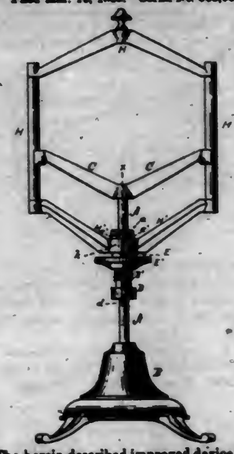


3. In combination with a coupling-head having a pivot-arm and a guard-arm, a coupling nose or knuckle pivoted in said pivot-arm and having a locking-arm extending from its hub or boss in a direction substantially opposite to the nose proper, a reversible double latch having arms of unequal length, either of which can be made to engage the locking-arm of the coupling-nose, and a spring-arm secured to the coupling-nose, so that it will extend into the space between the pivot and guard arms when said nose is open.

4. In combination with a coupling-head having a pivot-arm and a guard-arm, a coupling nose or knuckle pivoted in said pivot-arm and having a locking-arm extending from its hub or boss in a direction substantially opposite to the nose proper, a latch arranged to engage the locking-arm, a spring-arm secured to the coupling-nose, so that it will extend into the space between the pivot and guard arms when said nose is open, and a stop secured in the coupling-head, so as to engage and deflect the spring as the coupling-nose is closed.

5. In combination with a coupling-head having a pivot-arm and a guard-arm and made up of two plates B B', secured together and at a proper distance apart by stays arranged on the outer edges of said plates, so as to leave the space between said plates open and unobstructed in front, a coupling nose or knuckle pivoted in said pivot-arm and having a locking-arm extending from its hub or boss in a direction substantially opposite to that of the nose proper, a latch arranged to engage said locking-arm, a spring secured to said coupling-nose, so as to extend out into the space between the pivot and guard arms when the knuckle is open, and a retractible supplementary coupling device secured in the hollow space between the plates B B', so that it can be drawn out between the arms of the head.

6. In combination with a coupling-head having a pivot-arm and a guard-arm and made up of two plates B B', secured together and at a proper distance apart by stays arranged on the outer edges of said plates, so as to leave the space between said plates open and unobstructed in front, a coupling nose or knuckle pivoted in said pivot-arm and having a locking-arm extending from its hub or boss in a direction substantially opposite to that of the nose proper, a latch arranged to engage said locking-arm, a spring secured to said coupling-nose, so as to extend out into the space between the pivot and guard arms when the knuckle is open, a retractible supplementary coupling device secured in the hollow space between the plates B B', so that it can be drawn out between the arms of the head, and a stop on the front edge of the lower plate.



405,257. DISPLAY-RACK. CHARLES R. HARRIS, Williamsport, Pa. Filed June 19, 1888. Serial No. 277,516. (No model.)

Claim.—1. As an improved article of manufacture, an angular frame having display cards or advertisements affixed to the upper face of each side, hooks secured to the side pieces below the cards or advertisements, and chains or flexible devices leading upwardly from the corners and attached to a suspending-ring, substantially as set forth.

2. A display-rack consisting of an angular frame, screw eyes or staples securing the side pieces of the frame together, display cards or advertisements secured to the side pieces of the frame, hooks also attached to said side pieces, and flexible devices attached to the screw eyes or staples for holding the frame suspended, substantially as set forth.

405,258. CLOCK-MOVEMENT HOLDER. JOHN HARWOOD, Somerville, Mass. Filed Mar. 16, 1889. Serial No. 303,609. (No model.)

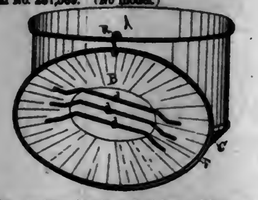
Claim.—The herein-described improved device for holding clock movements, consisting, essentially, of the standard A, threaded at its upper end and supported by a pedestal, externally-threaded tube D and set-screw d, tubular thumb-piece E, provided with the annular groove e and spring e', cross-head C, and frame H H' A, supported by said thumb-piece, substantially as and for the purpose set forth.

405,259. WRENCH. JOHN S. HENRY, Stonington, Conn., assignor of one-half to George L. Denison, same place. Filed Dec. 29, 1887. Serial No. 259,257. (No model.)

Claim.—1. An attachment for wrenches, comprising the holder D, adapted to bear on the jaw of the wrench, and having the flanges G G embracing the same, the clamping-screw mounted in one of the flanges and engaging the jaw, and the spring-actuated block sliding in the holder, substantially as specified.

2. An attachment for wrenches, comprising the holder D, having side flanges F, the serrated block mounted between the flanges and having inclined guide-slots P in its sides, and the guide-screws O, mounted in the flanges F and engaging the guide-slots P, substantially as specified.

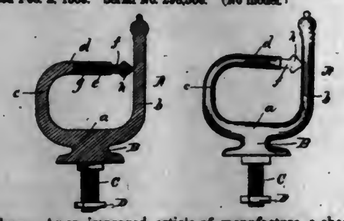
3. An attachment for wrenches, comprising the holder D, adapted to be attached to either jaw of the wrench and having the inclined plate E, the tapered or wedge-shaped block K, mounted on this plate and having its outer face serrated, and the spring attached to the plate and connected to the block, whereby the latter is normally held in the engaging position, substantially as and for the purpose specified.



4. The combination, with the wrench having parallel-faced jaws, of the block-holder D, adapted to be clamped on either jaw, and the sliding block mounted on the block-holder and having a free sliding movement, substantially as specified.

5. The attachment for wrenches, comprising the block-holder D, having a plate E, provided with a vertical stud I, the sliding wedge-shaped block K, mounted on the plate and having a groove in its under side engaging the said stud, and the spring M, attached to the stud I and bearing against the end of the said groove, substantially as specified.

6. The attachment for wrenches, comprising the block-holder D, having vertical side flanges F F, provided with threaded apertures N, the vertical stud I, the wedge-shaped serrated block K, sliding between the flanges F, and having grooves P in its sides and the groove L in its lower side, the spring M, attached to the stud I and operating in the groove L, and the guide-screws O, arranged in the apertures N and engaging at their inner ends in the grooves P, substantially as specified.

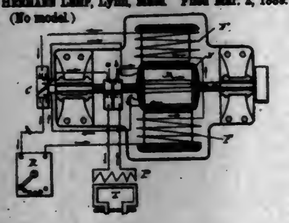


7. As an attachment for wrenches, the holder D, adapted to be attached to either jaw of a wrench, and having the side flanges F, and the serrated block K, fitted between the flanges, and sliding freely outward and inward over the outer face of the holder between the flanges, and the spring housed within and between the block and its holder and connected to said parts, respectively, as set forth.

405,260. FEED-BOX. JOHN W. JACOBS, Fremont, Ohio; John T. Garver administrator of said John W. Jacobs, deceased. Filed Oct. 3, 1888. Serial No. 287,589. (No model.)

Claim.—The combination, in a feed-box with a concaved or dish-shaped bottom, of a follower concaved or dish-shaped on its upper side, having an opening O, with regulating-bars across said opening, flange F, and guide-rod R, all substantially as and for the purpose set forth.

405,261. CHECK-REIN-HOOK. WALTER C. JENKS, Argyle, Wis. Filed Feb. 2, 1889. Serial No. 298,508. (No model.)



Claim.—As an improved article of manufacture, a check-hook consisting of an upright arm or post *b* and a hook with an upper substantially horizontal bent end with a recess therein, a spring mounted in said recessed end of the hook, and a conical headed pin bearing against said spring and held by the said recessed end of the hook normally against the upright post, substantially as described.

405,262. GARMENT. WILLIAM F. KEMP, Chicago, Ill., assignor to the Hay & Todd Manufacturing Company, of Michigan. Filed Dec. 10, 1888. Serial No. 293,111. (No model.)

Claim.—The improved garment described, having a rear filling-piece for giving fullness in the seat, which filling-piece is provided with two projections at its lower end separated by a notch and united to the front part of the garment along the margins of said notch, and to the rear part of the garment along its outer edges, substantially as described.

405,263. COMPOUND-WOUND ALTERNATING-CURRENT DYNAMO. HERMANN LEMP, Lynn, Mass. Filed Mar. 2, 1889. Serial No. 301,788. (No model.)

Claim.—1. In a dynamo-electric machine, the combination, with the field-magnet coil fed by an armature-coil in circuit with the work, of a separate exciting source feeding the same field-magnet coil in multiple with the said armature-coil.

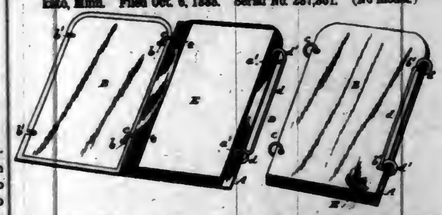
2. The combination of a transformer whose primary is in the uncommuted portion of the circuit of the armature of a dynamo, a field-magnet coil in a locally-commuted portion of said circuit and in series with the primary, and an exciter armature-coil operated in a field excited by its own currents and also connected to the field-magnet coil, as and for the purpose described.

3. The combination, with a transformer for supplying large-volume electric currents, of a dynamo-machine having a work-circuit armature-coil in series with the primary of the transformer and a separate exciter connected in multiple with the first to the field-magnet exciting-circuit, as and for the purpose described.

4. The combination, with a dynamo-machine having an armature-coil and field-magnet coil in series with variable work, of a separate exciting-coil feeding the field in multiple with the first armature-coil, as and for the purpose described.

5. The combination, with a dynamo-machine having a field-coil in series with an armature-coil and commutator, of a transformer having its primary in a portion of said circuit where the current is uncommuted, and a separate armature-coil supplying commuted current in multiple with the first-named armature-coil to the field coil or circuit.

6. The combination, in a dynamo-machine, of a main-circuit armature-coil in series with the work and field-magnet coil and an exciter source or coil independent thereof feeding the main coil in multiple with the first.



7. In a dynamo-electric machine, the combination, with a work-circuit coil, of an exciter-coil, a commutator between the same and the field-coil, a collector-ring between a terminal of the exciter-coil and the commutator, and a variable resistance between the collector-brush for said ring and the commutator.

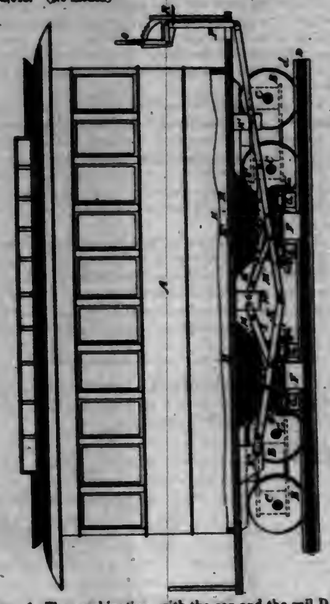
8. The combination, with the exciter-coil and the work-circuit coil, of two collector-rings in the circuit of the exciter-coil, a variable resistance in the connection of the collector-brushes therefor, two collector-rings in the circuit of the work-coil, brushes bearing on the same and including the work in circuit between them, and a commutator in the circuit of both coils and between the same and the field-magnet.

9. In a dynamo-electric machine, the combination, with the work-circuit coil connected to the work through a suitable collecting-ring, of an exciting armature-coil connected to a separate collecting-ring and a variable reactive coil in the connection from the brush of said ring to the circuit of the first-named coil, as and for the purpose described.

10. In a dynamo-electric machine, the combination, with two revolving armature-coils, of a field-magnet coil and a commutator to which one terminal of each armature-coil is connected, collector-rings to which the opposite terminals of the coils are connected, and a third ring connected to the opposite side of the commutator, as and for the purpose described.

405,264. SHEET-MUSIC BINDER. CHARLES M. LINDSAY, Mankato, Minn. Filed Oct. 6, 1888. Serial No. 287,361. (No model.)

Claim.—In music-binders, the clamp C, having hooks *c* and shanks *c'*, and the clamp D, consisting of a wire *d*, having two parallel end rings *d' d'*, in combination with the cover A, having holes *a'*, and the cover B, having holes *b b* and open slots *b' b'*, whereby music-sheets may be conveniently bound together and hung on racks, as described.



405,265. CHURN-DASHER. WILLIAM S. LINDSLEY, Ada, Ohio. Filed Dec. 31, 1888. Serial No. 295,051. (No model.)

Claim.—The improved churn-dasher herein described and shown, comprising the cross-bar B, secured to the lower end of the dasher-rod, the side bars C C, secured to the ends of the said cross-bar and having their upper corners cut away and provided in their inner faces with the V-shaped recesses D, which are continued above their upper contracted ends to form the inclined shoulders F, the perforated breakers secured to and between the cut-away corners of the side bars, and the perforated leaves pivoted in the upper ends of the recesses D and having their edges playing between the walls of said recesses and their corners adapted to come into contact with the shoulders F, as specified.

405,265.

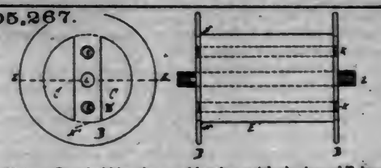
405,266. COMBINED CAR BRAKE AND CLUTCH. LUDWIG MAURER and HEINRICH C. SCHEER, New York, N. Y. Filed Mar. 5, 1889. Serial No. 302,015. (No model.)

Claim.—1. The combination, with the car and the rail D, of the vertically-movable gripper having jaws to engage the flanges of the rail, and the pressure-blocks arranged one at each end of said gripper and adapted to move in a direction opposite to the movement of the gripper and to bear upon the top of the rail, substantially as and for the purpose specified.

2. The combination, with the rail, of the gripper and the inclined scrapers on the ends of the gripper above the top of the rail, substantially as and for the purpose specified.

3. The combination, with the rail D, having flanges *d*, of the gripper having jaws to engage said flanges, and inclined at its ends, as at F', substantially as and for the purpose specified.

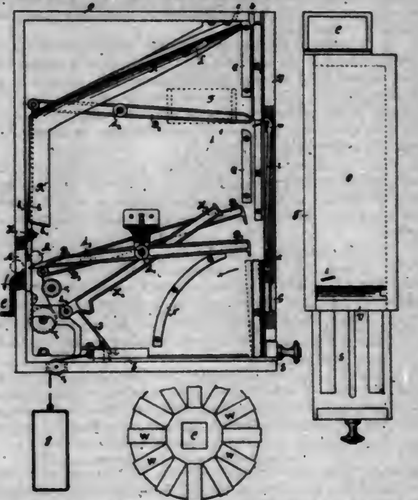
4. The combination, with the vertically-adjustable gripper and the vertically-movable pressure-blocks, of the system of levers for moving said blocks and gripper in opposite directions, substantially as shown and described.



5. The combination, with the car and the vertically-movable gripper and pressure-blocks, of the lever H on the gripper, the levers M, acting on the lever H, and the system of levers for operating the levers M, substantially as shown and described, and for the purpose specified.

6. The combination, with the car, the vertically-movable gripper, and the pressure-blocks movable in the opposite direction to that of the gripper, of the levers H, moving with the gripper, the levers M, connected with the pressure-blocks and acting on the levers H, and the system of levers connected with and arranged to operate the levers M, substantially as and for the purpose specified.

405,267. BOBBIN. CHARLES E. MERRIAM, Paterson, N. J. Filed Apr. 15, 1889. Serial No. 307,266. (No model.)



Brief.—The object of the invention is to provide a bobbin of improved construction in which it shall be impossible for the silk to be wound between the head and the end of the barrel.

405,267.

Claim.—In a bobbin, the combination, the barrel E, having the projecting portions C, of the heads B, having the openings C formed therein to receive said projecting portions, and having the central portions B' let into the ends of the barrel between said portions C, and rivets K, substantially as shown and described.

405,268. APPARATUS FOR AUTOMATICALLY CHANGING CIRCULATING-LIBRARY BOOKS. JULIUS MEHLHARDT, Dresden, Germany, assignor of one-half to Anton Brause, same place. Filed July 5, 1888. Serial No. 279,113. (No model.) Patented in Germany Mar. 16, 1888, No. 45,086; in England May 8, 1888, No. 6,878; in Luxemburg May 14, 1888, No. 901; in Belgium May 15, 1888, No. 81,712; in Italy June 19, 1888, No. 23,443; in France July 9, 1888, No. 190,403; in Canada July 24, 1888, No. 20,546; in Austria-Hungary Aug. 16, 1888, No. 19,406 and No. 34,368, and in Spain Aug. 20, 1888, No. 8,291.

Claim.—1. In an apparatus for the automatic exchanging of library-books, the combination, with the receptacle for containing the books, of a lock adapted to be released by the weight of a coin and a lock adapted to be operated by the weight of the book in the act of being replaced, and means for withdrawing said book when both locks are released, substantially as described.

2. In an apparatus for the automatic exchanging of books, the combination, with the receptacle, of locking-levers, one adapted to be operated by the weight of a predetermined coin and the other by the weight of a book in the act of being returned, and two chutes leading to said levers, one adapted to accommodate the book and the other the coin, substantially as described.

3. In an apparatus for the automatic exchange of books, the combination, with the two locking-levers operating independently to retain the book, one adapted to be released by the weight of a predetermined coin and the other by the weight of a book in the act of being returned, of two independent chutes or ways leading, respectively, to said levers and adapted to accommodate a coin and book, respectively, substantially as described.

4. In an apparatus for the automatic exchange of books, the combination of the receptacle having the vertical chute or guide for the introduction of a book into the receptacle, and the level below the chute adapted to engage a book to retain it in a vertical position at a point below the chute and adapted to be operated by the weight of a coin to release the book, substantially as described.

5. In an apparatus for the automatic exchange of books, the combination of the receptacle having the vertical chute or guide for the introduction of a book into the receptacle, and two independent levers below the chute adapted to engage a book to retain it in vertical position at a point below the chute, one of said levers adapted to be

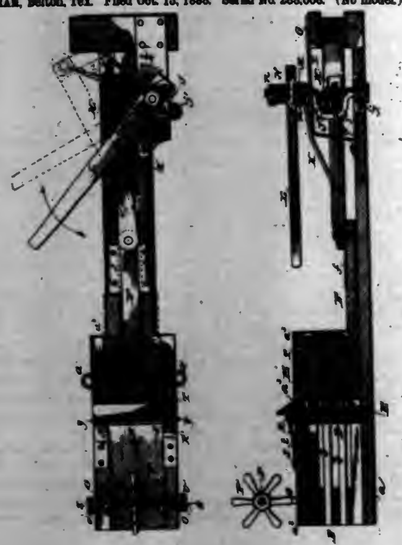
operated by the weight of a predetermined coin and the other by the passage of a book through the chute to release the book within the receptacle, substantially as described.

6. In an apparatus for the automatic exchange of books, the combination, with the chute for the introduction of books within the receptacle and the coin-chute, of locking-levers for retaining the books within the receptacle, one adapted to be operated by the weight of a coin, and a lever projecting into the book-chute and adapted to be operated by the passage of a book through the chute to operate the other locking-lever, whereby the book held by said locking-lever is released, substantially as described.

7. The combination, with the levers for retaining the book within the receptacle, one adapted to be operated by the weight of a coin and the other by the weight of a book to be exchanged, of a retaining lever or gat for retaining the coin in engagement with the coin-operated lever, and a connection between said lever or gate and the lever operated by the book, whereby the coin is released by the book-operated lever, substantially as described.

8. The combination, with the levers for retaining the book within the receptacle, one adapted to be operated by the weight of a coin and a lever adapted to be operated by the book to be exchanged connected to the other to operate the same, of a lever or gate for retaining the coin in engagement with the coin-operated lever, and the connection between the same and the lever operated by the book, whereby the coin-operated lever is depressed until the entrance of a book, substantially as described.

9. In an apparatus for the automatic exchange of books, the combination, with the levers for retaining the book in upright position, adapted to be operated by the entrance of a book to be exchanged and the weight of a predetermined coin, of a lever also adapted to be operated by the book to be exchanged and engaging the book within the receptacle to throw the same on its side, substantially as described.



10. In an apparatus for the automatic exchanging of books, the combination, with the receptacle and the drawer for withdrawing a book, of the lever engaging a book to retain it in upright position and operated by the drawer to release the book, substantially as described.

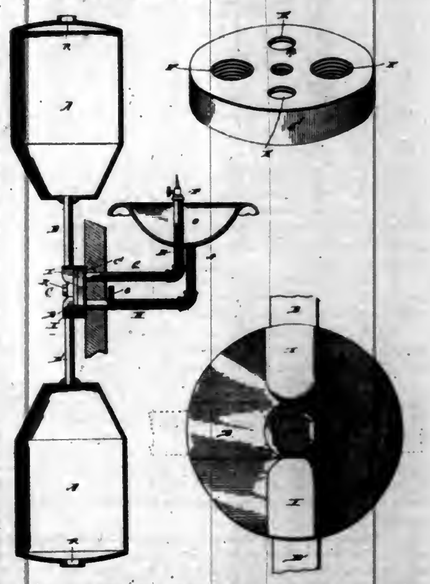
11. The combination, with the drawer and the lever operated thereby to retain the book in upright position, of the lever projecting in the path of the drawer and engaging said first-mentioned lever to release the same when the drawer is closed, substantially as described.

405,269. METHOD OF SIZING PULP. WILLIAM J. MEHRER, St. Helens, County of Lancaster, England. Filed Oct. 20, 1887. Serial No. 252,904. (No specimens.)

Claim.—The method of sizing pulp, which consists in saponifying rosin by treating it with aluminate of soda, adding the solution thus prepared to the pulp in the beating-engine, and then decomposing it by adding a solution of magnesian sulphate or its described equivalent, all substantially as and for the purpose specified.

405,270. BALING-PRESS. JOHN F. PATY and AMBROSE W. BIGHAM, Belton, Tex. Filed Oct. 13, 1888. Serial No. 288,006. (No model.)

Claim.—1. In a baling-press, the combination, with a plunger provided with a spring-actuated face-block, of a crank-shaft connected with said plunger and provided with an operating-lever, and a ratchet-connection between the latter and the crank-shaft, said ratchet, in connection with the spring-actuated face-block of a plunger, being adapted to permit the rebound of the plunger independent of the movement of the operating-lever, substantially as and for the purpose set forth.

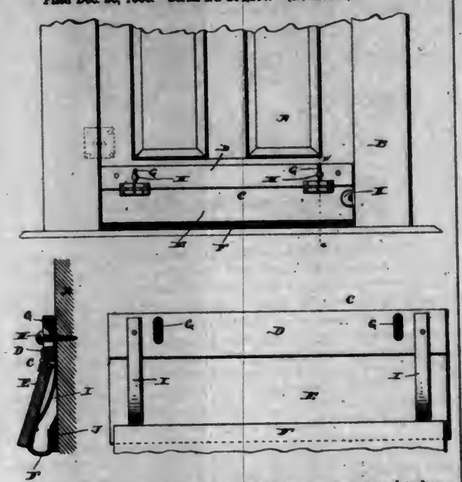


2. In a plunger for baling-presses, the combination, with the body, provided at its sides with longitudinal grooves, of a face-block provided at each of its sides with a rearwardly-extending arm corresponding to and adapted to slide within said grooves, said arms having longitudinal slots engaged by pins in the body adapted to limit the forward movement of the face-block, and springs interposed between the latter and said body, substantially as and for the purpose set forth.

3. In a baling-press, the combination, with the baling-chamber and plunger, of a spring-held tuck-board, and angular arms pivoted to the sides of the press and engaging the bearings of said board, said arms being elevated during the stroke of the plunger by lugs on the latter to elevate the tuck-board, substantially as and for the purpose set forth.

4. In a baling-press, the combination, with the baling-chamber and plunger, of a spring-held tuck-board disposed in a slot in the top of the former, and corresponding oppositely-disposed arms pivoted at their front ends to the sides of the press and provided at their free ends with upwardly-projecting extensions engaging the bearings of said board, said arms being adapted to be elevated during the stroke of the plunger by lugs on the latter, substantially as and for the purpose set forth.

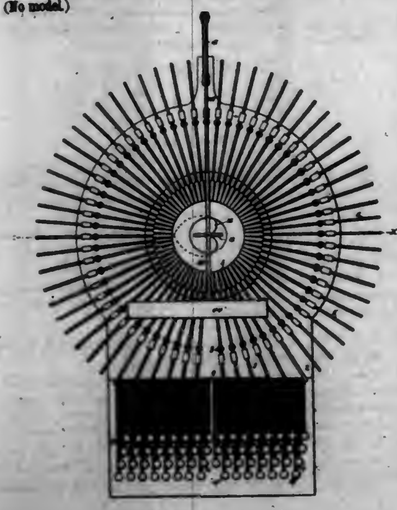
5. The herein-described baling-press, comprising the chamber having yielding sides and tension mechanism for compressing the same, a plunger provided with a spring-actuated face-block, a crank-shaft connected with said plunger and provided with an operating-lever, and a ratchet-connection between the latter and the crank-shaft, all arranged and adapted to operate substantially as and for the purpose set forth.



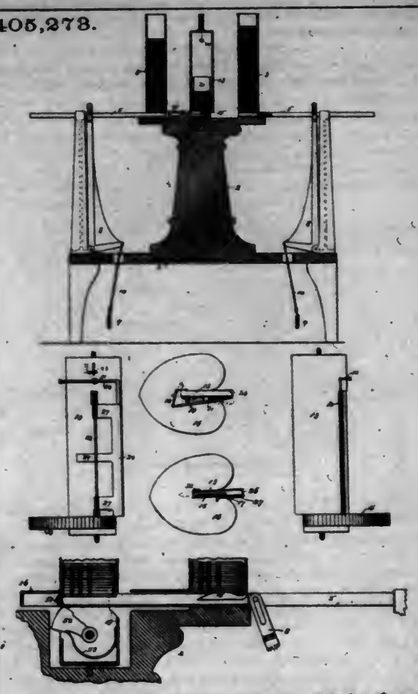
405,271. TANK-FOUNTAIN. JOHN W. PIERSON, St. Aubert, Mo., assignor of one-half to James A. Dickinson, same place. Filed May 28, 1888. Serial No. 275,394. (No model.)

Claim.—1. The combination of a fountain-basin, a flat circular stationary coupling-disk having a central bolt-hole and transverse inlet and discharge openings, the inlet and discharge pipes connecting said openings with the basin, a flat circular revoluble coupling-disk having L-shaped or angular passages connecting its inner face with its rim or periphery and adapted to register with the inlet and outlet passages of the stationary coupling-disk, the pivotal bolt connecting the revoluble with the stationary coupling-disk, the radially-extending pipes connected to the openings in the rim of the revoluble coupling-disk, and the tanks at the outer ends of said pipes, substantially as and for the purpose set forth.

2. The combination of a fountain-basin, an inlet-pipe having a nozzle, an outlet-pipe having a vent-tube, a flat circular stationary coupling-disk having transverse openings to which said pipes are connected, a flat circular revolubie coupling-disk having angular or L-shaped passages adapted to register with said openings, radial pipes connected to said passages and carrying the tanks, and the pivotal connecting-bolt, substantially as set forth.



405,272. WEATHER-STRIP. CLARK POLLEY, New Berlin, Pa. Filed Dec. 20, 1888. Serial No. 294,267. (No model.)



Claim.—1. The combination of the base-strip adapted to be secured to a door, the swinging leaf hinged to the base-strip, the springs secured at their upper ends to the base-strip and having their lower ends bearing on the swinging leaf, and the flexible strip having one edge secured to the swinging leaf and its other edge adapted to be secured to a door, as set forth.

2. The combination of the base-strip adjustably secured to the door, the swinging leaf hinged to the base-strip, the springs having their upper ends secured to the base-strip and their lower ends bearing on the swinging leaf, the strip J, secured to the door, and the flexible strip having its front edge secured to the swinging leaf and its rear edge secured to the strip J, as specified.

405,273. TYPE SETTING AND DISTRIBUTING MACHINE. GEORGE D. ROGERS, Minneapolis, Minn. Filed Sept. 6, 1886. Serial No. 212,817. (No model.)

405,273.

Claim.—1. In a type-setting machine, the combination of a series of type-cases arranged in radial lines around a central point, a series of type-carriers moving in radial lines from said type-cases to said central point, and a type-receiver located at said central point, substantially as described.

2. In a type-setting machine, the combination of a series of type-cases, a series of radially-moving type-carriers, and a pivoted composing-stick having a type-receiving aperture and adapted to be turned in either direction upon its pivots to present said aperture to any one of said carriers, substantially as described.

3. The combination, in a type-setting machine, of the pivoted stick 13, having a type-receiving aperture, a series of type-cases arranged in radial lines around said stick, a series of radially-moving type-carriers, and a cam on the spindle of said stick adapted to be engaged by a moving part of the carrier and turn said spindle on its axis, all substantially as described.

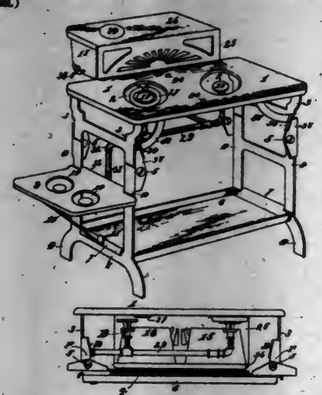
4. The combination, with the sliding carrier 5, having the groove 6 and shoulders 7, of the stick 13, having an aperture adapted to receive the carrier, and the curved tongue 15, arranged opposite the aperture in said stick, substantially as described.

5. In a type-setting machine, the type-carrier 5, having a groove 6 in its end, and shoulders 7 in the walls of the groove at a point below its top, as and for the purpose set forth.

6. In a type-setting machine, a vertical pivoted composing-stick having a type-receiving aperture in its end wall, substantially as and for the purpose set forth.

7. The combination, in a type-setting machine, with the stick 13, frame 35, and pusher 40, of the galley 44, having the hinged door 45, and the spring 46, all substantially as described.

8. In a type-setting machine, the galley having the inwardly-opening door 45, and the spring 46, adapted to hold said door in a closed position, but permitting it to yield inwardly upon the application of pressure against its front, substantially as described.



9. In a type-setting machine, the pivoted stick 13, having hinged doors at its front and rear, and means, substantially as described, connecting said doors, whereby both doors are opened and closed simultaneously, substantially as described.

10. In a type-setting machine, the pivoted composing-stick 13, having the inclined front door 26, the rear door 32, the spring 29, pivoted lever 30, and link 33, all substantially as described.

11. In a type-distributing machine, the combination of a central pivoted type-case, a series of type-receivers arranged in radial lines around said central type-case, and a series of type-carriers moving in

radial lines from said central type-case to the type-receivers, all substantially as described.

405,274. GASOLINE-STOVE. MARCUS S. SAGER, Washington Court-House, Ohio. Filed Sept. 26, 1887. Serial No. 250,746. (No model.)

Claim.—1. The combination, with the top plate 1 of a gasoline-stove and the burner-carrying distributing-pipe 29, located beneath and supported by said top plate, of the depending legs 3, secured to the top plate and having flanges 39, and the folding legs 4, hinged to said depending legs at a point below the distributing-pipe to fold inward below the distributing-pipe, and provided with stops 38 to hold them in a vertical position, substantially as described.

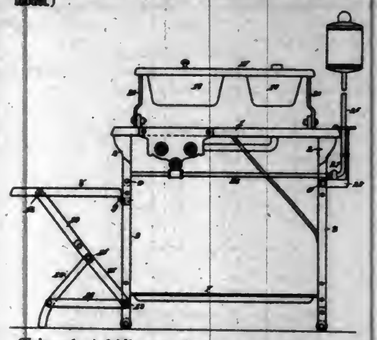
2. The combination, with the top plate 1 of a gasoline-stove, of the fixed depending legs secured to the top plate, the folding legs 4, hinged to said fixed legs to fold inward beneath the top plate, and the drip-pan 6, detachably connected with the lower portions of said folding legs to brace and hold the latter, substantially as described.

3. The combination, with the top plate of a gasoline-stove, of the fixed legs 3, secured to the plate and having the flanges 39, and the folding legs 4, pivoted to the fixed legs below said flanges and having the stops 38 above the pivots, substantially as described.

4. The combination, with the top plate of a gasoline-stove, of the fixed legs 3, secured to said plate, the folding legs 4, pivoted to the fixed legs to fold inward beneath the plate and having cross-rails 8, and the drip-pan 6, having hooked edges 7, detachably engaging the cross-rails, substantially as described.

5. The combination, with the top plate of a gasoline-stove, of the fixed legs 3, secured to said plate and having stop-flanges 39, the folding legs 4, pivoted to the fixed legs and having the stops 38 and cross-rails 8, and the drip-pan 6, detachably engaging the cross-rails, substantially as described.

6. The combination, with the top plate 1 of a stove, of the legs 3, fixed to the top plate, the legs 4, pivoted to the fixed legs and having the upper and lower cross-rails 13 and 8, the shelf 9, having the hooked edge 12, detachably engaging the top cross-rail, and the bracket 10, secured at one end to the shelf and having at its other end the hook 11, detachably engaging the lower cross-rail, substantially as described.



7. The combination, with the top plate of a gasoline-stove, of the burner, the distributing-pipe 29, arranged under the top plate, the tubular water-heater 17, the detachable connecting-pipes 22, 23, and 28, the bracket 25, hinged to the top plate and having the shelf 26, the movable bracket-supporting arm 36, and the gasoline and water tanks secured to the under side of the shelf to swing therewith beneath the top plate, substantially as described.

8. The combination, with the top plate 1, the burner, and the tubular heater 17, of the bracket 25, hinged to the top plate and having the shelf 26, the movable bracket-supporting arm 36, the water-tank 15, secured to the under side of the shelf, and the detachable pipes 22 and 23, connecting the ends of the tubular heater with the tank, substantially as described.

9. The combination, with the top plate 1, of the burner, the distributing-pipe 29, arranged thereunder and supported thereby, the bracket 25, hinged to the top plate and having the shelf 26, the bracket-supporting arm 36, the gasoline-tank 16, secured to the under side of the shelf, and the detachable pipe 28, connecting the tank and distributing-pipe, substantially as described.

10. The top plate of a gasoline-stove provided with fixed legs 3, having hinged inwardly-folding legs 4, in combination with the oil-distributing pipe 29 for the burners, connected with the top plate and located entirely above the hinge-joint connecting the folding legs with the fixed legs, so that the folding legs fold upon and protect the distributing-pipe, substantially as described.

405,275. GASOLINE-STOVE. MARCUS S. SAGER, Washington Court-House, Ohio. Filed Sept. 15, 1888. Serial No. 285,443. (No model.)

Claim.—1. A folding gasoline-stove comprising the top plate 1, having pendent fixed leg-sections 2, the folding leg-sections 3, hinged to the lower ends of the latter, the tank-carrying shelf 17, having supporting-brackets 20, loosely connected with the top plate and capable of swinging around with the shelf and tank to a position under the table between the stationary leg-sections, and the folding shelf 8, pivoted to one of the hinged leg-sections to fold upon the latter and move therewith beneath the top plate, substantially as described.

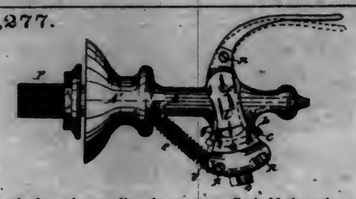
2. A folding gasoline-stove comprising the top plate 1, having pendent fixed leg-sections 2, the folding leg-sections 3, hinged to the lower ends of the latter, the folding shelf 8, pivoted to one of the hinged leg-sections to fold upon the latter and move therewith beneath the top plate, the braces 10 and 11, jointed together and pivoted, respectively, to the shelf and hinged leg-section, the foot 14, connected to one brace, and the pivoted link 16, connecting the foot with the hinged leg-section, substantially as described.

3. A folding gasoline-stove comprising the top plate 1, having slotted brackets 21 and the pendent fixed leg-sections 2, the folding leg-sections 3, hinged to the latter, and the tank-carrying shelf 17, having supporting-brackets 20, provided with pivot-bolts 22, moving in the slotted brackets to fold the tank-carrying shelf around beneath the top plate between the fixed leg-sections and above the hinges of the folding leg-sections, substantially as described.

4. A folding gasoline-stove comprising a top plate 1, having hinged leg-sections 3, the folding shelf 8, pivoted to one of said leg-sections, the braces 10 and 11, jointed together and pivoted, respectively, to the shelf and hinged leg-section, the foot 14, connected to one brace, and the pivoted link 16, connected to the foot and hinged leg-section, substantially as described.

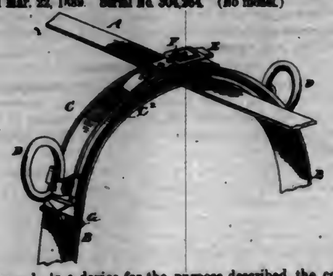
405,276. BOOK-BINDING. LAURA P. SANFORD, New York, N. Y. Filed Jan. 31, 1887. Serial No. 225,968. (No model.)

Claim.—1. The combination of one or more plates A with the back of the book-cover, said plates being held inclosed under the folded-over edge of said back, substantially as described.



2. The combination of one or more plates A with a book-back cover, the point of said plate being inserted through the slot in the folded-over edge of said back, substantially as described.

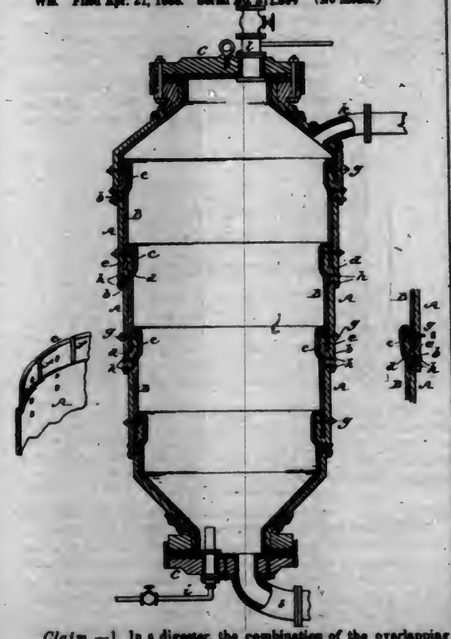
3. A series of plates A A, having thicker upper edges and tapering lower edges and of varying widths, united together at the points *a a a*, substantially as described.



405,277. FAUCET. ELIJAH U. SCOVILLE, Manlius, N. Y. Filed Jan. 21, 1889. Serial No. 296,963. (No model.)

Claim.—The within-described faucet, consisting of the barrel A, having its liquid-channel *a* terminating at the under side of said barrel and provided thereat with a segmental valve-seat *b*, having its curvature in the direction of the length of the barrel, the lever *l*, pivoted to opposite sides of the barrel A and axially at right angles thereto, and the valve *c*, carried on the lower end of the lever and provided with the downwardly-extended duct *d*, and the spring *e*, pressing the lever in one direction to normally hold the valve *c*, with its duct *d*, out of communication with the channel *a*, substantially as described and shown.

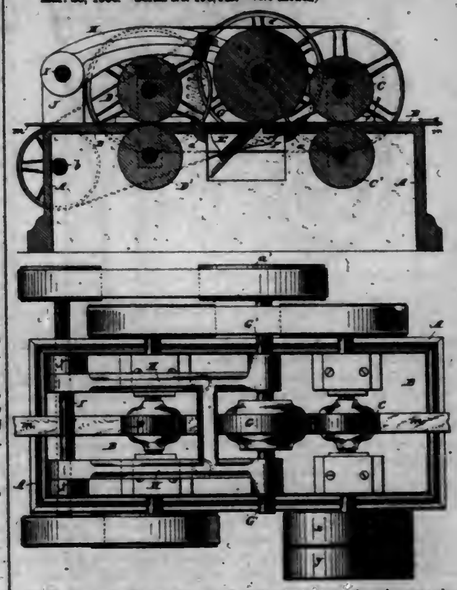
405,277.



405,278. REIN-SUPPORT. WILLIAM T. SIMS, Yazoo City, Miss. Filed Mar. 22, 1889. Serial No. 304,264. (No model.)

Claim.—1. In a device for the purpose described, the combination, with a strap having rings secured near its free ends and provided at its longitudinal center with means for securing the strap to the back-strap of a harness, of the cords or straps attached to the ends of the straps C for securing the said ends to the hip-straps of the harness, substantially as and for the purpose specified.

2. The combination, with the back and hip straps of a harness, of the strap C, secured at its longitudinal center to the back-strap, the rings D upon said strap, and the cords attached to the free ends of the strap and adapted for use in securing the said ends to the hip-straps of the harness, substantially as described.



405,279. PAPER-PULP DIGESTER. HENRY W. STERLING, Monico, Wis. Filed Apr. 21, 1888. Serial No. 271,294. (No model.)

Claim.—1. In a digester, the combination of the overlapping hard-metal-shell sections constructed at their upper ends with inwardly-bent annular offsets forming pockets above their overlapping contact portions, and the soft-metal lining arranged to extend over and down within said pockets, substantially as specified.

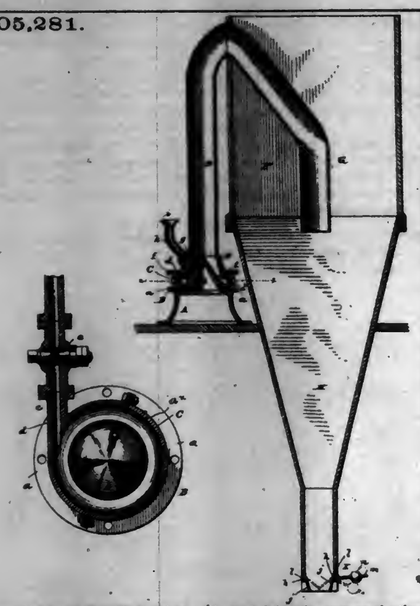
2. In a digester, the hard-metal-shell sections A A, arranged to overlap one another, as at *b*, and each constructed at their upper ends with inwardly-bent annular offsets *c*, split or divided in the direction of their depth, as at *f*, at suitable distances apart around each section, and forming, in connection with the adjacent section, pockets *d*, in combination with the soft-metal lining B, arranged to extend over and down within said pockets, and the bolts *g*, arranged to pass through the pocket portions of the overlapping shell-sections, essentially as and for the purposes herein set forth.

405,280. PLANING-MACHINE. BENJAMIN D. STEVENS, Burlington, Vt., assignor of one-half to Theodore S. Peck, same place. Filed Mar. 25, 1886. Serial No. 196,445. (No model.)

Claim.—1. The combination of the bed-plate, the plane-stock mounted therein, the front and rear feed-rolls, and the intermediate power-driven presser and feed-roll arranged to bear from above with yielding pressure upon the material at about the point where the plane-bit makes its cut, substantially as and for the purposes hereinbefore set forth.

2. The combination of the bed-plate, the plane-stock mounted in an opening therein so that its upper face shall be flush with that of the bed-plate, and the power-driven yielding presser and feed roll G, arranged to bear from above upon the face of the plane-stock, as and for the purposes hereinbefore set forth.

3. The bed-plate formed with an opening and with transverse ways for reception of the plane-stock and the removable plane-stock mounted therein, in combination with the front and rear feed-rolls and the intermediate power-driven yielding presser and feed roll G, these parts being constructed and arranged together for joint operation, substantially as hereinbefore set forth.



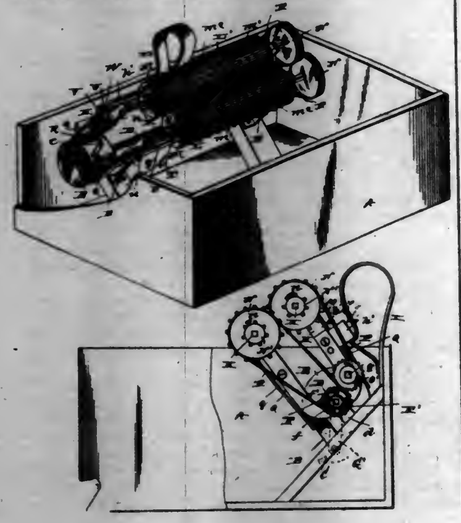
405,281. PULVERIZER. FRANCIS TARGADY, Brooklyn, assignor to Mary A. S. Flostray, New York, N. Y. Filed Feb. 9, 1888. Serial No. 263,522. (No model.)

Claim.—1. In an apparatus for reducing substances, the combination, with the body provided with circular chamber, supply-opening communicating therewith, and suitable discharge leading therefrom, of an air-inlet pipe communicating tangentially with said chamber, substantially as set forth.

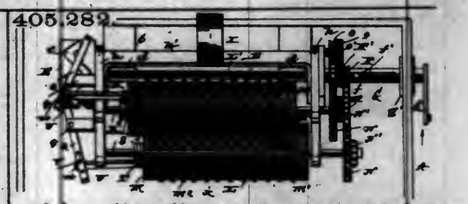
2. In an apparatus for reducing substances, the combination, with the body provided with circular chamber, supply-opening communicating therewith, and a suitable discharge leading therefrom, of a central cone located in said chamber, and an air-inlet pipe communicating tangentially with the latter, substantially as set forth.

3. In an apparatus for reducing substances, the combination, with the body provided with circular chamber, supply-opening communicating therewith, and a suitable discharge leading therefrom, of a re-

405,281.



movable lining in said chamber, and an air-inlet pipe communicating tangentially with the latter, substantially as set forth.



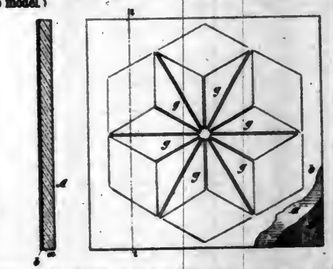
4. In an apparatus for reducing substances, the combination, with the body provided with the circular chamber and supply-opening communicating therewith, of an air-inlet pipe communicating tangentially with the reducing-chamber, a discharge-pipe leading threfrom, and a settling-chamber communicating with said discharge-pipe, substantially as set forth.

405,282. WASHING-MACHINE. AUSTIN F. TRIGGS, Watson, Minn. Filed Mar. 14, 1889. Serial No. 303,300. (Model.)

Claim.—1. In a washing-machine, the combination of the parallel squared shafts, the washing-cylinders mounted on the shafts and adapted to slide longitudinally thereon and provided with grooved collars 8 8, the driving-shaft geared to the squared shafts and carrying a cam-roll having an irregular groove, the levers provided at one end with anti-friction rollers traveling in the said groove, and the strape fitting on the grooved collars and connected by links to the free ends of the said levers, substantially as specified.

405,282.

2. In a washing-machine, the combination of the cylinder L, provided with a shaft which is mounted on stationary supporting-arms, the swinging frame carrying a cylinder L' and actuated by a suitable spring to hold the cylinders in contact, the driving-shaft geared to the said cylinders and carrying a cam-roll, and the levers connected to the cylinders and operated by the cam-roll, substantially as specified.



3. In a washing-machine, the combination of the parallel squared shafts provided with sprocket-wheels N N, the cylinders mounted on the said shafts and capable of a sliding movement thereon, the driving-shaft provided with a sprocket-wheel F, the sprocket-wheel O, geared to the sprocket-wheel F, the sprocket-chains connecting the wheels F O to the wheels N N, and the levers connected to the cylinders and operated by a cam-roll on the driving-shaft, substantially as specified.

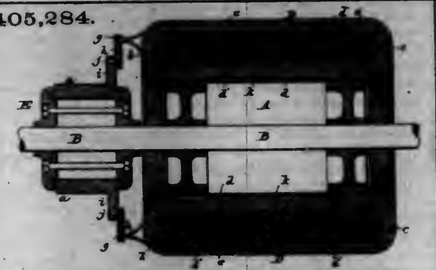
4. In a washing-machine, the combination of the parallel revoluble shafts carrying washing-cylinders and provided with sprocket-wheels N N, the squared driving-shaft, the sprocket-wheels F O, connected to the driving-shaft and geared to the sprocket-wheels N N by the sprocket-chains P P, and the crank-shaft provided with a square bore to fit on the driving-shaft, substantially as and for the purpose specified.

5. In a washing-machine, the combination, with the suds-box, of the inclined supporting-arms B B, the shaft mounted in bearings at the outer ends of the supporting-arms and carrying a washing-cylinder L, the driving-shaft mounted in bearings near the lower ends of the supporting-arms and geared to the cylinder L, the swinging frame pivoted on the driving-shaft and carrying a washing-cylinder L', which is geared to the driving-shaft, and the crank-shaft mounted in a bearing in the side of the suds-box, passing through a packing-box therein and provided with a squared bore to fit on the squared end of the driving-shaft, substantially as specified.

6. In a washing-machine, the combination of the parallel squared shafts carrying washing-cylinders and provided with sprocket-wheels N N, having sprocket-pinions N' N', the driving-shaft carrying a cam-roll and provided with sprocket-wheels F O, the sprocket-chains passing around the said sprocket-wheels, and the levers connected to the cylinders and operated by the said cam-roll, substantially as specified.

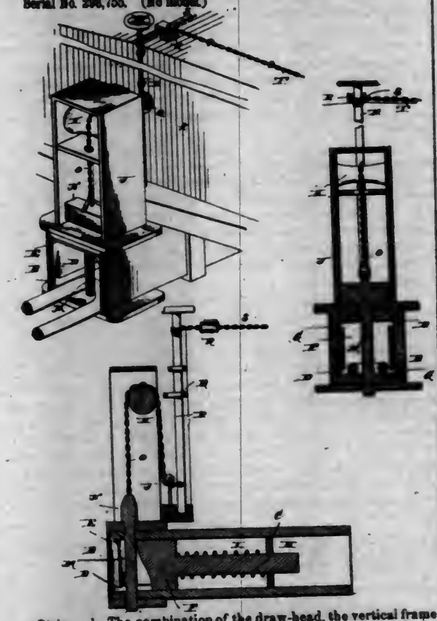
405,283. PROCESS OF CHIPPING OR CRYSTALLIZING GLASS. THOMAS J. THOMPSON, Brooklyn, assignor to the Matthews Decorative Glass Company, New York, N. Y. Filed Jan. 26, 1889. Serial No. 297,597. (No model.)

Claim.—The process of preparing glass for chipping, which consists in covering the glass where the same is not to be chipped with a covering of paint or varnish, in then covering the glass where it is to be chipped with a layer of glue, and in then cutting through the glue along the edge of the pattern to be chipped, as specified.



405,284. DYNAMO-ELECTRIC MACHINE. FRANK TRIPP, Oskaloosa, Iowa. Filed Oct. 22, 1888. Serial No. 288,736. (No model.)

Claim.—1. The armature herein described, consisting of a core and longitudinally-wound coils of copper wire encompassing the same, the core consisting of annular heads or end pieces, longitudinal bars connecting said heads, but electrically insulated from one of them, and circumferential windings or wrappings of iron.

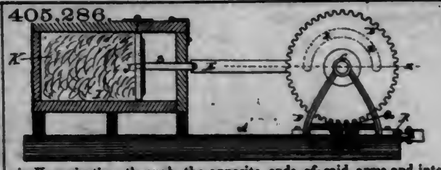


2. The armature-core consisting of heads *b c*, longitudinal bars *d*, connecting said heads and insulated from one of the same, and circumferential windings or wrappings passing about the cylinder formed of the heads and bars, substantially as shown and described.

3. The armature-core consisting of annular heads *b c*, longitudinal bars *d*, connecting the heads, but insulated from one of them, pins *d'*, projecting from said bars, and iron wrappings or windings *e*, passing between the pins and circumferentially about the series of bars *d*.

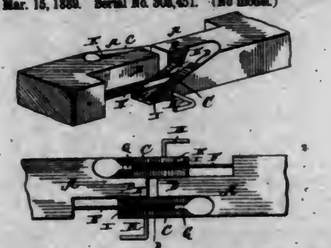
405,284.

405,285. CAR-COUPLING. MARTIN L. UNGER, Nelson, Nebr., assignor of one-half to Jacob Ritterbush, same place. Filed Feb. 5, 1889. Serial No. 298,755. (No model.)



Claim.—1. The combination of the draw-head, the vertical frame erected thereon, the transverse roller in the upper end of the frame, the coupling-pin moving in the vertical frame and having a cross-head N bearing against the sides of the vertical frame, the vertical rotary rod arranged in rear of the vertical frame, and the cable secured to the coupling-pin, passing over the roller and connected to the rotary rod, as set forth.

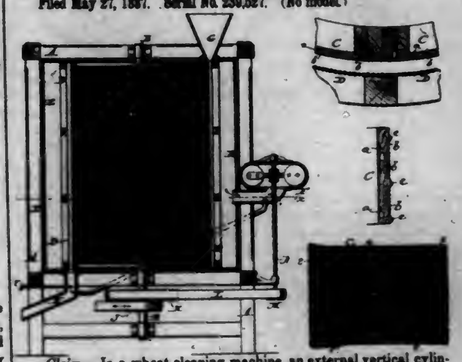
2. The combination, with the car and the draw-head, of the rotary rod mounted on the car, the spring secured to the car and wrapped around the said rod, the pulley on the upper side of the car, the cable secured to the rod and passing around the pulley, the vertical frame on the draw-head, the coupling-pin moving in said frame, and the cable connecting the pin with the rotary rod, as set forth.



405,286. MECHANISM FOR OPERATING BALING-PRESSES. JOSEPH WADLEIGH, Mills Grove, Ill. Filed Dec. 15, 1888. Serial No. 293,675. (No model.)

Claim.—In mechanism for operating baling-presses, the separate gear-wheels B B, mounted on separate shafts having a common axial line, and provided centrally on their inner sides with pivots H, recesses F, and semicircular recesses Z, in combination with arms G, hung to said pivots and lying in recesses F, a pitman E, provided with a cross-pin Y, projecting through the opposite ends of said arms and into recesses Z, means for connecting the pitman with the plunger of a baling-press, the worm-gear Q, meshing with the gear-wheels, and the shaft of the worm-gear provided with means for connecting it with suitable power, as and for the purpose specified.

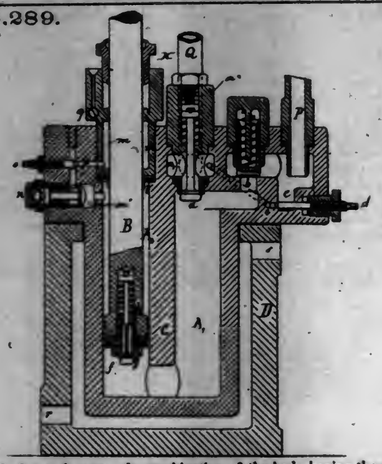
405,286.



405,287. CAR-COUPLING. WILLIAM G. WALKER, Black Oak, Mo. Filed Mar. 15, 1889. Serial No. 303,451. (No model.)

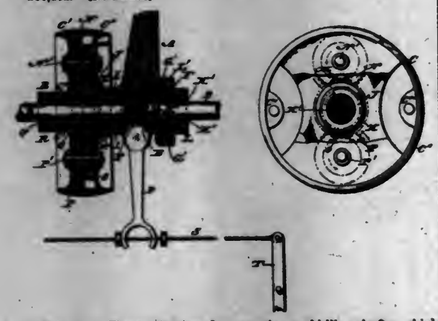
Claim.—As an improvement in car-couplings, the combination of the draw-head provided with the forwardly-projecting tongues C, having the upwardly and rearwardly inclined groove D in its upper side, the said groove having the ribs E on its opposing sides, the link F, pivoted at its rear end to the draw-head and provided at its front end with a knob G, adapted to engage under the ribs E of the opposing draw-head, and the rock-shaft H, mounted transversely in the lower portion of the tongue C, and provided with a crank-arm I, adapted to act on the link of the opposing draw-head, as set forth.

405,288. WHEAT-CLEANING MACHINE. ROSLA W. WELCH, Baltimore, Md., assignor, by direct and mesne assignments, of three-fourths to William T. Brunswell and Joseph S. Taylor, Jr., both of same place. Filed May 27, 1887. Serial No. 239,527. (No model.)



Claim.—In a wheat-cleaning machine, an external vertical cylinder, in combination with an internal vertical cylinder, the latter having its surface composed of the impervious plates having their entire outer surface broken by a series of fine ribs *b*, and provided in addition to said ribs with the two series of larger ribs *c*, extending spirally around the cylinder in reverse directions, as shown.

405,289. APPARATUS FOR COMPRESSING CARBONIC-ACID GAS. FRANZ WINDHAUSEN, Berlin, Germany. Filed Nov. 12, 1888. Serial No. 218,729. (No model.) Patented in Germany Aug. 22, 1885, No. 37,214; in France Dec. 3, 1885, No. 173,692; in Belgium Dec. 15, 1885, No. 71,047, and in Austria-Hungary Dec. 20, 1886, No. 34,528 and No. 63,576.

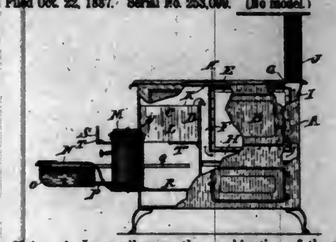


Claim.—1. The combination of the pump-body having the piston-cylinder, the channel *p*, communicating therewith, the valve *n*, the gland K, having the channel *m*, communicating with the channel *p* and having the outlet-channel *q*, the piston-rod in the piston-chamber and extending through the gland, and the packing *i* in the lower end of the gland, substantially as described.

405,289.

2. In an air-pump, the combination of the body having the cylinder, the chamber *a'*, communicating therewith, the escape-channel *c*, and the channel *e* between the same and chamber *a'*, with the inlet-pipe communicating with said chamber, the inlet-valve *a*, the outlet-valve *b* in channel *c*, and the compressing-piston, substantially as described.

405,290. FORWARD AND REVERSE MOTION MECHANISM. WILLIAM H. ZELLERS, Philadelphia, Pa. Filed July 17, 1888. Serial No. 280,192. (No model.)

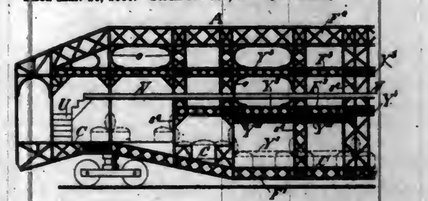


Claim.—1. The mechanism for reversing and idling shafts, which consists of pulley C, having surface K, gear-wheel H, with its sleeve H' surrounding said shaft, stationary hanger formed with bearing G and ridge G', friction-block L, secured to said sleeve H', adapted to impinge against said friction-ridge, loose sleeve F, encompassing sleeve H', shifter D, adapted to move sleeve F, which latter is adapted, substantially as shown, to throw block L against ridge G', or to be reversed to throw wheel H against the bearing-surface K of the pulley, gear-wheels M and N, rigged to turn together and to be operated by wheel H, and gear-wheel Q, secured to the shaft and engaging with gear-wheel N, substantially as described.

2. The mechanism for reversing and idling shafts, which consists of pulley C, having surface K, gear-wheel H, with its sleeve H' surrounding said shaft, stationary hanger formed with bearing G and ridge G', friction-block L, secured to said sleeve H', adapted to impinge against the friction-ridge, loose sleeve F, encompassing sleeve H', shifter D, adapted to move sleeve F, which latter is adapted, substantially as shown, to throw block L against ridge G', or to be reversed to throw wheel H against the bearing-surface K of the pulley, small gear-wheel M, engaging with wheel H, large gear-wheel N, rigged to turn with gear-wheel M, and small gear-wheel Q, engaging with gear-wheel N and secured to the shaft, substantially as described.

3. The mechanism for reversing and idling shafts, which consists of pulley C, having surface K, gear-wheel H, with its sleeve H' surrounding said shaft, stationary hanger formed with bearing G and ridge G', friction-block L, secured to said sleeve H', adapted to impinge against said friction-ridge, loose sleeve F, encompassing sleeve H', shifter D, adapted to move sleeve F, which latter is adapted, substantially as shown, to throw block L against ridge G', or to be reversed to throw wheel H against the bearing-surface K of the pulley, gear-wheels M and N, rigged to turn together and to be operated by wheel H, and gear-wheel Q, secured to the shaft and engaging with gear-wheel N, said gear-wheels M and N being mounted on a shaft or bar in bearings in the pulley, substantially as described.

405,291. OIL-STOVE. ANDREW F. ZIMMERLING, Milwaukee, Wis., assignor of one-half to J. A. Dutcher and P. H. Dutcher, same place. Filed Oct. 22, 1887. Serial No. 253,099. (No model.)



Claim.—1. In an oil-stove, the combination of the exterior wall or body A, combustion-chamber C, located in the front upper corner of said body A, oven B, located in rear of the combustion-chamber C, lamps M M, located beneath the combustion-chamber and surrounded at their upper ends with a separable bottom or partition formed in two parts T T', closing communication between the lamps and the combustion-chamber, downward air-duct F, located between the rear wall of said combustion-chamber and the front wall of said oven, horizontal air-duct H, located beneath the oven, and upward air-duct I, located in rear of the oven, all substantially as and for the purpose specified.

2. In an oil-stove, the combination of the body A, oven B, combustion-chamber C, located in the front upper corner of said body, vertical partition K, subdividing said combustion-chamber C into two separate compartments, lamps M M, separable partition or bottom T and T', surrounding the upper ends of said lamps, downward air-duct F, located between the rear wall of said combustion-chamber and the oven B, horizontal air-duct H, located beneath the oven, and upward air-duct I, located in rear of the oven, all substantially as and for the purpose specified.

3. In an oil-stove, the combination of the body A, oven B, combustion-chamber C, located in the front upper corner of said body, partition K, subdividing said combustion-chamber into two compartments upon the respective sides of the lamps M M, lamps M M, located beneath the combustion-chamber C, separable partition T and T', forming a bottom to said combustion-chamber around the upper ends of said lamps, downward air-duct F, located in front of the oven, horizontal air-duct H, located beneath the oven, upward air-duct I, located in rear of the oven, and air or draft duct J, extending upward above the body of the stove and terminating within the room, said duct J being adapted to produce the required draft by which the hot air from the combustion-chamber is caused to take a downward course around and beneath the oven, substantially as and for the purpose specified.

405,292. RAILWAY-CAR. MAX A. EDGNER, Montreal, Canada. Filed Mar. 16, 1889. Serial No. 303,502. (No model.)

Claim.—1. A railway-car frame statically constructed, having one or more sections each containing two or more sleeping-berths, one above the other, whose fixed frame-work is statically constructed to strengthen and stiffen the car-frame in various directions and integrally connected therewith, in combination with statically-trussed interior horizontal girders rigidly connected to the interior frame-work and forming an overhead passage-way V, substantially as described.

2. A railway-car frame statically constructed, having one or more sections each containing two or more sleeping-berths, one above the other, and having each a fixed frame-work forming girders in a longitudinal as well as transverse direction, all integrally connected together and to the car-frame, substantially as described.

3. A railway-car frame having one or more sections each containing two or more sleeping-berths, one above the other, having hinged folding beds working in a statically-constructed frame or girder work in a longitudinal as well as a transverse direction, this girder-work being integrally connected together and to the car-frame, substantially as described.

4. A railway-car frame forming a statically-constructed body externally and internally, in combination with an overhead passage-way V to permit access to the upper row or rows of berths, said passage-way forming a statically-constructed interior girder to strengthen and stiffen the interior bracing, and also the whole car-body, substantially as described.

5. A railway car-frame externally statically constructed, in combination with an internal statically-constructed berth frame-work, consisting of one or more series of longitudinal interior girders or struts, each series consisting of two or more girders one above the other, and one or more transverse girders, and one or more horizontal longitudinal girders, all integrally connected together and to the exterior frame-work, substantially as described.

6. A sleeping-car berth having suitable mechanism for raising it and lowering it, and additional means for securing it at various altitudes, in combination with statically-constructed frame-work secured to the car-body and having guide-posts d^6 and d^6, forming guideways for the berth, substantially as described.

7. A sleeping-berth for a railway-car having a frame or shell constructed of thin ductile metallic plates, having its bottom raised, furrowed, and paneled to give it increased strength with decreased weight, in combination with vertical guideways for the berth, substantially as described.

8. A railway-car frame having one or more sleeping-berths whose bedding shelves and frames are held in position by vertical guide-posts, in combination with wire ropes *y*, connected to drums and pulleys *p*, and suitable mechanism for elevating and lowering the same, substantially as described.

9. A railway-car having one or more seat-frames statically constructed and integrally connected thereto, each seat-frame consisting of paneled, furrowed, and ductile metallic plates, in combination with horizontal and transverse bracing and trussing, substantially as described.

10. A statically-constructed car-frame divided into sections by transverse girders or frames substantially equal to the length of sleeping-berths, in combination with sleeping-berths adapted to assume various vertical positions in said compartments, and statically-constructed seat-frames integrally connected to the floor and the sides of the car, substantially as described.

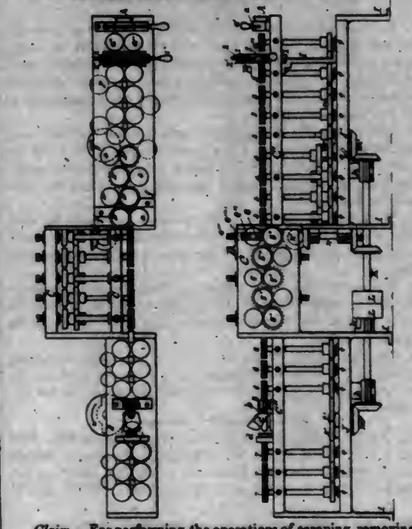
11. A railway-car having a series of berths and seats located in fixed compartments on either side of a central aisle, in combination with an overhead passage-way, the whole forming a statically-constructed external and internal frame-work integrally connected together, and having a stairway connecting the lower frame with the overhead passage-way, substantially as described.

12. A railway-car having a series of seats arranged in separate compartments on the floor of the car about either side of an aisle, in combination with a series of berths located in compartments above said seats, an overhead passage-way connected by a stairway to the lower floor of the car, the whole forming a statically-constructed frame-work, substantially as described.

13. In a railway-car, a series of seats located back to back on the floor of the car on opposite sides of a central aisle in separate compartments, in combination with a series of berths arranged in one or more tiers above said seats, and an overhead passage-way connected by a stairway to the lower floor, the whole forming a statically-constructed frame-work and being arranged substantially as described.

14. In a railway-car, a series of seats located on opposite sides of a central aisle on the floor of the car, in combination with a series of berths arranged in tiers above said seats, and an overhead passage-way connected by a stairway to the lower floor, said berths and seats being held in position in a series of compartments having vertical posts attached to the bottom, top, and side walls of a statically-trussed car-frame, substantially as described.

15. A railway-car frame externally and internally statically constructed, containing sleeping-berths, where any or all spaces not necessary for the easy access and exit and for operating same are trussed and knee-braced in any one or various directions to increase the strength and rigidity of the car-body, substantially as described.



16. A railway-car frame externally statically constructed, in combination with an internal statically-constructed berth frame-work consisting of one or more series of vertical and horizontal longitudinal interior girders or struts, each series consisting of two or more similarly-placed girders one above the other, and one or more transverse girders, all integrally connected together and to the exterior frame-work, substantially as described.

17. A railway-car frame externally statically constructed, in combination with an internal statically-constructed berth frame-work consisting of one or more series of horizontal, vertical, and inclined interior longitudinal girders or struts, each series consisting of two or more similarly-placed girders one above the other, and one or more transverse girders, all integrally connected together and to the exterior frame-work, substantially as described.

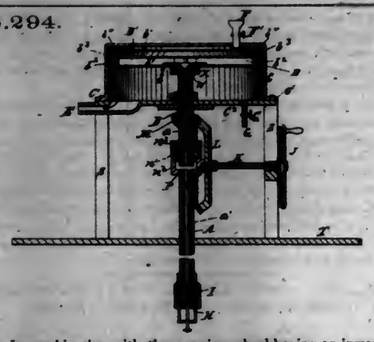
18. A railway-car having one or more statically-constructed seat-frames, each having its sides worked into the requisite shape out of thin ductile metallic plates, in combination with trussing or bracing at the back of the seat, and additional bracing or trussing under the seat-cushion adapted to support the latter, substantially as described.

19. A railway-car having one or more statically-constructed seat-frames, each having one or more stands or sides which are formed with trussing and bracing, said trussing and bracing being embodied in the back and bottom of the seat, whereby additional strength is given to the seat, substantially as described.

405,293. RATTAN-MACHINE. FRED B. ALEXANDER, Brooklyn, N. Y. Filed Mar. 28, 1888. Serial No. 269,755. (No model.)

Claim.—For performing the operations of scraping, removing the enamel from and splitting rattan with one handling, the combination, as herein set forth, of the following elements, to wit: a machine comprising three divisions, the first including a scraping device with rollers for feeding cane to the same, and rollers following the scraping device on the same plane with said feeding-rollers, but arranged in a zigzag line for the purpose of removing the enamel from two sides of the cane, the second division consisting of rollers set in a vertical plane but in a zigzag line to complete the removal of enamel from the cane, the third division comprising feeding-rollers and devices for splitting and delivering the cane, as described, and two pairs of standards supporting the whole, the middle pair joining the first and third divisions to the second, so that the path of the cane through the machine is in a direct line, all the rollers being driven by means of gearing from a main driving-shaft supported, substantially as shown, upon the standards of the machine, all substantially as herein shown and described.

405,294. CENTRIFUGAL FORCE-PUMP. JACOB BAKER, Greenville, Ohio. Filed July 24, 1888. Serial No. 280,868. (No model.)



Claim.—1. In a centrifugal force-pump, the pumping-wheel having the compartment or chamber B' and the orifices b^3 and the inwardly-inclined flange b^4, substantially as and for the purposes specified.

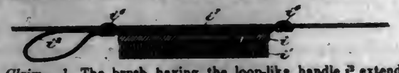
2. In a centrifugal force-pump, the pumping-wheel having the compartment or chamber B' and the radial partitions or arms, the chamber B' having the orifices b^3 and the flange b^4, substantially as and for the purposes specified.

3. In a centrifugal force-pump, the pumping-wheel having the chamber B' and the radial partitions or arms, the arms extending not quite to the outer wall of said chamber, substantially as and for the purposes specified.

4. In a centrifugal pump, the combination of the hollow pumping-wheel, a central hub projecting through one wall thereof, the radial arms or partitions located in the chamber of the wheel and fixed to the said hub, and the tightening-nut engaging with the projecting portion of the hub, whereby the said radial arms are secured in the wheel, substantially as described.

405,294.

5. In combination with the pumping-wheel having an inwardly-inclined rim or flange, the chamber C, in which is mounted the pumping-wheel, provided with the priming-pipe F and its regulating-cock, the priming-pipe being located in the chamber C at a point within the circumference of the inner edge of said inclined rim, substantially as and for the purposes specified.



6. The combination of the hollow pumping-wheel, the radial arms mounted within the chamber of the wheel, the hub W, to which the arms are fixed, having the flared upper end opening into the pumping-wheel, and the tightening-nut X, engaging with the said hub, substantially as described.

7. The combination of the pumping-wheel and the radial arms and partitions having hub W and tightening-nut X, and the suction-pipe A, screwed into the hub W, substantially as and for the purposes specified.

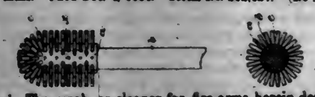
8. The combination of chamber C, provided with the delivery-pipe E, and the hollow wheel B, having compartment B', radial arms, orifices b^3, inclined rim b^4, and suction-pipe A, substantially as and for the purposes specified.

9. The combination of chamber C and hollow wheel B, having compartments B', radial arms b^3, inclined rim b^4, suction-pipe a, packing, and suction-pipe a', having valve, substantially as and for the purposes specified.

405,295. BATH-BRUSH. CHARLES J. BAILEY, Newton, Mass. Filed Oct. 3, 1887. Serial No. 251,335. (No model.) Patented in England Oct. 27, 1887, No. 14,630; in France Oct. 27, 1887, No. 186,625; in Canada Nov. 3, 1887, No. 27,929, and in Belgium June 6, 1888, No. 820,074.

Claim.—1. The brush having the loop-like handle i^2 extended through it, combined with the strap i^2, connected to the said handle at each side of the brush-back, substantially as described.

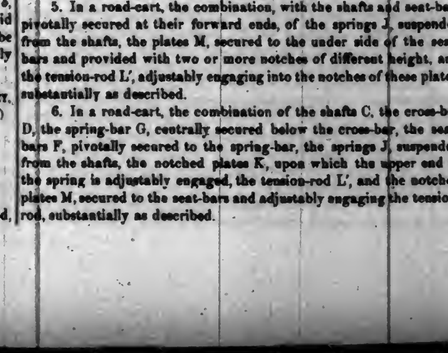
2. The brush having the back i and teeth i', made of soft rubber, the said back having a slot or pocket through it for the reception of the loop-like handle i^2, combined with the strap i^2, detachably connected to the said handle at each side of the brush, substantially as described.



405,296. BRUSH. CHARLES J. BAILEY, Newton, Mass. Filed Mar. 24, 1888. Serial No. 268,366. (No model.) Patented in England Oct. 27, 1887, No. 14,630; in France Oct. 27, 1887, No. 186,625; in Canada Nov. 3, 1887, No. 27,929, and in Belgium June 6, 1888, No. 820,074.

Claim.—1. In a brush, the flexible back a and teeth b, formed integral therewith, combined with the blade c, having the upturned end c', the shank f, and the handle f'', substantially as described.

2. In a brush, the flexible socketed back a, separate teeth b, formed integral therewith, and V-shaped projections within said socket, combined with the blade c, having recesses, as described, to be entered by said V-shaped projections, and the shank f, substantially as described.



405,297. SWAB OR CLEANER FOR GUNS. CHARLES J. BAILEY, Newton, Mass. Filed Dec. 4, 1888. Serial No. 292,637. (No model.)

Claim.—1. The swab or cleaner for fire-arms herein described, composed of the cylindrical body of rubber or like material having a series of exteriorly-arranged teeth integral therewith, as and for the purposes set forth.

2. The swab or cleaner for fire-arms herein described, composed of the socketed or hollow cylindrical body a, of rubber or like material, having formed within its socket shoulders, and a series of exteriorly-arranged teeth integral with said body a, as and for the purposes set forth.

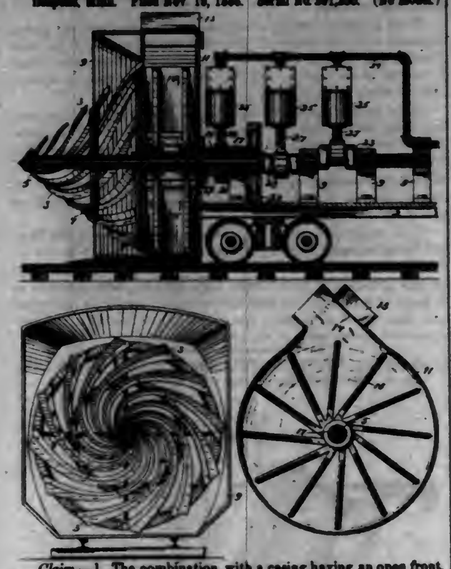
405,298. SUPPORT FOR DRAWING-MODELS. HENRY T. BAILEY, Scituate, Mass. Filed Mar. 6, 1889. Serial No. 302,109. (No model.)

Claim.—The combination of the table top or platform a, provided with a recess a^3 and socket-piece c, with an upright detachably connected with said platform by said socket-piece and adapted to work in a guide on a school-desk, and a clamp for holding said upright in adjusted position in its guide, substantially as described.

405,299. ROAD-CART. ELIAS W. BEAN, Plymouth, Mich. Filed Dec. 8, 1888. Serial No. 292,990. (No model.)

Claim.—1. In a road-cart, the combination, with the shafts, cross-bar, and seat-bars, of a round spring-bar centrally secured to the cross-bar and supporting with its free ends the front end of the seat-bars, and tapered from its middle toward its ends, substantially as described.

2. The combination, with the shafts and cross-bar of a road-cart, of the round spring-bar G, the bearing-block H, and clips I I, for securing it to the cross-bar, and the seat-bars provided with eyes upon their forward ends pivotally engaged with the free ends of the spring-bar, substantially as described.



3. The combination, with the shafts, cross-bar, and seat-bars of a road-cart, substantially as described, of the spring-bar G, supporting the free ends of the seat-bars, said spring-bar being centrally secured below the cross-bar and tapering from its middle toward the ends and provided with the upsets a and pivot pins or lugs b, substantially as described.

4. In a road-cart, the combination, with the shafts and seat-bars pivotally secured at their forward ends, of the supporting-springs suspended from the shafts, the notched plates M, secured to the under side of the seat-bars, and the tension-rod L', adjustably engaging with these plates and having their free ends connected to the supporting-springs, substantially as described.

5. In a road-cart, the combination, with the shafts and seat-bars pivotally secured at their forward ends, of the springs J, suspended from the shafts, the plates M, secured to the under side of the seat-bars and provided with two or more notches of different height, and the tension-rod L', adjustably engaging into the notches of these plates, substantially as described.

6. In a road-cart, the combination of the shafts C, the cross-bar D, the spring-bar G, centrally secured below the cross-bar, the seat-bars F, pivotally secured to the spring-bar, the springs J, suspended from the shafts, the notched plates K, upon which the upper end of the spring is adjustably engaged, the tension-rod L', and the notched plates M, secured to the seat-bars and adjustably engaging the tension-rod, substantially as described.

405,300. ROTARY SNOW-PLOW. EDWARD P. CALDWELL, Minneapolis, Minn. Filed Nov. 19, 1888. Serial No. 291,355. (No model.)

Claim.—1. The combination, with a casing having an open front, of a shaft extending through said casing, a conical cutter secured upon said shaft and having an open rear end in front of said casing, and a rotating fan located in said casing in the rear of said cutter, substantially as described.

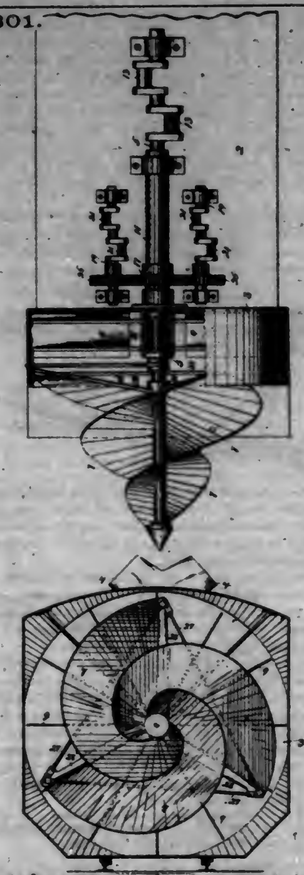
2. The combination, in a rotary snow-plow, with a casing having an open front, of a conical cutter formed of a series of spirally-arranged knives located in front of said casing, and a revolving fan located in said casing in the rear of said cutter, substantially as described.

3. The combination, in a rotary snow-plow, with a casing having an open front, of a revolving conical cutter formed of a series of spirally-arranged knives located in front of said casing, and an independently-revolving fan located in said casing in the rear of said cutter, substantially as described.

4. The combination of the rotating plow, the shaft 5, upon which said plow is secured, provided with the cranks 23, the steam-cylinders 25, having the piston-rods 27, connected with said cranks, the hollow shaft 17, surrounding said shaft 5, the fan 15, secured upon said shaft 17 and arranged in the rear of said plow, the eccentric 31 upon said shaft 17, and the steam-cylinder 35, having the piston-rod 23, engaging said eccentric 31, all substantially as described.

5. The combination, with the independently-rotating plow, of the rotating fan adapted to be driven in either direction, the double discharge-spout extending in opposite directions, and the pivoted cut-off arranged in said spout, substantially as described.

6. The combination, with the rotating plow, of the independently-rotating fan adapted to be driven in either direction, a fan-casing inclosing said fan, discharge-spouts extending in opposite directions from said casing, and a cut-off whereby either of said spouts may be closed, substantially as described.

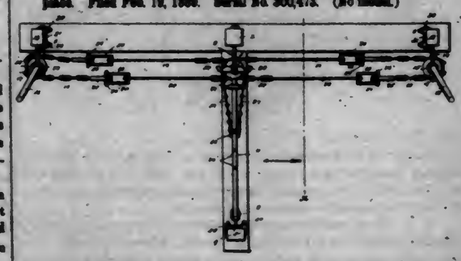


7. The combination, with the rotating plow provided with the spiral knives, of the independently-rotating fan adapted to be driven in either direction, the fan-casing provided with the oppositely-extending discharge-spouts, and the cut-off adapted to close either of said spouts, all substantially as described.

405,301. SNOW-PLOW. EDWARD P. CALDWELL, Minneapolis, Minn. Filed Feb. 11, 1889. Serial No. 299,570. (No model.)

Claim.—1. A snow-plow comprising, in combination, a conical cutter consisting of spirally-arranged knives tapering from the base of the cutter to its apex, and with open spaces between the rear ends of the knives at the base of the cutter, a fan-casing located in the rear of said cutter and having an open front, and a revolving fan located in said casing, substantially as described.

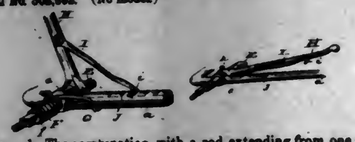
2. The combination, in a snow-plow, of a casing having an open front, a shaft extending through said casing and projecting in front thereof, a conical cutter consisting of a series of spirally-arranged tapering knives secured to said shaft, with open spaces between the knives and between their rear ends, and a revolving fan located in said casing in the rear of said cutter, substantially as described.



405,801.

3. The combination, in a snow-plow, of a casing having an open front, a shaft extending through said casing and projecting in front thereof, a conical cutter consisting of a series of spirally-arranged tapering knives secured to said shaft and having their rear ends extending into said casing, and a revolving fan located in said casing in the rear of said cutter, substantially as described.

4. The combination, with the revolving shaft provided with a cutter at its forward end, of the hollow shaft arranged upon said cutter-shaft and provided with a fan, a gear-wheel upon said hollow shaft, independent shafts located upon opposite sides of said hollow shaft, gear-wheels upon said shafts meshing with the gear-wheel upon said hollow shaft, and independent means for driving said cutter-shaft and said independent shafts, substantially as described.

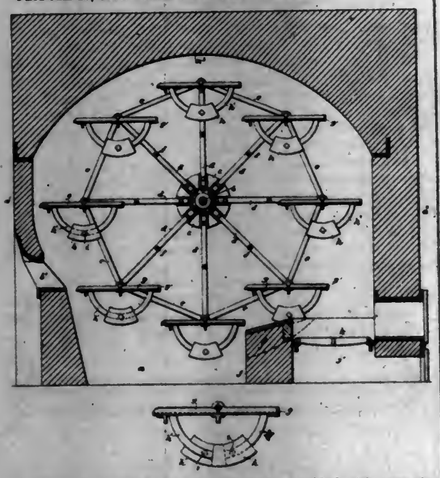


405,802. HAND-OPERATED SWINGING GATE. WESLEY C. CARTER, Galva, Ill., assignor of one-half to THOMAS W. PATTERSON, same place. Filed Feb. 12, 1889. Serial No. 300,473. (No model.)

Claim.—1. In a gate, the combination of a vertical pivot-shaft, having the pulleys at its lower end and a rigid cross-head at its upper end, a gate provided with the elongated hinge-loops, which fit loosely on said vertical pivot-shaft to adapt the gate to have a limited tilting movement and to swing or turn with said shaft, connections 27, intermediate of said gate and opposite ends of said cross-head, the vertical crank-shafts, each having a pulley, a chain passing around and connected to each pulley of the crank and pivot shafts, the connecting-rods, and a swivel connected to the rods and chains, all arranged and combined for service, substantially as herein shown and described.

2. The combination of a vertical pivot-shaft carrying a gate which is capable of a limited tilting movement, a cross-head fixed to said shaft, an adjustable sleeve fixed on one of the bars of said gate, and connections between said adjustable sleeve and the cross-head, substantially as described.

405,303. BUGGY-TOP. SHEPARD W. CATELY, Cortland, N. Y., as signer of one-half to Alice M. Etting, same place. Filed Mar. 9, 1889. Serial No. 302,602. (No model.)



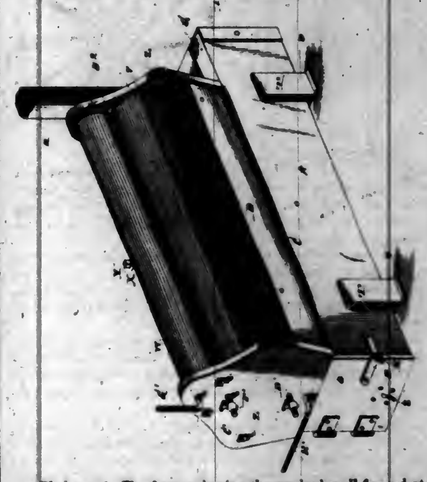
Claim.—1. The combination, with a rod extending from one side of the seat to the other, of a lever-arm secured thereto, one end of a detent pivoted to the outer side of the lever, and the other end held against the lever by frictional contact and adapted to be turned into notches on the seat-rail, as set forth.

2. The combination, with a rod holding the hinged braces of a top, having a lever secured thereto, with one end of a detent pivoted to the side of the lever and the other end resting on the seat-rail, of a spring on the rod with one end locked under the seat-rail having an upward traction, as and for the purpose set forth.

3. The combination, with a rod extending from one side of the seat to the other, having a lever adjustably secured thereto on the inner side of the seat-rail, said lever having one end of a detent pivoted to its side and the other end bent outward and held to the lever by frictional contact and adapted to be turned into notches on the seat-rail, of a coil-spring having its outer end secured on the square portion of the rod on the outer side of the rail, and its inner end locked under the rail in front of the rod, said spring having an upward traction on the top, as set forth.

405,304. BAKING-OVEN. ALEXANDER CRUMBIE, Arlington, N. J. Filed Jan. 29, 1889. Serial No. 297,900. (No model.)

Claim.—1. A baking-pan for reel ovens provided with arms depending therefrom at each end of the pan, both ends of each arm being secured to the pan, and counter-weights adjustably secured to the arms, substantially as shown and described.

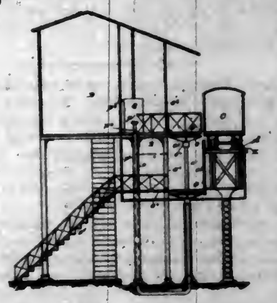


2. A baking-pan for reel ovens provided with the curved arms h', depending therefrom at each end of the pan, both ends of each arm being secured to the pan, and counter-weights h, adapted to be moved along the arms and adjustably secured to the arms, substantially as shown and described.

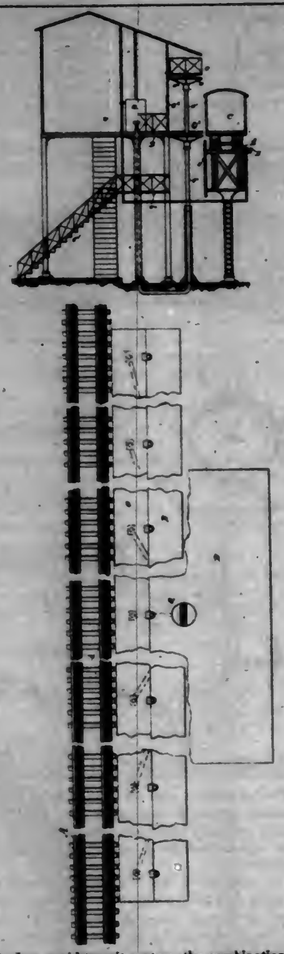
3. In a baking-oven, in combination, a revolving reel, the pans g, suspended from the reel, each pan being arranged close to its point of suspension, and the adjustable counter-weights h on curved arms h', secured at each end to and depending from the pans g, substantially as shown and described.

4. In a baking-oven, in combination, the oven-walls, the front wall being inclined inward at its lower part, the mouth b' in the inclined lower part thereof, the revolving reel pivoted in the oven-walls, the pans g, suspended from the reel, each pan being arranged close to its point of suspension, and the adjustable counter-weights h on curved arms h', secured to and depending from the pans g, substantially as shown and described.

5. In a baking-oven, in combination, the oven-walls, the front wall being inclined inward at its lower part, the mouth b' in the inclined lower part thereof, the revolving reel pivoted in the side walls, the pans g, suspended from the reel, each pan being arranged close to its point of suspension, the adjustable counter-weights h on curved arms depending from the pans, and the furnace j k, located at the back of the oven, substantially as shown and described.



405,305. WATER-HEATER. JOHN H. DULL, Red Key, Ind. Filed Jan. 29, 1889. Serial No. 297,999. (No model.)



Claim.—1. The furnace having the smoke-box F formed at its rear end, the sides of the smoke-box having their upper edges turned inward to form flanges G, for the purpose set forth, substantially as described.

2. The combination of the furnace having its bottom and sides formed integrally of rolled sheet metal and having the outwardly-curved extensions D at the upper edges of its sides, the transverse curved braces E, connecting said extensions, and the smoke-box provided with the inwardly-turned flanges G, the smoke-stack supported upon said flanges G, and the boiler supported upon the flanges D and braces E, substantially as set forth.

405,306. SYSTEM OF RAPID TRANSIT. HENRY FLAD, St. Louis, Mo. Filed June 16, 1887. Renewed Nov. 23, 1888. Serial No. 291,713. (No model.)

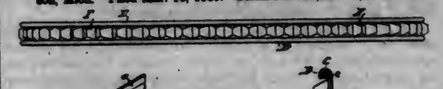
405,306.

Claim.—1. In a rapid-transit system, the combination, with stationary platforms located in different horizontal planes and a track located near the upper platform, of an elevator having upper and lower platforms and located between the stationary platforms and track, substantially as set forth.

2. The combination, with fixed platforms located in different horizontal planes and a track, of an elevator located between the track and fixed platforms and provided with two platforms, the latter when the elevator is in its lowest position registering, respectively, with the fixed platforms, substantially as set forth.

3. The combination, with a fixed platform and an elevator located adjacent thereto and having two platforms, of a series of hydraulic rams located beneath the movable elevator, a series of platform-supporting plungers adapted to slide within the rams, and means for operating the plungers, substantially as set forth.

4. The combination, with two fixed platforms located in different horizontal planes, a stairway to each platform, and a track, of an elevator located between the fixed platforms and track and provided with the platforms adapted when in their lowered positions to register with the fixed platforms, substantially as set forth.

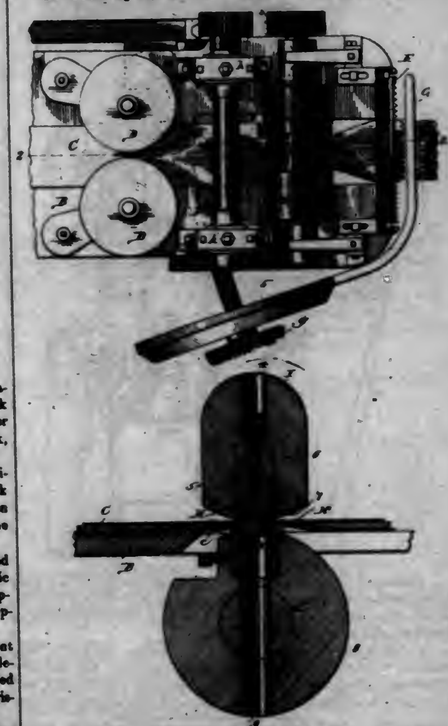


5. The combination, with a fixed platform and an elevator having two platforms located adjacent thereto, of the series of hydraulic rams, the elevator-supporting plungers adapted to work in the rams, a pressure-cylinder, pipes leading from the rams to the pressure-cylinder, and a power-supply in connection with the pressure-cylinder, substantially as set forth.

6. The combination, with the movable platform, the hydraulic rams, and the platform-supporting plungers, of the pressure-cylinder, the pipes leading from the rams to the pressure-cylinder, meters located at the cylinder ends of the pipes, and a power-supply in connection with the cylinder, substantially as set forth.

7. The combination, with the series of hydraulic rams, the platform-supporting plungers adapted to work in the rams, the pressure-cylinder, and the pipes leading from the several rams to the bottoms of the cylinder and terminating in a horizontal line, of a series of meters located in the ends of the pipes within the cylinder and means for communicating pressure to the cylinder, substantially as set forth.

8. The combination, with the hydraulic rams and the pressure-cylinder common to the several rams, of meters located in the conduits leading from the pressure-cylinder to the rams, adapted to regulate the flow of liquid to and from the rams, and mechanism connecting the several meters, whereby they are caused to operate simultaneously, for the purpose substantially as set forth.



405,307. BROW-BAND FOR BRIDLES. CONRAD B. FLOHR, Jackson, Mich. Filed Mar. 16, 1889. Serial No. 303,516. (No model.)

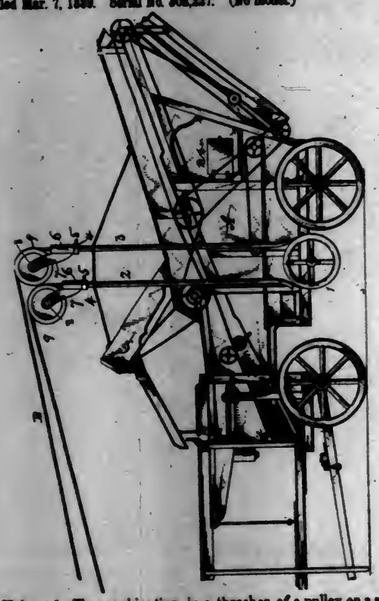
Claim.—In a brow-band for bridles, the combination of the flexible body having its edges bent over to form the flanges D D, elastic wires passing under said flanges, and ornamental pieces having flanged edges inserted under and held by said wires, substantially as shown and described.

405,308. PAPER-BAG MACHINE. ALBERT C. GETTIS, Chicago, Ill. Filed Aug. 13, 1888. Serial No. 282,549. (No model.)

Claim.—1. In a paper-bag machine, the combination, with suitable rolls for feeding the web of paper, a suitable former for folding the same, and a knife for cutting it into bag-lengths, of a punch for perforating the paper, said punch being located in position to perforate the paper adjacent, but entirely at one side of the line of the top edge of each bag, substantially as described.

2. In a paper-bag machine, the combination, with suitable rolls for feeding the web of paper, a suitable mechanism for folding said

web—such as a former having a cut-away space—and a knife or striker for cutting the web into bag-lengths, of male and female dies located, respectively, on opposite sides of the former adjacent its cut-away space, and located, also, in position to perforate the paper adjacent, but entirely at one side of the top edge of each bag, substantially as described.



3. In a paper-bag machine, the combination, with suitable mechanism for feeding a web of paper, of a former for folding said web, said former having a cut-away space, a female die located on one side of said former, a male die located on the opposite side of said former, shafts for said dies, and a cutting-blade in gear with said shafts, substantially as described.

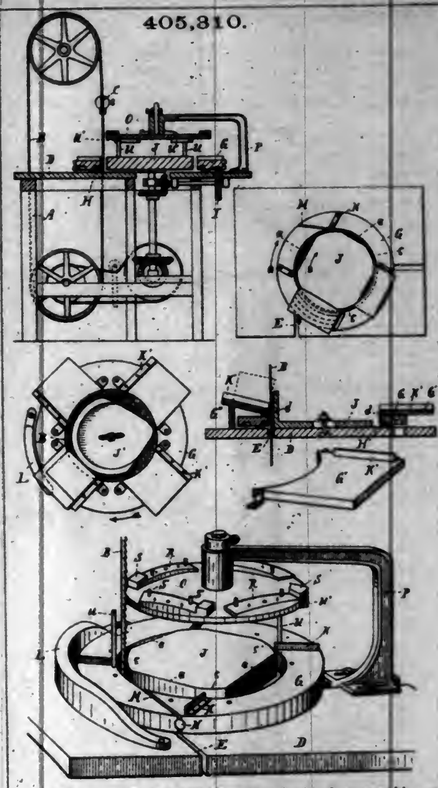
4. In a paper-bag machine, the combination, with suitable mechanism for feeding a web of paper, of a suitable former having a cut-away space, and rotary male and female dies, the said dies and said cut-away space being located out of the line of travel of the pasted seam of the web of paper, substantially as described.

5. In a paper-bag machine, the combination, with suitable mechanism for feeding a web of paper, of a suitable former over which said web is folded, and male and female dies located beyond the pasting mechanism, one of said dies being arranged to protrude through the former in the punching operation, whereby the stretching of the pasted seam is avoided, substantially as described.

6. In a paper-bag machine, the combination, with suitable mechanism—such, for example, as rolls, a former, and a knife—for feeding a web of paper and for folding the same and cutting the same into bag-lengths, of rotary male and female dies H and H', and shafts I and I', for carrying said dies, substantially as described.

405,309. DRIVING MEANS FOR THRASHING-MACHINES. HARRISON GILLETT, JAMES H. GILLETT, and ASA D. GILLETT, Lake City, Minn. Filed Mar. 7, 1889. Serial No. 302,237. (No model.)

Claim.—1. The combination, in a thrasher, of a pulley on a shaft of the machine, vertically-arranged guide-tubes, guide-pulleys swiveled to the upper ends of said tubes, and a rope or belt, substantially as described, and for the purpose set forth.



2. The combination, in a thrasher, of a pulley on a shaft of the machine, vertically-arranged guide-tubes, vertically and laterally adjustable guide-pulleys secured to the upper ends of said tubes, and a rope or belt, substantially as described, and for the purpose set forth.

405,310. SAW-TABLE GAGE. JOHN HARLEY, Detroit, Mich. Filed Oct. 31, 1888. Serial No. 290,613. (No model.)

Claim.—1. In a band-saw machine, a rotary annular feed-table adapted to carry the work, and revolving with its inner edge in proximity to the saw, substantially as described.

2. The combination, with the table of a band-saw machine, of a rotary annular feed-table mounted thereon to revolve with its inner edge in proximity to the saw, and a fence within said feed-table, substantially as described.

405,310.

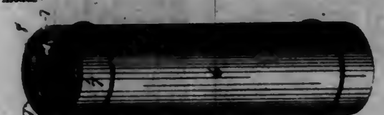
3. The combination, with the table of a band-saw machine, of a rotary annular feed-table mounted on said table, revolving with its inner edge in proximity to the saw, and of a saw-slot in said feed-table adapted to register with the saw-slot of the band-saw table, substantially as described.

4. The combination, with the table of a band-saw machine, of a rotary annular feed-table mounted on said table with its inner edge in proximity to the saw, a saw-slot in said feed-table adapted to register with the saw-slot of the band-saw table, and a detachable connection between the severed ends forming the saw-slot in said feed-table, substantially as described.

5. In a band-saw machine, the combination, with the saw-table, of the rotary feed-table mounted thereon to revolve with its inner edge in proximity to the saw, a supplementary table hinged at its inner edge near the inner edge of said rotary feed-table and provided with work-carrying stops, and a guide-rail secured to the saw-table and adapted to lift up the outer edge of the supplementary table, substantially as described.

6. The combination in a band-saw machine, of the band-saw table, a rotary annular feed-table mounted thereon to revolve with its inner edge in proximity to the saw, and a rotary feed-table mounted above the said rotary annular feed-table and revolving with its outer edge in proximity to the saw, substantially as described.

7. The combination, with a band-saw machine provided with a saw-slot E, of the rotary annular feed-table G, the saw-slot M in said feed-table adapted to register with the saw-slot E, and the dowel-pin N, substantially as described.



8. The combination, with a band-saw machine, of the annular feed-table G, the supplementary hinged tables G', and the guide-rail L, substantially as described.

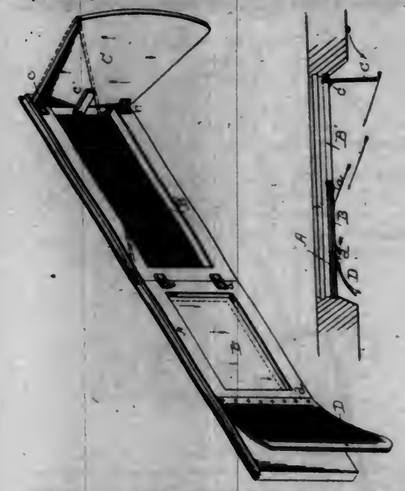
9. The combination, with a band-saw machine, of a rotary annular table G, having work-carrying stops K, and a fence secured within said annular table, an upper feed-table adjustably secured above the lower feed-table and provided with work-carrying devices and actuated by the lower feed-table, substantially as described.

10. The combination, with a band-saw machine provided with an annular feed-table G, which is provided with work-carrying stops and a fence secured within said annular feed-table, of the upper feed-table O', provided with an oscillating lever W, and carrying the supplementary bed R', substantially as described.

11. The combination, with a band-saw machine, of a rotary annular feed-table mounted thereon to revolve with its inner edge in proximity to the saw, and a fence secured within said rotary feed-table and provided with a circular outer face of the same radius as the cut of the saw on the work, substantially as described.

405,311. ROOFING-PACKAGE. WILLIAM L. HEMERLING and HENRY HEMERLING, Havana, Ill. Filed Aug. 20, 1888. Serial No. 283,202. (No model.)

Claim.—1. A roll of roofing with an edge of one or more of its inside coils turned in as a retaining device.



2. A roll of roofing with one or more supporting-heads retained therein by an interned edge on one or more of the inside coils of the roll.

3. A roll of roofing with one or more ends of a storage-chamber retained therein by an interned edge on one or more of the inside coils of the roll.

4. A roll of roofing with one or more end pieces secured within it against a resisting device by an interned edge on one or more of the inside coils of the roll.

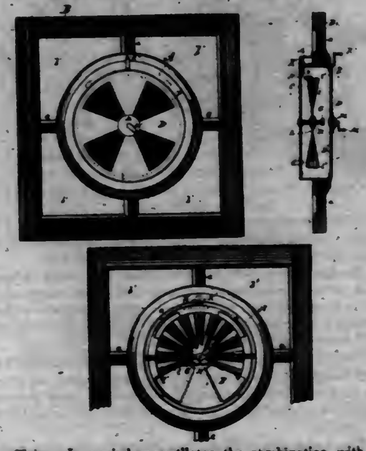
5. A roll of roofing with one or more supporting-heads secured against accompaniments stored therein by an interned edge on one or more of the inside coils of the roll.

405,312. CAR-WINDOW VENTILATOR. MILES C. HUYETT, Detroit, Mich., assignor, by mesne assignments, to Cecelia E. Huyett and Adie C. Keller, same place. Filed Aug. 27, 1888. Serial No. 283,969. (No model.)

Claim.—1. A car-ventilator consisting of a frame substantially coextensive in length with a window of the car and provided at one end with a guard arranged at a right angle with the frame and at the other end with a deflector forming a more or less acute angle with the frame, substantially as described.

2. A car-ventilator adapted to be fitted in the window-casing of a car underneath the window, consisting of a frame provided at one end with a guard standing at a right angles to the frame an opening or screen in the frame for the exit of air from the car, and a deflector adapted to throw the air from the side of the car, substantially as and for the purposes described.

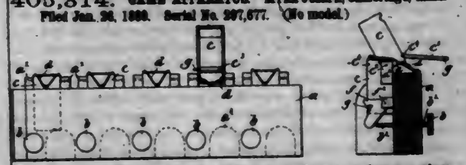
3. A portable car-ventilator adapted to be placed underneath a car-window when the latter is raised, consisting of a frame provided with an opening or screen and a guard attached thereto just forward of said opening or screen, substantially as and for the purposes described.



4. A car-ventilator consisting of a frame provided with a hinged guard at its forward end, adapted to prevent air from entering an opening or screen in said frame, and a deflector adapted to throw the air-current from the side of the car, substantially as described.

5. In a car-ventilator, the combination, with frame provided with an opening or screen in the forward half, a deflector at the rear end, and an outstanding guard at the forward end, of a guard adapted to prevent air from passing over the top of the outstanding guard and into the opening or screen, substantially as described.

6. A car-window ventilator consisting of a frame adapted for insertion beneath the sash provided with an exterior outstanding guard at its forward end, said frame imperforate along its rear half and provided with a screen or opening at its forward half, substantially as described.

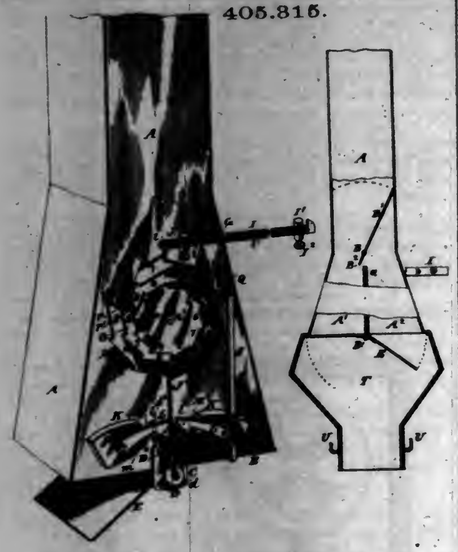


7. A car-window ventilator consisting of a frame adapted for insertion beneath the sash provided with an exterior outstanding guard at its forward end, said frame imperforate along its rear half and provided with a screen or opening in the forward half, and a deflector on the exterior at the rear end, substantially as described.

405,313. WINDOW-VENTILATOR. OLE IVERSEN, Anoka, Minn. Filed May 10, 1888. Serial No. 273,637. (No model.)

Claim.—In a window-ventilator, the combination, with the peripheral rim A, of the outer and inner face-plates C and D, having radial openings, the revolving cut-off plate C', mounted on a suitable support and provided with the rack c, the shaft K, provided with the pinion K', engaging said rack and having the handle K'', the crank-shaft M, provided with the handle M', both of said handles being on the same side of the ventilator, and the revolving cut-off plate D', rigidly attached to the shaft M, substantially as described.

405,314. GAME APPARATUS. MYER JOSEPH, Cambridge, Mass. Filed Jan. 30, 1889. Serial No. 297,677. (No model.)



Claim.—1. The combination of a receptacle mounted upon a pivot and movable about the same with a spring tending to turn the said receptacle about its pivot, and a detent that normally holds the said receptacle and prevents it from moving under the action of its spring, and a target co-operating with said detent, as described, whereby when the target is struck the receptacle is released and turned suddenly about its pivot by the spring to discharge the contents of the receptacle, substantially as described.

2. The combination of a pivoted spring-pressed receptacle provided with a side or cover pivoted upon said receptacle, and a detent which engages with said pivoted cover, and a movable target co-operating with said detent, substantially as described.

405,315. GRAIN-METER. WILLIAM W. LOCKWOOD and CHARLES M. BUMFORD, Prospect, Kans. Filed Mar. 6, 1889. Serial No. 302,127. (No model.)

Claim.—1. The combination, with the tube and the partition dividing the same into two compartments, of the hinged trap-doors

405,315.

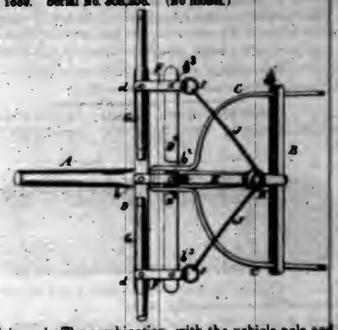
pivoted at the discharge end of said compartments and having a limited vertical movement on their pivots, substantially as shown and described, and for the purpose specified.

2. The combination, with the tube divided into compartments, as described, of the ears secured at the lower ends of said compartments and having elongated slots, the transverse shaft journaled in said ears and working in said slots, and the trap-doors carried by said shaft, substantially as shown and described.

3. The combination, with the tube and the partition *a*, of the pivoted switch-board, the trap-doors having vertical play and one of which is connected with said switch-board, and the scale-beam connected with the shaft of said trap-doors, substantially as and for the purpose specified.

4. The combination, with the tube divided into compartments, as described, and the pivoted switch-board and hinged trap-doors having free vertical play, of the scale-beam, the shaft on which said beam is pivoted, the rod connecting an end of said shaft with the shaft of trap-doors, the rod connecting the short arm of the scale-beam with the other end of said shaft, and the rod connecting switch-board with one of said trap-doors, substantially as and for the purpose specified.

5. The combination, with the tube, the vertical partition dividing the same into two compartments, and the pivoted switch-board above the partition, of the pivoted trap-doors beneath said receptacle, the pivoted scale-beam, the shaft to which beam is pivoted being extended across the tube and bent at right angles to form an arm, the rod connecting the free end of said arm with the shaft of the trap-doors, and the rod loosely connecting the shaft of the switch-board with one of said doors, substantially as described.

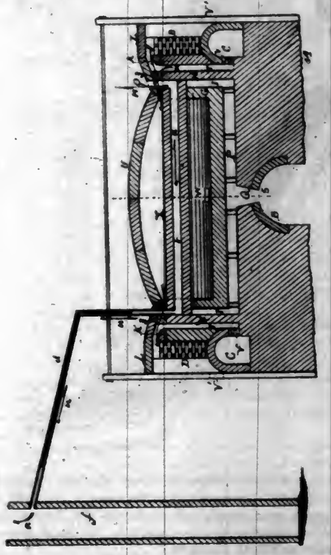


6. The combination, with the pivoted switch-board, the pivoted scale-beam, and the shaft carrying the trap-doors, of the rod connecting the short arm of the scale-beam with one end of said shaft, and the rod connecting the free end of the shaft on which the scale-beam is pivoted with the other end of the shaft carrying the trap-doors, substantially as described.

7. The combination, with the tube and the slotted ears secured thereto, of the transverse shaft working in the slots of said ears, the enlarged heads on the ends of said shaft, the pivoted switch-board, the pivoted scale-beam, and the rods connected at one end with the short arm of the scale-beam and with the shaft of the switch-board and the other end loosely engaging the shaft of the trap-doors between the ears and the enlarged heads, substantially as shown and described.

8. The combination, with the tube and the pivoted latches thereon, of the pivoted trap-doors, and the vertical extension of the shaft of said trap-doors provided at its free end with an anti-friction roller, substantially as shown and described.

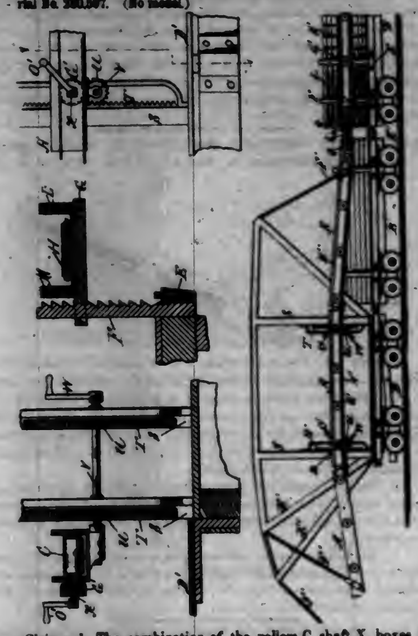
9. The combination, with the tube and the pivoted trap-doors, of the blocks on said tube, the registering device, and the rod connected at one end to one of said doors passed through an opening in one of said blocks and at the other end connected with the registering mechanism, substantially as shown and described.



405,316. DOUBLETREE. ANA MINOR, Harper, Kans. Filed Mar. 14, 1889. Serial No. 303,256. (No model.)

Claim.—1. The combination, with the vehicle-pole and two parallel doubletree-bars, each of said bars being independently pivoted to the pole, the clips F, connecting the free ends of said bars, the rings I, secured to the clips, and the cord J, passed around the drum K upon the pole and connecting the said rings I, substantially as described, and for the purpose specified.

2. The combination, with the vehicle-pole having two independent doubletree-bars pivotally connected at their ends, as described, and the rear bar connected by means of a cord or strap passed around a pulley upon the pole, of the metallic strip E, secured at one of its ends to the lower face of the pole, said strip being extended over the end and along the upper face of the pole and terminating directly above the forward doubletree-bar, substantially as and for the purpose specified.



405,317. GLASS-MELTING FURNACE. WILLIAM F. MOORE, Streator, Ill. Filed Dec. 15, 1888. Serial No. 293,673. (No model.)

Claim.—1. In a glass-melting furnace having gas and air supply chambers at each side, the combination, with a melting-tank having an air-cooling chamber surrounding the same, of a bridge-wall partition composed of a perforated lower section W, resting on the bottom of the tank, and a hollow upper section X, projecting through the sides of the tank and united with partition-walls between the air-cooling chamber and gas-channels, substantially as described.

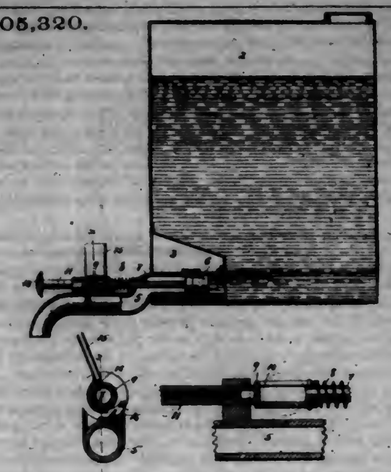
2. In a glass-melting furnace having gas and air supply chambers at each side, the combination, with a melting-tank having an air-cooling chamber surrounding the same, of a bridge-wall partition composed of a perforated lower section W, resting on the bottom of the tank, and a hollow upper section X, projecting through the sides of the tank and united with partition-walls between the air-cooling chamber and gas-channels, said upper section connecting with flues which extend vertically through the arch, and a pipe connected to one of said flues, said pipe leading to a chimney above the level of the flue, substantially as and for the purpose specified.

405,318. RAIL-TRACK-LAYING MACHINE. DAILY S. MOORE and CHRISTOPHER MCLENNAN, Hyde Park, Ill. Filed July 21, 1888. Serial No. 280,807. (No model.)

Claim.—1. The combination of the rollers C, shaft X, boxes A' A', located at each end of and within roller C, and bearings in the sides of tramway.

2. The combination of the rack T, pinion U, shaft Y, crank W, and tramway A, as and for the purpose shown.

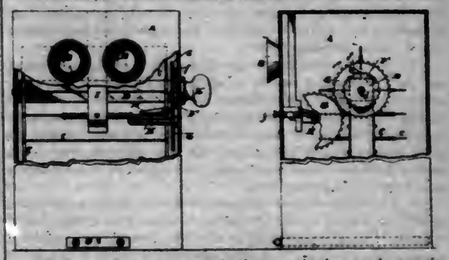
405,319. SASH-FASTENER. WILHELM E. HAGBOLM, Detroit, Mich. Filed Dec. 8, 1888. Serial No. 292,964. (No model.)



Claim.—1. In a sash-holder, the combination of the stationary wedge A, the movable wedge B, the lever C, pivotally secured in the stationary wedge and engaging into a recess of the movable wedge, the abutments *k l*, formed in the movable and stationary wedges, respectively, and the spring D, interposed between such abutments, substantially as described.

2. In a sash-holder, the combination of the stationary wedge A, the movable wedge B, the lever C, pivotally secured in the stationary wedge and engaging the movable wedge, the laterally-projecting spring-latch G, secured in said casing and adapted to engage into a keeper H, and the arm I on the lever C engaging said spring-latch, all substantially as described.

405,320. FLUID-RELEASING DEVICE. DAVID OLMSTED, Minneapolis, Minn. Filed Mar. 7, 1889. Serial No. 302,223. (No model.)



Claim.—1. The combination, with an air-tight tank, of a chamber communicating with the lower part of said tank and open at its top to permit the pressure of the atmosphere upon liquid in said chamber, a valve controlling the passage of liquid from said chamber, and a coin-operated mechanism governing said valve, substantially as described.

405,320.

2. The combination, with the air-tight tank 2, of the chamber 3, provided with the opening 4, communicating with said tank, the faucet-tube 5, connecting with said chamber 3, the valve 6, arranged to close said tube, the spring 8, and the tube 9, provided with a coin-receiving slot 10, substantially as described.

405,321. COIN-OPERATED STEREOSCOPE. CLARA E. PATTERSON, New York, N. Y. Filed Feb. 10, 1888. Serial No. 263,607. (No model.)

Claim.—1. A rotating shaft having a projection, a tube or coin-passage, a bolt to normally hold said projection and shaft from rotating, said bolt extending or projecting into the tube in the path of the coin, whereby the coin in passing through the tube moves said bolt and releases the shaft, allowing it to be rotated, a latch to hold said bolt away from the shaft projection, and a second projection carried by the shaft to trip the latch and release the bolt.

2. In a stereoscope, the combination of a picture-holder provided with a series of pictures, a rotating shaft to move the picture-holder, a handle to rotate said shaft and picture-holder to move the pictures successively before the sight-aperture, a projection upon said shaft, a coin-receiver provided with an aperture and terminating in a support, a push-pin to push the coin from one position without turning it over, and a bolt to prevent the rotation of the shaft and picture-holder projecting in the path of the coin and operated by it, when pushed, to release the projection on the shaft and allow the picture-holder to be rotated by the handle to cause the pictures to be moved successively before the sight-apertures.

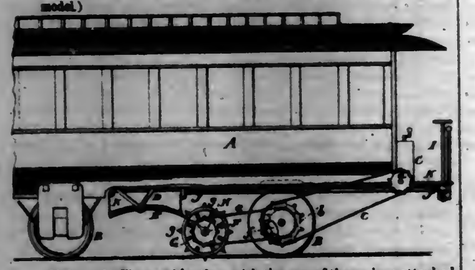
3. In a stereoscope, the combination of a picture-holder provided with a series of pictures, a handle and shaft to rotate said picture-holder to move the pictures successively before the sight-aperture, a rotating shaft moved by the rotation of the picture-holder, gearing between the two shafts, a bolt to prevent the rotation of said shaft, and through it the picture-holder, a coin-receiver provided with an aperture and terminating in a support, a push-pin to push the coin from one position to another, said bolt being arranged in the path of the coin and operated by it, when pushed, to release the projection on the shaft and allow the gearing and picture-holder to be rotated by the handle to move the pictures successively before the sight-apertures.

4. In a stereoscope, the combination of a picture-holder provided with a series of pictures, a shaft by which said picture-holder is rotated, having a projection, a handle to rotate said shaft, a coin-re-

ceiver provided with an aperture and terminating in a support, a push-pin to push the coin from one position to another, a locking-bolt to prevent the rotation of said shaft and picture-holder arranged in the path of the coin and operated by it, when pushed back, to release the projection on the shaft and allow it and the picture-holder to be rotated by the handle to cause the pictures to be moved successively before the sight-apertures, a latch to hold the locking-bolt open as soon as operated to unlock the picture-holder, and a latch-releasing projection upon the shaft to automatically unlatch the bolt and allow it to reset itself to prevent further rotation of the shaft and the picture-holder after a given number of pictures have been presented to view.

5. In a stereoscope, the combination of a picture-holder provided with a series of pictures, a shaft by which said picture-holder is rotated, having a projection, a handle to rotate said shaft, a coin-guide provided with an aperture to receive the coin, a locking-bolt to prevent the movement of the shaft and picture-holder extending into the path of the coin, and actuated thereby in its passage, whereby the picture-holder may be turned to present the pictures in succession before the sight-apertures during the passage of the coin through the guide into the coin-receptacle within the case of the stereoscope.

6. In a stereoscope, the combination of a picture-holder provided with a series of pictures, a shaft by which said picture-holder is rotated, having a projection, a handle to rotate said shaft, a coin-guide provided with an aperture to receive the coin, a locking-bolt to prevent the movement of the shaft and picture-holder extending into the path of the coin actuated thereby in its passage, whereby the picture-holder may be turned to present the pictures in succession before the sight-apertures during the passage of the coin through the guide into the coin-receptacle within the case of the stereoscope, a latch to hold said locking-bolt open, and a trip controlled by the rotating shaft to operate the latch and reset the bolt for actuation by the next coin deposited.



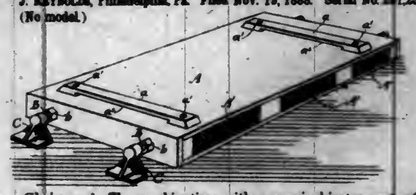
7. The combination of the handle E, shaft H, having projection A, connecting-gearing G, locking-bolts K and K^2, having tapered or beveled ends *k k'*, spring L, or its equivalent, to keep said locking-bolts normally in one position, a coin-guide, and a push-pin J, substantially as and for the purpose specified.

8. The combination of the handle E, shaft H, having projection A and pin N, connecting-gearing G, locking-bolts K and K^2, having tapered or beveled ends *k k'*, spring L, or its equivalent, to keep said locking-bolts normally in one position, a catch M, having arm *m*, for securing the lock out of reach of the projection A, and in which the pin N acts on the arm *m* to unlatch the lock after the shaft H has made a given movement, a coin-guide, and a push-pin J, substantially as and for the purpose specified.

9. The combination of the handle E, shaft H, having projection A, connecting-gearing G, lock K having a tapered or beveled end *k*, spring L, or its equivalent, to keep said lock normally in one position, a coin-guide, a push-pin J, and the pawl and ratchet *f* F, to prevent the shaft H rotating backward.

10. In a stereoscope, the combination of a picture-holder provided with a series of pictures, a rotary shaft to move said picture-holder, a coin-receiving tube provided with an aperture to receive the coin, a bolt to normally lock said rotary shaft against rotation and actuated by the coin in its passage to the receptacle to unlock said rotary shaft and allow its rotation in moving the pictures in succession before the sight-apertures, and an automatic relocking mechanism, substantially as described, controlled by the movement of the picture-holder to relock said rotary shaft after a given number of pictures have been moved before the sight-apertures.

405,322. ATTACHMENT FOR RAILWAY-CARS. GEORGE L. POTTS, Appleton, Wis. Filed Mar. 30, 1888. Serial No. 305,442. (No model.)



Claim.—1. The combination, with the car, of the springs attached thereto and the spiked wheel journaled in the free ends of said springs and connected with and operated by the driving-wheel of the car, substantially as shown and described.

2. The combination, with the car and the leaf-springs attached thereto and arranged substantially horizontally, as described, of the spiked wheel carried by said springs and the cords attached to said springs, and with a rotary shaft, whereby said cords may be actuated to raise or lower said spiked wheel, substantially as and for the purpose specified.

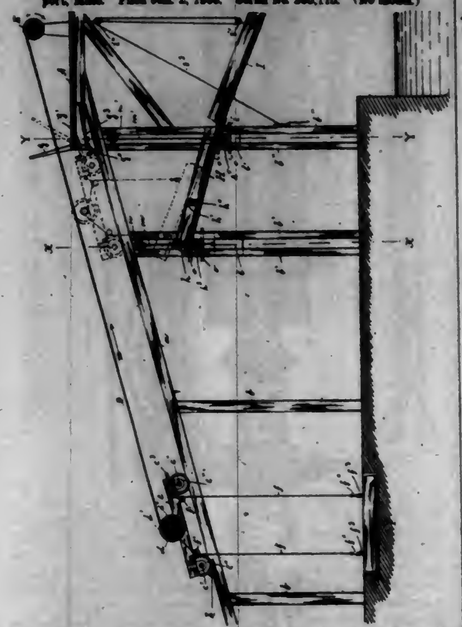
3. The combination, with the car, the springs attached to the under side thereof and arranged substantially horizontally, and the transverse shaft journaled in bearings at one end of said springs, of the spiked wheel on said shaft, the vertical shaft on the car, the cords attached at one end to said shaft and at the other to one end of said springs, and the cords attached to the other ends of said springs and to the vertical shaft, substantially as shown and described, and for the purpose specified.

405,323. RESONATOR FOR ORGANS OR PIANOS. ANDREW J. REYNOLDS, Philadelphia, Pa. Filed Nov. 19, 1888. Serial No. 291,234. (No model.)

Claim.—1. The combination, with a musical instrument, of a resonator consisting of a hollow box or shell in operative proximity to the instrument, sound-openings in said resonator, means for suspending the same from direct contact with the building in which it is placed, and a conduit for collecting and conveying the sound-vibrations from the instrument directly to the interior of said resonator, substantially as shown and described.

2. The combination of a resonator A, a series of cross-bars arranged therein under tension, and suitable brackets or equivalent supports directly connected with said cross-bars, substantially as shown and described.

3. The combination of the resonator A, a series of hollow cross-bars arranged therein under tension, and means for suspending said insulator from contact with the building in which it is placed, substantially as described.



405,324. PISTON FOR CALORIC-ENGINES. THOMAS J. RIDER, New York, N. Y., assignor, by mesne assignments, to William De La-mater and Leander A. Bevin, same place. Filed Feb. 4, 1889. Serial No. 298,557. (No model.)

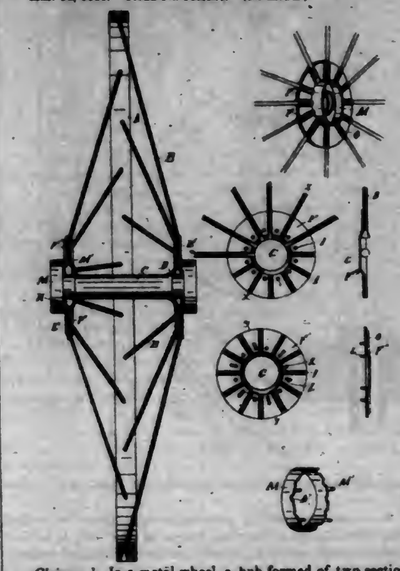
Claim.—1. In a caloric-engine, a transfer-piston consisting of a shell, diaphragms within the shell and fastened to it, and bars connecting the diaphragms, substantially as shown and described.

2. In a caloric-engine, a transfer-piston consisting of the shell *a*, in a single piece, the diaphragms *b*, the bars *c*, and the ring *d*, all arranged and combined substantially as shown and described.

405,325. ELEVATOR AND CONVEYER. JAMES B. ROGERS, Rockport, Mass. Filed Jan. 2, 1889. Serial No. 295,115. (No model.)

Claim.—1. In an elevator and conveyor, the combination of the frame supporting the track, the adjustable cross-beams in said frame, the chute having counter-weights and supported on said adjustable cross-beams, the platform carrying the spring-catch, the carriage mounted on the track having guide-pulleys journaled therein, a shaft carrying a large and small drums mounted in the carriage, a rope passing around the large drum for rotating the shaft, ropes passing around the small drums and guide-pulleys, and the box connected to said ropes, said parts being arranged and operating substantially in the manner and for the purpose described.

2. In an elevator and conveyor, the combination of the frame supporting a track, the cross-beams adjustable in said frame, the pins for retaining the cross-beams in their adjusted positions, the counter-weighted chute supported on said cross-beams, the platform carrying the spring lever-catch supported on the frame, the carriage carrying the guide-pulleys mounted on the track and having an eye adapted to be engaged by the lever-catch, the shaft mounted in the carriage carrying a large and small drums, a rope passing around the large drum, ropes passing around the small drums and over the guide-pulleys, and a box connected to the said ropes, said parts being arranged and operating substantially as and for the purpose described.



3. In an elevator and conveyer, the combination of the frame supporting a track, a counterweighted chute adjustable in the frame, a carriage having a shaft mounted therein carrying differential drums, guide-pulleys mounted in the corners of the carriage, ropes passing around the drums and guide-pulleys, a box connected to said ropes, a rope for rotating the shaft carrying the drums, and a lever having a hook at one end for engaging the carriage, said parts being arranged and operating substantially as and for the purpose described.

405,326. SASH-FASTENER. THOMAS H. ROSS, Evansville, Ind., assignor to the Ross Sash Lock Company, same place. Filed Dec. 11, 1888. Serial No. 293,317. (No model.)

Claim.—In a sash-fastener, the combination, with a window frame or sash provided with a rack-bar, of a box C, having a slot *c*, a plate D, having a slot *d*, lugs *d' d'' d''' d''''*, stud d^5, and guides *e e'*, a pawl F, having connecting-piece *f* and extension *f'*, adapted to slide, respectively, in the slots *c* and *d* and between the guides *e e'*, and a gear-wheel adapted to revolve upon the stud d^5, as shown and described, and for the purposes set forth.

405,327. METAL WHEEL. JOHN W. SAVAGE, Toledo, Ohio. Filed Mar. 11, 1889. Serial No. 302,936. (No model.)

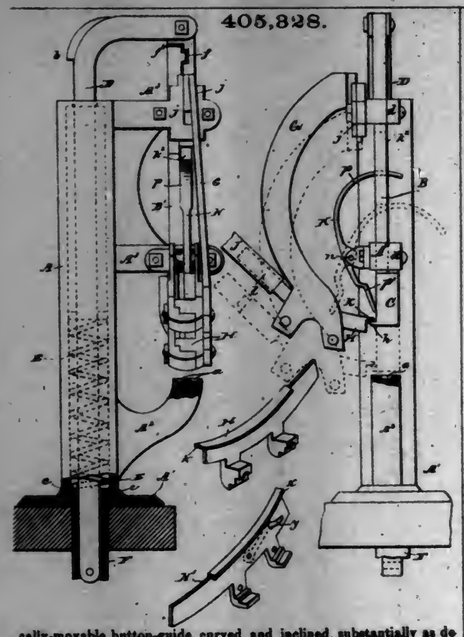
Claim.—1. In a metal wheel, a hub formed of two sections and a transverse spindle, each section comprising two disks, one of which has a concentric row of perforations, the opposite disk having projections registering with and adapted to pass through a number of perforations and be riveted to hold the disks in engagement with spokes between the same, as and for the purpose set forth.

2. In a metal wheel, hub-sections formed of two disks, between which the spokes are held by means of metal projections integral with a sand-band by the projections being passed through both sections and riveted, as and for the purpose set forth.

405,328. BUTTON-ATTACHING MACHINE. WARREN G. SLATER, Fremont, Mich., assignor to the Peninsular Novelty Company, Boston, Mass. Filed Aug. 25, 1886. Serial No. 211,571. (No model.)

Claim.—1. In a button-fastening machine, the combination, with the hollow pedestal provided with an anvil and guide-extensions, of the spring-actuated plunger-rod having a carved and shouldered upper extension, the two jaw-shanks bearing jaws C C and adapted to be opened and closed, as described, the jaw-shank B, pivoted to the said upper extension of the plunger-rod, and the jaw-shank B', attached to shank B by a lug and slot, both shanks being guided, substantially as described, and the vibrating dog having a pusher *p'*, as specified.

2. The combination, with the anvil and its frame, of the gripping-jaws, vertically movable, the carved guides arranged in the relation shown to said jaws, and the vertically-movable arm to which said guides are secured, and the curved dog K, provided with a button-pusher, substantially as described.



3. The combination, with the vertically-movable gripping-jaws having lifting-offsets on their sides, of the curved guides H, having lipped extensions on their lower ends and applied to a vertically-movable arm, and the curved dog K, provided with a pusher and actuated substantially as described.

4. The combination, with the vertically-movable spring-actuated gripping-jaws, of the vertically-movable arm G, the guides secured rigidly to this arm, the tube or magazine removably attached to it, and the vibrating dog K, provided with a pusher *p'*, substantially as described.

5. The curved guides H, formed of two longitudinal parts rigidly secured to the vertically-movable arm G, in combination with the vertically-movable jaws, a vibrating dog provided with a pusher, and a clinching-anvil, substantially as described.

6. The combination of the vibrating button-placing dog with the vertically-movable gripping-jaws, slotted as described, and the verti-

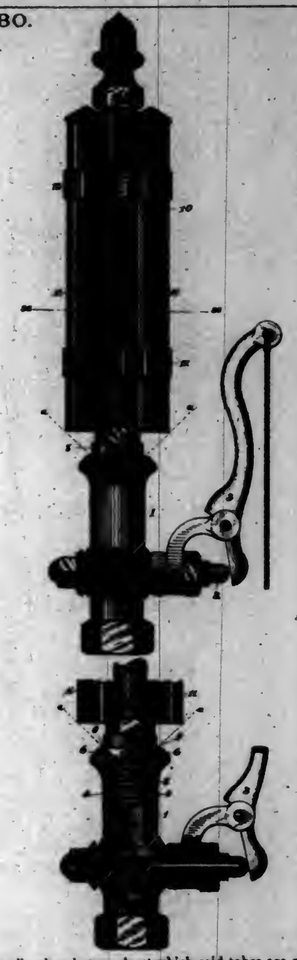
405,328.

cally-movable button-guide curved and inclined, substantially as described.

7. The combination of the gripping-jaws provided with the slot, as shown, with a button-placing dog formed as described, an inclined curved and vertically-movable guide H, and a clinching-anvil, substantially as described.

8. The button-machine herein described, consisting of a tubular pedestal, a spring-actuated plunger-rod having depending from and pivoted to its upper end one of the shanks of a pair of button-grippers, spring-actuated as described, a vertically-movable arm bearing guides H, and having removably attached to it a tube or magazine, a pivoted dog of curved form, having a transferrer *p'*, adapted for placing the buttons between said gripping-jaws, and an anvil on which the fasteners are clinched, substantially as described.

405,329. LOCK-CASE. EUGENE C. SMITH, New York, N. Y., assignor to the Universal Lock Company of New York, same place. Filed Jan. 31, 1889. Serial No. 298,200. (No model.)



Claim.—1. A lock-case constructed of the following parts: a top adapted to support the locking mechanism and having a circumferential depression around its edge, and a hollow body formed with the bottom and sides in one piece separate from the top and united to the top by its metal entering the aforesaid depression in the top, as herein described.

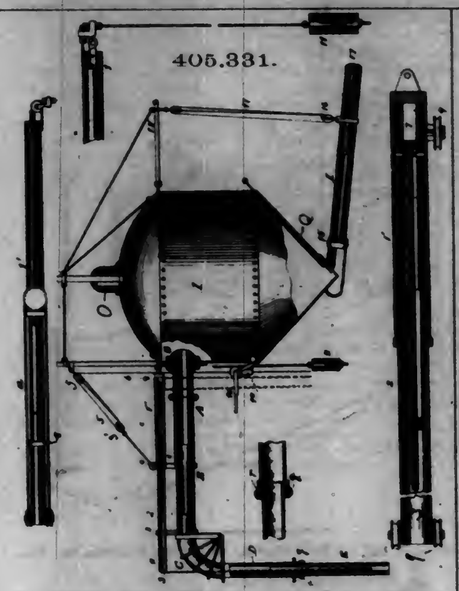
2. A padlock-case constructed of the following parts: a top having shackle-guiding openings formed in it and a downward-projecting part adapted to enter the lock-case body and support the locking mechanism, the said downward-projecting part having a circumferential depression around its edge, a body formed with the bottom and sides in one piece separate from the top, and the body and top being united together by the metal of the body entering the depression in the edge of the downward-projecting part of the top, as herein described.

405,330. STEAM-WHISTLE. HENRY V. SMITH, Birmingham, assignor, by mesne assignments, of one-half to Edward G. Burnham, Bridgeport, Conn. Filed Sept. 14, 1888. Serial No. 285,401. (No model.)

Claim.—1. The combination, with the group of resonant tubes,

405,330.

of the centrally-placed stem about which said tubes are grouped and whereon they are supported, a steamway axial with the stem and eccentric toward each and every one of the said tubes, and a valve whereby the said steamway is controlled, substantially as set forth.



2. In a steam-whistle, the combination, with the central supporting-stem and the steamway concentric with and having its line of throw outwardly from said stem, of the group of resonant tubes, the brackets in which said tubes are supported and whereby they are secured to said stem and are adjustable vertically relative thereto, and the valve for controlling the supply of steam to the way, substantially as set forth.

3. The combination, with the central supporting-stem threaded at its upper end and the steamway axial with the said stem, of the group of resonant tubes, the brackets wherein said tubes are held at the appropriate distances from the stem and whereby said tubes may be vertically adjusted upon said stem, and the check-nut threaded upon the top of the stem and abutting against the upper bracket, substantially as set forth.

4. The combination, with the stem threaded at its upper extremity, of the steamway at the bottom end of the stem, the plurality of resonant tubes, and the two brackets wherein they are supported, the lower bracket being plain and the upper bracket threaded for engagement with the stem, whereby the whistle-tubes may be adjusted, as desired, relative to the stem and held in their adjusted position, substantially as set forth.

405,331. PNEUMATIC GRAIN-CONVEYING APPARATUS. LYMAN SMITH, Kansas City, Mo. Filed Feb. 17, 1888. Serial No. 264,383. (No model.)

405,331.

Claim.—1. In a pneumatic grain-conveyer, the combination of a receiving-tank provided with an air exhaust or suction pipe, a receiving-pipe composed of vertical and horizontal sections, an adjustable elbow connecting said sections, a universal joint securing the horizontal section to the tank, and a system of ropes and pulleys for supporting and operating the receiving-pipe, substantially as described.

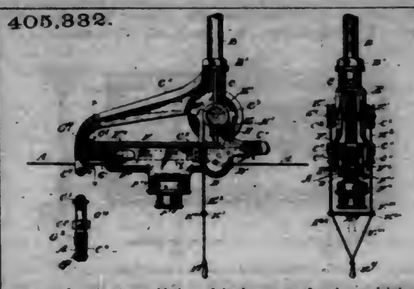
2. The combination of the receiving-tank and the receiving-pipe consisting of telescopic vertical and horizontal sections, an adjustable elbow connecting the sections, and a universal joint by which the receiving-pipe is connected to said tank, as set forth.

3. The combination of a receiving-tank provided with a suction or air pipe, a receiving-pipe composed of telescopic horizontal and vertical sections, an adjustable support or boom carrying the receiving-pipe and by which the same is longitudinally adjusted, a universal joint securing the horizontal section to the tank, a discharge-pipe for the tank secured to the same by a universal joint, and systems of ropes, pulleys, &c., by which the discharge-pipe and adjustable support are carried and operated, substantially as described.

4. The combination of the receiving-tank, the receiving-pipe composed of telescopic sections, and the telescopic boom supporting said pipe and adapted to adjust the same, as set forth.

5. The combination of a tank, a receiving-pipe composed of horizontal and vertical sections, the horizontal section being secured to the tank by a universal joint and the vertical portion being formed in telescopic sections, and a counterpoise for the vertical section, consisting of a weight located below the universal joint and ropes following the line of the receiving-pipe and secured to the bottom section of the vertical portion, substantially as described.

6. The combination of a receiving-tank, a receiving-pipe composed of horizontal and vertical portions connected by an adjustable elbow and composed of telescopic sections, a counterpoise for the vertical telescopic sections, and a telescopic boom above and parallel with the horizontal portion of the pipe and secured to the same, by which the length of the pipe is increased or diminished.



405,332. CASH AND PARCEL CARRIER. EDGAR B. STOCKING, Washington, D. C. Filed Feb. 23, 1889. Serial No. 301,522. (No model.)

Claim.—1. A bracket having a post-socket, bearings for a propelling device, and bearings for bearing-wheels, all arranged in line with each other, in combination with bearing-wheels and with a car having a plate which rests on the bearing-wheels, substantially as specified.

2. A bracket having a brace bored for the longitudinal passage of the track, slitted in intersection of the bore, and provided with a binding-screw, substantially as specified.

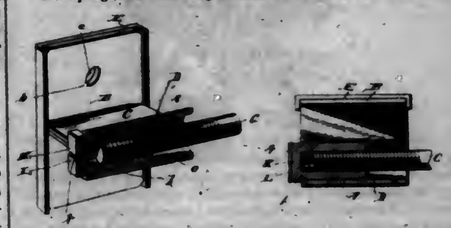
3. A bracket having a post-socket and depending legs provided with bearings for a propelling device and for bearing-wheels, and having an integral brace adapted for connection with a track, substantially as specified.

405,332.

4. A car having a U-shaped body, a top forming a driving-surface, and a depending integral heavy case, substantially as specified.

5. The combination of a car having a driving-surface, a propelling device arranged to take contact thereon, a bracket having elongated bearings, and a socket and a station-post, the bearings, socket, and post being in line with each other, substantially as specified.

6. The combination of a track, a car adapted to travel thereon and having a driving-surface, a propelling device mounted in a bracket having bearings elongated on lines at right angles to the track, and a pulling-cord depending from the propelling device and in line with the bracket, substantially as specified.



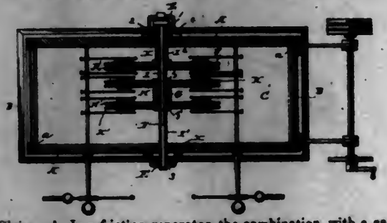
7. The combination of a car having a depending receptacle, pulling-cords depending at the sides of the car and in advance of its receptacle when at rest and merging in a common handle, and a spreader to prevent contact of the cords with the receptacle, substantially as specified.

8. The bracket C, having the socket C', legs C², provided with the bearings C³ D', and the brace C⁴, having socket C⁵ and slitted, as at C⁶, substantially as shown and described.

9. The car consisting of the top F and separate body F', the body F' and the case F⁴ being formed in a single piece and adapted for connection with the top, substantially as specified.

10. The combination, with a car, a propelling device adapted to be put in operative condition by the car, and a spring constructed and arranged to remain quiescent during the greater portion of the operation of the propelling device for preliminarily and partially putting said propelling device into operative position, substantially as specified.

405,333. HANGING SLIDING CURTAINS. THOMAS TRIBE, Colorado Springs, Colo. Filed Aug. 20, 1888. Serial No. 283,242. (No model.)



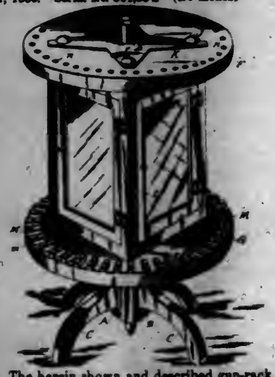
Claim.—1. The brackets provided with sleeves or tubular sockets having smooth interiors, combined with the screw-bolts fitting loosely and adapted to revolve in the sleeves or sockets and provided with threaded bores, and the rod provided with threaded extremities engaging the bores of the screw-bolts, substantially as specified.

2. The brackets provided with sleeves or tubular sockets, combined with the revoluble screw-bolts fitting loosely in the sleeves or sockets, provided with threaded bores and having heads on their outer ends bearing against the outer ends of the sleeves or sockets, and the rod or wire having threaded ends engaging the bores of the screw-bolts, substantially as specified.

3. The combination, with the brackets provided with sleeves or tubular sockets D D, of the revoluble screw-bolts K, fitting snugly in the sleeves or sockets and having angular heads bearing against the outer ends of the sleeves or sockets and provided with transverse grooves, and the rod or wire having threaded ends engaged in the bores of the said screw-bolts, substantially as specified.

4. The herein-described brackets for curtain-hangers, comprising the washer having its edges turned up, the base-plate fitting between the turned-up edges of the washer, and having its center looped up to form a tubular sleeve or socket D, and the revoluble screw-bolts fitting in the said sleeves or sockets and provided with a threaded bore to engage the end of a rod or wire, substantially as specified.

405,334. FRICTION-GENERATOR. HENRY E. WAITE, New York, N. Y. Filed Feb. 25, 1889. Serial No. 301,106. (No model.)

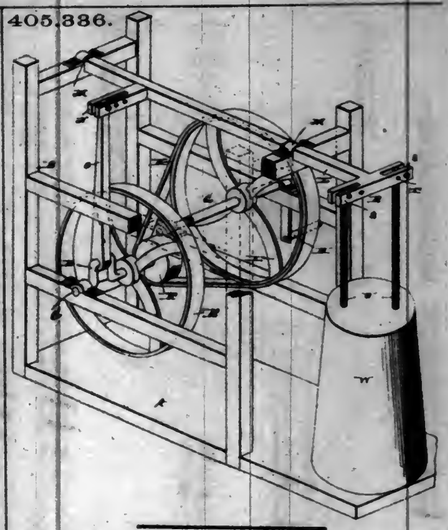


Claim.—1. In a friction-generator, the combination, with a case, of bearings mounted upon the outside of the case, a shaft carrying one or more plates supported in said bearings, and hollow shafts mounted upon the first shaft and carrying other plates, substantially as described.

2. In a friction-generator, the combination, with an air-tight case, of bearings mounted upon the outside of the case, a shaft mounted in said bearings and carrying one or more plates, and also provided with a pulley outside the case, and two or more hollow shafts mounted upon said first shaft and carrying plates, and each provided with a pulley outside of the case, substantially as described.

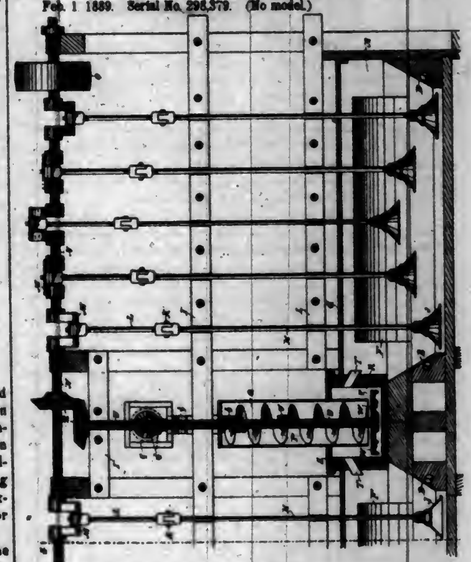
3. In a friction-generator, the combination, with the rotating plates, of a series of metallic sector-pieces secured thereon, each sector having a projecting center portion, and a brush arranged to contact with said plates throughout the length of the projection portion, substantially as described.

405,335. GUN-RACK. MILES H. AHERNE, Montgomery, Ala. Filed Feb. 27, 1889. Serial No. 301,234. (No model.)



Claim.—1. The herein shown and described gun-rack, composed of the stand, the post rising from the stand, and the rack mounted on the said post, composed of the upper support having a series of openings for the insertion of the muzzles of the guns, and having hooks in the rear of the said openings, the lower support having a corresponding series of notches to receive the ends of the gunstocks, and having hooks on its under side, and the glass case centrally disposed and extending from the lower to the upper support, substantially as and for the purpose described.

2. The herein shown and described gun-rack, composed of the stand, the post rising from the stand, the upper and the lower supports, the upper support having openings and hooks in the rear of the openings, and the lower support having notches and hooks on the under side opposite the notches, the post H, the glass case, the rims or strips secured to the supports for fastening the post H and the glass case in position, the strengthening-plates, and the rods for securing the said supports together, substantially as described.



405,336. CHURN-MOTOR. HENRY C. ANDERSON, Whitsborough, Tex., assignor to Charles C. Clemens and John B. Choice, same place. Filed Jan. 25, 1889. Serial No. 297,508. (No model.)

Claim.—The combination of the frame, the rock-shaft arranged longitudinally in the top of the same and having the arm N and the cross-head R, the dasher-rods pivoted to the cross-head, the crank-shaft journaled transversely in the frame below the rock-shaft and having the fly-wheel E and the pulley F, the pitmen connecting the crank-shaft and the arm N, the driving-shaft arranged transversely in the frame, the pulley I thereon, and the belt connecting the pulleys I and F, as set forth.

405,336.

405,337. AMALGAMATOR. JOSEPH BEHR, West Point, Cal. Filed Feb. 1 1889. Serial No. 298,379. (No model.)

Claim.—1. An amalgamator consisting of a containing-tank with amalgamated plates fixed upon the sides, in combination with the series of vertically-moving amalgamated dashers, substantially as described.

2. The containing-tank with amalgamated sides, the inverted conical dashers consisting of amalgamated plates, the vertical stems moving in guides, and the crank and crank-shaft whereby the dashers are moved into and out of the pulp, substantially as and for the purpose herein described.

3. The hollow bell-shaped amalgamated dashers with their vertical stems and operating-cranks, a tank with amalgamated sides within which said dashers reciprocate, in combination with a central distributing-tub, the vertical screw conveyer discharging into the bottom thereof, the stirrers at the bottom of the conveyer-shaft, and discharge-pipes opening outwardly from the sides of the tub, substantially as described.

4. The amalgamating-tank with the vertically-reciprocating dashers, a central distributing-tub with the discharge-pipes, a vertical screw

conveyer, and the stirrers or agitators fixed to the bottom of the conveyer-shaft, in combination with the feed-passages opening one above the other into the conveyer-tube, and the horizontal conveyer discharging into the uppermost of said chutes, substantially as and for the purpose herein described.

5. The tank with the reciprocating dashers, the surrounding amalgamated plates, in combination with the steam-heating pipes extending along the tank sides beneath and in contact with the plates, substantially as described.

405,338. NUT FOR CARRIAGE-AXLES. PEARSON D. BLISS, Bridgeport, Conn. Filed Dec. 26, 1888. Serial No. 294,657. (No model.)

Claim.—The herein-described axle-nut, consisting of an internally and externally screw-threaded part provided with wings and of set-screws passing through said wings, with their ends bearing upon the face of the internally-screw-threaded and adjustable part, in combination with the said internally-screw-threaded and adjustable part, substantially as and for the purpose described.

405,339. POCKET CARD-CASE. CHARLES J. BUFFUM, Boston, Mass. Filed Apr. 26, 1889. Serial No. 308,702. (No model.)

Claim.—1. In a device of the character described, the combination of an outside folding cover A, provided with an interior pocket *a*, a tongue-piece B, having a flap *b*, a re-enforcing piece C, having a folded upper portion *c*, and a pack of cards or sheets D, the tongue-piece, its flap, the re-enforcing piece, and the inner end of the pack being joined together, as described.

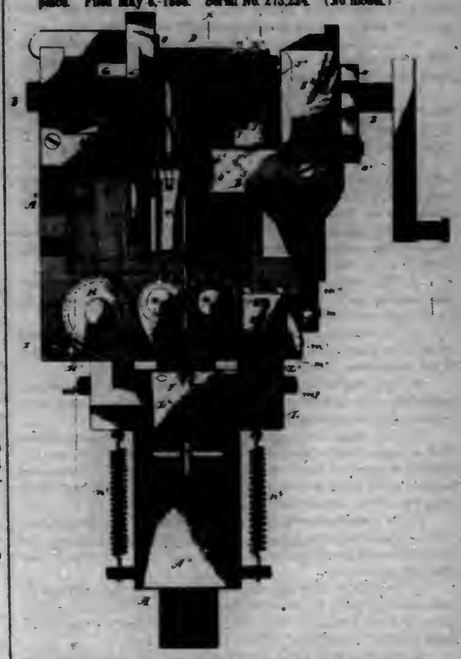
2. In a device of the character described, the combination of an outside folding cover A, provided with an interior pocket *a*, a tongue-piece B, having a folded portion or flap *b*, a re-enforcing piece C, having a folded upper portion *c*, and a pack of perforated cards or sheets D, the tongue-piece, its flap, the re-enforcing piece, and the inner end of the pack being joined together by gum and by stitching *d*, as described.

405,340. ROCKING-CHAIR ATTACHMENT. WILLIAM I. BOWKER, La Grange, Ill. Original application filed Sept. 9, 1887, Serial No. 249,270. Divided and this application filed Jan. 12, 1889. Serial No. 296,169. (No model.)

Claim.—1. A platform rocking-chair attachment comprising a compressible spiral spring and two attaching-brackets, secured at their ends to the spring and having said ends farther apart at one side of the spring than at the other, substantially as described.

2. A platform rocking-chair attachment comprising a compressible spiral spring longer at one side than the other and two attaching-brackets adapted to receive and hold the terminal coils of the spring, substantially as described.

405,341. ROCKING-CHAIR ATTACHMENT. WILLIAM I. BOWKER, La Grange, Ill. Original application filed Sept. 9, 1887, Serial No. 249,270. Divided and this application filed Jan. 15, 1889. Serial No. 296,450. (No model.)



Claim.—1. A platform rocking-chair attachment comprising a compressible spiral spring and two attaching-brackets secured thereto and holding the terminal coils of the spring at opposite sides thereof, substantially as described.

2. A platform rocking-chair attachment comprising a compressible spiral spring and two attaching-brackets secured thereto and holding the terminal coils of the spring at opposite sides thereof, one at the side adjacent to the rocker and base-rail and the other at the side farthest therefrom, substantially as described.

3. A bracket for rocking-chair attachments, comprising a plate to be secured to the rocker or base-rail, an extended portion to pass through the body of the coils, and projections at the end of the extended portion adapted to receive and hold one of the terminal coils of the spring at one side of the body of the coils, substantially as described.

405,342. STAPLE FORMING AND CLINCHING MACHINE. JOHN CRAWFORD, Reading, Pa., assignor of one-half to Edwin R. Wiegand, same place. Filed May 8, 1888. Serial No. 273,224. (No model.)

Claim.—1. In a machine for forming and applying wire staples, the combination, with a wire-feeding device and a cutter for severing the wire into proper lengths for staple-blanks, of grippers and formers constructed and arranged to grip the staple-blanks and form the staples, and then insert them into the material to be fastened, substantially as set forth.

2. In a machine for forming and applying wire staples, the combination, with a wire-feeding device and a cutter for severing the wire into proper lengths for staple-blanks, of grippers and formers constructed and arranged to form the staple-blanks into staples and awls for guiding the staples through the material, substantially as set forth.

3. In a machine for forming and applying wire staples, the combination, with a wire-feeding device and a cutter for severing the wire into proper lengths for staple-blanks, of grippers and formers for forming and inserting the staples and grooved needles for guiding the ends of the staples through the material, substantially as set forth.

4. In a machine for forming and applying wire staples, the combination, with a wire-feeding device and a cutter for severing the wire into proper lengths for staple-blanks, of grippers and formers for forming and inserting the staples, and grooved needles having inclines constructed to bend the free end of the staple after its insertion into the material, substantially as set forth.

5. In a machine for forming and applying wire staples, the combination, with a wire-feeding device and a cutter for severing the wire into proper lengths for staple-blanks, of grippers and formers for forming and inserting the staples, and a support for automatically moving

the material toward the staples as they are being inserted in the material, substantially as set forth.

6. In a machine for forming and applying wire staples, the combination, with a wire-fastening device and a cutter for severing the wire into proper lengths for staple-blanks, of grippers and formers for forming and inserting the staples, and an anvil for clinching the free ends of the staples after they have been inserted in place, substantially as set forth.

7. In a machine for forming and applying wire staples, the combination, with devices for forming and inserting the staples, of a clinching-anvil constructed and arranged to clinch the free ends of the staple while it is held by the inserting devices and to clinch them again after the staple has been released from the inserting devices, substantially as set forth.

8. In a machine for forming and applying wire staples, the combination, with grippers, of staple-forming jaws provided with inserting-awls, substantially as set forth.

9. In a staple forming and clinching machine, a wire-gripping device for inserting the staples, composed of a fixed limb and a pivoted limb having mating jaws, substantially as set forth.

10. In a staple forming and clinching machine, the combination, with a wire-cutter, of a gripping device adapted to grip the staple-blank near its center, substantially as set forth.

11. In a staple forming and clinching machine, a wire-gripping device which is adapted to move vertically and by pivotal movement of one limb grip a staple-blank, then elevate and bend its limbs into staple form, substantially as set forth.

12. In a staple forming and clinching machine, the combination, with a wire-cutter, of two vertically supported and reciprocating gripping-limbs, which are adapted to separate and close to grip a staple-blank between their jaws, substantially as set forth.

13. The combination, with devices for holding a staple, of a vertically-rocking table adapted to support the material into which the staple is to be inserted.

14. The combination, with devices for holding a staple, of a vertically-rocking anvil or clinching-bar adapted to engage the ends of the staple while the latter is held by the holding devices.

15. In a staple and clinching machine, two grooved awls secured to movable blocks and adapted to move toward or from each other in the same plane, substantially as set forth.

16. In a staple forming and clinching machine, two grooved awls supported to lie parallel in the same plane and adapted to move away from each other, substantially as set forth.

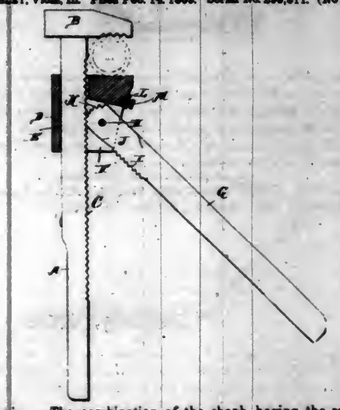
17. In a staple forming and clinching device, the combination, with a staple-blank-gripping device supported to reciprocate and adapted to bend the blank on its upward stroke, of a pair of supported grooved awls which receive the staple on its downward passage in the gripping device, substantially as set forth.

18. In a staple forming and clinching machine, the combination, with reciprocating wire-gripping jaws, of a wire-feeding device and means to consecutively move the feeder and close the gripper, substantially as set forth.

19. In a staple forming and clinching machine, the combination, with a wire-gripping device and means to reciprocate this device vertically, of a wire-feeder, a wire-cutter, and mechanism to move the feeder, cutter, and gripper, substantially as set forth.

20. In a staple forming and clinching machine, the combination, with a wire-gripping device having a fixed and a moving jaw and made to reciprocate periodically, and two grooved awls, of a wire-feeder, a wire-cutter, a rocking table, a rocking anvil, and means to support these parts of the machine and move them in harmony with each other, substantially as set forth.

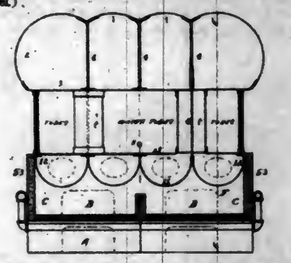
21. In a staple forming and clinching machine, the combination, with a supporting-standard, of a rocking anvil and a rocking table supported on this standard, and mechanism to rock the anvil and table simultaneously as well as consecutively, substantially as set forth.



22. In a staple forming and clinching machine, the combination, with a bracket-plate which affords support to staple-forming devices, a cam-shaft, and cam-hubs and cam-disks mounted on and secured to the cam-shaft, of a wire-gripping device composed of one rigid and one movable jaw, the said gripping device having a vertical and also a horizontal reciprocation periodically by the action of the cam-disks and projections thereon, substantially as set forth.

23. In a staple forming and clinching machine, the combination, with a supporting-frame or bracket-plate and a standard, of a cam-shaft revolubly mounted on the frame, cam disks and hubs fixed on this shaft, and a pair of gripping-jaws, one of which is movable, actuated periodically to open, close, and move vertically as well as horizontally by the revolution of the cam-shaft, substantially as set forth.

24. In a staple forming and clinching machine, the combination, with a standard, a bracket frame or plate secured on the standard, a cam-shaft adapted to rotate, and cams affixed upon this shaft, of two gripping-jaws which are given an opening and closing as well as vertically and horizontally reciprocating movements at periodic intervals, a wire-feeding device, two adjustable grooved awls, and a wire-cutter, substantially as set forth.



25. In a staple forming and clinching machine, the combination, with a frame or supporting device, a cam-shaft revolubly supported on this frame, and cam disks and hubs affixed upon this shaft, of a pair of gripping-jaws which open, close, and move in a vertical as well as a horizontal plane at proper intervals, two grooved awls adapted to move toward or from each other in the same vertical plane and remain periodically fixed parallel to each other, a wire-feeding device, a wire-cutting device, a rocking table, and a clinching-anvil, substantially as set forth.

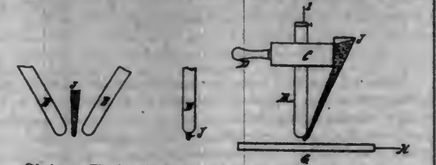
405,343. COMBINED NUT AND PIPE WRENCH. WILLIAM T. CHESLEY, Viola, Ill. Filed Feb. 14, 1888. Serial No. 299,811. (No model.)

Claim.—The combination of the shank having the rack-bar formed on its inner side and provided with a fixed jaw at its outer end, the sliding jaw, the operating-lever pivoted in a recess in the latter and having a series of teeth upon its inner side, a series of teeth at its inner end concentric with its pivoting-point, and an intermediate beveled portion, and a spring secured adjustably to the sliding jaw and adapted to bear against the operating-lever, substantially as set forth.

405,344. STEAM-BOILER. NATHAN B. CLARK, U. S. Navy, and FRANK B. KIDD, Baltimore, Md. Filed Dec. 6, 1888. Serial No. 292,854. (No model.)

Claim.—1. In a steam-boiler, the combination of the top and bottom members composed of arches, and downcast conduits overlapping the edges of said arches and forming passages from one arch to another, as well as a connection between top and bottom members.

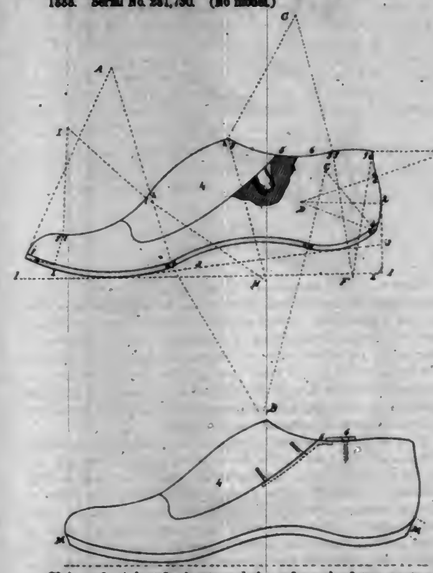
2. In a steam-boiler, the combination of top and bottom members composed of arches united by conduits overlapping the edges of the adjacent arches, and ties or braces passing through said conduits, uniting the edges of the arches in the two members.



3. In a steam-boiler having top and bottom members composed of arches, as described, and connecting-conduits overlapping the edges of adjacent arches, the combination, with the arches, of ties passing through the conduits and also fastened to the tube-plates of the arches, substantially as described.

4. The combination, with a steam-boiler having top and bottom members and connecting water-tubes, as described, of fixed perforated pipes in proximity to said water-tubes, whereby steam may be thrown on the exterior of the tubes and into the passages between them.

5. The combination, with a steam-boiler having water-tubes, of a fixed pipe in proximity to said tubes, said steam-pipe having perforations leading in many directions, so as to direct a current of steam or air onto and between the water-tubes, substantially as described.



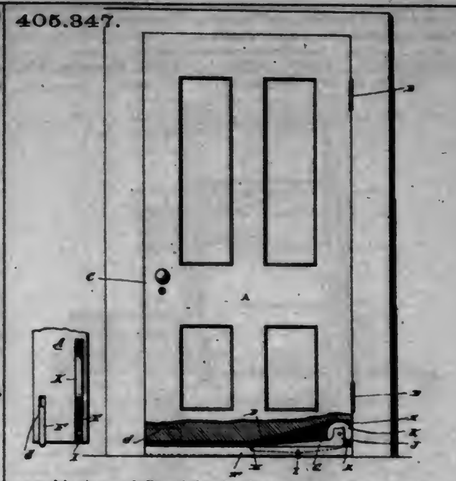
6. A steam-boiler consisting, essentially, of a top member and a bottom member and vertical water-tubes connecting the same, the members being composed of arches of less curvature in the tube-plates than in the outer plates, substantially as described.

405,345. PROCESS OF ELECTRIC WELDING. CHARLES L. COFFIN, Detroit, Mich. Filed Dec. 20, 1888. Serial No. 294,194. (No model.)

Claim.—The herein-described process of electric welding, consisting in feeding metal to the joint through the welding-arc from a supply carried on the welding-tool.

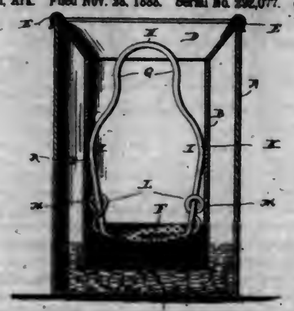
405,346. LAST. JOHN CONDELL, New York, N. Y. Filed Aug. 2, 1888. Serial No. 281,790. (No model.)

Claim.—1. A last for boots and shoes formed of two parts consisting of a last proper and a last-block, the two being united by a vertical ogee joint at the forward end, and a suitable fastening device which locks the last and last-block together, substantially as described.



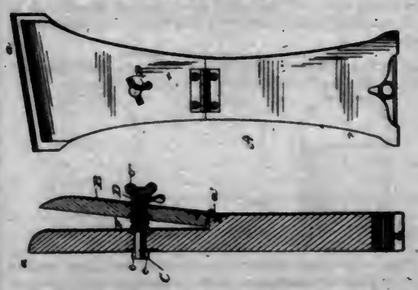
2. A last for boots and shoes consisting of a last proper and a last-block, the two united by a vertical ogee joint at the forward end, and an inclined pin on the block entering an opening in the last, substantially as described.

405,347. WEATHER-STRIP. HARLOW W. COOK, Ottawa, Kans. Filed Sept. 20, 1888. Serial No. 285,871. (No model.)



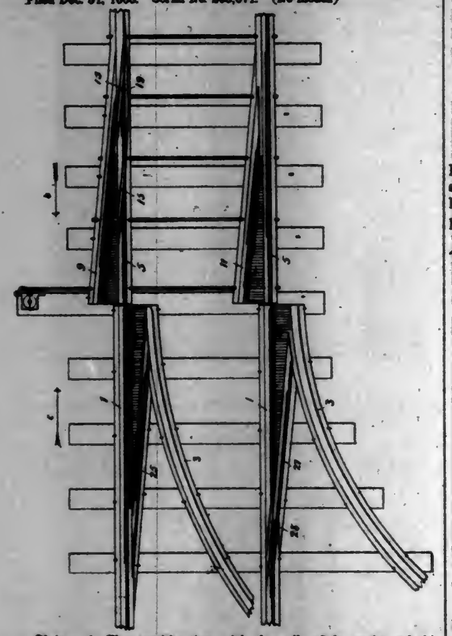
Claim.—As an improvement in weather-strips, the combination, with the door having the recess D in its lower edge and the notches *d d* and E in its side edges, of the strip F, arranged in the recess D and having its ends moving in the notches *d d*, the angle-lever pivoted at one end to the center of the strip F and at about its center to the door, within the recess D, and having an arm at its free end projecting upward in the notch E, and the disk journaled on said arm, substantially as specified.

405,347.



405,348. COMPRESSION-EXTRACTOR. HENRY A. CRANDELL, Harrison, Ark. Filed Nov. 28, 1888. Serial No. 292,077. (No model.)

Claim.—The combination, with a vessel having perforated bottom, of the perforated plate or follower having a handle provided with outwardly-bowed resilient portions adapted to retain the said plate or follower in position by frictional contact with the walls of the vessel and to admit of gradual upward movement of said follower, substantially as and for the purpose set forth.



405,349. STITCHING-CLAMP. COLEMAN DOM, Laddonia, Mo. Filed Mar. 9, 1889. Serial No. 302,628. (No model.)

Claim.—In a clamping device, two jaws, one shorter than the other and shaped at their upper ends substantially as described, the shorter one hinged to the longer one, in combination with the screw-threaded bolt C, fitted in holes formed in said jaws and having on its head the lateral arms *c c*, adapted to coincide with slots *d d*, and having thumb-piece *c'*, and nut D, having internal screw-thread located on bolt C between the jaws B and thumb-piece *c'* and adapted to turn

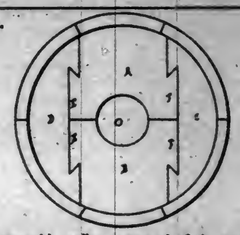
on said bolt to close the jaws, and spring F between the jaws, all as described, and for the purpose named.

405,850. SAFETY-SWITCH. LOUIS DUBE, Minneapolis, Minn. Filed Dec. 31, 1888. Serial No. 295,071. (No model.)

Claim.—1. The combination, with the rails of the main and side tracks and the switch-rails, of the stationary rails 25 and 27, arranged between the rails of the side and main tracks and extending from the rails of the side track toward the rails of the main track, and adapted to guide onto the main track a train passing into the space between the main and side tracks, substantially as described.

2. The combination, with the movable switch-rails, of the rails 3 and 1, with either of which said switch is adapted to connect, of the rail 25, extending from the outer side of one of the rails 3 to the inner side of the corresponding rail 1, and the rail 27, extending from the inner side of the other rail 3 to the outer side of the other rail 1, substantially as described.

3. The combination, with the rails 3 and 1, one of the said rails 1 being provided with the groove 28, of the rails 25 and 27, extending from said rails 3 to said rails 1, as described, and the switch adapted to connect with either said rails 3 or 1, substantially as described.



4. The combination, with the switch-rails 5, provided with the branch rails 9 and 11, of the rails 3 and 1, and the branch rails 25 and 27, extending from said rails 3 to said rails 1, all substantially as described.

405,851. POWDER-DUSTING CAN. WARREN DENNIS, Edmeston, N. Y. Filed Apr. 21, 1888. Serial No. 271,414. (No model.)

Claim.—The combination of the cylindrical can 1, the handle 2 thereof, and the semi-spherical or conical perforated bottom 3, secured in the lower portion of the can by the edge of the bottom entering an encircling groove, and solder and strip 5 covering the groove, the bottom being so located in the can that the lowest point thereof shall be above the line of the bottom of the shell of the can, substantially as set forth.

405,852. SEPARABLE PULLEY. HENRY J. GILBERT, Saginaw, Mich. Filed Mar. 7, 1889. Serial No. 302,900. (No model.)

Claim.—A separable pulley composed of the parts A, B, C, and D, the parts A and B divided from each other diametrically by a straight line and divided from the parts C and D on the irregular lines E and F, whereby interlocking joints are formed between the parts A B and the parts C D, substantially as shown and described.

405,853. TOY. JOHN C. HALL, Brooklyn, N. Y. Filed Feb. 23, 1889. Serial No. 300,974. (No model.)

Claim.—1. In a mechanical toy, the figure of a rooster, bird, or similar creature mounted upon a roller with its feet placed astride the same and eccentrically pivoted thereto, whereby a rising-and-falling motion is imparted to the figure, in combination with a push-rod attached to the axle of the roller and passing through the body portion of the figure, and a pair of wings provided with projections upon the shoulders which pass through the sides of the rooster, and an elastic connection between said axle and projections, arranged in the manner and for the purpose substantially as described.

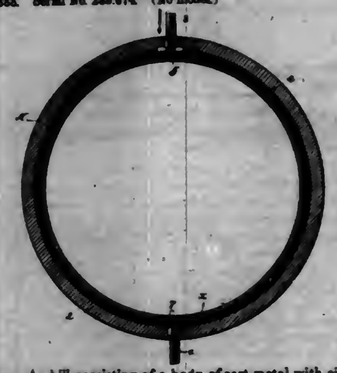
2. In a mechanical toy, a figure of a rooster, bird, or similar creature supported upon a roller, the supports being eccentrically pivoted to the roller, so as to turn therewith, whereby a rising-and-falling motion is imparted to the figure, in combination with wings or their equivalents pivoted in the sides of said creature, and an elastic device attached to the inner ends of the wings in such a manner as to draw said ends down and thereby raise the wings during the rising motion of the rooster, in the manner and for the purpose substantially as described.

3. In a mechanical toy, the combination of a figure of a rooster, bird, or similar creature having its feet eccentrically pivoted upon a roller, a push-rod passing through the body of the figure and attached to the axle of the roller, a pair of wings provided with cleat-shaped projections passing through slots in the sides of the figure, and a spring connected with said projections and the roller-axle, in the manner and for the purpose described.

405,854. APPLIANCE FOR ILLUSTRATING SPHERICAL TRIGONOMETRY. FLETCHER HAWN, Lebanon, Ohio. Filed Nov. 16, 1888. Serial No. 291,048. (No model.)

Claim.—1. In an educational appliance, the combination of the disk A, provided with a slot, and the half-disk mounted in the slot and adapted to assume a position at any desired angle to the disk A, whereby plane and spherical angles may be illustrated, substantially as specified.

2. As an educational appliance, the combination of the disk A, provided with a slot B, the half-disk E, mounted in the said slot, and the half-disk G, swiveled to the edge of the half-disk E, substantially as specified.



3. In an educational appliance, the combination of the disk A, provided with a radial slot B, the slotted shaft mounted at its ends in bearings at the ends of said slots, the half-disk E, arranged in the slot in said shaft, and the half-disk G, swiveled to the edge of the half-disk E, substantially as specified.

4. In an educational appliance, the combination of the disk A, provided with the radial slot B, the slotted shaft D, mounted in bearings in the said slot, the disk E, arranged in the slot and pivoted at its inner edge to the shaft, and the half-disk G, swiveled at its center to the edge of the disk E, substantially as specified.

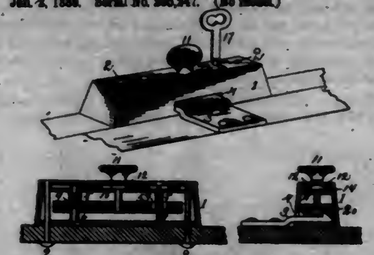
5. In an educational appliance, the combination of the disk A, provided with the slot B, the slotted shaft D, mounted in the slot, the half-disk E, arranged in the slot in the shaft, the slotted shaft F, mounted in bearings on the half-disk, and the half-disk G, arranged in the slot in the shaft F, substantially as specified.

6. In an educational appliance, the combination of the disk A, provided with a slot B, the slotted shaft D, mounted in the slot B, the half-disk E, pivoted in the slot in the said shaft, the shaft F, mounted in bearings on the edge of the half-disk E and provided with a slot *f*, terminating a short distance from the inner end of the shaft, and the half-disk G, mounted in the said slot and having the semicircle *g* cut from its center, as and for the purpose specified.

405,855. CAR-WHEEL CHILL. WILLIAM H. HOLLISTER, Ramapo, N. Y., assignor of one-half to William W. Snow, same place. Filed Oct. 31, 1888. Serial No. 289,674. (No model.)

Claim.—A chill consisting of a body of cast metal with circulating-passages formed by wrought-metal pipes embedded in the cast-metal body in immediate proximity to the chilling-face, and provided with inlet and outlet branches, substantially as set forth.

405,856. VEHICLE-AXLE. JOHN M. HUSSELL, Wilkes-Barré, Pa., assignor of one-half to John W. Parmelee, same place. Filed Mar. 25, 1889. Serial No. 304,614. (No model.)



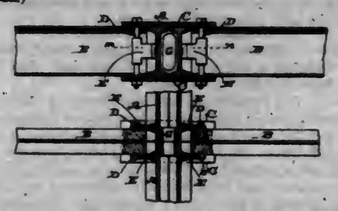
Claim.—1. In a vehicle-axle, an annular flange or collar located at the inner end of the spindle and having an annular undercut recess in its inner side, and a transverse slot communicating with said recess, substantially as set forth.

2. In a vehicle-axle, an annular flange or collar located at the inner end of the spindle and having an annular undercut recess in its inner side, an annular groove, and a slot in the under side of said flange connecting the annular groove with the undercut recess, substantially as set forth.

3. In a vehicle-axle, a flange or collar located at the inner end of the spindle and having an annular undercut recess with a beveled or tapering outer wall, an annular groove, and a slot in the lower side of said flange connecting said groove with the undercut recess, substantially as set forth.

4. In a vehicle-axle, an annular flange or collar located at the inner end of the spindle and provided with an annular undercut recess having beveled or sloping outer wall, and a slot extending through said flange or collar to the undercut recess of the same, substantially as set forth.

405,857. BAG-LOCK. FREDERICK F. INGRAM, Detroit, Mich. Filed Jan. 2, 1888. Serial No. 295,247. (No model.)



Claim.—1. In a fastening for hand-bags and the like, a catch, a spring-actuated locking-bar for engaging the same, thumb-piece rotatively mounted therein and adapted to lift the same from engagement with said catch, lugs upon the stem of said thumb-piece, and key-actuated sliding tumbler for controlling the turning and lifting of said thumb-piece, substantially as and for the purpose herein specified.

2. In a fastening for hand-bags and the like, a catch, locking-bar mounted upon guides and adapted to be lowered or raised therenpon for engagement with and disengagement from said catch, thumb-piece rotatively mounted in said bar and adapted to lift the same, lugs on the stem of said thumb-piece, key-actuated sliding tumbler or tumblers for controlling the raising and turning of said thumb-piece, plate between which and the top of the case the said tumbler slides, and springs between said plate and locking-bar, substantially as and for the purpose herein specified.

3. In a fastening for hand-bags and the like, a catch 3, spring-actuated locking-bar 5, thumb-piece 11, rotatively mounted therein and by means of which the same is adapted to be lifted from engagement with said catch, lugs 12, carried by the stem of said thumb-piece, key-actuated sliding tumbler for controlling the raising and turning of said thumb-piece, and stop 20, substantially as and for the purpose herein specified.

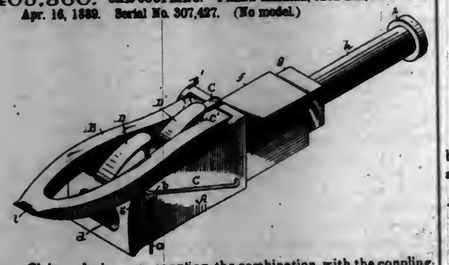
4. In a fastening for hand-bags and the like, a catch 3, spring-actuated locking-bar 5, thumb-piece 11, rotatively mounted therein and by which the same is adapted to be lifted from engagement with said catch, and lugs 12, carried by the stem of said thumb-piece, in combination with a case having slot 13, adapted to receive said lugs when turned to register therewith, and a key-actuated tumbler 14, having aperture 15 and recess 16, substantially as and for the purpose herein specified.

405,858. SUPPORT FOR BEAMS OR GIRDERS. PETER H. JACKSON, San Francisco, Cal. Filed Feb. 19, 1888. Serial No. 300,453. (No model.)

Claim.—1. A girder composed of two or more metallic beams and an abutting beam or beams, independent metallic plates extending across the girder and above and below the abutting beam or beams, and clamping-bolts or means for securing the end of the abutting beam or beams and the plates together, in combination with wedges or cams whereby pressure is applied laterally to the girder-beams, substantially as described.

2. A girder composed of one or more metallic beams and the abutting beam or beams, independent metallic plates extending across the girder above and below the abutting beam or beams, and clamping-bolts extending through the top and bottom plates upon opposite sides of the girder-beam, in combination with cams or wedges exerting a lateral pressure upon one side of the girder-beam, and a resistant consisting of the clamping-bolts upon the opposite side, substantially as described.

3. A girder composed of a metallic beam or beams and an abutting beam or beams, the independent metallic plates extending above and below the girder and abutting beams, and the clamping-bolts passing through said plates and also through recesses formed in the flanges of the beams, whereby the beams are held in position between the clamping-plates, substantially as described.

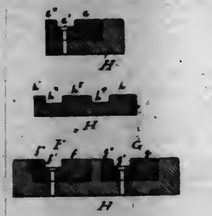


4. A girder consisting of a metallic beam or beams and an abutting beam or beams, the independent metallic plates extending above and below the girder and abutting beams, and the clamping bolts and nuts, in combination with a filling of a plastic material which will set or harden around the ends of the abutting beams and the bolts between the plates, substantially as described.

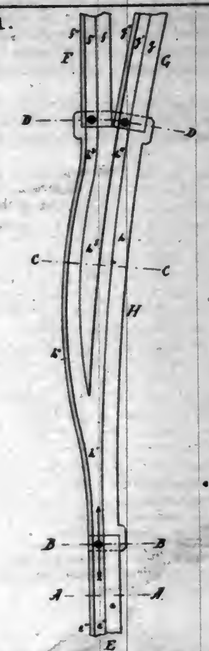
405,359. METALLIC BINDER FOR BOXES. FRANK G. JOHNSON, New York, N. Y. Filed July 12, 1888. Serial No. 279,793. (Model.)

Claim.—The jointless sheet-metal binder having three sides at right angles to and inclined toward each other, one side being composed of a main portion and a folded portion, as set forth.

405,360. CAR-COUPLING. FRANK KARRER, Rich Hill, Mo. Filed Apr. 16, 1888. Serial No. 307,427. (No model.)



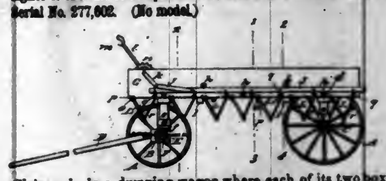
Claim.—1. In a car-coupling, the combination, with the coupling-hook seated and held at its rear or inner end upon the draw-head, of the lever pivoted in said draw-head and having an arm resting upon said draw-head and beneath said link, and means to operate said lever, substantially as set forth.



2. The draw-head having upon its upper side at the forward edge a coupling-hook, the coupling-link having the inner or rear rectangular end resting and held in a corresponding seat or socket upon the upper side of the draw-head at its inner or rear end, the hook and button applied to the upper side of said draw-head to coact with said seat or socket to retain the coupling-link in position, and the link pivoted in said draw-head and having an arm resting under said coupling-link and upon the draw-head, together with the chain or rope to operate said lever, substantially as set forth.

405,361. RAILWAY-SWITCH. WILLIAM J. KELLY, Boston, assignor of one-half to Charles H. Arnold, Woburn, Mass. Filed Nov. 3, 1888. Serial No. 289,867. (No model.)

Claim.—1. In a railroad-switch, the combination, with the main rail E and the branching rails F and G, of a diverter interposed between said main and branch rails and consisting of a continuous wheel-bearing to one branch rail, a continuous side guard-lip to the other branch rail, and a central fixed pointed tongue running back and forming a continuous flush edge for the wheel-tread of one rail and for the side guard-lip of the other rail, substantially as described.



2. A railroad-switch consisting of a wheel-tread, side guard-lip, and central pointed tongue broadened at one end and serving as wheel-tread and side guard-lip, all cast in one integral piece and adapted to

be interposed between a main rail and two branch rails, substantially as described.

405,362. DUMPING-WAGON. BERNARD KILLEEN, Big Rock, assignor of one-half to Joseph H. Flick, Dixon, Iowa. Filed June 19, 1888. Serial No. 277,602. (No model.)

Claim.—1. In a dumping-wagon where each of its two box-sides supports in suitable guides a longitudinal slide-bar, mechanism, substantially as described, for lowering the free edge of the pivoted transverse flaps forming the floor of such box when horizontal to a vertical position, and vice versa, in combination with a transverse shaft journaled through such box-sides, a crank-arm on each end of such shaft outside of said box, a vertical handle rigidly attached to said shaft carrying a catch-lever and bolt to engage with the notches of a segment attached to one of the sides of said box, and each of such longitudinal bars connected to the end of one of such cranks by an intermediate pivoted bar, for the purposes stated, and substantially as described.

2. In a dumping-wagon, the front axle provided with the stirrup F, combined with the king-bolt attached to the upper and lower bolster, the lower part of said king-bolt passing vertically through suitable apertures in the upper and lower arms of said stirrup and at the rear of said axles, substantially as described.

3. In a dumping-wagon where each of its two box-sides supports in suitable guides a longitudinal slide-bar, mechanism, substantially as described, for moving such bars forward and backward, and such box provided with transverse flaps trunnioned thereto, substantially as described, and arranged to swing from a vertical to a horizontal position, and vice versa, in combination with the chains or straps r, running over pulleys q on said box-sides and connecting said transverse flaps with said longitudinal bars, for the purposes stated, and substantially as described.

405,363. VELOCIPEDE. WILLIAM H. KITTO, Plymouth, County of Devon, England. Filed Feb. 6, 1889. Serial No. 298,928. (No model.) Patented in England July 28, 1888, No. 10,816.

Claim.—1. In a velocipede, the combination, with a pivoted brake-lever for bearing against the wheel-tire, of a bracket clamped to the

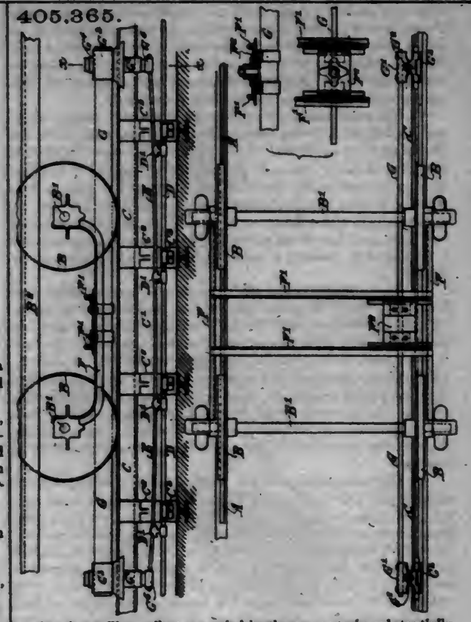
fork of the machine, a foot-lever pivoted to the said bracket, and a rod pivoted to the foot-lever and operatively connected with the said brake-lever, substantially as and for the purpose set forth.

2. In a velocipede, the combination, with the pivoted brake-lever, of a foot-lever pivoted to the fork of the machine, a hand-lever pivoted to the steering handle-bar, and rods pivoted to the said hand and foot levers, respectively, and operatively connected with each other and with the said brake-lever, substantially as and for the purpose set forth.

405,364. PACKAGE FOR MERCHANDISE. HENRY A. LEE, Glen Ridge, N. J. Filed Feb. 1, 1889. Serial No. 298,571. (No model.)

Claim.—1. As a new article of manufacture, a utility package for merchandise, composed of a tapering cylindrical sheet-metal body *a*, open at the larger end and a perforated bottom at the smaller end, and a cover *b*, having an edge to engage the upper edge of the body, said body and cover having an ornamental surface and being adapted to form a flower-pot and saucer, substantially as set forth.

2. As a new article of manufacture, a utility package for merchandise, composed of a tapering cylindrical body *a*, open at the larger end and closed by a perforated bottom at the smaller end, and a lid or cover *b*, having a scalloped edge, said body and cover being adapted to form a flower-pot and saucer, substantially as set forth.



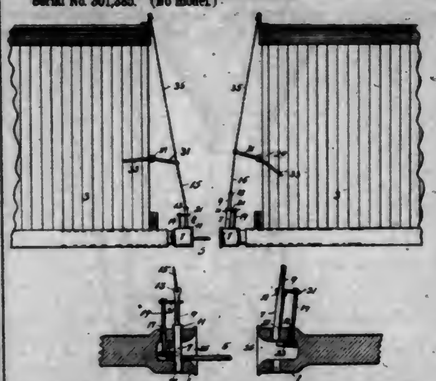
405,365. ELECTRIC RAILWAY. ALEXANDER L. LIMPET, Westminster, assignor of one-half to Edward Hodson Bayley, Eltham, England. Filed July 10, 1888. Serial No. 279,593. (No model.) Patented in England Oct. 4, 1887, No. 13,447; in France Apr. 4, 1888, No. 189,767, and in Belgium Apr. 4, 1888, No. 81,902.

Claim.—1. In an electrical tramway or railway, the combination of a trailing collector of electricity, as E, suitably connected to the car or carriage, with an electrical conductor made up of insulated metallic sections electrically and flexibly connected and provided at convenient distances apart with rubbing-pieces having a cross-section corresponding to the section of the collector, and against the whole rubbing-surface of which the collector rubs as it is dragged along, substantially as described.

2. An electrical conductor for electric tramways or railways, consisting of a main portion composed of insulated metallic sections flexibly connected and provided with rubbing-pieces, a relief-conductor in electrical connection with main portion, and a control-wire consisting of sections of wire terminating in plug-switches in electrical connection with the flexible connections of the main portion, substantially as described, and for the purpose set forth.

3. The combination, in an electrical conductor for electric tramways or railways, of sections or lengths of iron set a short distance apart, flexible connections between the adjacent ends of said sections, and rubbing pieces or surfaces attached to said sections, the whole being insulated from earth, substantially as described.

4. In an electric tramway or railway, the combination, with a continuous electrical conductor, of insulated brackets for carrying the said conductor, said brackets being provided with rubbing-pieces to



receive the trailing collector carried by the car or train, substantially as specified.

5. A trailing collector for electric tramways or railways, consisting of a length or continuous lengths of wire rope upon which is or are strung short pieces of hard-metal tube to form the rubbing-surface of the collector, substantially as described.

6. In electrical tramways or railways, the combination, with a car, of a trailing collector, a beam secured to a laterally-traveling carriage carried by the car-frame, and swinging attachments for connecting the collector to the beam, substantially as described.

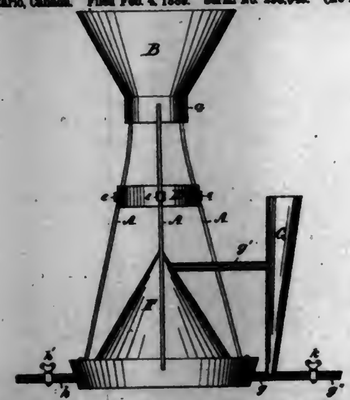
7. In electrical tramways or railways, the combination, with a car, of a trailing collector, spring-supports for the collector, and gripping-clips for securing the free ends of the collector, substantially as described.

405,366. CAR-COUPLING. HENRY L. LOWE, St. Paul, Minn., assignor of one-half to Louis Nickow, same place. Filed Feb. 27, 1889. Serial No. 301,385. (No model.)

Claim.—1. In a car-coupler, the combination of a coupling-pin having a notch for holding it in a raised position, and a link-weight loosely connected to said pin and arranged to be supported by said pin when in its raised position, so as to leave the throat of the draw-head free for a coupling-link to enter, substantially as described.

2. In a car-coupler, the combination of a notched coupling-pin and link-weight loosely connected together in such a manner that the weight of said link-weight and connections will, when the pin is raised,

cause the notch to engage with the coupler-head and thus support the pin in such position, the link-weight also being supported by the pin, so that the throat of the coupler-head is open to receive a coupling-link, and so that when the coupling-pin is down in engagement with the link the link-weight has freedom of vertical movement, while the pin remains stationary, substantially as described.



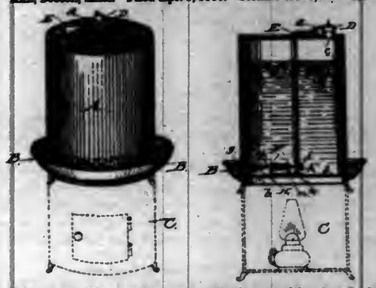
3. The combination, with the coupler-head of a railway-car, of the coupling-pin 7, having the shoulder 11 and the notch 27, the rod 19, sliding freely in the hole 17 and having at its upper end the arm 21, which connects with said pin and slides freely on it from the shoulder 11 upward, the length of said rod 19 and of said pin from shoulder to point being substantially equal, and the link-weight 23, rigidly secured to the lower end of the rod 19, and adapted to rest its weight and that of the rod 19 and arm 21 upon the inner end of a coupling-link inserted in said coupler-head, substantially as described.

4. An automatic car-coupler comprising, in combination, the pin 7, having a notch 27 on one side near its point adapted to engage with the coupler-head when the pin is raised out of the recess of the head and to support it in such raised position, the rod 19, arranged to move freely in the orifice 17 and rigidly secured to the arm 21, which connects loosely with the pin, the weight 23, rigidly secured to the lower end of the rod 19, and adapted to rest upon a link when inserted into the coupler-head, the rod 29, turning in suitable bearings on the car-body and having the arm 31 linked to said coupling-pin, and suitable handles 33 for operating the same, substantially as described.

5. The combination, with the coupler-head of a railway-car, of a coupling-pin 7, having a notch 27 near its point adapted to rest upon the edge of the pin-hole in the top of the head when the pin is withdrawn as far as the notch, and to support the pin in its raised position, the rod 19, fitting loosely in a vertical hole in the head and adapted to slide in the same, having a plate 23 at its lower end adapted to rest upon a coupling-pin in said head, and having the arm 21 at its upper end, by means of which it is loosely secured to the pin, said arm being arranged to slide upon said pin and to be stopped by the shoulder 11, said rod 19 being of such length as to permit the pin to be wholly withdrawn from the recess of the head, but preventing its withdrawal entirely from the head, substantially as described.

6. The combination, with the coupler-head of a railway-car, of the coupling-pin 7, having the notch 27 and the shoulder 11, the rod 19, freely slidable in the hole 17, and having the arm 21 secured to the pin 7 and adapted to rest upon the shoulder 11 and to slide freely upon said pin above said shoulder, the weight 23, secured to the rod 19, and adapted to rest upon a coupling-link inserted in the coupler-head, the length of said rod 19 between the arm 21 and the weight 23 being substantially equal to the length of the coupling-pin from the point to the upper side of the shoulder 11, and suitable link-connections with said pin, by means of which it can be lifted from the top of the car or from either side of the car by the additional means of a suitable rod having an arm joined to said link-connections, substantially as described.

405,867. MILK-PURIFIER. DAVID M. MACPHERSON, Lancaster, Ontario, Canada. Filed Feb. 4, 1889. Serial No. 298,649. (No model.)



Claim.—1. The combination of the cone-shaped cooler F, provided with a rim *f* and overflow-pipe H, the tripod-stand A, carrying a milk-receiver E, provided with a strainer D and perforated outlet C, the wire sleve E, adjustably attached to the legs of stand A, and the receptacle G, having pipes *g g'*, for inlet and outlet of water to the cooler.

2. The combination, with the stand A, having flexible legs supporting a milk-receiver B, of the wire sleve E, having projections *e* adjustably engaging the legs of said stand, substantially as set forth.

405,868. PROCESS OF MAKING DOUBLE SALTS OF MERCURY. ERNST MERCK, Darmstadt, Germany, assignor to E. Merck, same place. Filed Mar. 29, 1888. Serial No. 268,782. (No specimens.) Patented in England Feb. 29, 1888, No. 3,094.

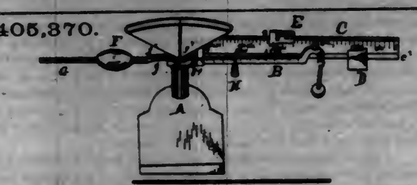
Claim.—The herein-described process of obtaining double salts of mercury, which consists in treating a uni or multi valent phenol with an acidulated solution of a peroxalt of mercury, substantially as described.

405,869. POULTRY DRINKING-FOUNTAIN. FRANCIS E. MERRIMAN, Boston, Mass. Filed Apr. 3, 1889. Serial No. 305,841. (No model.)

Claim.—1. The combination, with the vessel having the inlet and outlet openings, of a cap closing the inlet-opening and provided with a projection or arm, a horizontally-moving valve closing the outlet, and a rod between the valve-stem and screw-cap provided with means for withdrawing the valve when the cap is fitted in position.

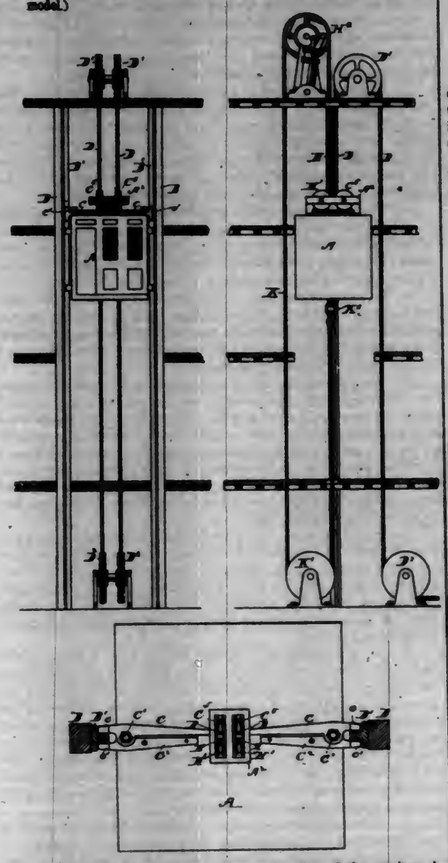
2. The combination, with the vessel having the inlet at its top, a discharge-tube, and a trough into which the tube discharges, of a vertical rod movable on its axis and provided with an upper and lower laterally-projecting arm, a screw-cap fitted over the inlet at the top of the can, having an arm or projection which engages and axially moves the vertical rod when the screw-cap is turned, a horizontally-moving valve-stem actuated by the lower arm of the rod, and a conical valve adapted to be seated in the discharge-tube and to be withdrawn therefrom when the screw-cap is turned, substantially as herein described.

3. The vessel A, having the surrounding trough, the inlet at its top, and the discharge-tube entering into the trough, in combination with the horizontally-moving valve-stem, the valve thereon adapted to be seated in the discharge-tube, a spring surrounding the valve-stem, a vertical rod movable on its axis and having upper and lower lateral arms, and a screw-cap fitted over the inlet to the vessel, having an arm extending outwardly and engaging the upper arm of the vertical rod, whereby said rod is moved on its axis and the valve withdrawn by the lower arm of said rod engaging the valve-stem, substantially as herein described.



4. The combination, with the vessel having an inlet and outlet and a trough into which the outlet discharges, of a horizontally-moving conical valve for closing said outlet, a screw-cap for closing the inlet and provided with a projection, an axially-moving rod engaged by the projection on the screw-cap to withdraw the valve when the cap is fitted in position, and a spring for returning the valve and closing the outlet when the screw-cap is removed for filling the vessel, substantially as herein described.

5. The vessel having the heating-chamber beneath, the trough surrounding the vessel, the tube discharging into the trough, and the inlet at the top of the vessel, in combination with a screw-cap having the arm or projection, the vertical rod having its upper bent end engaged thereby and having a laterally-projecting arm at its bottom, the standards, the horizontally-moving valve-stem mounted therein, having a conical valve adapted to automatically close the discharge when the screw-cap is removed, and a spring for forcing the valve to its seat, said valve-stem being actuated and the valve withdrawn when the screw-cap is fitted in position, substantially as herein described.

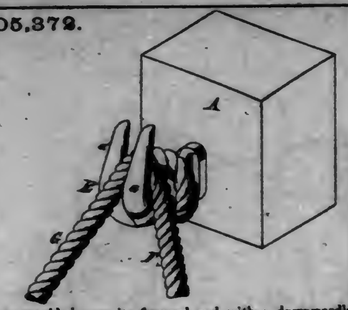


405,870. SCALE-BEAM INDICATING WEIGHT, PRICE, OR NUMBER OF BUSHELS IN A QUANTITY OF GRAIN. WILLIAM G. MCLAUGHLIN, Springfield, Mo. Filed Jan. 14, 1887. Serial No. 224,333. (No model.)

Claim.—In a scale, the combination of the beam B, the removable bar C, having the arms c^2 on its side and denoting-characters on its face, the weights E and D on the upper and lower edge of the bar C, respectively, and a rod G, having weight F thereon and oppositely-diverging arms on its inner end, substantially as described.

405,870.

405,871. SAFETY DEVICE FOR ELEVATORS. WILLIAM R. NICKERSON, Cambridge, Mass. Filed Jan. 17, 1889. Serial No. 296,611. (No model.)



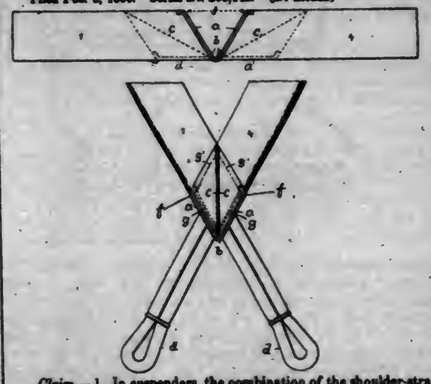
Claim.—1. In an elevator, the combination of the carriage A, hoisting-rope D, retarding-rope H, and its retarder, adapted to resist more strongly as the speed of the descending car increases, with a grip device to which the hoisting-rope D and retarding-rope H are both attached, but pulling in opposite directions, the hoisting-rope D tending to loosen the grip and the retarding-rope H tending to set it, whereby an undue increase in the velocity of the descending carriage will cause the increased resistance of the retarder through the rope H to overcome the tension of the hoisting-rope D and operate the grip, substantially as and for the purpose set forth.

2. In an elevator, the combination of the carriage A, guide B', the gripping device consisting of the fixed arm C^3 and pivoted gripping-arm C, having attached to it and being held inoperative by the hoisting-rope D, with the retarding-rope H, also attached to the arm C, but pulling in the opposite direction from the rope D, and a retarder, all operating together substantially as and for the purpose set forth.

405,872. HITCHING DEVICE FOR ROPES. ISAAC R. PALMER, Middletown, Conn. Filed Mar. 12, 1889. Serial No. 303,009. (No model.)

Claim.—A hitching device consisting of a substantially-straight stem provided near its forward end with a downwardly-extending transverse depression, and a fork extending upwardly from said stem in front of said depression and having its crotch higher than said depression, substantially as specified.

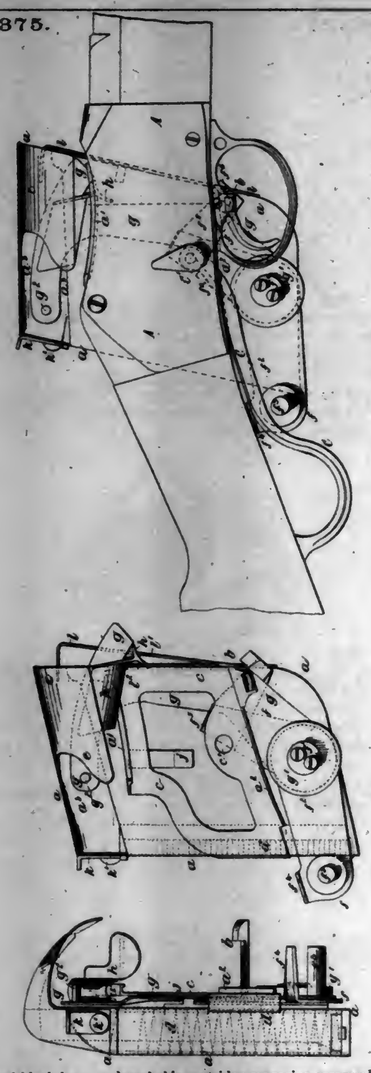
405,872.



405,873. DETACHABLE STRAINER. PHILIP PFEIL, St. Louis, Mo., assignor of one-half to George Brandon, same place. Filed Jan. 21, 1889. Serial No. 297,076. (Model.)

Claim.—In a detachable strainer, the tin-metal lip or stopper B, having the opening b^2 and wire-cloth strainer proper C, soldered to the under side of said tin-metal lip or stopper B, in combination with the reversible wire fastener D, having crooked wire clamps f^1 f^2 and terminating crook *l*, by means of which the same can be fastened or clamped to the spout A when inserted in the crease *a'* of spout A, and also released from the same, as and for the purpose set forth.

405,874. SUSPENDERS. JAMES B. POLLOCK, Kansas City, Mo. Filed Feb. 8, 1889. Serial No. 299,142. (No model.)



Claim.—1. In suspenders, the combination of the shoulder-straps having their rear ends cut and folded diagonally to form separate pockets, the adjacent sides of which are stitched together vertically, and the loops or button-hole straps secured in said diagonal pockets by stitching, substantially as specified.

2. As an improved article of manufacture, the suspenders, the shoulder-straps of which are cut on a bias, with their cut edges connected by a binding, as at *e*, brought together and folded over the loops or button-hole straps and stitched thereto, as at *g*, said shoulder-straps being stitched together, as at *e*, substantially as and for the purpose specified.

405,875. MAGAZINE FIRE-ARM. LOUIS SILVERMAN, London, England. Filed Sept. 11, 1888. Serial No. 286,102. (No model.)

Claim.—1. The combination, with a breech-loading fire-arm, of

405,875.

a pivoted block-lever, a detachable cartridge-magazine arranged on the fire-arm and having a side discharge-opening at its top, a spring located in the magazine for raising the cartridges, a bent lever pivoted between its ends on the inner side of the magazine and engaged at its lower end by the block-lever, and an elbow-lever pivoted on the inner side of the magazine and engaged and disengaged by the upper end of the bent lever, and having a plate at its upper end to fit a breech-block and advance a cartridge into the gun-barrel, substantially as described.

2. The combination, with a breech-loading fire-arm, of a pivoted block-lever, a cartridge-magazine secured to the fire-arm and having a curved top, a lateral top discharge-opening, and a laterally-projecting curved shield to overhang the shoe of the fire-arm, a spring located in the magazine to elevate the cartridges, a bent lever pivoted between its ends to the inner side of the magazine and engaged at its lower end with the block-lever, and a lever pivoted at its lower end to the inner side of the magazine, engaged and disengaged by the upper end of the bent lever, and having at its upper end a plate to advance a cartridge along a breech-block into the gun-barrel, substantially as described.

3. The combination, with a breech-loading fire-arm, of the pivoted block-lever, a magazine secured to the fire-arm and having a side opening at the top of its inner side, a spring in the magazine for elevating the cartridges, an elbow-lever pivoted to the inner side of the magazine and having at its upper end a laterally-projecting plate to fit the groove in a breech-block and advance a cartridge into the gun-barrel, and a lever pivoted to the inner side of the magazine, connected with and swung by the block-lever, and having a projection to engage and disengage the elbow-lever to swing it rearward when the block-lever is depressed, substantially as described.

4. The combination, with a breech-loading fire-arm having a pivoted block-lever for operating the breech-block, of a magazine having a side opening and a curved upper end for directing the cartridges laterally through the side opening, a spring for moving the cartridges toward said curved end, a pivoted elbow-lever having a plate at its upper end for advancing the cartridges into the barrel, a bent lever connected with the block-lever and having a projection f^4, engaging the elbow-lever, and a catch j, for disengaging the projection from the elbow-lever, substantially as described.

5. The combination, with a breech-loading fire-arm having a shoe A and a block-lever C for moving the breech-block, of the magazine-casing a, having a side opening a^2 and the upper and lower lateral flanges a' a^3, engaging, respectively, the upper and lower edges of the shoe, a spring in the casing for moving the cartridges to the side opening, and a lever actuated by the movement of the block-lever to advance the cartridges into the barrel, substantially as described.

6. The combination, with a breech-loading fire-arm having a shoe A, of a pivoted block-lever C, a magazine-casing a, having upper and lower lateral flanges a' a^3, respectively, engaging the upper and lower edges of the shoe, and a lateral spring-catch b, detachably engaging a part of the fire-arm, a bent lever pivoted between its ends to the side of the magazine-casing and engaged at its lower end by the block-lever, and an elbow-lever pivoted to the side of the magazine-casing, engaged by the upper end of the bent lever, and having at its upper end a lateral plate to advance a cartridge along a breech-block into the gun-barrel, substantially as described.

7. The combination, with a breech-loading fire-arm, of a magazine detachably secured thereto and having a curved top, an inclined portion, a top side opening, and an overhanging curved top shield, a spring d, located wholly in the rear part of the magazine to act only on the rear ends or bases of the cartridges, a pivoted block-lever, a bent lever pivoted on the magazine and engaged by the block-lever, and an elbow-lever pivoted on the magazine, engaged by the bent lever, and having a plate to advance the cartridges into the gun-barrel, substantially as described.

8. The combination, with a breech-loading fire-arm having a pivoted block-lever for operating the breech-block, of a magazine having a side opening and a spring for moving the cartridges to said opening, a spring-impelled elbow-lever g, movable past the said side opening, and a bent lever f, connected with and operated by the block-lever and engaging and disengaging the spring-impelled lever, substantially as described.

9. The combination, with a breech-loading fire-arm having a pivoted block-lever for operating the breech-block, of a cartridge-magazine having a side opening and an upper curved end for directing the cartridges laterally through the opening, a spring for moving the cartridges toward the said curved end, the pivoted elbow-lever swinging past the side opening and serving to hold the cartridges in the magazine when said lever is in the forward position, and a pivoted bent lever loosely connected with the block-lever and engaging the elbow-lever to swing the latter rearward when the block-lever is operated to open the breech, substantially as described.

10. A cartridge-magazine for a breech-loading gun having a block-lever for operating the breech-block, consisting of a casing having a side opening, upper and lower flanges a' a^3, to engage the upper and lower edges of the gun-shoe, and a lateral catch b, to detachably engage a part of the gun, an elbow-lever g, for advancing the cartridges to the gun-barrel, and a bent lever f, engaging the elbow-lever and having studs f^3 f^4 to loosely engage the block-lever, substantially as described.

11. A cartridge-magazine for a breech-loading gun, having a pivoted block-lever for operating the breech-block, consisting of a casing a, having a side opening a^2, a curved upper portion for directing the cartridges laterally through the opening, a spring d, for moving the cartridges upward, the upper and lower flanges a' a^3, for engaging the upper and lower edges of the gun-shoe, a lateral catch b, for detachably engaging a part of the gun, an elbow-lever g, pivoted on the casing and having the bent plate A at its upper end, a bent lever f, mounted on the pivot of the elbow-lever, provided with a projection f^4, and having studs f^3 f^4, for loosely engaging the block-lever, and a catch j on the casing for disengaging the projection on the bent lever from the elbow-lever, substantially as described.

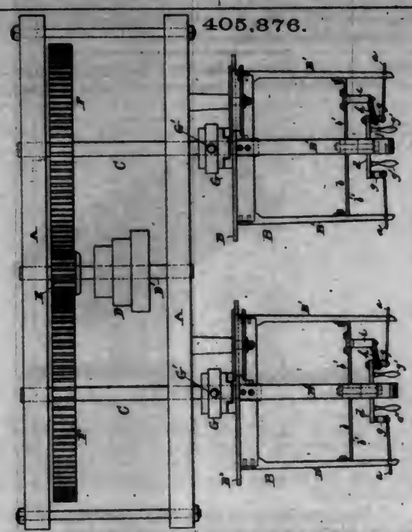
405,876. MACHINE FOR REELING WIRE. HERBERT SMITH, Worcester, Mass. Filed Dec. 17, 1888. Serial No. 293,883. (No model.)

Claim.—1. In a block for reeling wire, the combination of the arms B' thereof, having transverse openings in their outer ends, with the frame b, provided with a central pivot-bolt and having radial arms secured at their outer ends to the arms B', the transverse disk d, pivoted on said central bolt of the frame, and the radial holding-arms a, pivoted to said disk and extending through the transverse openings in the outer ends of arms B', substantially as set forth.

2. In a block for reeling wire, the combination of the arms B' thereof and frame b, secured thereto, with the transverse disk d, pivoted to said frame b, the radial holding-rods a, pivoted to said disk, and whose outer ends fit and are adapted to slide in transverse openings in the arms B', and the spring-rod A, pivoted at one end to the frame b and at its other end to disk d, substantially as set forth.

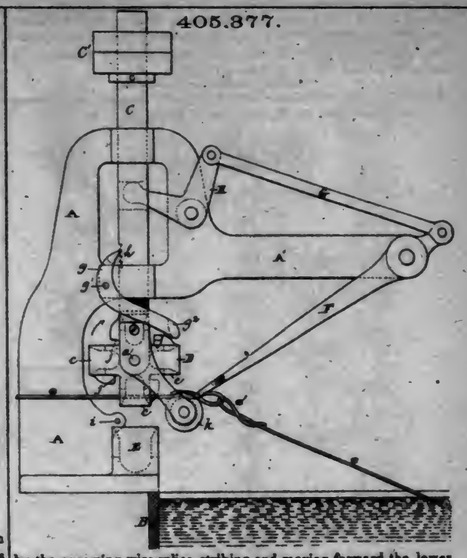
3. In a block for reeling wire, the combination of the arms B' thereof and the frame b, secured thereto, with the spring-rod A and disk d, substantially as set forth.

4. A block for reeling wire having a series of longitudinal arms, and a transverse frame arranged within the block, having a series of radial arms secured to said longitudinal arms, in combination with a series of radial transverse holding-rods adapted to fit at their outer ends in transverse openings in the outer ends of the aforesaid longitudinal arms, and having means whereby said rods may be held with their outer ends projecting laterally outside of the block, substantially as set forth.



405,877. AUTOMATIC WIPING DEVICE FOR WIRE-GALVANIZING. HERBERT SMITH, Worcester, Mass. Filed Jan. 7, 1889. Serial No. 295,645. (No model.)

Claim.—1. An automatic wiping device for wire-galvanizing and similar apparatus, comprising, in combination, the following elements: a stationary box or receptacle for containing the wiping material, a rotatable star-wheel having socketed arms adapted also to contain the wiping material and to be combined with said stationary wiper at certain stages in the wiping operation, a suitable slide-shaft for supporting said rotatable star-wheel, means for automatically stopping the rotatable wheel and guiding the ends of its arms, one at a time, into engagement with the stationary wiper, means for lifting the wire to keep it in line with the rotatable wheel at one side of its pivot, mechanism for automatically moving the slide-shaft to disengage its rotatable wheel from the stationary wiper by contact of the wire-splice therewith in the forward movement of said splice, means for holding the slide-shaft in its adjusted position for a certain time and then disengaging it by contact with the mechanism set in motion by the wire-splice, and suitable supports for the various parts, substantially as set forth.



2. In a wiping device for wire-galvanizing and similar apparatus, the combination of a stationary wiper with a rotatable star-wheel having socketed arms adapted to hold suitable wiping material, and whose arms are adapted to engage with the stationary wiper, one at a time, also having suitable supports and means for operating the same toward and from the stationary wiper, substantially as set forth.

3. In an automatic wiper for wire-galvanizing and similar apparatus, the combination of the vertical slide-shaft and its appendages with a swinging lever and mechanism operatively connected therewith adapted to elevate the slide-shaft automatically when operated by the oncoming wire-splice striking and moving forward the lower end of said swinging lever, substantially as set forth.

405,876.

405,877.

4. In an automatic wiper for wire-galvanizing and similar apparatus, the combination of the vertical slide-shaft and its appendages with a latch device for holding the same in an elevated position for a certain time, and adapted to be automatically disengaged therefrom to allow the parts to descend by engagement with mechanism operatively connected with and set in motion by the oncoming wire-splice when the latter arrives in contact therewith, substantially as set forth.

5. In an automatic wiper for wire-galvanizing and similar apparatus, the combination of the slide-shaft and its appendages with lifting mechanism set in motion by contact with the oncoming wire-splice, adapted to elevate the slide-shaft automatically, and a suitable latch device for holding said shaft and its appendages in an elevated position, adapted to be automatically disengaged therefrom to allow said parts to descend by engagement with the mechanism set in motion by said wire-splice, substantially as set forth.

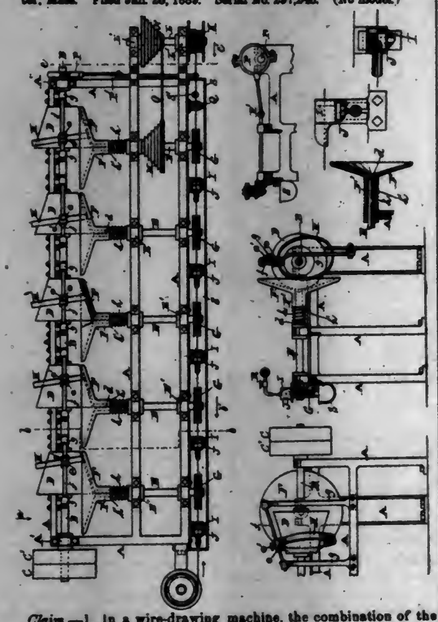
6. The combination of the stationary wiper E and the vertically-operated slide-shaft C with the rotatable star-wheel D, having arms c, provided with sockets at their outer ends to hold the wiping material and with holding-shoulders j, the stationary stop i, and frame A, substantially as set forth.

7. The combination of the stationary wiper E and the vertically-operated shaft C with the rotatable star-wheel D, having arms c, provided with sockets at their outer ends to hold the wiping material, the stationary stop i, and frame A, substantially as set forth.

8. The combination of the slide-shaft C, having the guide-roll k, mounted on its lower end in front of and at one side of the axis of the star-wheel D, with said star-wheel fitted to turn longitudinally in the bottom of said slide-shaft, substantially as set forth.

9. The combination of the slide-shaft C, provided with notches h, also having the guide-roll k, or its equivalent, mounted on its lower end, and the star-wheel D, fitted to turn on said lower end and adapted to be operated by the wire-splice in its passage forward, with the pivoted pawl g and frame A, substantially as set forth.

10. The combination of the slide-shaft C, having the notches h, with the pawl g, pivoted to frame A, adapted to engage at its upper end with said notches and to be automatically disengaged therefrom by connection with the mechanism actuated by the wire-splice in its passage forward, substantially as set forth.



11. The combination of the rotatable star-wheel D, having the holding-shoulders j, with the stationary stop i and stationary wiper E, substantially as set forth.

12. In an automatic wiper for wire-galvanizing and similar apparatus, the combination of the shaft C, fitted to slide in frame A, with the lifting-lever H, connecting rod or link G, swinging lever F, and frame A, said lever F being adapted to engage at its lower end with the wire-splice as the latter moves forward, substantially as set forth, and for the purpose specified.

13. In an automatic wiper for wire-galvanizing and similar apparatus, the combination of the swinging lever F, adapted to engage with the wire-splice as the latter moves forward, the connecting rod

or link G, and lifting-lever H, with shaft C, fitted to slide in frame A and provided with notches *h*, pawl *g*, pivoted to frame A and adapted to engage at its upper end with said notches, and said frame A, substantially as and for the purpose set forth.

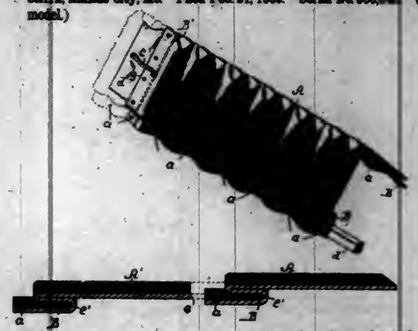
405,878. WIRE-DRAWING MACHINE. HERBERT SMITH, Worcester, Mass. Filed Jan. 28, 1889. Serial No. 297,242. (No model.)

Claim.—1. In a wire-drawing machine, the combination of the series of friction driving-cones D, friction-driven disks F, adjustable friction-belts H, arranged between said cones and disks, the drawing-through pulleys, and suitable means for supporting and operating the various parts, substantially as and for the purpose set forth.

2. In a wire-drawing machine, the combination of the series of friction driving-cones D, friction-driven disks F, adjustable friction-belts H, arranged between said cones and disks, the drawing-through pulleys, the reducing-dies, and suitable means for supporting and operating the various parts, substantially as and for the purpose set forth.

3. In a wire-drawing machine, the combination of the series of friction driving-cones D, friction-driven disks F, adjustable friction-belts H, arranged between said cones and disks, the drawing-through pulleys, the reducing-dies, the spool or block upon which the finished product is coiled, and suitable means for supporting and operating the various parts, substantially as and for the purpose set forth.

4. In a wire-drawing machine, the combination of the series of friction driving-cones D, friction-driven disks F, adjustable friction-belts H, arranged between said cones and disks, the drawing-through pulleys, the reducing-dies, the spool upon which the finished product is coiled, a wire-guide for properly distributing the wire over said spool, and suitable means for supporting and operating the various parts, substantially as and for the purpose set forth.



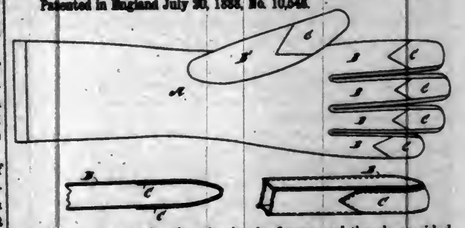
5. In a wire-drawing machine, the combination of the shaft E, driven from the main shaft B through the friction-cone D, friction-belt H, and friction-disk F, and having the cone-pulley M thereon, with the belt O, cone-pulley N, shaft L, spool K, and frame A, substantially as set forth.

6. In a wire-drawing machine, the combination of the shaft E, driven from the main shaft B through the friction-cone D, friction-belt H, and friction-disk F, and having the cone-pulley M thereon, with the belt O, cone-pulley N, shaft L, spool K, a wire-guide operated from the main shaft through suitable connections for guiding the wire laterally from one end to the other of the spool as it is being coiled thereon, and frame A, substantially as set forth.

7. In a wire-drawing machine, the wire-guide operated from the main shaft through an eccentric on said shaft, and a jointed rod or pitman fitted to slide next to the wire in stationary bearings, substantially as set forth.

8. The combination of the shaft E, its bearings E' on frame A, and friction-disk F, having the hub or sleeve F' and fitted to slide longitudinally on said shaft E, with the feather-key *d* and spring *h*, substantially as and for the purpose set forth.

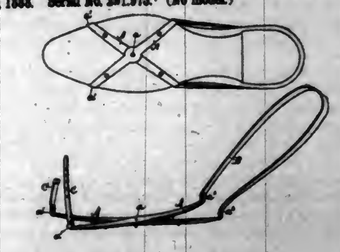
405,879. SLIP OR LOCK JOINT FOR CORRUGATED IRON. JOHN SMITH, Kansas City, Mo. Filed Feb. 21, 1889. Serial No. 300,841. (No model.)



Claim.—1. The corrugated metal plate the edges whereof are bent directly across the corrugations of the plate, whereby inwardly-extending sockets corresponding to a cross-section of the corrugations are formed upon the edges of the plate, substantially as and for the purpose specified.

2. The corrugated metal plates the longitudinal edges whereof are bent directly across the corrugations of the plates, whereby inwardly-extending sockets having the wave-like contour of corrugations are formed along said edges, in combination with duplicate corrugated plates having one of their longitudinal edges entering the said sockets, substantially as and for the purpose specified.

3. The combination, with the layer or layers of tar-paper or cement, of the corrugated metal plates having interconnecting edges, and the end of one overlapping or underlapping the end of the other, and the hooked fastener interposed between said ends of the plates and receiving in its hook the overlapping end of a plate, substantially as specified.



4. The combination of the duplicate corrugated metal plates the longitudinal edges of which are provided at one side with inwardly-extending corrugated sockets arranged underneath the plates and having outwardly-projecting portions formed integrally with the sockets and provided with nail-receiving apertures, substantially as and for the purpose specified.

405,880. GLOVE. CHARLES B. BUALL and EDWARD SCOONES, London, England. Filed Dec. 14, 1888. Serial No. 293,631. (No model.) Patented in England July 30, 1888, No. 10,548.

Claim.—A textile glove having its fingers and thumb provided with a re-enforce piece consisting of a narrow single piece of material forming a front on the palm side and also passing over the end and down the interior of the back for a distance from the end, substantially as specified.

405,881. ICE-CREEPER. MARTIN STEINER, Erie, Pa. Filed Nov 27, 1888. Serial No. 291,973. (No model.)

Claim.—In an ice-creeper, the combination of the cross-bars A A, pivoted together at their point of intersection and having their ends a' a^2 turned up to form jaws, the spikes upon the under surfaces of said bars, the toe-straps adjustably connecting the front ends of said bars, and an elastic heel-strap connecting the rear ends of the same, substantially as and for the purpose described.

405,882. TELEPHONE-SWITCH. ALFRED STROMBERG, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Apr. 4, 1887. Serial No. 233,617. (No model.)

Claim.—1. The combination, with the bell-crank lever, which forms the telephone-support, of the flat beat spring, one end being fixed, the free end of said spring pressing against one of the arms of said support and vibrating between the fixed opposing contacts of the switch to alternatively change the connection of the spring from one side to the other as the telephone is placed upon and removed from the support.

2. The combination, with the pivoted telephone-supporting lever and stops for limiting the movement thereof, the shorter arm of said pivoted support being in engagement with the free end of the spring *c*, of said spring *c*, rigidly secured at one end and beat and adjusted, as described, and the contact-points on opposite sides of spring *c*, upon which said spring closes alternatively as the pivoted arm is operated on taking down and hanging up the telephone.

3. In an electric switch, the combination, with the flat spring *c*, fixed at one end and bent around to come between opposing contact-points, of said contact-points or connections, and the pivoted lever mechanism operating between fixed stops normally held in position by the tension of the said spring with which said mechanism is connected to allow said spring to close upon the connection on one side thereof, said spring being lifted from said connection and forced to close upon the opposing connection when the position of the lever mechanism is changed, whereby the circuits may be changed on the movement of the lever mechanism from one fixed stop to the other, substantially as described.

405,883. CORK-EXTRACTOR. KESSEE TAYLOR, Frankfort, Ky. Filed Mar. 11, 1889. Serial No. 302,773. (No model.)

Claim.—In a cork-extractor, an evenly-curved pointed blade flattened on its concave side and having cutting-edges at the sides tapering toward the point, substantially as shown and described.

405,884. CAR-COUPLING. ALVIN W. VAN DORSTON, Washington, D. C., assignor to the Van Dorston Combined Car Coupling Equipment Company, Portland, Me. Filed May 12, 1888. Serial No. 273,067. (No model.)

Claim.—1. In an automatic car-coupling, the combination, with a pivoted jaw having a recess, of an india-rubber block secured in said recess by means of a buffer acting in contact therewith to receive the shock and prevent damage to the side wall of the draw-head and to the said jaw, substantially as described.

2. In an automatic car-coupling, the jaw having a suitable recess, a rubber cushion therein, a buffer *c*, arranged in said recess, and the rivet *d*, for securing the buffer movably in place, substantially as described.

3. In a car-coupling, the draw-head having a cushion in one side, combined with a jaw pivoted in the draw-head on that side containing the cushion and also having a cushion in itself, the two cushions co-operating in the movement of the jaw to break the force of blows, and thus preserve the draw-head and jaw from damage therefrom, substantially as described.

4. In an automatic car-coupling, the interlocking jaw-arm having the guard A^5, projecting forwardly beyond the plane of a right line drawn from the pivotal center of the jaw-arm to the inner forward end of said arm, substantially as shown, combined with a draw-head of the close-coupler, as distinguished from the free-slack kind, to compel said interlocking arm to rotate and engage with one or more of

405,884.

the locking-tumblers without contact or shocks upon the front jaw-faces and walls of the draw-head, substantially as described.

5. In a car-coupling, the draw-head having the pocket a^5 and cushion therein, and the column a^4 on that side of the draw-head in which the jaw is pivoted, combined with said jaw, and a cushioned buffer therein, substantially as described.

6. In a car-coupling, the jaw having a suitable recess containing a cushion *b'*, and a buffer or piston *c*, adapted to move back and forth in said recess, combined with a draw-head against one side wall of which the thus cushioned jaw strikes, substantially as described.

7. In an automatic car-coupling of the twin-jaw class, the combination of the jaw-arm provided with a cushioned piston with the draw-head having a column a^4, against which the buffer or piston *c* of the jaw-arm strikes, to receive the blow on the jaw, substantially as described.

8. In a car-coupling, the socketed guard-arm having a cushion in its bottom, combined with the plain straight headless buffer *c*, substantially as described.

9. In an automatic car-coupling, the draw-head having diverging arms and a connecting bottom wall of undulating outline, combined with a pivoted jaw whose outer face is substantially elliptical, its nose round, and its inner face flattened between two curvilinear surfaces, and terminating in the clearance a^6 to give thickness and increased wearing-body to the knuckle, substantially as described.

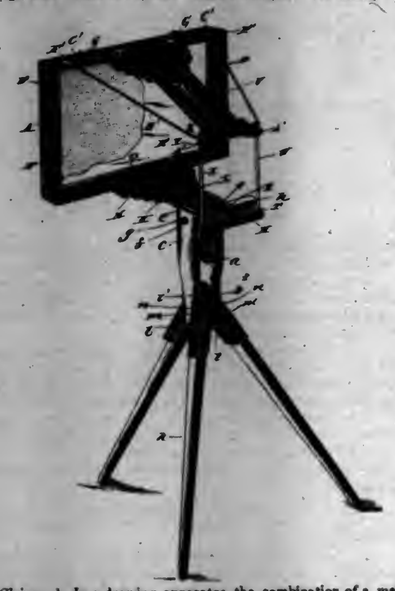
10. In an automatic car-coupling, the draw-head having divergent arms with an intervening bottom wall whose surface is a compound or undulating curve with a rise between the axial line of the draw-bar and the guard-arm, combined with a jaw pivoted in said draw-head and having a knuckle whose outer face is substantially elliptical in outline, its nose rounded, and its inner face flattened between two curves, substantially as described.

11. In an automatic car-coupling, the draw-head having divergent arms with an intervening bottom wall whose surface is a compound or undulating curve with a rise between the axial line of the draw-bar and the guard-arm, combined with a jaw pivoted in said draw-head and having a knuckle whose outer face is substantially elliptical in outline, its nose rounded, and its inner face flattened between two curves and having a clearance-cavity at the angle of the jaw, substantially as described.

12. In an automatic car-coupling, the draw-head having divergent arms and a connecting-wall, combined with a jaw pivoted in said draw-head and having a knuckle with a substantially elliptical outer face, the rear of which is depressed or cut away to form a clearance and a buffing surface, substantially as described.

13. In an automatic car-coupling, a draw-head having divergent arms with an intervening connecting-wall having an undulating surface, combined with a jaw pivoted in said draw-head and having a knuckle with a substantially elliptical outer face, a rounded nose, and a flattened inner face bounded on each side by curved surfaces, and one or more cushions interposed between the arm of the jaw and the draw-head, substantially as described.

405,885. CORKSCREW. WILLIAM A. WILLIAMSON, Newark, N. J. Filed Jan. 12, 1888. Serial No. 260,493. (No model.)



Claim.—A corkscrew consisting of a handle the ends of which are provided with hollow posts formed integrally on said ends, the

405,385.

ends of the posts abutting against each other to form a bearing, an inner or supplemental post or rivet arranged within said bearing formed by the abutting posts on the ends of the handle, and a worm or screw provided with an eye or loop encircling said bearing, for the purposes set forth.

405,386. DRAWING APPARATUS. WILLIAM S. WORDEN, Holdrege, Nebr. Filed Oct. 3, 1888. Serial No. 287,035. (No model.)

Claim.—1. In a drawing apparatus, the combination of a main frame, a folding frame hinged to the lower front edge of the same and having a groove to receive a glass plate and a drawing-sheet, and suitable locking-catches, and a head-rest hinged to the upper rear edge of said main frame, substantially as set forth.

2. The combination, in a drawing apparatus, of the frame A, the board or arm K, hinged to the lower side thereof, the board or arm U, hinged to the upper side of the frame, and the frame or bail W, hinged or pivotally connected to the outer end of one said boards or arms and adapted to be secured to the other, for the purpose set forth, substantially as described.

3. The combination, in a drawing apparatus, of the frame A, the arms or boards hinged to the lower and upper sides thereof, one of said arms or boards having a catch or detent, a frame or bail W, hinged or pivoted to the other arm or board and adapted to be engaged by said catch or detent, for the purpose set forth, substantially as described.

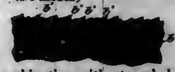
4. The combination, in a drawing apparatus, of the frame A, the arm or board K, hinged to the lower side thereof, the arm or board U, hinged to the upper side of said frame, the right-angled plates secured on opposite sides of the free end of arm U, and the frame or bail W, having the spindles or pintles engaging openings in the right-angled plates and in the arm U, substantially as described.

5. The combination, with a drawing apparatus comprising the frames A and W and the connecting-arms between the upper and lower sides thereof, of the bail hinged or pivoted to the frame A and adapted to fold upon the upper arm, for the purpose set forth, substantially as described.

6. The combination, with the drawing apparatus having the base arm or board K, of the tripod or support having the clamping-arms adapted to engage the said board and the screws to compress the said arms or jaws thereon, substantially as described.

7. The combination, with a drawing apparatus having the base board or arm K, of the tripod or support having the clamping-jaws, the latter having their upper ends rounded or convexed and provided with the vertical extensions or flanges, for the purpose set forth, substantially as described.

8. In a drawing apparatus, the combination of the main frame, the clamping-frame hinged thereto, the base-board hinged to said main frame, hinged frames to support the main frame in an upright position, and the tripod or support having the clamping-arms adapted to engage the said base-board, substantially as set forth.

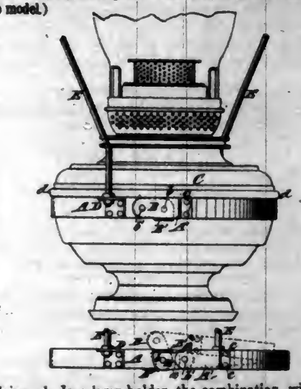


9. The combination, with a drawing-frame, of a head-rest hinged to the upper edge of said drawing-frame and a supporting-frame connected pivotally to the free end of said head-rest, substantially as set forth.

10. In a drawing apparatus, the front frame carrying the glass plate and drawing-sheet, the top arm or board U, bottom arm or board K, and rear end piece W, all of said parts being hinged or pivoted together so as to fold one upon the other, as set forth.

11. The combination, with a drawing-frame, of a hinged head-rest, a supporting-frame connected pivotally to the free end of the latter, and a bail pivoted to the drawing-frame and resting with its free end upon the head-rest, substantially as set forth.

12. The combination of the drawing-frame, the hinged head-rest, the supporting-frame pivoted to the free end of the latter, the hinged base-board, a bail pivoted to the drawing-frame and adapted to rest upon the head-rest, and a tripod having clamping-jaws adapted to engage the base-board, substantially as set forth.

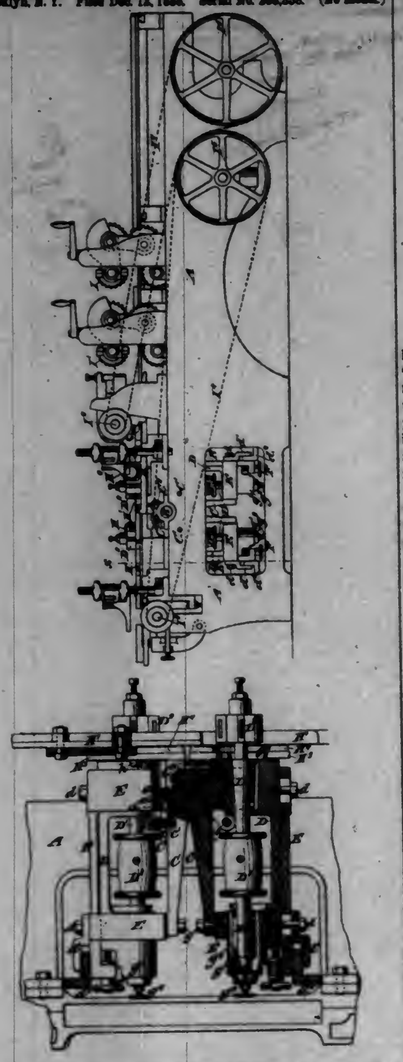


405,387. LOOM-TEMPLE. NICHOLAS I. ALLEN, Boston, assignor to the Dutcher Temple Company, Hopedale, Mass. Filed May 7, 1888. Serial No. 273,115. (No model.)

Claim.—1. The combination, with a temple-head, of a roll covered with fish-skin applied thereto, substantially as described.

2. The herein-described temple-roll, consisting of a body, as *a*, and a covering of fish-skin, having the points of the skin directed toward the end of the roll, to thereby prevent the cloth slipping on the said covering in the line of the axis of rotation of the roll, substantially as described.

405,388. LAMP-HOLDER. LEWIS J. ATWOOD and FREDERICK W. TOBEY, Waterbury, Conn., assignors to the Plume & Atwood Manufacturing Company, same place. Filed July 13, 1888. Serial No. 279,845. (No model.)

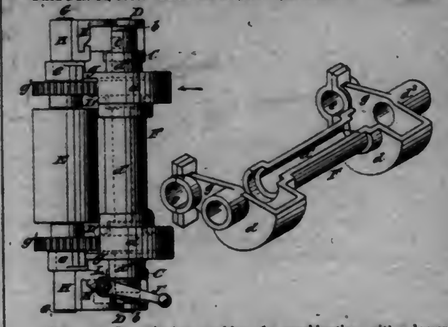


Claim.—1. In a lamp-holder, the combination, with a ring, of a support for said ring, said ring having an opening in one side and a reversible link arranged within said opening, and having a loose connection with both of the adjacent ends of the ring, the ends of the ring when in a normal position lapping past each other, so as to present the upper edge of the ring in an approximately horizontal plane, substantially as specified.

2. The combination, with a ring, of a support for said ring, said ring having an opening in one side, the ends of the ring being capable of overlapping one another, and a reversible link arranged between said overlapping ends and having a loose connection with both of said ends of the ring, the ring when in a normal or closed position presenting its upper edge in an approximately horizontal plane, substantially as specified.

3. The combination, with a ring, of a support for said ring, said ring having an opening in one side, a reversible link arranged within said opening and having a loose connection with both of the adjacent ends of the ring, and a projection constituting a stop upon one of said end portions of the ring, substantially as specified.

405,389. PLANING AND MOLDING MACHINE. HENRY F. AUTENRIETH, New York, assignor to the Glen Cove Machine Company, (Limited,) Brooklyn, N. Y. Filed Dec. 12, 1888. Serial No. 293,338. (No model.)



Claim.—1. In a planing and molding machine, the combination, with a main frame, of a side cutter-head, a spindle upon which said side cutter-head is mounted, a spindle-frame in which said spindle is mounted, and another frame separate from said spindle-frame and supported from the main frame, to which the spindle-frame is detachably secured, substantially as specified.

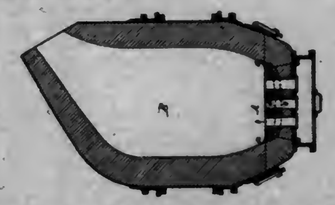
2. In a planing and molding machine, the combination, with a side cutter-head, of a spindle upon which said cutter-head is mounted, a spindle-frame pivotally hung, so that it may be swung to adjust the cutter-head at an angle or incline, a clamping device for securing the same in such angular or inclined position, and an adjusting-screw for imparting a vertical adjustment to the spindle-frame, substantially as specified.

3. In a planing and molding machine, the combination, with a single support, of cutter-legs mounted on said support, clamping-jaws upon said cutter-legs for securing the cutter-legs to the support, screws for operating said jaws, worm-wheels upon said screws, and worms engaging the worm-wheels to rotate the screws, substantially as specified.

405,390. PLANING-MACHINE. HENRY F. AUTENRIETH, New York, assignor to the Glen Cove Machine Company, (Limited,) Brooklyn, N. Y. Filed Dec. 14, 1888. Serial No. 293,867. (No model.)

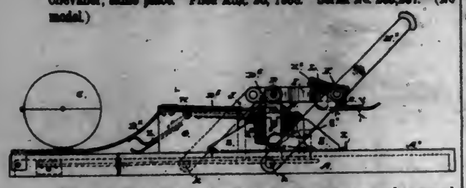
Claim.—1. In a planing-machine, the combination, with a lower presser-roll, of an upper presser-roll, gearing transmitting motion from one roll to the other, vertically-movable journal-boxes for the upper roll, guides in which said journal-boxes move, a rigid connection between opposite ends of the upper roll made independently of the upper-roll shaft and extending widthwise of the machine in close proximity to the upper roll, and a single screw operating through said rigid connection to cause parallel raising and lowering of the upper roll, substantially as specified.

2. In a planing-machine, the combination, with the shaft B', of the links C, hung upon said shaft and provided with hubs *c*, the shaft D, journaled in the hubs *c*, the roll E, mounted upon the shaft G, and the casting F, engaging the shaft G, substantially as specified.



405,391. OIL-BURNER. PHILIP L. BEAR, Hamilton, Ohio. Filed Jan. 21, 1889. Serial No. 297,002. (No model.)

Claim.—1. In an oil-burner, the combination, substantially as set forth, of a steam-tube having a discharge end or nozzle and an oil-tube within the same and having a nozzle end, entirely around which a steam-ajutage is formed between the exterior of the nozzle of the oil-tube and the interior of the nozzle of the steam-tube, the nozzle end of the oil-tube being provided with an oil-ajutage extending around within and close to said steam-ajutage, except at the lower portion, at which portion of the steam-ajutage the oil-ajutage is blank.



2. In an oil-burner, the combination, substantially as set forth, of a steam-chamber having a nozzle, an oil-tube disposed therein and having a general closure at its end at said steam-nozzle, and having two vertically-disposed oil-ajutages joined at their tops by a horizontal oil-ajutage.

405,392. PROCESS OF REPAIRING CONVERTER-BOTTOMS. ERNST BERTRAND, Kladno, Bohemia, Austria-Hungary, assignor to the Pottstown Iron Company, Pottstown, Pa. Filed July 19, 1888. Serial No. 280,437. (No model.)

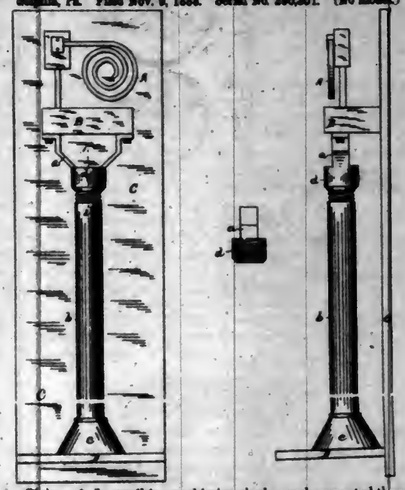
Claim.—The mode herein described of prolonging the life of a basic converter-bottom, said mode consisting in alternately blowing a heat and then inserting new tuyeres and rebuilding with basic lining material the partially-burned bottom up to the original surface-level, whereby the bottom is so rebuilt after each heat, all substantially as set forth.

405,393. MACHINE FOR AFFIXING POSTAGE-STAMPS, &c. LOUIS J. BORIE, San Francisco, Cal., assignor of one-half to George P. Chevalier, same place. Filed Aug. 20, 1888. Serial No. 283,267. (No model.)

Claim.—1. In a machine for affixing postage-stamps and gummed labels, the combination of the oscillating presser-plate having devices to seize and attach the stamp or label to its bottom surface, the hinged platen, and a device on the platen for seizing the strip or ribbon of stamps at the first line of perforations, arranged for operation as set forth.

2. In a machine for affixing postage-stamps and gummed labels, the combination, with the oscillating presser-plate having devices to seize and attach the stamp to its bottom surface, of the moistening device arranged for operation, as described, to rise into contact with the stamp on the bottom of the presser-plate in the forward movement thereof and to drop clear of it at the return movement, as set forth.

3. In a machine for affixing postage-stamps and gummed labels, a spool for holding the stamps or labels in the form of a perforated strip or ribbon, the movable platen for holding and presenting the stamps at the end of the ribbon, having a device to engage and hold the ribbon at the first line of perforations, a moistening device arranged in front of said platen, the traveling presser-plate having devices to seize and attach a stamp from the end of the ribbon to the bottom face of the presser-plate when brought in contact with the platen, and means, substantially as described, for elevating the platen to meet the bottom of the presser-plate and remain in contact therewith during the first part of its forward movement, for seizing and pulling off the end stamp presented on the platen, substantially as set forth.

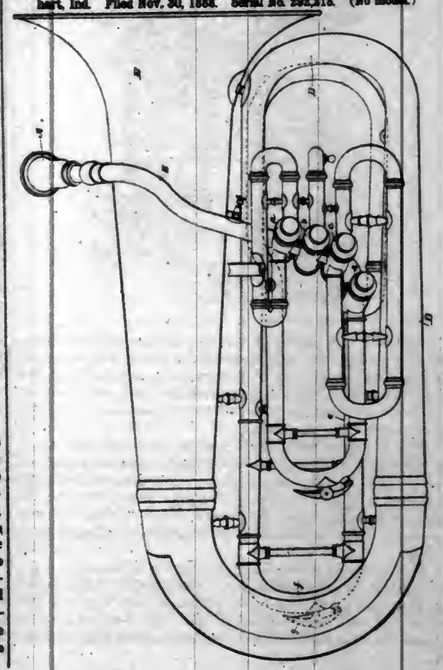


4. In a machine for affixing postage-stamps and gummed labels, the stamp-holding platen D, having a sprig-tongue for holding down the stamp, the tracks or raised sides *d d*, and the longitudinal grooves d^3 d^4 on either side of the tongue, in combination with the oscillating presser-plate E, having yielding points *p*, for seizing and attaching the stamp to its bottom surface, and the oscillating frame H, for operating the presser-plate, substantially as described, to operate as set forth.

5. The combination of the base A, the spool B, mounted thereon at one end, the table or surface $A^\times$ at the opposite end, the hinged and movable platen D and platen-support G, the spring W, adapted to hold down the stamp on the platen, the bar $U^\times$, having pins U, arranged to play through slits in the platen and engage in the line of perforations in the ribbon of stamps, the oscillating presser-plate E, having yielding points *p p*, a moistening device in front of said platen capable of movement, and mechanism, substantially as described, operated by or from the oscillating movements of the presser-plate for bringing the moistening device into action during the forward movement of the presser-plate, when the stamp is on it, and for depressing said device out of contact on the return when the presser-plate is empty, as set forth.

6. In a machine for affixing gummed stamps or labels, a presser-plate having oscillating movement in an arc, as described, between a stamp-holding bed or platen and a table or surface on which the article to be stamped or labeled is laid, and a device, in combination therewith, for seizing and attaching the stamp or label to the bottom of said plate, and adapted to take the stamp or label at the beginning of the upward movement and to carry it forward in contact with suitable moistening devices during said movement, and, finally, withdraw and leave the stamp or label upon the article or surface placed to receive it at the end of the oscillating movement, as set forth.

7. The herein-described machine for separating gummed stamps or labels from a strip or perforated ribbon, moistening the gummed side, and, finally, affixing it by pressure upon the envelope or article to be stamped, consisting, essentially, of a spool for carrying the ribbon, the hinged platen D, for presenting the end portion of the ribbon, a device on said platen for seizing the ribbon at the line of perforations that separate the first stamp, the oscillating presser-plate E, capable of movement in a vertical arc in a forward direction from over the said platen, and of maintaining a horizontal position during such movement, a moistening device arranged in front of the said platen and adapted to be set in the path of the presser-plate in its forward movement, and to be drawn out of contact with it on the return, a device on the presser-plate operating to seize and attach the stamp to the bottom of the plate, consisting of yielding points or pins projecting beyond the bottom of the plate, and the table or surface in front of the moistening device to present the envelope or article to be stamped, substantially as described, for operation as set forth.

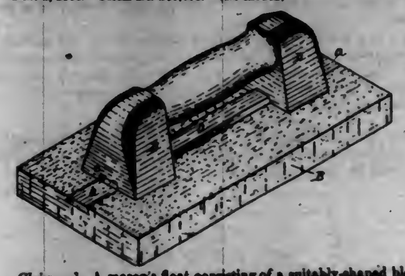


405,394. ATTACHMENT FOR CLOCKS. EDWARD T. CRANE, Philadelphia, Pa. Filed Nov. 9, 1888. Serial No. 290,351. (No model.)

Claim.—1. In a striking or chiming clock, a rod supported thereon, one end of which bears against the bracket carrying the gongs and the other against the bottom of the clock, substantially as and for the purpose set forth.

2. The combination, with the gong-bracket and bottom of a striking or chiming clock, of a bracket having a threaded boss, a rod one end of which is threaded and screwed into said boss, and a support resting upon the bottom of the clock and against which the lower end of said rod bears, substantially as set forth.

405,395. MUSICAL WIND-INSTRUMENT. CHARLES G. CONN, Elkhart, Ind. Filed Nov. 30, 1888. Serial No. 292,218. (No model.)



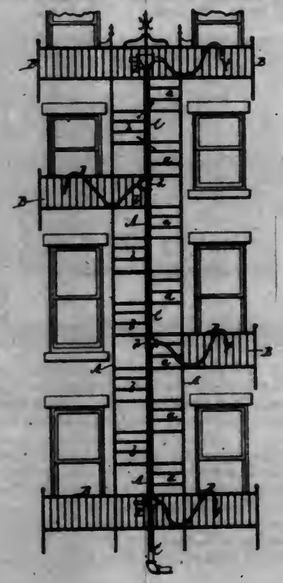
Claim.—1. A musical wind-instrument having valves placed diagonally across the piece, for the purpose set forth.

2. A musical wind-instrument having a direct air-passage from the mouth-piece through the diagonally-arranged valves to the water-key in the tuning-slide, as and for the purpose set forth.

3. The combination of a musical wind-instrument having valves placed diagonally across the piece with a direct air-passage through said valves from the mouth-piece to the water-key in the tuning-slide, substantially as set forth.

405,396. MASON'S FLOAT. ISAAC H. CONRAD and ALFRED W. POUNDER, Elkhart, Ind., assignors, by direct and mesne assignments, of two-thirds to Edwin S. Conrad and Malcolm Pounder, same place. Filed Nov. 2, 1888. Serial No. 289,736. (No model.)

Claim.—1. A mason's float consisting of a suitably-shaped block or strip of cork provided with a handle, substantially as set forth.

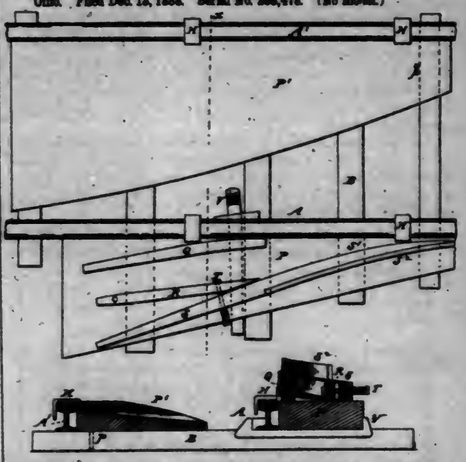


2. A mason's float consisting of a suitably-shaped cork block or strip having a handle and provided with the stiffener to prevent warping, substantially as set forth.

405,397. FIRE-ESCAPE. WILLIAM S. COOK, Rochester, N. Y. Filed Dec. 24, 1888. Serial No. 294,494. (No model.)

Claim.—1. A fire-escape consisting of a series of cages attached to suitable supports and arranged in a vertical line, said cages alternating and forming steps, whereby a person can descend by stepping from one to another, as herein shown and described.

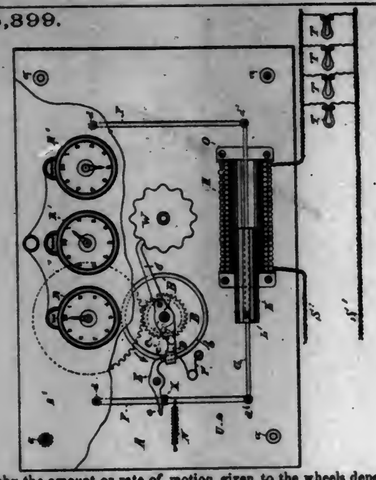
2. A fire-escape consisting of vertical bars or rods attached to the face of a building, and a series of cages attached thereto alternating in position and forming steps, whereby a person can descend by stepping from one to another, as herein shown and described.



3. In a fire-escape, the combination of vertical bars or rods forming a support, a series of cages attached thereto alternating in position, forming steps, whereby a person can descend by stepping from one to another, and balconies opening into the back of the cages, as shown and described, and for the purpose specified.

405,897.

405,898. CAR-REPLACER. CHARLES H. DAILEY, East Liverpool, Ohio. Filed Dec. 13, 1888. Serial No. 293,473. (No model.)



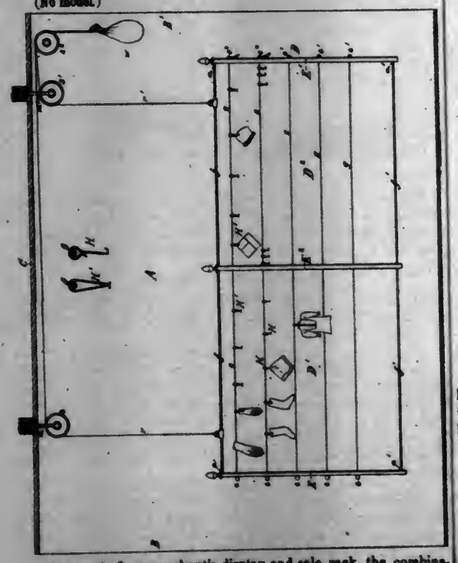
Claim.—A car-replacer consisting of the two plates P P', the former provided with guide-rails Q R S, and extension S', having the vertical guard-flange S^2, the middle guide-rail being rear pivoted and spring held in front to the outer guide-rail, as and for the purpose set forth.

405,899. ELECTRIC METER. RUDOLF DIESEL, New York, N. Y., and PHILIP DIESEL, Elizabeth, N. J. Filed Feb. 21, 1889. Serial No. 300,749. (No model.)

Claim.—1. In an electric meter, the combination of a train of wheels and indicating-dials, a friction-clutch applied to one of said wheels, means, substantially as described, for giving regular impulses to a lever operating upon said friction-clutch, a solenoid in the translating-circuit, a movable core therefor, mechanism connected with said core, which governs the extent of motion of said friction-clutch, whereby variable motion is given to said wheels according to the position of said core.

2. In an electric meter, the combination of a solenoid, a movable core therefor, mechanism connected with said core, a train of wheels with indicating-dials, a friction-clutch applied to one of said wheels, means, substantially as described, for giving regular impulses to said friction-clutch when a current is passing, and a lever operating upon said friction-clutch through the mechanism attached to said core,

405,899.



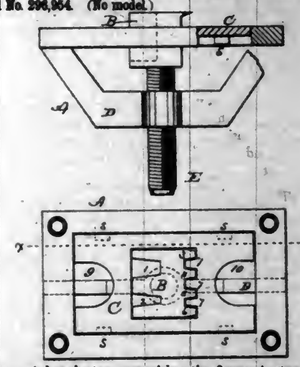
whereby the amount or rate of motion given to the wheels depends upon the position of said core.

3. The combination of the solenoid, its core, the clutch D, means, substantially as described, for operating said clutch at regular intervals when a current is passing, the wheel B, having its rim grasped by said clutch D, the train connected therewith, the lever E, which determines the amount of motion given to the wheel B by the clutch, and the springs P and N.

4. The combination of the solenoid, its core, the clutch D, means, substantially as described, for operating said clutch at regular intervals when a current is passing, the wheel B, having its rim grasped by said clutch, the train connected therewith, and the lever E, having a curve of such form as to compensate the decreased rate of movement of said core on an increase of current by an increased range of movement of said clutch.

5. The combination of an electro-magnetic device operated upon by the current to be measured, an intermittently-operated friction-clutch, substantially as described, and a registering apparatus driven by said friction-clutch at a rate determined by the position or condition of said electro-magnetic device.

405,400. DISPLAY AND SALE RACK FOR MERCHANDISE. SAMUEL R. DUNLAP, Eutaw, Ala. Filed Mar. 1, 1889. Serial No. 302,217. (No model.)



Claim.—1. In a merchant's display and sale rack, the combination of the rack formed of end posts E E' and upper and lower connecting-rods *f f'* and intermediate display-wires *g*, and the balancing and suspending mechanism attached to each end of the rack and to the wall or frame-work of the store-room, substantially as described.

2. In a merchant's display and sale rack, the combination of the end posts E E', intermediate post E², connecting-rods *f f'*, intermediate display-wires *g*, passing transversely through the post E² and serving as adjusting or tension rods, and the balancing and suspending mechanism attached to each end of the rack and to the wall or frame-work of the store-room, substantially as described.

3. In a merchandise display-rack, the combination of the posts E E' E², connecting-rods *f f'*, display-wires *g*, provided with self-retaining hooks or clasps, and means for balancing and elevating and lowering the rack, said means being applied at each end of the rack and to the wall or frame-work of the building, substantially as described.

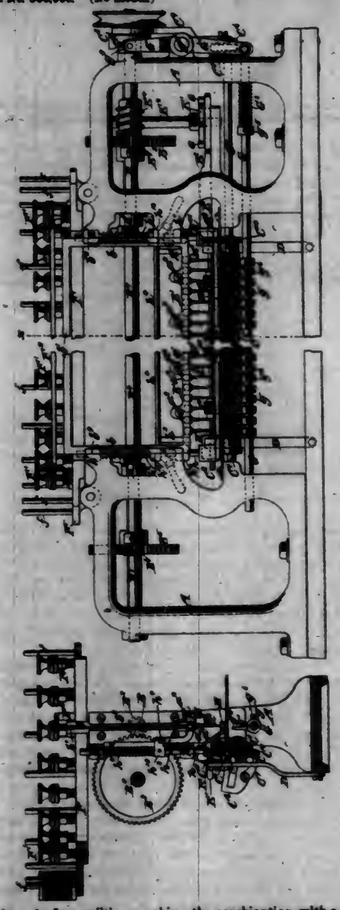
4. In a rising and descending merchandise display and sale rack, in combination, the side supporting-posts, and horizontally-connecting rods, cords, weight, and pulleys, a cord and pulley being at each end of the rack and both operated by a single weight at one end thereof, substantially as and for the purpose described.

405,401. BENCH-STOP. JOHN C. BOERET, Dayton, Ohio, assignor of one-half to Callender & Patterson, same place. Filed Jan. 21, 1889. Serial No. 296,954. (No model.)

Claim.—A bench-stop comprising the frame A, stop B, with projections on one face and slots in the opposite face, and the binding-plate C, with projections, substantially as shown and described.

405,402. PAPER-CUTTER. LEO EHRLICH, St. Louis, Mo., assignor to the American Roll Paper Company, same place. Filed June 30, 1888. Serial No. 278,606. (No model.)

Claim.—1. In a paper-cutter, the combination of a suitable support, a roll of paper, a knife located a distance from the roll of paper, and a wire bail located just beneath and adjacent to the knife for supporting the end of the paper, substantially as and for the purpose set forth.



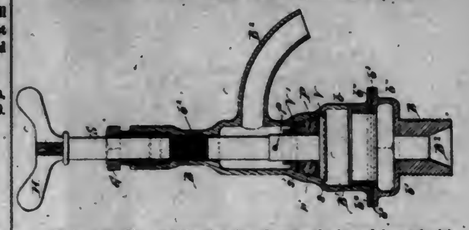
2. In a paper-cutter, the combination of a suitable support, a roll of paper, a suitable knife, and an eccentric cam bearing against the end of the roll of paper to prevent its retrograde movement, substantially as and for the purpose set forth.

3. In a paper-cutter, the combination of a suitable support, a roll of paper, a suitable knife, and a cam pivoted to a suitable support at one end of the roll of paper and bearing against the roll of paper to prevent its retrograde movement, substantially as and for the purpose set forth.

4. In a paper-cutter, the combination of a suitable support, a roll of paper, a suitable knife, and a cam pivoted to a suitable support and provided with an elastic band and a handle and bearing against the roll of paper, substantially as and for the purpose set forth.

5. In a paper-cutter, the combination of a suitable support, a roll of paper, a suitable knife, an eccentric located at and bearing against one end of the roll of paper, and a bracket located at the other end of the roll of paper, substantially as and for the purpose set forth.

405,403. QUILTING-MACHINE. ALFRED FAHLBERG, Brooklyn, assignor to Eli W. Broadbent, New York, N. Y. Filed Feb. 21, 1889. Serial No. 300,660. (No model.)

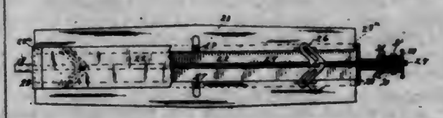


Claim.—1. In a quilting-machine, the combination, with a needle-bar composed of parallel sections, of needles having heads arranged between said sections, said heads being provided with flanges extending beneath the sections of the needle-bar and at right angles to the direction of the length thereof, and clamping devices for securing said sections together, substantially as specified.

2. In a quilting-machine, the combination, with a needle-bar, of a number of needles secured thereon and capable of adjustment in the direction of the length of the bar, a number of loopers, a bar upon which said loopers are adjustably secured, so as to be adjustable in the direction of the length of the bar, and mechanism for imparting a longitudinal reciprocation to said bar, substantially as specified.

3. In a quilting-machine, the combination, with reciprocating needles, of a non-rotary looper-bar, a number of loopers arranged on said bar, all of said loopers having hooks extending approximately parallel with the axis of said bar, and mechanism for imparting a longitudinal movement to said bar, substantially as specified.

405,404. STOP-COCK. MARIA M. FORRESTER, Brussels, Belgium. Filed Feb. 4, 1888. Serial No. 263,001. (No model.) Patented in Belgium Nov. 19, 1887, No. 73,616; in Germany Nov. 20, 1887, No. 43,064; in Spain Dec. 9, 1887, No. 7,006; in France May 14, 1888, No. 190,561; in England May 16, 1888, No. 7,204; in Italy May 19, 1888, No. 23,517, and in Austria-Hungary May 23, 1888, No. 21,676 and No. 9,260.



Claim.—1. The combination, in a faucet, of a barrel formed with an interior wall-seat part *p'*, tapering toward the outflow, supplemented by a bevel wall-seat *s'* of less seat area, with a valve-operating stem having a tapering rubber plug-valve P, the taper whereof being of a less angle than the angle of taper of the wall-seat part *p'*, the valve V', corresponding with the valve-seat *s'*, an abutment V, for confining the said rubber valve and the stem-ing part *p*, substantially as described.

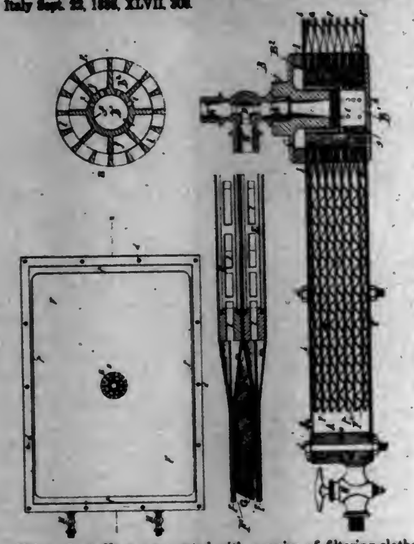
2. In a faucet, the barrel formed with interior circular wall-seats *s s'*, of unequal diameter, and an intermediate wall-seat *p'*, tapering from the seat of greatest to the seat of least diameter and having an area greater than the combined area of the said seats *s s'*, in combination with a valve-operating stem having a tapering rubber valve whose greatest diameter is less than the wall-seat of greatest diameter, the unyielding valves V V', corresponding to the said wall-seats of unequal diameter, and an abutment *p*, for the valve of least diameter, substantially as described, for the purpose specified.

3. In a faucet, the valve-stem having a plug-valve composed of a tapering rubber part P, a fixed end part V, and a loose end part V', the two latter having seat-forming faces of greater angle of taper than the angle of taper of the said rubber valve, combined with a barrel having formed on its inner wall joining seats *p'*, *s*, and *s'*, corresponding to the said separate wall-seats, and a stem pin or lug *p*, co-operating with the loose valve part, substantially as described.

4. In a faucet, the barrel formed with a conical wall part between the inflow and the outflow, the taper standing in the direction of the outflow and forming three separate and distinct joining wall-seats *p'*, *s*, and *s'*, the intermediate one standing at a less angle of taper and having the greatest area, in combination with a valve-stem having three co-operating valve parts P, V, and V', the intermediate part being rubber and having an angle of taper less than the angle of taper of the wall-seat *p'*, and the part *p*, for opening the valve parts V' and P, substantially as described.

405,405. LEVELING-BOARD FOR COTTON-GIN FEEDERS. FERDINAND C. GAMMON, GEORGE L. ROLLINS, and HERBERT WADSWORTH, Bridgewater, Mass., assignors to the Eagle Cotton Gin Company, same place. Filed May 1, 1888. Serial No. 272,496. (No model.)

Claim.—1. The leveling-board having fixed sides and adjustable wings, cams for adjusting said wings, and a spindle for adjusting said cams, as set forth.



2. The leveling-board having adjustable wings, cams for adjusting said wings, a screw-threaded spindle for adjusting said cams, and a nut for adjusting said spindle, substantially as set forth.

3. The leveling-board having adjustable wings, a longitudinally-movable spindle, arms carried by said spindle having cam-slots, and studs carried by said wings engaging in said slots, as set forth.

4. The rotary leveling-board having radially-adjustable wings, a screw-threaded central spindle, a fixed revolubie nut engaging said spindle, studs on said wings, and cams engaging said studs and attached to the spindle, as set forth.

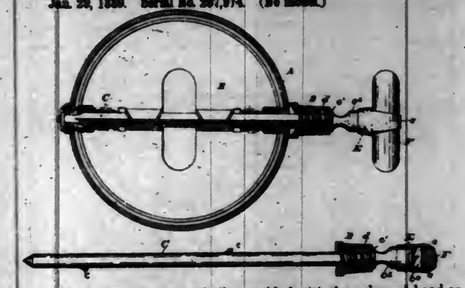
5. The rotating leveling-board having radially-adjustable wings, a central spindle capable of longitudinal movement, inclined arms on the spindle engaging with studs on the wings, and studs for preventing end motion of the wings, substantially as and for the purpose set forth.

405,406. FILTER. BENJAMIN E. GARSIDE, Castres, France. Filed Mar. 20, 1888. Serial No. 304,015. (No model.) Patented in France Oct. 2, 1886, No. 178,826; in Spain Sept. 17, 1888, No. 8,703; in England Sept. 20, 1888, No. 13,035; in Portugal Sept. 20, 1888, No. 1,269, and in Italy Sept. 22, 1886, XLVII. 308.

Claim.—1. A filter constructed with a series of filtering-cloths, corrugated metallic reticulated plates interposed between said filtering-cloths, a central inlet-chamber having apertures communicating with the pockets formed between the filtering-cloths, and a casing containing said filtering-cloths, plates, and inlet-chamber, all combined substantially as set forth.

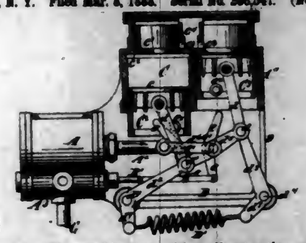
2. A filter composed of a casing, a series of filtering-cloths in the same and provided with central apertures, a series of corrugated metallic reticulated plates between the filtering-cloths, a central apertured cylinder composed of rings, between which the inner edges of said cloths are held, and a perforated and winged chamber in said cylinder, all combined substantially as set forth.

3. A filter composed of a casing, a series of filtering-cloths within said casing and having central apertures, corrugated metallic reticulated plates between the filtering-cloths, a central cylinder composed of apertured rings, between which the inner edge of the filtering-cloths are held, a perforated and winged chamber in said cylinder, which chamber has a bottom plate resting against the under side of the bottom of the casing and pressing said bottom of the casing against the bottom of the cylinder formed of the apertured rings, a flanged collar screwed into the chamber, and a cock on the top of said collar, all combined substantially as set forth.



4. In a filter, the combination of a receiver, a distributer disposed therein, a series of textile pockets disposed in said receiver around said distributer, and having their mouths opening into the distributer, and annular corrugated reticulated plates disposed in said receiver between said textile pockets.

405,407. BAKER'S PEEL FOR CRACKERS, &c. SAMUEL S. GOLDMAN, St. Louis, Mo. Filed Jan. 10, 1889. Serial No. 296,012. (No model.)



Claim.—In a baker's peel for crackers, &c., the combination of the wooden body of the peel provided with a wide countersink in one side and a narrower one in the other side of its forward end, the sharp metal tip or blade with flanges integral with said tip that fill said countersinks, the attachment-arms 8, and flanges 9 of said arms secured to the flanges 6 and 7 of the metal edge tips and that project rearward at about a right angle from the same, the countersinks 10 in the wooden body of the peel, in which said angle-arms and flanges are inserted, and the rivets 11, that fasten said metal attachment, substantially as described, and for the purpose set forth.

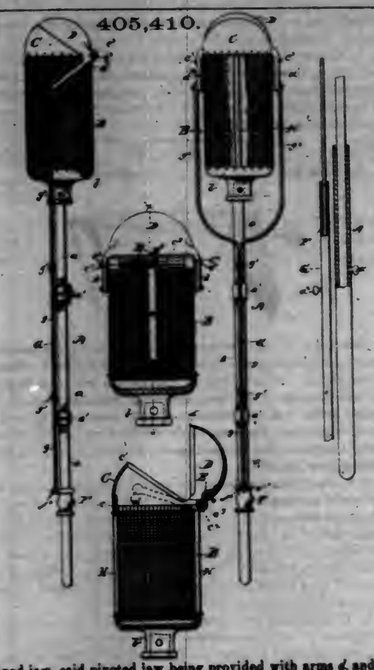
405,408. STOVE-PIPE DAMPER. MATTHEW GRISWOLD and ORIN R. HASCHETT, Erie, Pa.; said Haschett assignor to said Griswold. Filed Jan. 28, 1889. Serial No. 297,914. (No model.)

Claim.—The damper-spindle provided with the enlarged head or end to receive and retain the handle-sleeve and having the transverse rib on its end for engaging the grooved block or handle, in combination with the removable sleeve engaging said enlarged end of the spindle and having the malleable arms or fork for receiving and clamping the block to the spindle, substantially as described.

405,409. DIRECT-ACTING ENGINE. ROBERT HARDIE, Schenectady, N. Y. Filed Mar. 8, 1888. Serial No. 266,547. (No model.)

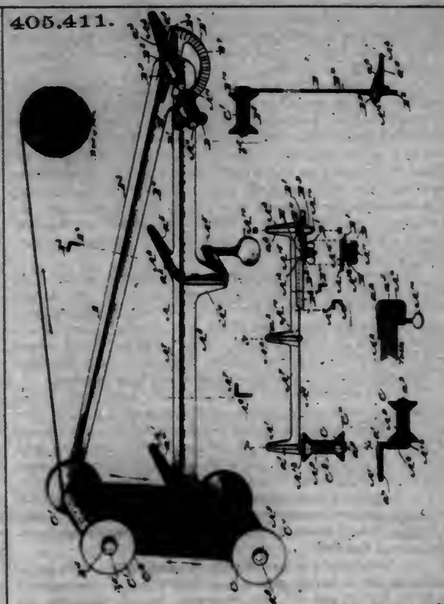
Claim.—1. The combination, with a direct-acting motor piston and cylinder, of two single-acting pump pistons and cylinders, two pairs of toggle-levers for the pump-pistons, each pair having a fixed fulcrum and connected with the pump-pistons and the two pairs being connected together, so that the levers of one pair straighten into line as those of the other pair deflect from a straight line, and a connection between the rod of the motor-piston and the movable joints of the toggle-levers, substantially as herein described.

2. The combination, with a direct-acting motor piston and cylinder, of two single-acting pump pistons and cylinders, two pairs of toggle-levers, each pair consisting of two members d^3 or d^3 and d, jointed together at d', the former d^3 or d^3 fulcrumed at d^4, and the latter d connected with its pump-piston, the link d^5, connecting the movable joints of the two pairs of levers, and the link connecting said link d^5 at a point between its ends with the motor piston-rod, substantially as herein described.



3. The combination, with a direct-acting motor piston and cylinder, of two single-acting pump pistons and cylinders, two pairs of toggles consisting of the levers d^3 d^3, fulcrumed at d^4 and having the toes or arms d^7, connected by the spring D', and the rods d, jointed to said levers and to the pump-pistons, and a connection between the motor piston-rod and the movable joints of the pairs of toggle-levers, substantially as herein described.

4. The combination, with a direct-acting motor piston and cylinder, and a valve for controlling the movements of said piston, of two single-acting pump pistons and cylinders and pairs of toggle-levers through which said pump-pistons are operated by the motor-piston, and levers e, connected with the valve-rod of the motor-cylinder and which are operated on alternately by the pump-pistons in their descending movements to move the valve, substantially as herein described.



405,410. FRUIT-PICKER. EDGAR S. HARPER, Tyler, Tex. Filed Feb. 7, 1889. Serial No. 299,002. (No model.)

Claim.—1. In a fruit-picker, the combination, with a supporting-rod, of the receptacle supported upon the upper end of said rod, said receptacle being constructed of wire-gauze, and provided at its lower end with the cup-shaped piece b, forming the bottom to said receptacle, and at its upper end with the fixed cutting-jaw C, a second cutting-jaw D, pivoted to said receptacle and adapted to co-operate with said fixed jaw, said pivoted jaw being provided with arms d, and the operating-rod bifurcated at its upper end, the arms whereof are pivoted to said arms d, substantially as described.

405,410.

405,411.

2. In a fruit-picker, the combination, with the supporting-rod A, made in sections and united by screw-threaded ferrules, of the receptacle B, supported upon the upper end of said rod and in line therewith, said receptacle being constructed of wire-gauze and provided at its lower end with the cup-shaped piece b, forming the bottom to said receptacle, and at its upper end with the fixed cutting-jaw C, a second cutting-jaw D, pivoted to said receptacle and adapted to co-operate with said fixed jaw, said pivoted jaw being provided with the arms d, and operating-rod G, made in sections and united by screw-threaded ferrules, said rod being bifurcated at its upper end, the arms whereof are pivoted to said arms d, and pivoted at its lower end to the sleeve or handle F, adapted to slide upon said rod A, substantially as specified.

405,411. SKEIN-HOLDER. ISAAC W. REYNOLDS, Philadelphia, Pa. Filed Apr. 13, 1888. Serial No. 307,152. (No model.)

Claim.—1. As an article of manufacture, a skein-holder consisting of the detachable bar A, having spool C attached to one end and pivot A^{14} to the other end, and a radial arm B, pivoted to A^{14}, having spool C' attached to the free end thereof, and a stop-support forming part of a circle concentric with said pivot, together with an adjustable stop adapted to engage with said arc and secure the said radial arm B in various positions of adjustment and set the spools C and C' at various distances from each other, substantially as described.

2. In combination with the bar A, having supports A' A^6 at the opposite ends thereof above, and thumb-screw A^{10} at the middle thereof beneath, the spool C, projecting laterally from one end of said bar and adapted to rotate freely upon a bearing, and a radial arm B, pivoted at one end to the opposite end of said bar A, and means for retaining the said bar B in various positions of adjustment thereupon, and the spool C', projecting laterally from the free end of said arm B and adapted to rotate freely upon a bearing, the whole constructed to operate substantially as and for the purposes described.

3. In combination with the bar A, having rearwardly-projecting end supports A' A^6 and a middle support A^9 above the horizontal level of the lower surfaces of A' and A^9, and a thumb-screw acting from beneath against said support A^9 and adapted to cause secure engagement of said bar A to the margin of a table at the ends thereof before engagement of A^9 therewith, the spool C, pivoted arm B, means for fixing the same at various positions of adjustment, and spool C', substantially as described.

4. In combination with the bar A and rotating spool C at one end thereof, and arm B, with rotating spool C' at the free end thereof, adapted to operate in connection with said spool C for receiving and holding skeins of yarn and the like, said arm B pivoted to said bar A at the rear end thereof, and having a corrugated arc of a circle B' concentric with said pivoted support, together with set-nut D, adapted to engage against said arc and secure the said arm B to the said bar A in various positions of adjustment, substantially as described.

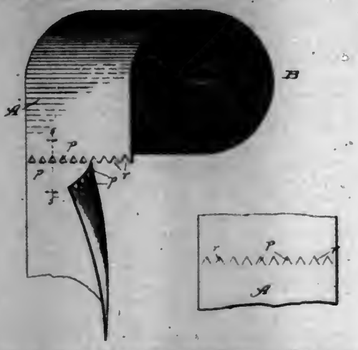
5. In combination with the spool C, spool-support A^5, attached to bar A, longitudinal bar A, having clamp-supports above and set-screw A^{10} beneath, and journal A^{14}, projecting horizontally to the front from the rear end thereof, and threaded pin A^{11}, and the radial arm B, having spool-support B^5 at the free end thereof, and the spool C' and journal-box B^6 near the opposite end, said journal-box fitted over said pin A^{14} and forming a pivoted bearing for said arm B, and semicircle B', attached to said arm B concentric with journal-box B^6, and having a corrugated outer surface B^7, together with washer E, surrounding pin A^{11}, said pin screw-threaded, and thumb-nut D, having flat under surface D^2, adapted to compress said washer against the corrugations B^7 of said semicircle B' and securely fix the arm B in various radial positions of adjustment, substantially as described.

6. In a skein-holding device, in combination with bar A, spool C, arm B, and spool C', said arm radially pivoted at one end thereof to one end of said bar A and having corrugated semicircle C' B' concentric with said pivot and operating against the front face of said bar A, the raised part A^{15}, having corrugations A^{13}, corresponding to corrugations of the semicircle B', and screw-threaded pin A^{11} adjacent to the free margin of said semicircle, together with the compressing thumb-screw D, and the washer E interposed between the under face of said thumb-screw D^2 and the upper face of the corrugations B^7 of said semicircle B', and the corrugations A^{13} of said raised part A^{15} and adapted to engage simultaneously with the corrugations B^7 and A^{13}, substantially as and for the purposes described.

7. In a skein-holder, the detachable bar A, having spool C supported thereupon and adapted to rotate at one end thereof, and the pivoted arm B, having spool C' supported thereupon and adapted to rotate at the free end thereof opposite and in connection with said spool C, the said arm B overlapping the said bar A when closed upon said pivot, the upper surface of said arm B removed, as shown at B^{11}, in rear of pivoted support B^5 A^{14}, and the semicircle B', and a stop to engage with said semicircle and fix the arm B in various positions of adjustment, said semicircle B' in rear of said support A^{14} B^5 occupying a plane vertical and in front of said bar A adapted to give clearance to said semicircle in adjusting the arm B at various heights, substantially as described.

8. In a skein-holder, the bar A, formed of angle-iron, having flat top A^7 and vertical front A^6, supports A' A^6, and thumb-screw A^{10} beneath, and radial arm B, pivoted to one end of said bar A and adapted to be raised or lowered upon said pivot, together with spool C, supported upon pin A^5 at the free end of said bar A, and spool C', supported upon pin B^5 at the free end of said arm B, said spools

adapted to rotate freely upon said pins A^9 and B^9, and means for fixing the said arm B, with said spools C and C' parallel with each other and at various distances apart upon said pivoted support of said arm B, substantially as described.



9. In a skein-holder, the arm A, supporting horizontal and forwardly-projecting spool C at one end thereof, and arm B, supporting horizontal and forwardly-projecting spool C' at one end thereof opposite to and parallel with said spool C, said arm B pivoted at its rear end by a horizontal pivot A^{14} B^9 to the rear end of said bar A, and means for retaining the said arm B in various positions of adjustment upon said pivot, said arm B and said bar A having an angular form in cross-section, the horizontal part B^2 of the arm B overlapping the horizontal part A^7 of the bar A when closed and the vertical part B^4 of said arm B adjacent to the vertical part A^6 of said bar A, substantially as described.

10. As an article of manufacture, a skein-holder consisting of the bar A, formed of cast metal having supports A' A^3 A^5, lug A^8, pins A^{14} and A^{11}, formed integral therewith, and radial bar B, formed of cast metal, having journal-box B^9 and semicircle B' formed integral therewith, and the rotating spools C and C', attached to said bar and said arm, said arm pivoted to said bar at A^{14} B^9, and the thumb-nut D, operating against said semicircle, substantially as described.

11. In a skein-holder, in combination with spool C, pin A^9, and bar A, the pivoted arm B, having pin B^9, and spool C', adapted to rotate thereupon and having pivoted attachment A^{14} B^9 to the rear end of said bar A at the rear end of said arm B, and corrugated semicircle B' B^7, concentric with said pivot, said semicircle having raised stop B^8 and thumb-screw D, adapted to engage with said semicircle and fix the same at various points of adjustment, said stop B^8 adapted to engage with said thumb-screw D and arrest the movement of said semicircle prior to disengagement thereof with said thumb-screw, substantially as described.

12. As an article of manufacture, the skein-holder consisting of cast-metal bar A, having spool-support A^6 A^{13}, one or more supports A' A^3 A^5, lug A^8, pins A^{14} and A^{11}, formed integral therewith, and pivoted arm B, having spool-support B^{10}, journal-box B^9, and corrugated semicircle B' B^7, formed integral therewith, and a thumb-nut D, adjustably secured upon the threaded pin A^{11} and overlapping the front face of said semicircle B', adapted, when in place, to prevent the escape of said journal-box B^9 from said pin A^{14} without heading or otherwise securing the same, substantially as described.

405,412. PERFORATED PAPER. OLIVER H. HICKS, Chicago, Ill. Filed May 17, 1888. Serial No. 274,183. (No model.)

Claim.—1. As a new article of manufacture, a sheet or web of paper perforated to form a tearing-line and having the material cut away to produce the perforations only partially severed from the sheet or web, substantially as described.

2. As a new article of manufacture, a sheet or web of paper perforated with angular perforations to form a tearing-line and having the material cut away to produce each perforation unsevered at only one edge from the sheet or web, substantially as described.

3. As a new article of manufacture, a sheet or web of paper provided with triangular perforations forming a tearing-line and having the V-shaped pieces cut away in producing perforations unsevered at their bases only from the sheet or web, substantially as described.

4. As a new article of manufacture, a sheet or web of paper perforated to form a tearing-line and having the material cut away to produce the perforations only partially severed therefrom and folded against the web or sheet, substantially as described.

5. As a new article of manufacture, a sheet or web of paper provided with triangular perforations forming a tearing-line and having V-shaped pieces cut away in producing perforations unsevered at their bases only from the sheet or web and folded against the latter, substantially as described.

6. As a new article of manufacture, a rolled web of paper perforated at intervals to form tearing-lines and having the material cut away to produce the perforations only partially severed from the web and folded against the same in the direction toward the free end of the roll, substantially as described.

405,418. PAPER BOX FOR CIGARS. OLIVER H. HICKS, Chicago, Ill. Filed Apr. 9, 1889. Serial No. 306,510. (No model.)

Claim.—1. A blank formed of paper or analogous material for producing when folded a receptacle B, the blank having beveled edges *p*, extending at corresponding or substantially corresponding angles from near the ends of the blank toward the transverse line of its longitudinal center, and severed short of such center, and at both sides thereof, to produce, when the blank is folded upon itself at or near the said transverse line, a short base *r*, tapering toward its bottom, substantially as described.

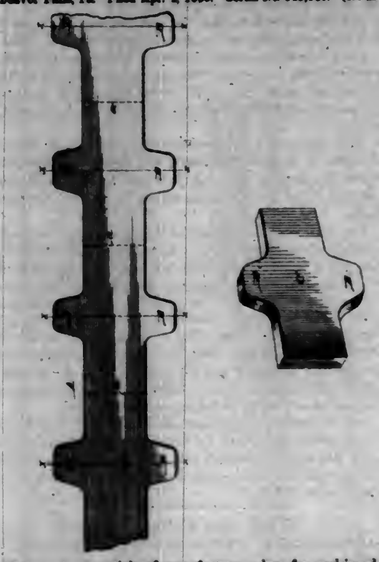
2. A blank formed of paper or analogous material for producing when folded a receptacle B, the blank having beveled edges *p*, extending at corresponding or substantially corresponding angles from near the ends of the blank toward the transverse line of its longitudinal center, and cut away short of such center, and at both sides thereof, thereby producing edges *q*, to afford, when the blank is folded upon itself at or near the said transverse line, a short base *r*, tapering toward its bottom, substantially as described.

3. A blank A, for producing when folded a receptacle B, and comprising paper or analogous material having beveled edges *p*, extending at corresponding or substantially corresponding angles from near its ends toward the transverse line of its longitudinal center, and cut away short of such center, and at both sides thereof, thereby producing the beveled edges *q*, to afford, when the blank is folded upon itself at or near the said transverse line, a short base *r*, tapering toward its bottom, and lines or creases *y*, extending from the edges *q*, in the diverging directions of the latter to the ends of the blank, substantially as described.

4. A receptacle B for cigars, formed of paper or analogous material and having a short tapering base *r*, sides flaring from the said base to the mouth of the receptacle at angles more acute with reference to the longitudinal center of the receptacle than the sides of the tapering base, and stiff flaring edge sections *p'* narrower than the adjacent flaring sides, substantially as described.

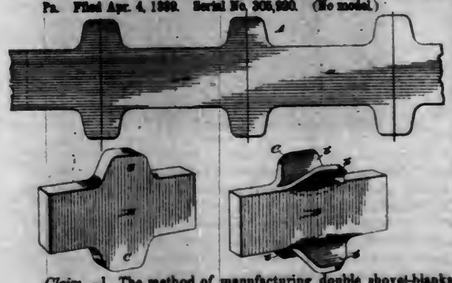
5. A receptacle B for cigars, formed of paper or analogous material and having a short tapering base *r*, open at its opposite ends, sides flaring from the said base to the mouth of the receptacle at angles more acute with reference to the longitudinal center of the receptacle than the sides of the tapering base, and stiff flaring edge sections *p'* narrower than the adjacent flaring sides and extending from the plane of the top of the base *r* toward the mouth of the receptacle, substantially as described.

405,414. THILL-COUPLING. ARTHUR HOMEWOOD, Wilmington, Del., assignor of one-half to William S. Haines, same place. Filed Mar. 13, 1889. Serial No. 303,099. (No model.)



Claim.—1. The combination of the bearing-arms adapted to support the thill-iron, the cap pivoted to said bearing-arms and adapted to engage over the thill-iron, and the locking-levers pivoted to the outer ends of the bearing-arms and engaging the front end of the cap, as set forth.

2. The combination of the bearing-arms having notches in their upper edges, the thill-iron provided with a transverse pin having its ends engaging said notches, the cap pivoted to the bearing-arms and provided with notches engaging the ends of the said transverse pin and having horizontal recesses in its front edges, and the locking-levers pivoted on the front ends of the bearing-arms and engaging the horizontal recesses in the front edges of the cap, as set forth.



3. The improved thill-coupling consisting of the following elements in combination: the bearing-arms E, having notches F in their upper edges, the thill-iron provided with a transverse pin D, engaging said notches, the cap pivoted to the bearing-arms and having the depending arms I, provided in their lower edges with the notches J, engaging the ends of the pin D, and in their front edges with the recesses N, and the locking-levers pivoted on the upper sides of the bearing-arms at the front ends of the same, engaging the recesses N and passing rearward alongside the arms I, as set forth.

405,415. BAR FOR THE MANUFACTURE OF SHOVEL-BLANKS. JAMES J. JOHNSTON, Columbiana, Ohio, assignor to Henry M. Myers, Beaver Falls, Pa. Filed Apr. 4, 1889. Serial No. 305,919. (No model.)

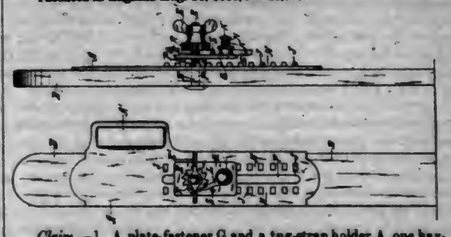
Claim.—As an article of manufacture, a bar for making double shovel-blanks, said bar having projections on its edges opposite each other, and the distance between the centers or lines *x* of said projections being about equal to the width of a shovel-blade, substantially as described.

405,416. METHOD OF MAKING SHOVEL-BLANKS. JAMES J. JOHNSTON, Columbiana, Ohio, assignor to Henry M. Myers, Beaver Falls, Pa. Filed Apr. 4, 1889. Serial No. 305,920. (No model.)

Claim.—1. The method of manufacturing double shovel-blanks to the shearing-point, which consists in producing a bar with projections on its edges opposite each other, severing the bar between the projections into sections of a length about equal to the width of a shovel-blade, reducing the sections by rolling them into double shovel-blanks, then severing the double blanks transversely, and finally pointing each single blank separately, substantially as described.

2. The method of manufacturing double shovel-blanks, which consists in severing sections from a bar having projections on its edges opposite each other, splitting the projections, reducing the sections by rolling them in the direction of the projections and forming double shovel-blanks, then severing the double blanks transversely, and finally pointing each blank separately, substantially as described.

405,417. METHOD OF MAKING HAT-SWEATS. CHARLES E. KEATOR, Brooklyn, N. Y. Filed Feb. 28, 1889. Serial No. 300,983. (No model.)



Claim.—1. The mode herein described of making a hat-sweat of the proper size, said mode consisting in laying the sweat around a former of the desired size, with the ends of the sweat lying over each other, and cutting one end of the sweat upon the said former, all substantially as set forth.

2. The mode herein described of making a hat-sweat of the proper size, said mode consisting in laying the sweat around the former of the desired size, with the ends of the sweat overlying each other, and cutting both ends of the sweat upon the said former, all substantially as set forth.

3. The mode herein described of making a hat-sweat of the proper size, said mode consisting in laying the sweat around a former of the desired size, with one end overlying the other, and then cutting both the overlying ends upon a zigzag line upon the said former, all substantially as specified.

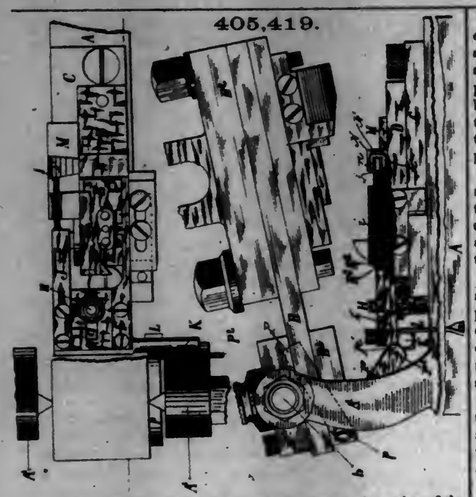
405,418. TUG-STRAP HOLDER FOR LOOMS. THOMAS KNUBLEY, Sarnia, Ontario, Canada, assignor of one-half to George H. Matheson, same place. Filed Sept. 27, 1888. Serial No. 286,523. (No model.) Patented in England Aug. 20, 1888, No. 11,990.

Claim.—1. A plate-fastener G and a tug-strap holder A, one having recesses H and the other projections P, fitted loosely to said recesses, in combination with means for clamping them together and to the side of a picking-stick, as and for the purpose set forth.

2. The stud or flange S, in combination with the plate-fastener G, pin or bolt K, having head or shoulder K', spring N, dog L, thumb-nut E', ratchet R, and bolt E, as and for the purpose set forth.

3. A plate-fastener G and a tug-strap holder A, one having recesses H and the other projections P, fitted loosely to said recesses, in combination with a picking-stick and means for clamping them together and to the side of the picking-stick, as and for the purpose set forth.

4. A plate-fastener G and a tug-strap holder A, one having recesses H and the other projections P, fitted loosely to said recesses, in combination with a ratchet R, thumb-nut E', bolt E, picking-stick D, dog L, spring N, pin K, formed with shoulder K', and stud or flange S, as and for the purpose set forth.



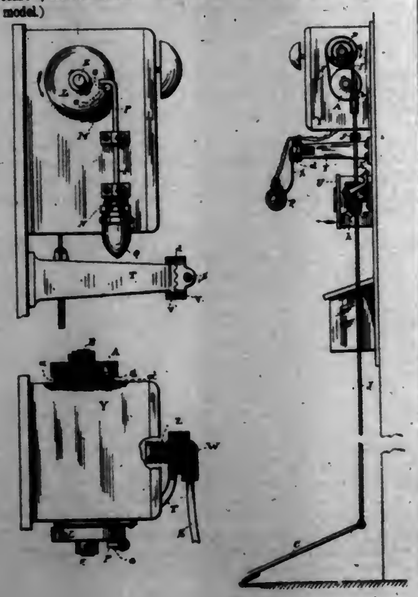
405,419. TYPE-CASTING MOLD. HENRY KLEBS, Chicago, Ill., assignor to Barnhart Bros. & Spindler, same place. Filed Sept. 7, 1888. Serial No. 284,792. (No model.)

Claim.—1. In a mold for casting type, in combination with the fixed member of the mold, and a bar reciprocating therein having its forward end constituting part of the type-body-forming face of the mold, an arm actuated by the arm which carries the oscillating member of the mold and actuating said reciprocating bar, substantially as and for the purpose set forth.

2. In a mold for casting type, in combination with the fixed member of the mold, and a bar reciprocating therein having its forward end constituting part of the type-body-forming face of the mold, an arm actuated by the arm which carries the oscillating member of the mold and actuating said reciprocating bar, and a spring reacting against the bar to resist its forward thrust, substantially as set forth.

3. In a mold for casting type, in combination with the fixed member of the mold, and a bar reciprocating therein having its forward end constituting part of the type-body-forming face of the mold, an arm connected to the arm which carries the oscillating member of the mold and engaging the reciprocating bar, the connection of said

405,419.



arm to the oscillating member being such as to permit motion of the arm thereat, whereby it may be moved aside at will to prevent its engagement with the reciprocating bar, substantially as set forth.

4. In a mold for casting mortised type, in combination with the carriage and body secured thereon having a fixed core, and a reciprocating bar underneath the core having its forward end constituting part of the type-body-forming face of the mold, an arm actuated by the arm which carries the upper member of the mold and actuating the reciprocating bar, and a spring reacting against the bar to resist its forward thrust, substantially as and for the purpose set forth.

5. In combination with the carriage and the body having the fixed core, the reciprocating bars I and J, the former lying underneath the core, the latter projecting through the vertical wall of the jet-block, said reciprocating bars being rigidly united at the rear end, and a laterally-projecting arm K, rigid with them both, the arm P, actuated by the arm which carries the upper member of the mold and contacting the arm K, and a spring L, reacting against said arm on the opposite side from the contact of the lever P, substantially as and for the purpose set forth.

405,420. ATTACHMENT FOR TELEPHONES. HERMANN KOHLOW, Cleveland, Ohio. Filed Jan. 7, 1889. Serial No. 295,711. (No model.)

Claim.—1. The combination, with a telephone, the pulley A, secured to the shaft of the magneto-bell, the pulley D, and disk L, of a shaft transversing the said bell-casing, a flexible band connecting the said pulleys, a treadle having a rod and flexible attachment with the pulley D, the disk L being arranged to control the movements of the button M and provided with means to lift the lever N, a weight Q to depress said lever, and a spring on the magneto-bell shaft to raise the treadle, constructed and arranged substantially as and for the purpose described.

2. In a telephone apparatus, the combination, with a connecting-rod, of a treadle for turning the shaft of a telephone magneto-bell, the guide *e* for said rod, the hook *h*, hinged to said guide, and the spring *j*, bearing upon said hook, and a collar attached to said rod to arrest the movement of said treadle, constructed and arranged substantially as and for the purpose specified.

3. In telephone attachments, the combination of the pulleys A and D, a band connecting said pulleys, a volute spring G within the pulley A and attached to the shaft thereof, a band I on the extension of the pulley D, for connection with the rod of a treadle, a collar *f* on said rod, the guide *e* for said rod, and the hook *h*, arranged in relation to said collar, for the purpose described, and substantially as shown.

4. With a telephone, the combination of the knob M, rod P, and revoluble disk L, the inner face side of said disk arranged to receive and depress the knob M, the outer face side provided with a lug O to lift the rod P and lever N, in the manner as and for the purpose described.

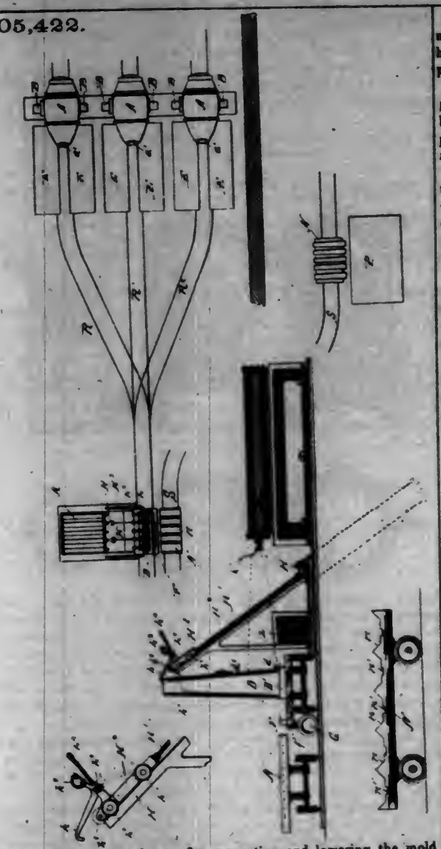
5. The combination, at the side of the telephone, of the knob M, rod P, and disk L, said disk having a tapering depression in the inner face side, and a lug projecting from the outer face side thereof to operate simultaneously in depressing the knob M and lifting the rod P of the lever N, substantially in the manner as described and shown.

6. With a telephone, the combination of the shaft B, the pulley A, pulley D, and treadle C, the pulley A being secured to the shaft B and the treadle C to an extension H of pulley D, the pulleys A and D connected with a band F and the pulley H with the treadle by means of the band I and rod J, constructed and arranged substantially in the manner as set forth, and for the purpose specified.

7. In combination with the shaft B, the pulleys A D, with bands F and I, connected to a treadle for turning said shaft, and a spring attached to said shaft and the side of a telephone for reverse rotation of said shaft, constructed and arranged substantially as described, and for the purpose set forth.

405,421. WATER-PROOF MATERIAL FOR COATS. JAMES W. LANE, New York, N. Y. Filed Dec. 15, 1888. Serial No. 293,721. (No model.)

Claim.—1. An improved material for articles of clothing, consisting of a textile fabric having raised figures or ribs on one side and a smooth surface on the other side and a coating of rubber on the smooth side, substantially as set forth.



2. An improved material for articles of clothing, consisting of a textile fabric having raised figures or ribs on one side intersecting one another and a smooth surface on the other side and a coating of rubber on the smooth side, substantially as set forth.

405,422. APPARATUS FOR THE MANUFACTURE OF STEEL. CROMLEY LAW and CHARLES R. HOWE, South Chicago, assignors of one-tenth to Enoch Ward, Chicago, Ill. Filed Dec. 18, 1888. Serial No. 293,867. (No model.)

Claim.—1. The combination, with a rotary converter, of fixed or stationary supports upon and between which it swings, a mold-car carrying a series of molds, and a fixed track for said car extending between said supports and under said converter, and a bowl or funnel C, said bowl or funnel being mounted on an adjustable carriage, and a platform upon which said funnel-carriage travels extending above and parallel to said track, substantially as specified.

2. The combination, with a car having a pivoted mold mounted

405,422.

thereon, of an inclined ram for supporting and lowering the mold into a horizontal position, a support L for the mold to rest upon, and inclined guides for the piston of said ram, substantially as specified.

3. The combination of a converter, a mold-car having a series of molds mounted thereon, a mold-car track extending from the converter to a stripping-plant, and a stripping-plant consisting of an inclined ram furnished with a grappling device for tilting the molds into a horizontal position and a horizontal ram for pushing the ingots out of the molds, substantially as specified.

4. The combination of a converter, a mold-car having a series of molds mounted thereon, a mold-car track extending from the converter to a stripping-plant, consisting of an inclined ram furnished with a grappling device for tilting the molds into a horizontal position, and a horizontal ram for pushing the ingots out of the molds, said molds being hinged or pivoted to the mold-car, substantially as specified.

5. The combination, with a car having a series of pivoted molds mounted thereon, of a pair of inclined hydraulic rams, a cross-head connecting the same, whereby the whole series of said molds may be simultaneously lowered, and inclined guides for said cross-head to travel on, said cross-head being furnished with grappling devices to engage said molds, substantially as specified.

6. The combination, with a mold-car having a series of molds mounted thereon, of an inclined ram H, having a grappling device, and a horizontal ram K, substantially as specified.

7. The combination, with a mold-car having a series of molds mounted thereon, of an inclined ram H, having a grappling device, a horizontal ram K, and a support L, said molds having holding notches or projections *d* to engage said support, substantially as specified.

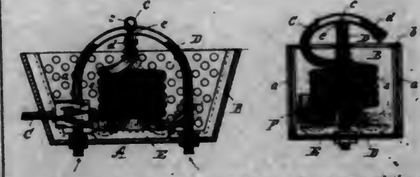
8. The combination, with a mold-car having a series of molds mounted thereon, of an inclined ram H, having a grappling device, and a horizontal ram K, a track upon which said mold-car travels, and a second track adjacent thereto for another car, so that the act of pushing the ingots out of the molds will deliver the same upon said car, substantially as specified.

9. The combination, with a car having a series of pivoted molds mounted thereon, of an inclined ram having a piston furnished with a hook or grappling device at its upper end adapted to engage the upper end of the mold, substantially as specified.

10. The combination, with a car having a series of pivoted molds mounted thereon, of an inclined ram having a piston furnished with a hook or grappling device at its upper end adapted to engage the upper end of the mold, and inclined guides for said piston, substantially as specified.

11. The combination, with a car having a pivoted mold mounted thereon, of an inclined ram for supporting and gradually lowering the mold in a horizontal position, and a support L for the mold to rest upon, said mold having a holding notch or projection adapted to engage said support, and a horizontal ingot-extractor ram, substantially as specified.

12. The combination, with a car having a series of pivoted molds mounted thereon, of a pair of inclined hydraulic rams, and a cross-head connecting the same, whereby the whole series of said molds may be simultaneously lowered, said cross-head being furnished with hooks or grappling devices, substantially as specified.



13. The combination, with a car having a series of pivoted molds mounted thereon, of a pair of inclined hydraulic rams, a cross-head connecting the same, whereby the whole series of said molds may be simultaneously lowered, said cross-head being furnished with hooks or grappling devices, and inclined guides for said cross-head to travel on, substantially as specified.

14. The combination of converter A, platform E, bowl or funnel C, its carriage C' and track *c'* on said platform E, mold-car F and molds D mounted thereon, and hydraulic ram G, having piston G' furnished with coupling-head *g*, substantially as specified.

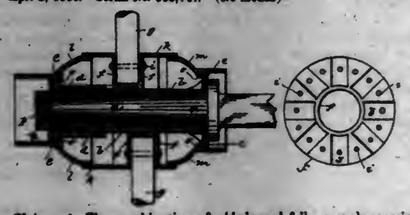
15. The combination of a converter, a mold-car having a series of molds mounted thereon, a mold-car track extending from the converter to a stripping-plant, and a stripping-plant consisting of an inclined ram furnished with a grappling device for tilting the mold into a horizontal position and a horizontal ram for pushing the ingots out of the molds, and a furnace-car and furnace-track adjacent to said stripping-plant, said horizontal ram operating to push the ingot out of the mold and onto the furnace-car, substantially as specified.

16. The combination of a converter, a mold-car having a series of molds mounted thereon, a mold-car track extending from the converter to a stripping-plant consisting of an inclined ram furnished with a grappling device for tilting the molds into a horizontal position and a horizontal ram for pushing the ingots out of the molds, said molds being hinged or pivoted to the mold-car, and a furnace-car and furnace-track adjacent to said stripping-plant, said horizontal ram operating to push the ingot out of the mold and onto the furnace-car, substantially as specified.

405,423. HYDROCARBON-HEATER. LEVI W. LOMBARD, Boston, Mass., assignor to the Petroleum Fuel Company, of Maine. Filed Mar. 12, 1888. Serial No. 303,007. (No model.)

Claim.—1. A hydrocarbon vaporizer and burner consisting of a combustion-chamber, a coiled vaporizing-pipe therein terminating in a curved end portion and provided with a delivery-orifice located some distance from the end of said pipe and in a plane above its termination, and an air-supply pipe, substantially as and for purposes herein specified.

2. A hydrocarbon vaporizer and burner consisting of a perforated combustion-chamber, a coiled vaporizing-pipe with a bent terminal having a fuel-orifice transversely of its bore and located at some distance from the extreme end of said pipe and in a plane above it, an air-supply pipe open at both ends, and with an aperture aligned with the fuel-orifice to permit fuel to pass directly across the bore of the air-pipe, all operating substantially as herein described.



3. In combination with a stove, a removable foraminated chamber B, a liquid-fuel feed-pipe C, terminating in a helix within said chamber, a heater F, and an air-supply pipe D, both within said chamber, said pipes C and D being provided with apertures *b c*, arranged in alignment and the aperture in the liquid-fuel pipe being above the end thereof, substantially as set forth.

4. In combination with a heating or cooking apparatus, a combustion chamber or box B, provided with foraminated removable sides and top, a heater F therein, a fuel-supply pipe C, connected with said

heater, and the coil *a*, terminating in a bend, the supply-orifice *c* in the top of said bend, the air-supply pipe D, with its transverse aperture *e*, the orifice *c* being above the end of pipe C, substantially as described.

5. In combination with a heat or steam generating apparatus, a foraminated combustion-chamber B, a fuel feed-pipe C, terminating in a helix within said chamber, a heater F, and air-supply pipes D, both within said chamber, said pipes terminating at their upper ends at a point adjacent to but to one side of the fuel-pipe C, and the delivery fuel-orifice *c*, transversely of the fuel-pipe and in alignment with the space between the ends of said air-pipes, substantially as herein described.

405,424. VEHICLE-WHEEL. JOHN B. LOTT, Kittanning, Pa. Filed Apr. 2, 1889. Serial No. 305,747. (No model.)

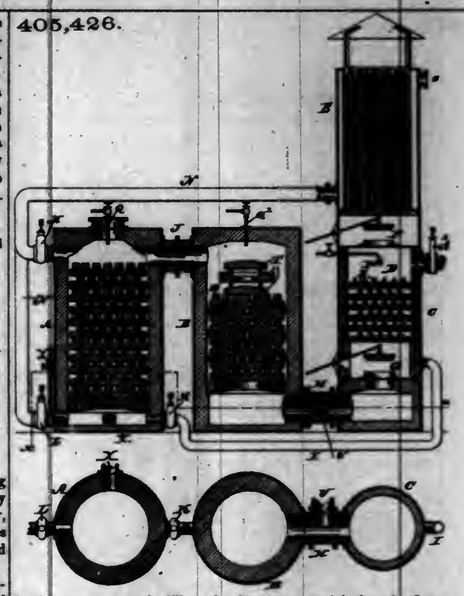
Claim.—1. The combination of a U-shaped felly, a spoke passing through the same, a wedge or cap shaped piece fitted within the felly on a plane below the edges thereof, a rivet which unites the felly, spoke, and cap-shaped piece together, and a tire having the recesses or grooves in its edges which receive the edges of the tire, all arranged and combined substantially as described.

2. The combination of a U-shaped felly, a spoke having a longitudinally-divided end passing through the felly, and a fixed piece fitted between the divided ends of the spoke within the felly, substantially as described.

3. In combination with the felly *r*, the tubular spokes *g*, projecting into the same, the wedge-shaped piece *i*, and divided end *y* of the spoke *g*, and the bolt or rivet *h*, as and for the purpose described.

405,425. BARREL-BUNG. JOHN LOURIN, West Bay City, Mich. Filed Nov. 15, 1888. Serial No. 290,868. (No model.)

Claim.—1. In a barrel-bung, the combination, with the bushing *a*, having the tapering portion *c*, and the flange *d*, provided with the groove *f* and the lug *e*, of the packing-ring *g* within the groove, the cover *m*, secured by the pivot *p* to the lug *e* and provided with the incline *q* and the stop *t*, and the portion *s*, projecting upwardly from the said flange *d* and provided with the hook *r*, engaging with the said incline *q*, substantially as set forth.

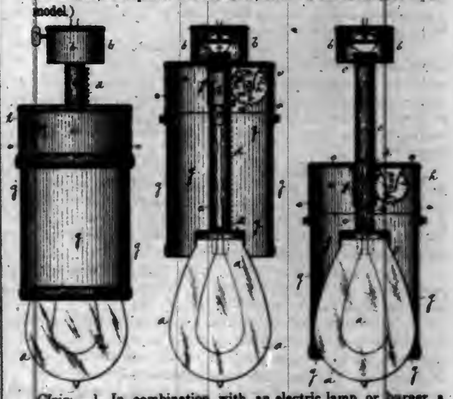


2. The combination, in a barrel-bung, of the bushing *a*, having in its central opening a seat *h* and the lower tapering portion *c*, and provided with a flange *d*, having the groove *f* and packing-ring *g*, the cover *m*, pivotally secured to the upper side of the flange *d*, with the perforated cover *i* upon the said seat *h*, and with one edge hinged to the bushing *a*, substantially as set forth.

405,426. APPARATUS FOR THE MANUFACTURE OF HYDROCARBON GAS. LEWIS P. LOWE, Lynn, Mass. Filed Apr. 4, 1888. Serial No. 269,603. (No model.)

Claim.—1. In an apparatus for manufacturing hydrocarbon gas, the combination of the chambers A B, lined with refractory material each having a filling of open-work refractory material and the chamber A having an outlet *x* in its base, the flue J, connecting said chambers above said refractory filling, the air-blast pipe L, with an injected oil-pipe having the valve Y, said pipe L entering the base of the chamber A, the stack C, with upward continuation E, with interior tubes and an air-opening O, the said stack C connected to chamber B by the tube H below the refractory filling of said stack and chamber, the spray water-pipe P, leading into stack C above the bars Z therein, and the hydrocarbon-pipe Q', leading into chamber B at the top thereof, substantially as and for the purpose set forth.

2. In an apparatus for manufacturing hydrocarbon gas, the combination of the chambers A B, lined with refractory material and each



405,426.

having an open-work filling of refractory material, the tube J, connecting said chambers above said filling, the stack C, with top and bottom valves F and G and filling-bars Z, the tube H, connecting chamber B and stack C below said fillings and having side outlet U, the water-spray pipe P, leading in stack C above said bars Z, the pipe I, leading from the stack C below said bars Z to the base of said chamber A, and the hydrocarbon-pipes Q', leading into top of said chamber B', substantially as and for the purpose set forth.

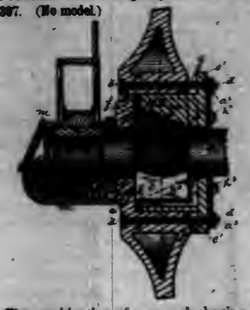
3. In an apparatus for manufacturing hydrocarbon gas, the combination of the chambers A and B with refractory linings, coal filling in chamber A and refractory open filling in chamber B, the connecting-tube J, the stack C, with continuation E, having air-opening O, the hot-air-blast pipe N, with valve M, leading into top of chamber A, the air-blast pipe L, with valve at base of chamber A, the tube H, connecting the chamber B and the stack C below their fillings of open-work refractory material and having the outlet U, and the pipe I, leading from stack C to base of chamber A, substantially as and for the purpose set forth.

405,427. SHEATH FOR REGULATING LIGHT FROM ELECTRIC LAMPS. WILLIAM H. MELANEY, Pittsburg, Pa., assignor of one-half to R. C. Totten, same place. Filed Dec. 12, 1887. Serial No. 257,547. (No model.)

Claim.—1. In combination with an electric lamp or burner, a substantially opaque sheath surrounding and longitudinally adjustable over the lamp, substantially as and for the purposes set forth.

2. In combination with an electric lamp or burner, a tubular extension secured thereto, and a substantially opaque sheath mounted

on said extension and surrounding and longitudinally adjustable over said lamp, substantially as and for the purposes set forth.



3. In combination with an electric lamp or burner, a tube or extension secured thereto and having a rack-face thereon, a sheath mounted on said extension and surrounding said lamp, and a pinion carried by said sheath and engaging with said rack, substantially as and for the purposes set forth.

4. In combination with an electric lamp or burner, a tube or extension secured thereto, and a sheath mounted on said extension and surrounding the lamp, and having a spring-lip or friction device adapted to hold the sheath in any desired position, substantially as set forth.

5. In combination with an electric lamp or burner, a substantially opaque sheath surrounding and longitudinally adjustable over the lamp, and a shade or reflector carried by and at the base of the sheath, substantially as and for the purposes set forth.

6. In combination with the electric lamp *a*, the tube or extension *e*, having the rack *d*, the sheath mounted on said tube and having the tubular extension *f*, provided with the spring-lip *l*, and the pinion engaging said rack, substantially as and for the purposes set forth.

405,428. CAR-AXLE. WILLIAM H. MELANEY, Pittsburg, assignor of one-half to Robert C. Totten, Allegheny, Pa. Filed July 9, 1888. Serial No. 279,267. (No model.)

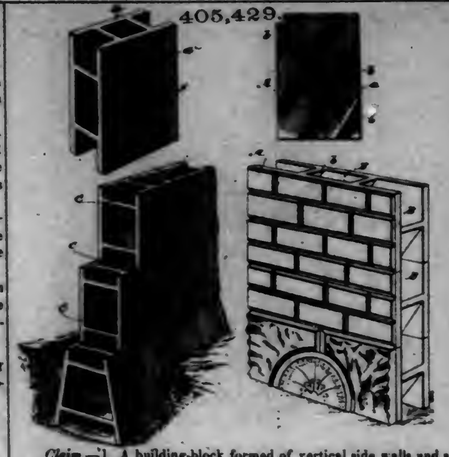
Claim.—1. The combination of a car-axle having a bulb or ball journal with a wheel mounted thereon, bearing-chucks corresponding in shape to and fitting around said bulb-journal, and a sleeve or follower secured to the wheel and holding said chucks in position, substantially as and for the purposes set forth.

2. The combination of a car-axle having a bulb or ball journal with a wheel mounted thereon, bearing-chucks corresponding in shape to and fitting around said journal and having wedge-faces on their outer sides, and a sleeve or follower secured to the wheel and holding said chucks in position, and provided with corresponding wedge-faces, whereby said chucks can be adjusted on said bearing, substantially as and for the purposes set forth.

3. The combination of the car-axle having the bulb-journal *a'* and shoulders a^2 at each end thereof, with the wheel mounted thereon, the bearing-chucks corresponding in shape to and fitting around the bulb and having end faces b^2, and the sleeve or follower secured to the wheel and holding said chucks in position, substantially as and for the purposes set forth.

4. The combination of the axle having the bulb-journal *a'*, with a wheel mounted thereon, the chucks *b*, having the wings *b'* and inclined faces b^3, the sleeve or follower *c*, having the seats c^2, and the projecting inclined faces c^3, adapted, respectively, to hold the said wings and press against said inclined faces, substantially as and for the purposes set forth.

5. The combination of the axle, the wheel-body having lugs *i*, the sleeve or follower *c*, having the flange *c'*, provided with seats c^2, the chucks *b*, bolts *d*, and nuts d^2, for tightening said chucks, substantially as and for the purposes set forth.



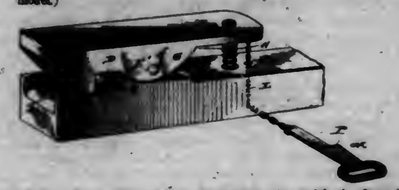
6. The combination, with a wheel having the bearing-chucks *b*, of the oil port or ports *e*, leading into the spaces *c'* between the chucks *b*, substantially as and for the purposes set forth.

7. The combination, with a wheel having the bearing-chucks *b*, of the oil port or ports *e*, leading into the spaces *c'* between the chucks *b*, and the annular oil-space *k*, substantially as and for the purposes set forth.

8. The combination, with an axle having a bulb-journal, a wheel mounted thereon, and the sleeve or follower *c*, of a locking-plate *h*, having projections *h'* and depressions h^2 secured to the flange *c'* by set-screws h^3, fitting in slots h^4 and adapted to move therein, and the nuts d^2, substantially as and for the purposes set forth.

405,429. BUILDING-BLOCK. JOHN A. MIRON, New Orleans, La. Filed Mar. 21, 1889. Serial No. 304,236. (No model.)

405,429.

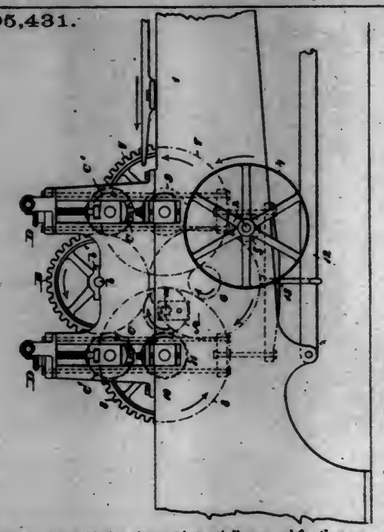


Claim.—1. A building-block formed of vertical side walls and a series of parallel inclined chambers, substantially as shown and described.

2. A building-block formed of parallel side walls and transverse parallel diagonally-arranged partitions made integral with said side walls, and forming inclined parallel chambers, substantially as shown and described.

3. As a new article of manufacture, a building-block constructed of clay, metal, or other desired material, formed of parallel side walls and transverse diagonal partitions cast integral therewith, said partitions forming parallel diagonally-disposed chambers opening in the sides and ends of said block, substantially as and for the purpose specified.

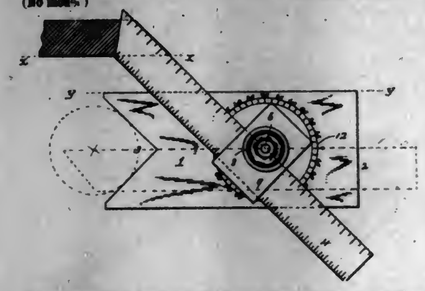
405,430. CAR-COUPLING. J. CEYLON PEARLEE and FRED W. BEAVAN, Hudson, N. Y. Filed Apr. 24, 1889. Serial No. 308,426. (No model.)



Claim.—In a car-coupling, the combination, with the draw-head having its forward end recessed and shouldered and provided with the fulcrum, of the coupling-jaw pivoted to the draw-head and having its forward end beveled and provided with a shoulder on its under side, the said jaw also having a recess to form depending flanges, which are perforated, the coupling-bolt connecting the jaw to the draw-head, the spring-surrounded rod connecting the rear end of said jaw to the draw-head, the loop-bracket, and the shouldered key passing through said bracket and connected with the rear frame of the pivoted jaw by means of a chain passing through an aperture in the draw-head, substantially as specified.

405,431. PLANING MACHINERY. LAURENCE POWER, Philadelphia, Pa., assignor to L. Power & Co., same place. Filed June 6, 1888. Serial No. 276,236. (No model.)

Claim.—1. In a feeding mechanism for planing machinery, the frame-work, the driving-gear, the train of gearing operated thereby, the lower feed-rolls operated by said gearing, the upper feed-rolls vertically adjustable in the frame, the gear-wheels carried by said upper feed-rolls, and the shaft mounted rigidly in the frame, carrying gear-wheels which mesh with the gear-wheels of the upper feed-rolls and operating the same, all arranged and operating substantially in the manner and for the purpose described.



2. The frame-work 1, with driving-shaft journaled therein, in combination with the train of gearing 5, 6, 7, and 8, the lower feed-rolls 9 and 10 on the shafts of said gears 7 and 8, the upper feed-rolls C C, with gear-wheels C C on the shafts thereof, the shaft *b*, with gear-wheels B thereon meshing with gear-wheels C C, said shaft *b* and shafts of lower feed-rolls being journaled in fixed bearings in the frame-work of the device, and the shafts of the upper feed-rolls having

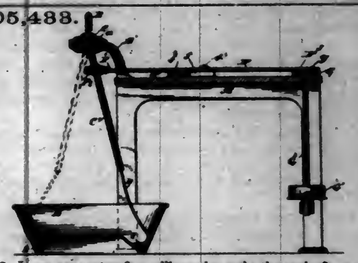
405,431.

vertically-adjustable bearings, substantially as and for the purpose set forth.

405,432. CENTER-SQUARE, BEVEL, AND PROTRACTOR. WALLACE R. PRATT, Boston, Mass. Filed Apr. 15, 1889. Serial No. 307,328. (No model.)

Claim.—1. As a new article of manufacture, a try and bevel square composed of a stock formed with an internal right angle at one end, a graduated circle inscribed upon its upper surface having its center coincident with the central longitudinal axis of the stock, a pivotal blade thereon, and the clamping mechanism, as described, the reading-edge of the blade and the locking-bolt coinciding with the center of the graduated circle, substantially as herein set forth.

2. In combination with the stock of a bevel inscribed with a graduated circle centered upon the longitudinal central axis of said stock, the bolt slotted to its center transversely of said stock, the pivotal clamp-plate, and the blade moving axially with said bolt, the center of the bolt, the bottom of the bolt-slot, and the reading-edge of the blade all coinciding with the center of the graduated circle, substantially as and for purposes specified.



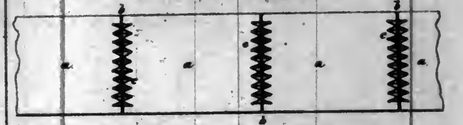
3. In a bevel and try square, the interiorly right-angled stock 1, the graduated circle 12 thereon, the transverse bolt 6, slotted at 7, and the clamp-plate 9 axially thereof, with its slot 10, combined with a blade 4, which engages said slots 7 10, movable axially and transversely through said bolt and held by the thumb-nut 8, substantially as herein stated.

405,438. ROD-COILING APPARATUS. ALFRED REBHAHN, Cleveland, Ohio. Filed Feb. 23, 1889. Serial No. 300,980. (No model.)

Claim.—1. A wire-rod-coiling machine consisting, in combination, of the main frame A, the block *f* on the main frame, the vibrating arm F, in connection with said block *f*, and attached at its front end to the distributer C, provided with the joint C, the opposite end being secured to disk G or its equivalent, the receptacle E, having a slot *h*, and means for operating said machine, substantially as shown.

2. In an apparatus for coiling wire rods, the receptacle E, provided with a slot *h* and having its bottom elevated toward its center, substantially as shown.

405,433.

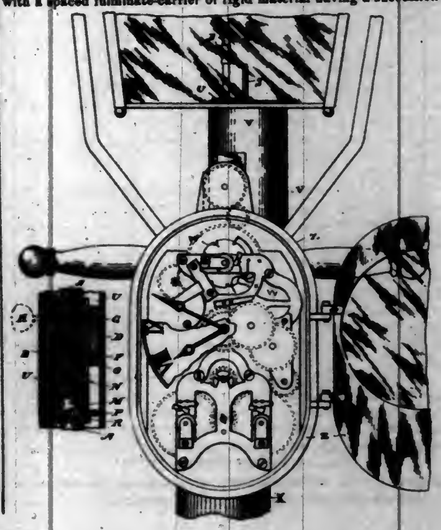


3. In an apparatus for coiling wire rods, the main frame A, provided with the overhanging arm A', having a bearing adapted to support the distributer C, in combination with the pivotal block *f* and the vibrating arm F, and means for operating said arm, substantially as shown.

4. In an apparatus for coiling wire rods, the vibrating arm F, pivoted to the sliding block *f* on the main frame A, substantially as shown.

5. The combination, in a wire-rod-coiling machine, of the distributer C, having a hollow ball-joint C, with the vibrating arm F pivoted to the sliding block *f*, substantially as shown.

6. The combination, in a wire-rod-coiling machine, of the coil-receptacle E, provided with a slot *h* and having its bottom elevated toward its center, with the distributer C and means for rotating said distributer, consisting of the vibrating arm F, pivoted to the sliding block *f*, and the crank-disk G or its equivalent, substantially as shown.



405,434. BELTING. CHARLES A. SCHIEREN, Brooklyn, N. Y. Filed Dec. 10, 1888. Serial No. 293,073. (No model.)

Claim.—The herein-described belt, composed of a series of singly-ply sections of selected leather having abutting ends and transverse continuous wire-stitching uniting said butt joints or ends, whereby longitudinal strains upon the belt are transmitted and equalized transversely throughout the width of the joints, substantially as described.

405,435. AUTOMATIC GAS LIGHTING AND EXTINGUISHING APPARATUS. NATHANIEL H. SHAW, Somerville, and AI R. SHAW, Medford, Mass.; said Nathaniel H. Shaw assignor to the American Automatic Gas Lighting Company, Portland, Me. Filed Aug. 31, 1888. Serial No. 284,249. (No model.)

Claim.—1. The combination of the gas-burner and rotary cock with a spaced fulminate-carrier of rigid material having a succession

405,435.

of fulminate charges permanently attached thereto, an igniting device, and a time mechanism for automatically actuating them, substantially as set forth.

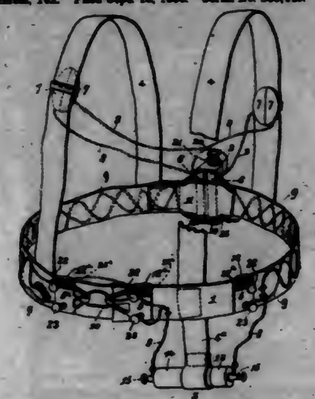
2. The combination of the gas-burner, rotary cock, and time mechanism, with a solidly-filled fulminate-carrier having spaced pits, and the explosive compound permanently fixed therein, and an igniting device, substantially as and for the purpose set forth.

3. The combination of the gas-burner, rotary cock, time mechanism, and hammer, with a rotary carrier having in its face a series of accurately-spaced pits or depressions containing fulminate, substantially as and for the purpose set forth.

4. The combination of the gas-burner, rotary cock, time mechanism, and hammer, with a cylindrical rotary fulminate-carrier provided in its periphery with a succession of pits or depressions to localize the explosive material, substantially as set forth.

5. The combination of the gas-burner, rotary cock, time mechanism, and hammer, with a rotary and longitudinally-movable cylinder having at regular intervals peripheral pits containing fulminate, and with a suitable feed mechanism to bring such pits beneath the hammer, substantially as and for the purpose set forth.

6. The combination of gas-burner, rotary cock, hammer, and time mechanism, with a cylindrical fulminate-carrier having peripheral fulminate charges arranged in succession spirally, and with an automatic feed mechanism having a shaft screw-threaded to correspond in pitch with the spirally-arranged fulminate deposits on said cylinder, substantially as set forth.



7. In an automatic gas-lighting apparatus, the gas-burner and rotary cock, the spark-forming device consisting of a hammer and rotary cylinder having spirally-arranged peripheral pits containing fulminate, a screw-threaded central shaft of corresponding pitch, a slotted tube interposed between said shaft and cylinder, a ratchet and pawl to actuate said tube, and a pin from said cylinder traversing the tube-slot and engaging with said screw-thread, substantially as set forth.

8. In an automatic gas-lighting apparatus, the combination of a suitable spark-forming device with the burner, a secondary gas-jet arranged to discharge a limited amount of gas beside the burner when the spark is formed, and with a rotary cock having double gas-passages, as described and shown, adapted to supply gas to said secondary jet momentarily and to the burner permanently, for the purpose set forth.

9. In an automatic gas-lighting apparatus, substantially as described, the spark-forming devices, the burner, and the rotary cock having double gas-passages, as described and shown, in combination with a secondary gas-pipe having lateral perforations arranged one above another from the spark-point toward the burner, for the purpose set forth.

10. In an automatic gas-lighting apparatus, substantially as described, the spark-forming devices, the burner, and rotary cock, in combination with a secondary lighting-tube and an inclosing-shell adapted to carry the flame upwardly from such tube, substantially as set forth

405,436. ELECTRO-MEDICAL BELT. WILLIAM J. SEELEYE, Columbia, Tex. Filed Sept. 15, 1888. Serial No. 285,469. (No model.)

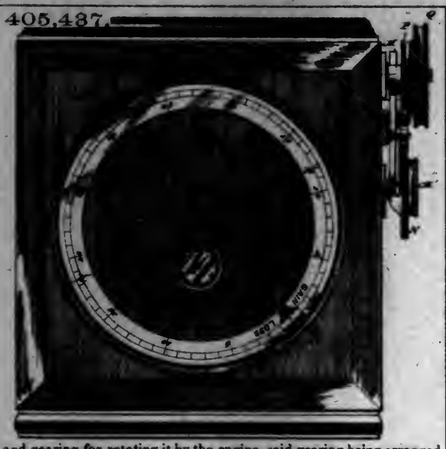
Claim.—1. In an electro-medical appliance, the combination, with a belt or other support, adjustable contact-plates 5 7, distributed over said support and having binding-posts, suitable conductors secured to the appliance, an electric battery, an induction-coil carried by the appliance and connected to the conductors, and conductors running from the secondary wire of the induction-coil and adapted to be connected to the different contact-plates at will, substantially as herein set forth.

2. In an electro-medical appliance, substantially as described, the combination, with the support 1 4, battery 2, sling 4', for supporting said battery, induction-coil 3, having contacts 6, forming a clamp for holding the coil to the support, contact-plates 5 7, secured to the support, and conductors 8 9, connecting the battery with the induction-coil and the induction-coil with the contact-plates, respectively, substantially as shown.

3. In an electro-medical appliance, substantially as described, the combination, with a support, a clasp for securing said support, a battery, a device for imparting a current of electricity to the body, and connection between the battery and said device, said connection including in circuit the clasp for securing the support, whereby the connection is broken when said support is removed, substantially as set forth.

4. In an electro-medical appliance, substantially as described, the combination, with the support, battery and induction coil carried by said support, connection between said battery and induction-coil, contact-plates on the support, conductors running from said induction-coil and adapted to be secured to any and all of the plates, and insulating-covers 11, adapted to insulate the contact-plates from the body and fold back from said plates, as and for the purpose explained.

5. The electric battery to be applied to medical belts, substantially as described, consisting of the correspondingly screw-threaded cylindrical cups 13 14, having binding-screws 15, a cup-shaped electrode 16, secured to one of the cups of the cell, and an elongated electrode 26, secured in the other cup by a binding-post, and having the insulating-knob 27, one of said cups also having a vent-hole 18, closed by a screw-plug 19, all substantially as herein described.



6. In an electro-medical appliance, substantially as herein described, an induction-coil for application to such appliance, consisting of the coil 3, longitudinal insulated contact-plates 6, connected to the secondary wire of the induction-coil and forming a clamp for securing the coil to the appliance, and a movable sleeve 20, having a binding-screw 21, for securing said sleeve at any desirable point, all substantially as hereinbefore described.

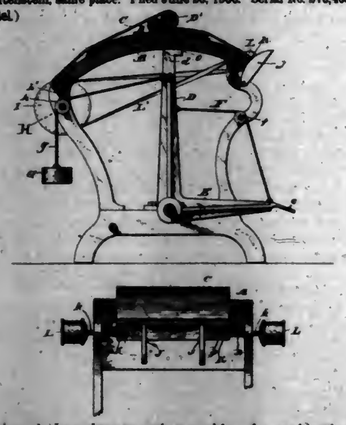
7. In an electro-medical appliance, substantially as described, the combination, with suitable generators and conductors running therefrom, of the metallic plates 5, having binding-screws 22 23, one of said binding-screws on each plate being insulated from the plate and the other making electrical connection therewith, substantially as shown, whereby the insulating-screws may be used for a primary conductor, and the secondary screws may be used to connect the plates as contact-plates to the secondary conductor, substantially as described.

405,437. SPEED-INDICATOR. ALBERT R. SHERMAN, Pawtucket, R. I. Filed Dec. 26, 1888. Serial No. 294,701. (No model.)

Claim.—1. A speed-indicator consisting of the combination, with a time-clock having the usual graduated face and moving index-hands, of an additional or supplemental dial or scale having circular graduations marked thereon and arranged to travel around the clock-dial,

405,437.

and gearing for rotating it by the engine, said gearing being arranged outside the clock mechanism, substantially as described.



2. A speed-indicator consisting of the combination, with a time-clock, of an annular dial surrounding the clock-dial and graduated, as described, and gearing for connecting the annular dial to the engine, substantially as described.

3. The combination, with a time-clock, of an annular dial surrounding the clock-dial, a toothed disk or wheel arranged behind the clock and having a cuff or flange extending around the clock and adjustably connected to the annular dial, and a gearing connecting the toothed disk to the engine, substantially as described.

4. The combination, with the gears of a speed-indicator, of a ratchet-wheel, oscillating arm hung upon the axis of said wheel and provided with segment M' and a pawl, a detent for the ratchet-wheel, and a weight with cord passing over the said segment and over a pulley, substantially as and for the purpose described.

5. The combination, with the clock-frame and the case, of a bolt C, a flanged sleeve D, surrounding the bolt, the washer E, arranged between the clock-frame and the sleeve, and the disk or toothed wheel F, arranged to rotate between the flange of the sleeve and the washer, substantially as described.

405,438. CIGAR-WRAPPING MACHINE. JAMES E. SMITH, New York, N. Y., assignor of two-thirds to Adolph Moonelis and Benjamin Lichtenstein, same place. Filed June 28, 1888. Serial No. 278,465. (No model.)

Claim.—1. In a cigar-wrapping machine, the combination, with a rolling-table and devices for wrapping the wrapper around the bunch, of a retaining device located at one end of said rolling-table, and a rotary header located laterally of said retaining device for finishing one end of a cigar held in said retaining device, substantially as described.

2. In a cigar-wrapping machine, the combination, with a rolling-table, an apron, and a rocking arm carrying a presser-roll, of a retaining device located at one end of the rolling-table, below the latter, for receiving the cigar directly from the apron, and a rotary header arranged laterally of said retaining device for finishing one end of the cigar while it is held in the retaining device, substantially as described.

3. In a cigar-wrapping machine, the combination, with a rolling-table, an apron, and a rocking arm carrying a presser-roll, of a retaining device located at one end of said table for receiving the cigar from the apron, a rotary header normally held in position laterally of said retaining device to finish one end of a cigar, and means for causing said header to recede from the path of the cigar when it is deposited in the retaining device, substantially as described.

4. In a cigar-wrapping machine, the combination, with a rolling-table, an apron, and a rocking arm carrying a presser-roll, of a retaining device located at one end of said table, a rotary header arranged laterally of said retaining device and adapted to be automatically thrown out of the path of the cigar when the latter is discharged from the apron into the retaining device, and mechanism for returning the header in position to act on the end of the cigar while the latter is in the retaining device, substantially as described.

5. In a cigar-wrapping machine, the combination, with a rolling-table, an apron, and a rocking arm carrying a presser-roll, of a retaining device located at one end of said table for receiving the cigar from the apron, a pair of rotary headers supported in juxtaposition to the retaining device, so as to slide laterally off one another when the cigar is deposited in the retaining device, and springs for returning the headers upon the ends of the cigar, substantially as described.

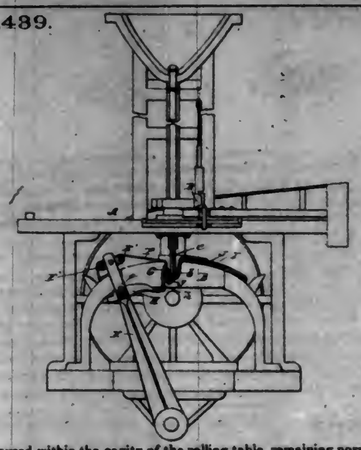
6. In a cigar-wrapping machine, the combination of rolling-table, an apron, a rocking arm carrying a presser-roll, the rotary shafts mounted in bearings to slide endwise therein and each carrying a hollow cone-shaped header at its inner end, and springs for forcing the headers laterally to adjust one of said headers in position to operate on one end of a cigar when the latter is deposited in a retaining device from the rolling-apron, substantially as described.

7. In a cigar-wrapping machine, the combination, with a rolling-table, an apron, and a rocking arm carrying a presser-roll, of a transverse shaft H, adapted to be rotated when the rocking arm moves through connections with the latter, the reciprocating shafts *k*, arranged at one end of the rolling-table and having hollow headers on their inner approximate ends, connections between said shafts and the shaft H for rotating the headers, and springs for moving the shafts *k* and the headers laterally to adjust one of the headers upon one end of the cigar, substantially as described.

8. In a cigar-wrapping machine, the combination, with a rolling-table, an apron, and a rocking arm carrying a presser-roll, of a rotary shaft H, having the pulleys, the reciprocating shafts *k*, arranged at the opposite end of the table from the shaft H, and having pulleys, which are belted to the pulleys of the shaft H, the hollow cone-shaped headers fixed to the inner ends of the shafts *k*, and springs for moving the shafts and headers toward each other, substantially as described.

9. In a cigar-wrapping machine, the combination, with a rolling-table and an apron, of a retaining device located at one end of said table, a rotary header located laterally of said retaining device to act upon one end of a cigar after it has been deposited in the retaining device, and a rocking arm having a presser-roll and adapted to traverse the rolling-table and provided with suitable devices to move the header laterally of the retaining device when said arm approaches the latter to deposit the cigar therein, substantially as described.

10. In a cigar-wrapping machine, the combination of a cigar-rolling table having its upper surface covered continuously with vertical yielding bristles, which terminate a short distance from the front end of said table, a rocking arm carrying a presser-roll, an apron connected to said table and passing over said presser-roll to form a bight at the front end of the table for the reception of the bunch when the arm is at rest in its normal position at the front of the table, a retaining device located at the opposite end of the table, and a rotary header arranged laterally of said retaining device, substantially as described.



405,439. CIGAR-BUNCHING MACHINE. JAMES E. SMITH, New York, N. Y., assignor of two-thirds to Adolph Moonelis and Benjamin Lichtenstein, same place. Filed June 28, 1888. Serial No. 278,466. (No model.)

Claim.—1. In a cigar-bunching machine of the class described, having a movable grip located within a cavity in which the bight of an apron is formed, said grip pressing automatically against the bight in the apron immediately after the filler is deposited therein, and thereby closing the throat or open space in the bight of said apron, substantially as and for the purpose described.

2. In a cigar-bunching machine, the combination, with a rolling-table having a cavity therein, an apron, and a plunger, of a movable grip housed within the cavity of the rolling-table and adapted to press against the bight in the apron immediately after the filler has been deposited therein, substantially as and for the purpose described.

3. In a cigar-bunching machine, the combination, with a rolling-table having a cavity therein, an apron, and a plunger, of a movable

405,439.

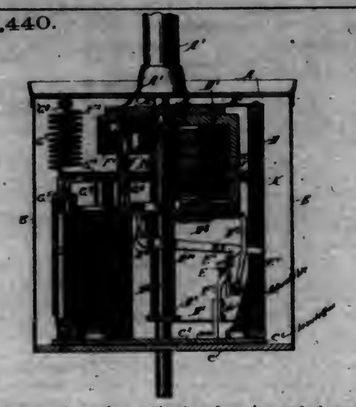
grip housed within the cavity of the rolling-table, remaining normally at rest during the descent of the plunger to deposit the filler on the apron, and devices for automatically forcing the grip against the bight in the apron on the upstroke of the plunger, substantially as and for the purpose described.

4. In a cigar-bunching machine, the combination, with a rolling-table having a cavity therein, an apron, a plunger, and a rocking arm carrying the pressing or bunching rolls, of a movable grip arranged in said cavity and remaining at rest while the plunger descends and deposits a filler in a bight in the apron, and devices operated by the rocking arm for positively moving said grip against the bight in the apron on the upstroke of the plunger, substantially as and for the purpose described.

5. In a cigar-bunching machine, the combination, with a rolling-table having a cavity therein, an apron, and a plunger, of a movable grip housed within the cavity in the rolling-table and having its pivot arranged substantially in the vertical line of movement of the plunger and at a point below the lower limit of the downstroke of said plunger, and devices for holding the body of the grip at rest, out of the path of the plunger, and for closing the grip against the bight in the apron immediately after the filler has been deposited therein, substantially as and for the purpose described.

6. In a cigar-bunching machine, the combination, with a rolling-table having a cavity therein, an apron, and a plunger, of a pivoted grip housed within the cavity of the rolling-table, and a gravity-pawl connected to said grip for opening it, substantially as and for the purpose described.

7. In a cigar-bunching machine, the combination, with a rolling-table, an apron, and a plunger, of a movable pivoted grip housed within the cavity of the rolling-table, and a gravity-pawl connected to the grip and arranged in the path of the rocking arm, to be elevated thereby when said arm is at rest at one end of the table, substantially as and for the purpose described.



8. In a cigar-bunching machine, the combination, with a rolling-table, an apron, and a plunger, of a transversely-curved and pivoted grip located within the cavity of the rolling-table, a gravity-pawl supported on a depending fulcrum-block and connected with the grip, and a rocking arm adapted to raise the gravity-pawl and close the grip, said pawl being pivoted at an immediate point of its length and having the heavy end thereof arranged in the path of a rocking arm, substantially as described.

9. In a cigar-bunching machine, the combination of a rigid rolling-table having a cavity in its middle, and the upper surface thereof at one side of said cavity entirely covered with a continuous series of vertical yielding bristles or projections which provide a compressible yielding surface for the apron to impinge against, an apron connected to the table, a plunger, and a rocking arm carrying the pressing or bunching devices arranged to swing over the cavity and elevate the bight in the apron and filler upon the yielding surface of the rolling-table, substantially as described.

405,440. ELECTRIC-ARC LAMP. ELMER A. SPERRY, Chicago, Ill. Filed Oct. 22, 1883. Serial No. 208,813. (No model.)

Claim.—1. In an arc lamp, the combination of a main-circuit electro-magnet or solenoid with a moving frame on which it is supported, a carbon-rod-clamping device moved by said electro-magnet or solenoid, and a shunt-magnet or solenoid adapted to move said frame.

405,440.

2. In an arc lamp, the combination of a main-circuit electro-magnet or solenoid with a moving frame on which it is supported, a carbon-rod-clamping device moved by said electro-magnet or solenoid, and a shunt-magnet or solenoid adapted to move said frame, said moving frame suspended on spring-bars.

3. In an arc lamp, the combination of a main-circuit electro-magnet or solenoid with a moving frame on which it is supported, a carbon-rod-controlling device moved by said electro-magnet or solenoid, and a derived-circuit electro-magnet or solenoid adapted to move said frame.

4. In an arc lamp, the combination of a moving frame with a main-circuit electro-magnet or solenoid supported on such frame, a carbon-rod clamp actuated thereby, and a lever pivoted at one end and attached toward its other end to an armature of the derived-circuit electro-magnet or solenoid and connected with such frame, so that the movement of the latter is affected by the derived-circuit electro-magnet or solenoid.

5. In an arc lamp, the combination of the moving frame with a main-circuit electro-magnet or solenoid supported thereon, a carbon-rod clamp actuated thereby, and a lever fulcrumed on a rigid support attached to the armature of the derived-circuit electro-magnet or solenoid, and connected with such frame, so that the motion of the frame is affected by the derived-circuit electro-magnet or solenoid.

6. In an arc lamp, the combination of a moving frame with a main-circuit electro-magnet or solenoid supported thereon, a carbon-rod clamp actuated thereby, and a lever fulcrumed at one end and attached toward its other end to the armature of the derived-circuit electro-magnet or solenoid, an elastic support for such lever opposing the derived-circuit electro-magnet or solenoid, said frame resting upon said lever.

7. In an arc lamp, the combination of a moving frame with a main-circuit electro-magnet or solenoid supported thereon, a carbon-rod clamp actuated thereby, and a derived-circuit electro-magnet or solenoid, a lever rigidly supported at one point and elastically supported at another and connected with the frame and the derived-circuit electro-magnet or solenoid, so that the latter affects the movement of the former.

8. In an arc lamp, the combination of a carbon-separating electro-magnet or solenoid with a carbon-clamp connected therewith and operated thereby, a derived-circuit electro-magnet or solenoid, and an armature operated by the latter and connected with the former, so as to move the said carbon-separating magnet or solenoid.

9. In an arc lamp, the combination of a moving carbon-separating device containing a main-circuit electro-magnet or solenoid and a carbon-rod clamp controlled thereby to separate the carbons, with a derived-circuit electro-magnet or solenoid, and an armature connected therewith and operated thereby, and connected also with the moving carbon-separating device.

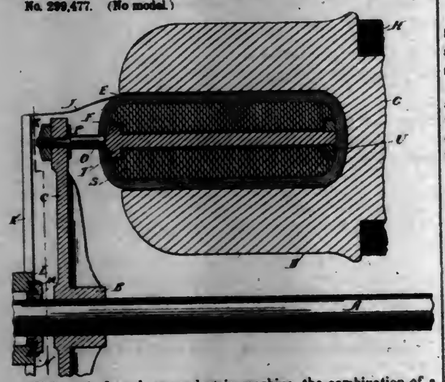
10. In an arc lamp, the combination of a moving main-circuit carbon-separating electro-magnet or solenoid with a carbon-clamp connected therewith and operated thereby, a derived-circuit electro-magnet or solenoid, and a lever connected with said carbon-separating device and operated by the derived-circuit electro-magnet and solenoid, said lever supported fixedly at one end and elastically at the other.

11. In an arc lamp, the combination of a carbon-separating device, consisting of a parallel moving frame, a main-circuit electro-magnet or solenoid supported thereon, a carbon-rod clamp supported by such electro-magnet or solenoid, with a derived-circuit electro-magnet or solenoid, and an armature extending between the latter magnet and the frame, so that it affects the motion of said frame.

12. In an arc lamp, a moving carbon-separating device containing the main-circuit electro-magnet or solenoid and the carbon-rod clamp, in combination with a double-acting stop for the clamp, both clamp and stop controlled by said magnet.

13. In an arc lamp, an electro-magnet mounted on a movable frame, in combination with a carbon-rod-clamping device and a double-acting stop for such clamp, both carbon-rod clamp and the stop therefor actuated by said electro-magnet.

14. In an arc lamp, an electro-magnet mounted on a moving frame, a carbon-rod clamp, a double-acting stop for such carbon-clamp, and a derived-circuit electro-magnet, an armature therefor connected with the clamp, both clamp and stop being actuated by the first-mentioned magnet or solenoid, and the clamp by the second-mentioned electro-magnet or solenoid.



15. In an arc-lamp, an electro-magnet mounted on a movable frame, in combination with a carbon-rod-clamping device, a double-acting stop for such clamp, connections from the electro-magnet or solenoid to the clamp and stop, and a derived-circuit electro-magnet or solenoid, and an armature actuated thereby and connected with the carbon-separating device.

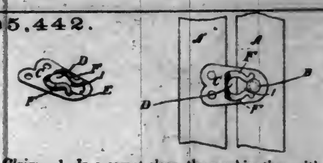
16. In an arc lamp, the combination of a moving elastically-supported carbon-seperating device, which contains a main-circuit electro-magnet or solenoid and a carbon-rod clamp, a double-acting stop for said clamp, a derived-circuit electro-magnet or solenoid, and an armature actuated by the last-mentioned electro-magnet or solenoid and connected with so as to move the carbon-separating device.

17. In a carbon-clamp for arc lamps, the combination of two opposed carbon-clamping pieces, one shaped like a bell-crank lever, an arm on which both are pivoted, the one at its angle, and means for moving said latter piece to control the carbon.

18. In a carbon-clamp for arc lamps, the combination of two opposed carbon-clamping pieces, one shaped like a bell-crank lever, an arm on which both are pivoted, one at its angle, and means for simultaneously moving the pivoted end of said arm and swinging the angular piece on such pivot to cause the pieces to clamp or release the carbon.

405,441. DYNAMO. ELMER A. SPERRY, Chicago, Ill., assignor to the Sperry Electric Company, same place. Filed Feb. 11, 1889. Serial No. 299,477. (No model.)

Claim.—1. In a dynamo-electric machine, the combination of a rotating spider with a series of bolts projecting therefrom and secured thereto and an armature secured on such bolts independently of the spider.

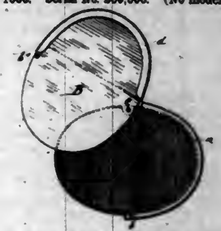


2. In a dynamo-electric machine, the combination of a rotating spider with a series of bolts projecting therefrom and secured thereto by a collar and nut on opposite sides of such spider-arms, with an armature secured to such bolts independently of the spider.

3. In a dynamo-electric machine, the combination of a rotating spider with a series of bolts secured thereto and projecting therefrom, and an armature secured on such bolts between a flange and a nut on each of said bolts.

4. In a dynamo-electric machine, the combination of a rotating spider with a series of bolts projecting from the arms thereof, each secured thereto by a flange and nut on opposite sides of such spider-arm, with an armature secured on such bolts, between a flange and a nut on each of them.

5. In a dynamo-electric machine, the combination of a rotating spider with an annular armature and bolts, which project from and are secured to the spider, and to which in turn is secured the armature independently of the spider.

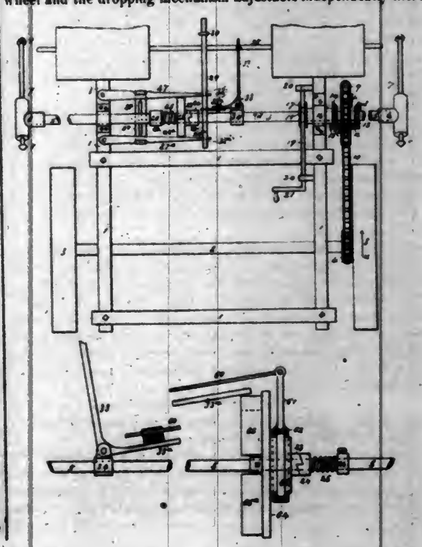


405,442. CORSET-CLASP. CHARLES H. STARR and JOHN W BOOTON, Bridgeport, Conn. Filed Nov. 8, 1888. Serial No. 290,271. (No model.)

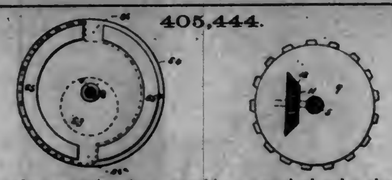
Claim.—1. In a corset-clasp, the combination, with a headed pin secured to one section of the busk, of the eye having an enlarged opening terminating in a diminished recess and a pair of spring-fingers sheared and raised from the stock of said eye and forming the sides of said opening, said fingers being integral with the eye at the rear and having their forward ends converged and diverged, substantially as set forth.

2. In a corset-clasp eye, the spring-arms sheared and raised therefrom and integral at their rear with the stock of the eye, and having their forward ends converged to form a channel narrower than the diameter of the pin and then diverged, an opening D being formed in the eye and coinciding with the inner edges of said arms, said opening terminating in a diminished recess E immediately beyond the said channel, substantially as shown, and for the purposes set forth.

405,443. SHEET-METAL BOX. AUGUST STAHR, New York, N. Y. Filed Nov. 3, 1888. Serial No. 289,866. (No model.)



Claim.—1. A sheet-metal box composed of a body having a flanged rim and a lid pivoted at the side of the body and adapted to swing in the plane of the box, said lid being engaged by said rim, substantially as set forth.



2. A sheet-metal box composed of a body having a flanged rim and a lid pivoted at the side of the body and engaged by said rim, said lid being provided with a box-shaped portion that fits over one end of the body, so as to retain the lid on the box in connection with the flanged rim, substantially as set forth.

405,444. CHECK-ROW CORN-PLANTER. GUSTAV A. TRODE, Holstein, Iowa. Filed Jan. 16, 1889. Serial No. 296,470. (No model.)

Claim.—1. In a corn-planter, the combination, with the ground-wheel and the dropping mechanism adjustable independently thereof,

405,444.

of gearing connecting them, comprising a sun-wheel and a planet-wheel, and a handle connected with one of these latter wheels, substantially as set forth.

2. In a corn-planter, the combination, with the ground-wheel, the dropping mechanism adjustable independently thereof, and gearing connecting them, comprising a sun-wheel and a planet-wheel, of means for normally holding one of these latter wheels from turning about its axis, and a handle connected with said wheel, substantially as set forth.

3. In a corn-planter, the combination, with the ground-wheel and the dropping mechanism, of gearing connecting them, comprising a sun-wheel and a planet-wheel, a worm-wheel on the shaft of one of them, and a crank-shaft having a worm engaging said worm-wheel, substantially as set forth.

4. In a corn-planter, the combination, with the ground-wheel and the dropping mechanism, of gearing connecting them, comprising a sun-wheel and a planet-wheel, and a handle having intermediate mechanism connecting it with the sun-wheel, substantially as set forth.

5. In a corn-planter, the combination, with the ground-wheel, the dropping mechanism, and gearing connecting them, comprising a sun-wheel and a planet-wheel, of means for normally holding the sun-wheel from turning about its axis, and a handle having connection with said wheel, substantially as and for the purpose set forth.

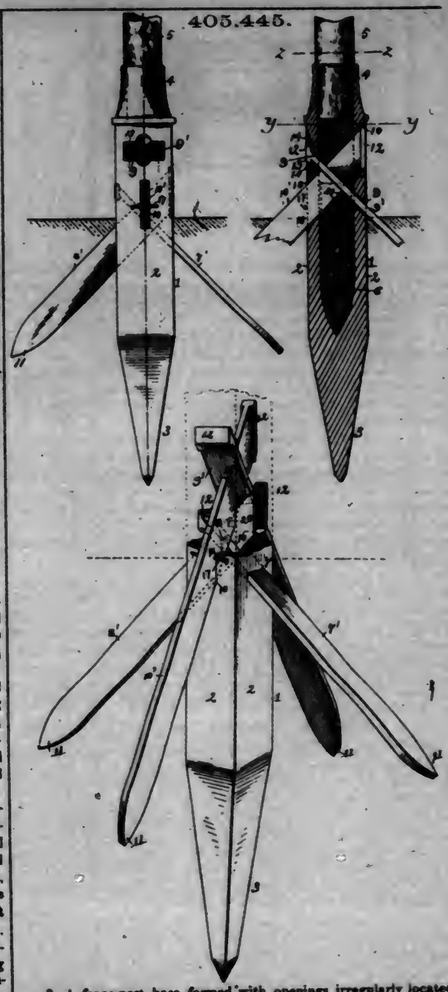
6. In a corn-planter, the combination, with the dropping mechanism and the ground-wheel, of the gearing connecting them, comprising the shaft 5, the wheel 9, loosely mounted thereon, the miter-wheel 13, secured to said shaft, the miter-wheel 12, carried by the wheel 9 and gearing with wheel 13, and the miter-wheel 14, concentric with wheel 9 and gearing with wheel 12, substantially as set forth.

7. In a corn-planter, the combination, with the ground-wheel and the dropping mechanism, of the gearing connecting them, comprising the shaft 5, the wheel 9, loosely mounted thereon, the miter-wheel 13, secured to said shaft, the miter-wheel 12, carried by wheel 9 and gearing with wheel 13, the miter-wheel 14, concentric with wheel 9 and gearing with wheel 12, and the hand mechanism for controlling wheel 14, substantially as set forth.

8. In a corn-planter, the combination, with the dropping mechanism and the ground-wheel, of the gearing connecting them, comprising the shaft 5, the wheel 9, mounted loosely thereon, the miter-wheel 13, secured to said shaft, the miter-wheel 12, carried by wheel 9 and gearing with wheel 13, the miter-wheel 14, gearing with wheel 12, the short sleeve 15, surrounding shaft 5, and to which wheel 14 is secured, the worm-wheel 17, secured to sleeve 15, and the hand-shaft having worm 18, engaging worm-wheel 17, substantially as set forth.

9. In a corn-planter, the combination, with the dropping mechanism and the shaft 5, of the wheel 22, secured to the shaft and having the eccentric surface x y and concentric surface y z, the spring-actuated levers 27 and 27^b, bearing upon opposite sides of said wheel, the slide-rod 29, with which said levers engage alternately, and connections between said rod and the dropping mechanism, substantially as set forth.

10. In a corn-planter, the combination, with the dropping mechanism and the shaft 5, of the cam-wheel 22, the spring-actuated levers 27 and 27^b, bearing upon opposite sides of said wheel, the slide-rod 29, having slots 32 and 32^a, with which said levers engage, respectively, and connections between said rod and the dropping mechanism, substantially as set forth.



11. In a corn-planter, the combination, with the dropping mechanism and the shaft 5, of the cam-wheel 22, the spring actuated levers 27 and 27^b, bearing upon opposite sides of said wheel, the slide-rod 29, with which said levers have loose connection, and the bell-crank lever 33, engaged at one end by said rod and at the other having connection with the dropping mechanism, substantially as set forth.

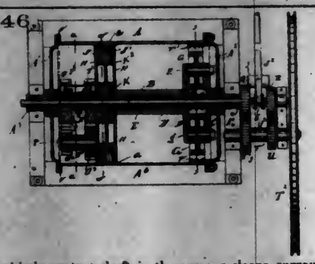
405,445. BASE FOR FENCE-POSTS. WILLIAM H. THOMSEN, New York, N. Y. Filed Nov. 30, 1888. Serial No. 292,189. (No model.)

Claim.—1. A fence-post base formed with a point to enter the ground and having detachable interlocking anchor-pins extending crosswise thereto and adapted to enter the ground, substantially as shown and described.

2. A fence-post base formed with openings irregularly located therein, in combination with interlocking anchor-pins which extend through the openings and project laterally from the base, substantially as shown and described.

405,445.

3. A fence-post base formed with openings irregularly located therein, in combination with interlocking anchor-pins which extend through the openings and project at an incline downward from the base, the anchor-pins being inserted through the base in regular order to interlock each other, with means for fastening in place the pins last inserted, substantially as shown and described.



4. In a fence-post base, substantially as described, the base 1, formed with internal chamber 6, the inclined aligning opposite openings 7 8 9 10 in the walls of chamber 6, a fence-post socket 4 at its top, and a tapering lower end 3, substantially as shown and described.

5. A fence-post base 1, formed with internal chamber 6, the inclined aligning opposite openings 7 8 9 10 in the walls of chamber 6, a fence-post socket 4 at its upper end and the tapering point 3 at its lower end, the upper openings 7 8 9 10 having countersunk recesses 13, with notches 14 in their edges, in combination with the interlocking anchor-pins 7′, 8′, 9′, and 10′, having heads 12, fitting recesses 13, and inserted in regular order through openings 7 8 9 10, respectively, to interlock each other, the pins 7′ and 9′ having openings 15 and 16 for the passage of pins 8′ and 10′, and the pins 7′ and 8′ having notches 19 and 20 for the passage of pin 10′, and the pin 10′ having a hole 18, and the pin 17, fitting hole 18, to secure pin 10′ in place, substantially as shown and described.

405,446. WINDLASS. CARL G. TOURNE, Pittsburg, Pa. Filed June 12, 1888. Serial No. 277,000. (No model.)

Claim.—1. In a windlass, the combination, with a cylinder, of a

405,446.

longitudinal independent shaft in the same, a sleeve surrounding the shaft and driven from the same, gearing for driving the cylinder from said sleeve, a brake in the drum, and gearing for operating the brake from the shaft in the drum, substantially as herein shown and described.

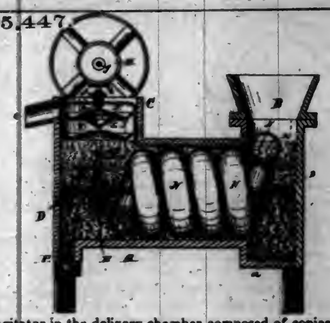
2. In a windlass, the combination, with a cylinder, of a longitudinal independent shaft in the same, a sleeve surrounding the shaft and driven from the same, gearing for driving the cylinder from the sleeve, a brake in the drum, an arm on the shaft, and gearing for operating the brake, said gearing being operated by the arm on the shaft, substantially as herein shown and described.

3. In a windlass, the combination of a hollow cylinder, bearings on which said cylinder rotates, an independent shaft extending longitudinally through the cylinder and its bearings, gear-wheels supported in part by one of said bearings, an internal gear on the inside of the cylinder meshing with said gear-wheels, a sleeve on said shaft, a pinion on said sleeve, said pinion engaging said gear-wheels, an arm on the shaft, and a cog-wheel on the sleeve, said cog-wheel being driven from said arm, substantially as described.

4. In a windlass, the combination with a cylinder, of an independent longitudinal shaft on the same, a sleeve surrounding the shaft and driven from the same, gearing for driving the cylinder from said sleeve, an arm on the shaft having two opposite pins, a cog-wheel mounted loosely on the shaft and having a segmental slot, a cog-wheel fixed on the sleeve and having a like segmental slot, the above-mentioned pins entering said slots, a brake, and gear-wheels for operating the brake from said fixed and loose cog-wheels, substantially as herein shown and described.

5. In a windlass, the combination, with a cylinder, of an independent longitudinal shaft in the same, a sleeve surrounding the shaft and driven from the same, gearing for driving the cylinder from said sleeve, the arm P^4 on the shaft, provided with the two opposite pins P^2 P^3, the cog-wheel N, mounted on the end of the sleeve and having a segmental slot into which the pin P^4 passes, the cog-wheel O, mounted loosely on the shaft and having a segmental slot into which the pin P^3 passes, the disks H, mounted loosely on the sleeve, the brake-shoes J, pivoted between the disks H, the hub K, having the racks K^2 and cams K^3, and gearing for operating the racks K^2 from the cog-wheel N, substantially as herein shown and described.

6. In a windlass, the combination, with a cylinder, of a longitudinal independent shaft in the same, a sleeve surrounding and driven from said shaft, gearing for driving the cylinder from said sleeve, the cog-wheel N, mounted rigidly on the end of the sleeve and having a segmental slot, a like cog-wheel O, mounted loosely on the shaft and having a segmental slot, the arm P^4 on the shaft, having the opposite pins P^2 P^3 entering the slots in the wheels N and O, the disks H, mounted loosely on the shaft, the brake-shoes J, pivoted between said disks, the hub K, having the racks K^2 and cams K^3, the pinions L on the shafts L', mounted in one of the disks H, the cog-wheels M, mounted on the opposite ends of the shafts L' and engaging the cog-wheel N, the cog-wheels O^2 and O^3 on the same shaft, and the cog-wheel O', engaging the cog-wheels O and O^3, substantially as herein shown and described.



405,447. AMALGAMATOR. MILTON T. VAN DERVEER, Amsterdam, N. Y. Filed Apr. 1, 1889. Serial No. 305,578. (No model.)

Claim.—1. In an amalgamating-machine, the combination of the casing filled with mercury and having a feed-hopper and delivery-chamber, with a revoluble tubular screw conveyer submerged in the mercury and having a mouth to receive the pulp from the hopper and a delivery end below the chamber, and the mechanism for operating said screw, substantially as specified.

2. The combination of the casing having an upstanding feed-hopper and delivery-chamber at its opposite ends, and a tubular body, with a tubular screw conveyer mounted in the tubular body, having a series of internal blades secured to the outer wall thereof, and the mechanism for operating said conveyer, substantially as described.

3. The combination of the casing having a feed-hopper and delivery-chamber at opposite ends, and the revoluble tubular screw conveyer therein adapted to receive and carry the pulp from the hopper to the delivery-chamber through the body of amalgamating fluid, with

405,447.

the agitator in the delivery-chamber composed of conical perforated disks, constructed and arranged substantially as set forth.

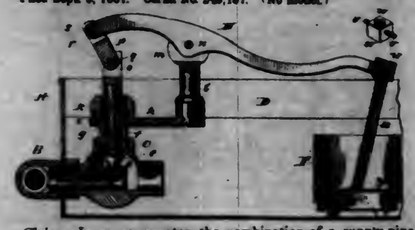
4. The combination of the casing having a feed-hopper and delivery-chamber, with the agitator mounted in said chamber and composed of the spider and conical disks perforated near their center and having corrugated edges, all substantially as specified.

5. The combination of the casing having a tubular body and a feed-hopper and delivery-chamber at opposite ends thereof, with the shaft D, the tubular screw conveyer mounted thereon, having an internal series of transverse blades and a receiving-mouth *n*, adapted to rise above the level of mercury in the feed-hopper, the agitator in said chamber, and the mechanism, substantially as described, for imparting motion to the screw and agitator, substantially as set forth.

6. The combination of the casing having an inclined tubular body and a feed-hopper and delivery-chamber at opposite ends thereof, with an inclined Archimedean screw conveyer for the pulp mounted on an inclined shaft in the tubular body of the casing, and mechanism for operating the same, substantially as set forth.

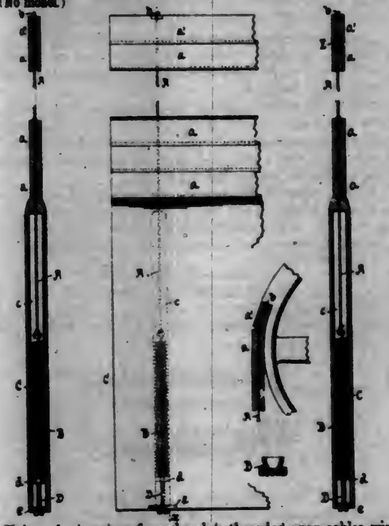
7. The combination of casing A, having an inclined tubular body with the inclined tubular screw conveyer N, submerged in mercury, and the blades O in said conveyer, and the shaft and gearing for operating said conveyer, all substantially as specified.

8. The combination of the casing constructed substantially as described and the tubular screw conveyer therein mounted on a central shaft and having a series of internal blades O and mouth *n*, and the shaft and gearing for operating said conveyer, with the oscillating agitator I, composed of spider K and perforated disks J J L, all substantially as and for the purpose described.



405,448. FEED MECHANISM FOR SEWING-MACHINES. CHAS W. WEISS, Brooklyn, assignor of one-half to Charles Kruse, New York, N. Y. Filed Mar. 21, 1889. Serial No. 304,147. (No model.)

Claim.—1. The combination, in a sewing-machine, with its rotating shaft, its table, a swinging arm dependent from the table, a shaft secured to the free end of said arm, a sleeve upon said shaft, a bar coupling said sleeve with an eccentric on the rotating shaft, and a feed-dog carried by the sleeve to rise and fall and move back and forth with the vibration of said shaft and the oscillation of said sleeve, of an adjustable arm pivoted to the main shaft, an adjustable link pivoted to vibrate upon said arm and made to engage loosely the end of the sleeve-shaft, and a second arm coupled to the link and actuated by an eccentric on the main shaft to produce an oscillation of the link upon its pivotal center, all substantially in the manner and for the purpose herein set forth.



2. The combination, in a sewing-machine, with its rotating main shaft, its table, a swinging arm dependent from the table, a shaft secured to the free end of said arm, a sleeve upon said shaft, a bar coupling said sleeve with an eccentric on the rotating shaft, and a feed-dog carried by the sleeve to partake of its movements, of an arm pivoted to the main shaft, a vibrating link engaging loosely the end of the sleeve-shaft and pivoted to said arm to move with it to and from the axis upon which the swinging arm carrying the sleeve-shaft vibrates, an eccentric on the main shaft, a bar coupling said link with said eccentric, an annular cam dependent from the table to engage the arm to which the link is pivoted, and a thumb-piece fitted on the table and actuating said cam, all substantially in the manner and for the purpose herein set forth.

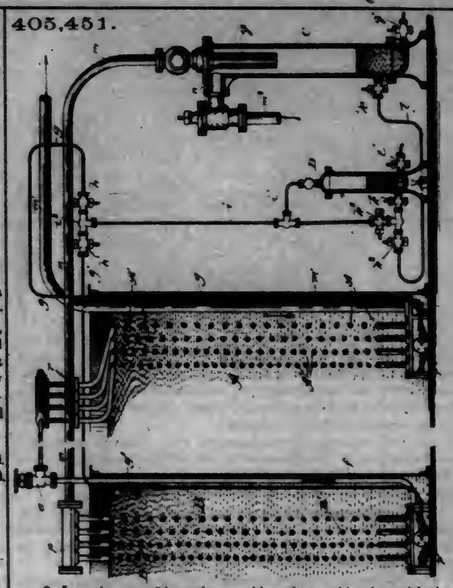
405,449. AUTOMATIC SUPPLY-VALVE FOR EVAPORATORS. WILLIAM WILCOX and WILLIAM A. WILCOX, Jr., Grand Rapids, Mich. Filed Sept. 8, 1887. Serial No. 249,137. (No model.)

Claim.—In an evaporator, the combination of a supply-pipe, a valve having a stem projecting through the upper end of the valve-case, a sleeve surrounding the stem, provided with a shoulder or seat, a detachable plate supported upon said sleeve and seat and provided with a post at its free end having a fulcrum on its upper end, a nut for clamping said plate upon said sleeve, a float having an externally screw-threaded rod, a lever having a link connecting it to the valve-stem, and a nut pivoted in the opposite end, by which it is connected to the float, substantially as described.

405,450. PARTITION, SHUTTER, AND THE LIKE. JAMES G. WILSON, New York, N. Y. Filed Nov. 24, 1888. Serial No. 291,800. (No model.)

Claim.—1. A series of wooden slats threaded upon cables, wires, or bands, combined with tension-producing springs, substantially as described.

2. A rolling partition or shutter composed of wooden slats threaded upon cables, wires, or bands, combined with tension-producing springs, and means for adjusting the tension of said springs, substantially as described.



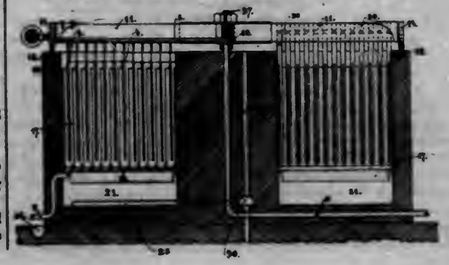
3. The combination, with a series of wooden slats, of springs located in one of the end slats and cables, wires, or bands extending through the slats, the opposite extremities of said cables, wires, or bands being respectively attached to the springs and to the opposite end slat, substantially as described.

4. The combination, with a series of wooden slats threaded upon cables, wires, or bands, of springs attached to the extremities of the cables, and additional springs interposed between two or more of the slats, substantially as described.

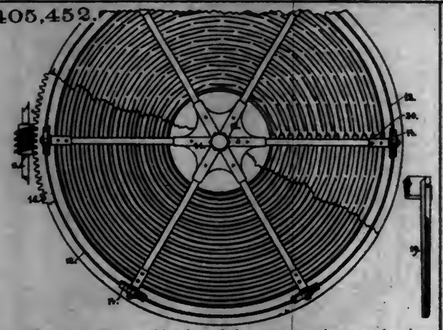
405,451. OIL-EXTRACTING AND GAS-SAVING APPARATUS FOR ICE OR REFRIGERATING MACHINES. FREDERICK W. WOLF, Chicago, Ill. Filed Dec. 2, 1887. Serial No. 256,767. (No model.)

Claim.—1. In an ice or refrigerating machine having an oil-trap C, communicating with the compressor and condenser, a gas-saving and oil-extracting apparatus D, controllably communicating directly with the oil-trap C and the condenser and refrigerator, and provided with a suitable cock through which to withdraw out of the machine the accumulated oil, substantially as described.

405,451.



2. In an ice or refrigerating machine, the combination, with the compressor, of an oil-trap C, communicating with the discharge end of the compressor, a condenser B, communicating with the oil-trap, a refrigerator A, communicating with the condenser and with the suction end of the compressor, and a gas-saving and oil-extracting apparatus D, communicating directly and controllably with the oil-trap C and with the condenser and refrigerator, near the lower ends thereof, and provided with a suitable cock through which to withdraw out of the machine the accumulated oil, substantially as described.



3. In an ice or refrigerating machine, the combination, with the compressor, of an oil-trap C, communicating with the discharge end of the compressor, a condenser B, communicating with the oil-trap and provided at its lower end with a syncline manifold *p'*, a refrigerator A, communicating with the condenser and with the suction end of the compressor, and provided at its lower end with a syncline manifold *r'*, and a gas-saving and oil-extracting apparatus D, communicating directly and controllably with the oil-trap C and with the manifolds *p'* and *r'*, and provided with a suitable cock through which to withdraw out of the machine the accumulated oil, substantially as described.

4. In an ice or refrigerating machine, the combination, with the compressor, of an oil-trap C, communicating with the discharge end of the compressor, a condenser B, communicating with the oil-trap, a refrigerator A, communicating with the condenser and with the suction end of the compressor, a gas-saving and oil-extracting apparatus D, having a discharge-outlet *l'*, pipes *g* and *g'*, leading, respectively, from the lower ends of the refrigerator and condenser, a pipe *i*, communicating at one end, controllably, with the pipes *g* and *g'* and toward its opposite end with the device D, and a pipe *l*, affording communication between the oil-trap C and device D, near their bases, substantially as described.

405,452. APPARATUS FOR THE ELECTROLYSIS OF LEAD. CHARLES O. YALE, Rome, N. Y., assignor of one-half to Moses M. Davis, same place. Filed Mar. 8, 1886. Serial No. 194,453. (No model.)

405,452.

Claim.—1. The combination of the conveyer-pipes opening into the bottom of the decomposing-vats, the decomposing-vats arranged upon substantially the same horizontal plane, return-drains, the central core in the decomposing-vats, radial arms mounted on the central core provided with electric conductors, and the cathodes mounted in the vat and electrically connected.

2. The decomposing-vats provided with a central non-electric conductor-core, in combination with the radial arms mounted above the core having electrical conductors on the radial arms, and the circular cathodes mounted in the vats and electrically connected.

3. The decomposing-vats, in combination with the radial arms mounted to be moved above the vat, provided with electric conductors to connect with the anodes, and the circular cathodes mounted in the vats and electrically connected.

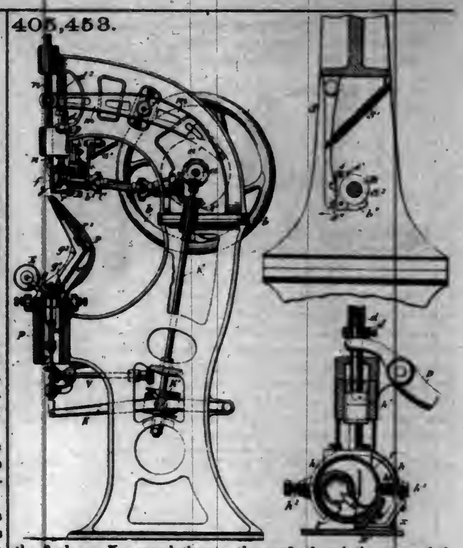
4. The conveyer-pipes connecting with the decomposing-vats, the decomposing-vats, the return-conductors, and the conveyer-pipes opening into the vat through radial pipes in the bottom thereof, in combination with radial arms moving above the vat and provided with electrical conductors to connect with the anodes, and the circular cathodes mounted in the vat and electrically connected.

5. The decomposing-vat arranged to receive the solution at the bottom thereof, in combination with radial arms above the vat for suspending the soluble anodes electrically connected, the cathodes mounted in the vat and electrically connected, and the moving scraper on the surface of the cathodes.

6. The decomposing-vat and the radial arms having electric conductors, in combination with the circular cathodes mounted in the vat and electrically connected, and the brushes mounted on the radial arms to be moved therewith, engaging the opposing sides of the cathodes, substantially as set forth.

7. The combination of a decomposing-vat having a central core therein, the radial arms mounted thereon, and means whereby they may be rotated horizontally, the arms carrying movable conductors connecting with the permanent conductor at the core of the vat, the combing or brushing device mounted on the radial arms, each combing or brushing device consisting of a double brush arranged so that the brushing-surfaces are in opposition with the surfaces of the cathodes, and the circular cathode-plates mounted in the vat and electrically connected.

8. The combination of a circular vat with a core therein, the solution-diffusing conveyers located at or near the bottom of the vat, a permanent electrical conductor in the central core, the radial arms carrying radial conductors connecting with the permanent conductor, the cathodes mounted in the vat and electrically connected, and the brushing device arranged so that they move on the opposite surfaces of the circular cathode-plates.



9. In the mechanism used in electrolysis, the succession of circular cathode-plates arranged in the decomposing-vat and electrically connected, and radial arms above the vat electrically connected, substantially as set forth.

405,453. SOLE-SEWING MACHINE. JOHANNES ALBRECHT, Cannstadt, Würtemberg, assignor to Otto Herz, Frankfort, Germany. Filed Aug. 17, 1888. Serial No. 283,063. (No model.) Patented in Germany Oct. 23, 1886, No. 41,153, and in France Nov. 23, 1886, No. 179,537.

Claim.—1. In a sole-sewing machine with a straight vertical needle, a shuttle rotating in its case in a vertical plane behind the said needle above the stuff or material being sewed, in combination with the shuttle-case, the vertically-yielding bar *d*, carrying said case, the bearing B, and the universally-jointed shuttle-driving shaft, whereby an automatic adjustment to the thickness of the stuff is effected, substantially in the manner as described.

2. In a sole-sewing machine, the combination, with the vertically-yielding bar *d*, the shuttle-case *r*, carried thereby, and the presser-foot *x'*, attached to the shuttle-case *r*, of the pivoted presser-ring *h*,

405,453.

the feed-arm X, secured thereto, the shaft a^3, and the cams c^2 c^3, formed thereon, all arranged substantially as shown, and for the purpose described.

3. In a sole-sewing machine, the combination, with the shaft a^3 and the cams c^2 and c^3, formed therein, of the pivoted presser-ring *h*, the shuttle-case *r*, screws h^2 and h^3, springs h^4 and h^5, the projection *h*, and the feed-arm carried by the said ring *h*, all arranged substantially as shown, and for the purpose described.

4. In a sole-sewing machine, the locking device consisting of the arm S, spring S', claw *s*, and rack *s'*, in combination with the projections s^3 on the arm S, cam b^3, attached to the shuttle-driving shaft a^3, bearing B, shuttle-case *r*, presser-point *x'*, together with the ring *h* and feed-arm X.

405,454. ROLLER-HOLDER FOR PHOTOGRAPHIC FILMS. LOUIS H. BANNISTER, Rochester, N. Y., assignor to the Eastman Dry Plate and Film Company, same place. Filed Aug. 3, 1885. Serial No. 173,370. (No model.)

Claim.—1. In a roller-holder for photographic films, the combination, with the measuring-roller, of a spring or lever carrying a pricking-point, a pinion on the shaft of the roller, and a gear with which the pinion engages, provided with a device by which the pricking-point is projected at intervals to mark the line of separation between the exposures of the film, as set forth.

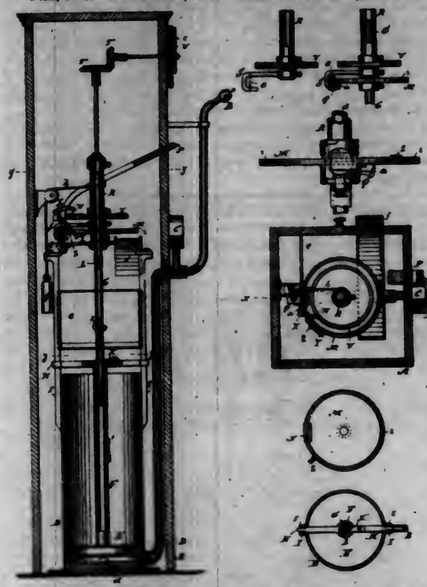
2. In a roller-holder for photographic films, the combination, with the measuring-roller, of a spring or lever carrying a pricking-point, a pinion on the shaft of the roller, a gear with which the pinion engages, provided with a device by which the pricking-point is projected at intervals to mark the line of separation between the exposures of the film, and an indicator connected with gear from the outside, whereby each turn of the indicator will indicate an exposure, as set forth.

3. In a roller-holder for photographic films, the combination, with the measuring-roller G, of the spring or lever K, provided with the projecting end *d*, the pinion *g* on the shaft of the roller, and the gear *h*, with which the pinion engages, said gear being provided with a wing *i*, which is intermittingly brought in position to depress the spring-arm and project the pricking-point, as herein shown and described.

4. In a roller-holder for photographic films, the combination, with the measuring-roller, of a spring or lever carrying a pricking-point, a pinion on the roller, a gear with which the pinion engages, provided with a device by which the pricking-point is projected at intervals to mark the line of separation between the exposures of the film, and an indicator connected with the gear from the outside, said indicator having a degree of free end movement and provided with a

key-hole socket at its inner end, and the gear provided with a key-head to engage with said socket, as set forth.

5. In a roller-holder such as described, the combination, with a roller actuated by contact with the film, of a film-marker and devices intermediate the roller and marker for actuating the latter, substantially as described.



6. In a roller-holder, and in combination with the film supporting and feeding devices and a roller moving in unison with the film as the latter is advanced or fed, a film-marker and actuating mechanism therefor deriving motion from said roller, substantially as described.

7. In a roller-holder such as described, and in combination with the measuring-roller thereof, a film-marker rotating in unison with the measuring-roller and caused to engage the film at regular intervals occurring after two or more rotations of the measuring-roller, substantially as described.

8. In a roller-holder such as described, and in combination with the measuring-roller thereof, a film-marker moving in unison with the measuring-roller and held normally from contact with the film during the rotation of the roller, and devices operating upon said marker to bring it into contact with the film at intervals, substantially as described.

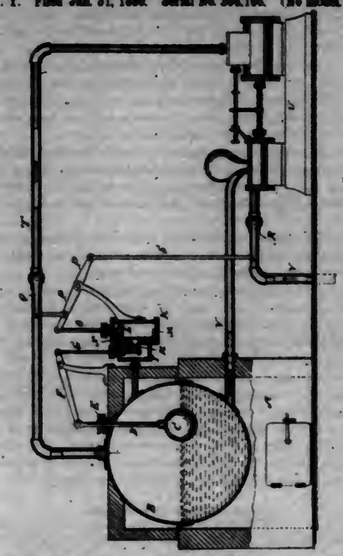
9. In a roller-holder such as described, and in combination with the film actuating and measuring devices, a reciprocating marker held normally removed from the film, and actuating mechanism connected to the measuring devices and operating to project the marker toward the film, substantially as and for the purpose specified.

405,455. COIN-RELEASED SPIROMETER. JOHN F. BLAKE, New York, N. Y. Filed Feb. 26, 1886. Serial No. 193,444. (No model.)

Claim.—1. The combination, with a piston E, a shaft rotated by said piston, and an index, of a rotary coin-carrier adapted to interlock the shaft and index, substantially as described.

2. The combination, with a piston E, a shaft rotated by said piston, and an index, of an arm or disk M, provided with a coin-receiving recess and secured to said shaft, and an arm S for engaging the rim of the coin and also secured to said shaft, substantially as described.

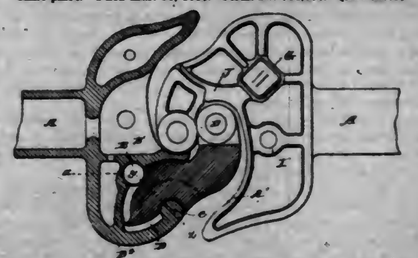
3. The combination, with a rotatable shaft and an index, of a coin-carrier adapted to interlock the shaft and index, and a detent adapted to hold the index stationary during the return movement of the shaft, substantially as described.



4. The combination, with a piston E, a shaft rotated by said piston, and an index, of a coin-carrier adapted to interlock the shaft and index, a detent adapted to hold the index stationary, and a trip Z for releasing the detent when the piston has returned to its starting-point, substantially as described.

5. The combination of a piston, a shaft rotated by the piston, an index, a coin-carrier adapted to interlock said shaft and index, a closed receptacle *c*, and an accessible receiver *f*, said receptacle and receiver located to receive coins at different points in the movement of the carrier, substantially as described.

6. The combination, with a rotatable shaft and an index, of a coin-carrier adapted to interlock the shaft and index, said coin-carrier consisting of an arm S and disk M, said disk being constructed to support a coin until the disk is in its starting position, substantially as described.



7. The combination, with a rotatable shaft and an index, of a coin-carrier adapted to interlock the shaft and index, said coin-carrier consisting of an arm S and disk M, said disk being provided with a steadying flange or groove, substantially as described.

405,456. BOILER FEED-REGULATOR. PAUL DOHN, New York, N. Y. Filed Jan. 31, 1889. Serial No. 298,196. (No model.)

Claim.—The combination of a boiler, a feed-water pump, a steam-pipe connecting the steam-space of the boiler with the pump for operating the latter, a feed-water pipe connecting the pump with the water-space of the boiler, a valve in the steam-pipe, a valve in the feed-water pipe, a steam-cylinder having a valve-chest connected with the boiler and provided with a movable valve, a float in the boiler having a lever-connection with the valve in the steam-chest, a piston in the cylinder, and a swinging-lever connection between the piston and the valve of the steam-pipe leading to the pump and the valve of the feed-water pipe to simultaneously open and close each valve, substantially as described.

405,457. CAR-COUPLING. WILLIAM P. BRAUN, New York, N. Y., assignor, by mesne assignments, to the Consolidated Coupling Company, same place. Filed Mar. 19, 1888. Serial No. 268,230. (No model.)

Claim.—1. In a car-coupler, the combination, with the draw-head having an arc-shaped slot formed therein, of a movable knuckle provided with an arc-shaped stem and a buffing-face substantially oval in shape, and the crown of the oval at about the center of the buffing-face, substantially as described.

2. In a car-coupler, the combination, with the draw-head having an arc-shaped slot formed therein and the arc-shaped top and bottom bearing-shoulders, of a movable knuckle provided with an arc-shaped

stem, and the bearing-shoulders on the top and bottom of said stem, which register with the shoulders of the slot, substantially as described.

3. In a car-coupler, the combination, with a draw-head having an arc-shaped slot formed therein and a semi-cylindrical vertical opening for the locking-pin, of the movable knuckle provided with horizontal ribs on the arc-shaped face of said knuckle-stem, and a semi-cylindrical vertical opening for the locking-pin in the body of said stem.

4. In a car-coupler, the combination, with the draw-head having an arc-shaped recess formed therein, of a movable knuckle provided with an arc-shaped stem having ribs on the arc-shaped face of said stem, and a locking-pin square at the top and cylindrical at its upper and middle portions and semi-cylindrical between its upper and middle portions and at the lower portions of said pin.

5. As a latch-pin for a car-coupler constructed substantially as specified, pin L, square at the top, cylindrical at N and O, and semi-cylindrical at P and Q.

6. In a car-coupler, substantially as specified, a latch-pin hole square at the top and substantially concentric with the curved inner surface of the recess in the coupler-head, said latch-pin hole contracted at the bottom of the coupler-head to a semi-cylindrical form and lying entirely outside of the path in which the jaw moves.

7. In a car-coupler, the combination, with the draw-head provided with an arc-shaped slot, of the movable knuckle having an arc-shaped stem and oval buffing-face, the crown of the oval at about the center of the buffing-face, and a straight or substantially straight traction-face.

8. In a car-coupler, a draw-head the plane of the curvature of the buffing-face of which is at an angle of seventy-seven degrees with the axis of said coupler, substantially as set forth.

9. In a car-coupler, a knuckle the plane of the curvature of the buffing-face of which is at an angle of seventy-seven degrees with a line drawn through the center of said knuckle, or the point from which the arc which determines the shape of the end of the knuckle is struck, substantially as set forth.

10. In a two-part car-coupler the parts of which are identical in construction, the combination, with the draw-head the angle of the buffing-face of which is seventy-seven degrees to the axis of the draw-head, of the movable knuckle the angle of the buffing-faces of which is seventy-seven degrees with a line drawn through the center of said knuckle, whereby the angle of movement of the couplers relative to each other is one hundred and thirty degrees, substantially as set forth.

405,458. FOUNTAIN-PEN. JOHN D. BRAY, Montreal, Quebec, Canada. Filed Apr. 14, 1888. Serial No. 270,615. (No model.)

Claim.—1. The combination, with a tubular pen-staff having a feeder at its forward extremity, an opening or aperture in rear of the finger-grasping portion, and a pen-holder to receive the pen to be fed by the feeder, of a compressible bulb communicating with the interior of the staff through said rear opening and resting when the pen is in use against the forefinger in rear of its outer joint, substantially as set forth.

2. The combination, with the reservoir-tube A, having a rear aperture *d*, a point *c*, apertured at its extremity only, and an extension *b*, of the bulb C, mounted on the tube and its extension over the aperture *d*, substantially as set forth.

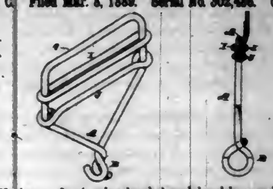
3. The combination, with the reservoir-tube having a point apertured at its extremity only, an extension at the rear end of the tube, and an air-inlet through the rear end of the tube, of the air-bulb upon the tube and its extension and communicating with the interior of the tube through said air-inlet, and the cap D, having a valved end opening, substantially as set forth.

4. In a reservoir-pen, the reservoir-tube having the upwardly-curved point apertured at its extremity, and the longitudinally-extending pen-receiving slot from which the pen extends across the said apertured extremity, substantially as set forth.

5. As an improved article of manufacture, a fountain-pen comprising the reservoir-tube A, having the curved point *c*, threaded and apertured at its extremity only, the solid rearwardly-extending shank *b*, threaded at its rear end, the air-bulb C, secured on the rear end of said tube and on the shank and communicating, as at *d*, with the interior of said reservoir-tube, the cap *f*, and the larger cap D, having an aperture in its closed end provided with a closure, substantially as set forth.

405,459. HARROW. WARREN M. BRINKERHOFF, Auburn, N. Y. Filed July 31, 1888. Serial No. 281,492. (No model.)

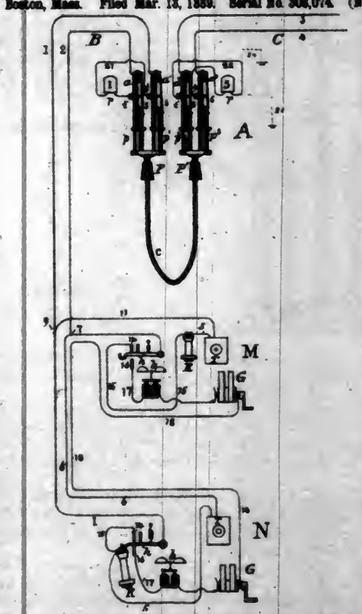
Claim.—1. A runner for harrows having a horizontally-disposed flat portion and a vertically-disposed portion of convex form in cross-section, substantially as described.



405,459.

2. A runner for harrows having a horizontally-disposed flat portion and a vertically-disposed portion of convex form in cross-section and of increased thickness centrally to sustain wear, substantially as described.

3. A runner for harrows having a horizontally-disposed flat portion and a vertically-disposed portion convex in cross-section and ribbed or corrugated to give it rigidity, substantially as described.

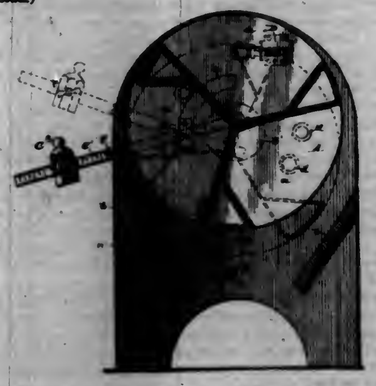


405,460. TRACE-CARRIER. DEMPSEY T. BRYAN, Rocky Mount, N. C. Filed Mar. 8, 1889. Serial No. 302,496. (No model.)

Claim.—1. A wire back-band buckle consisting of a rectangular upper portion, and the ends of the wires being brought together at the lower portion and formed into a hook for the trace, and two bars sliding longitudinally upon the sides of the rectangular portion, between which and the upper end of the frame the back-band is clamped when the bars are drawn upward, substantially as described.

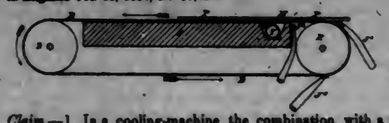
2. The combination, with a back-band buckle made of wire having its upper portion bent into a rectangular form, and the ends of the wires brought together at the lower portion and formed into hooks adapted to be separated for the insertion of the trace, of a loop and a bar sliding longitudinally upon the sides of the rectangular frame, between which and the upper end of the frame the back-band is clamped when the loop and bar are drawn upward, substantially as shown and described.

405,461. METALLIC TELEPHONE-CIRCUIT. HENRY L. BOSBANK, Jersey City, N. J., assignor to the American Bell Telephone Company, Boston, Mass. Filed Mar. 13, 1889. Serial No. 303,074. (No model.)



Claim.—1. The combination, with a metallic telephone-circuit having two or more sub-stations connected thereon, of calling appliances at each sub-station, the said calling appliances being normally included in series in the said circuit, a branch circuit from each of the said sub-stations to one of the said main lines, as indicated herein, the said branch being normally open at the said sub-station, telephones included in said branch circuit, and a switch at each sub-station having its movable element permanently in electrical connection with the main line not connected with the telephone branch of its own station, the said switch being adapted to maintain the continuity of the metallic circuit through the call apparatus of both sub-stations when the line is at rest, and through the telephones of its own station breaking the calling-circuit of both stations when the said telephones are being used, substantially as described.

2. The combination, substantially as hereinbefore set forth, in a metallic-circuit system of telephonic communication, of a central station, two sub-stations, each being provided with telephones, calling appliances, and an automatic telephone-switch actuated by the removal and replacement of the receiving-telephone, two main-line wires, one extending from the central station to the switch-lever of the terminal station, forming one side of a metallic electric circuit, and the other extending from the central station to the switch-lever of the intermediate station and forming a portion of the other side of the said metallic circuit, a continuation line extending from the resting or normal switch-contact of the intermediate station through the calling appliances of both stations to the resting-contact of the terminal station, forming the remainder of the second side of the metallic circuit and normally uniting the two switch-levers, (the receiving-telephone being in place,) whereby the calling appliances of both stations are normally included in circuit, and an independent normally-open branch line for each station extending from the working or telephone-switch contact through the telephones of said station to a permanent junction with the main line leading to the switch-lever of the other station, the said branch being in each case adapted to serve as a substitute for that portion of the metallic circuit which includes the several calling appliances of both stations, the removal of the receiving-telephone from its holder at either station being thereby adapted to close the telephone branch of said station, and to open the circuit of the calling apparatus at both stations.

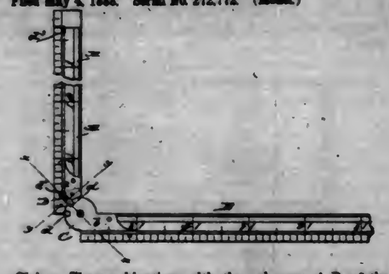


3. The combination, with a main metallic telephone-circuit extending between a main station and a plurality of sub-stations, and normally-closed loops, one for each sub-station, the loops being in series in the said circuit, and each including the calling apparatus of its respective sub-stations, of a series of normally-open loops, one for each sub-station, the said loops being in multiple arc with each other and each including the telephones of its respective sub-station, and an automatic switch at each sub-station connected with one of the main circuit-wires and adapted to form a part of one side of the loops of either class, according to its position, the calling apparatus and telephones in their several loops being uniformly upon the other side, whereby the use of the circuit at either station for telephony is adapted to prevent the other stations from using their calling apparatus, and whereby the several stations are enabled to simultaneously use their telephones for communication with each other, substantially as hereinbefore described.

405,462. GRAIN-WEIGHING APPARATUS. JAMES E. BURKEBARRICK, Robinson, Kans. Filed Feb. 9, 1889. Serial No. 299,285. (No model.)

Claim.—The grain or other measurer having the rotary compartment cylinder or receptacle hung or journaled upon a bail-shaped lever having a weighted graduated arm or extension, a spring-encircled stop disposed in the path of rotation of a series of projections upon the rotary cylinder or receptacle, and the spring stop or snap preventing any reactory movement of said cylinder or receptacle, substantially as described.

405,463. DEVICE FOR SETTING OR COOLING PHOTOGRAPHIC EMULSIONS. JAMES W. T. CADETT, Ashstead, County of Surrey, England. Filed Nov. 20, 1888. Serial No. 291,309. (No model.) Patented in England Oct. 10, 1887, No. 13,726.



Claim.—1. In a cooling-machine, the combination, with a table having one or more channels in its surface, of the revoluble rollers journaled at the ends of the table, the carrier-belt passing over said table and around the rollers, and one or more pipes delivering water within the said grooves in the table for cooling the under side of the belt, substantially as and for the purpose set forth.

2. In a cooling-machine, the combination, with a table having one or more channels in its surface, of the revoluble rollers journaled at the ends of the table, the carrier-belt passing over said table and around the rollers, one or more pipes adapted to deliver water upon the upper surface of the belt, and one or more pipes delivering water within the said grooves in the table for cooling the under side of the belt, substantially as and for the purpose set forth.

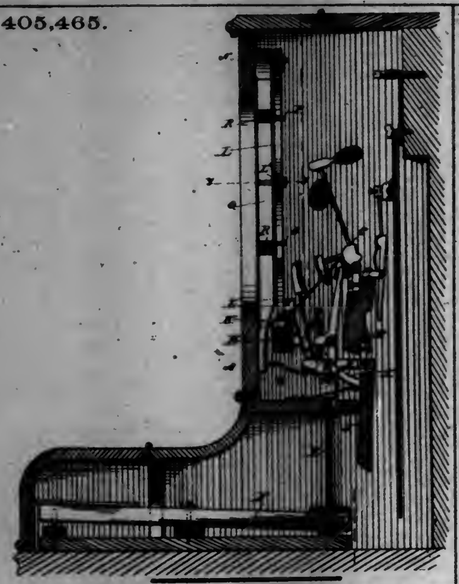
3. In a cooling-machine, the combination, with a table having a transverse groove on its surface near its rear end, of the revoluble rollers journaled at the ends of the table, the carrier-belt passing over said table from rear to front, and a pipe provided with one or more openings for delivering water within the said groove in the table and cooling the under side of the belt, substantially as and for the purpose set forth.

405,464. SCALE-MEASURE. WILLIAM COOK, New York, N. Y. Filed May 4, 1888. Serial No. 272,772. (Model.)

Claim.—The combination, with the rule-arms A B, of the joint face-pieces *a b*, provided with notches in their contiguous curved edges, as specified, and the slide D, arranged in the notch of face-piece *a*, said notch having undercut sides for the purpose of retaining the slide therein, as shown and described.

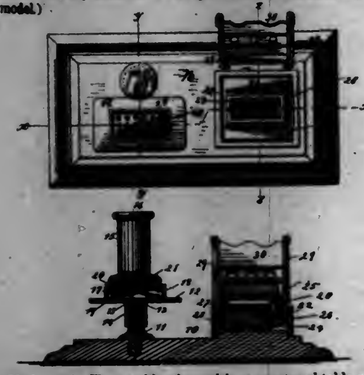
405,465. TOUCH-REGULATOR FOR PIANOS. CARL P. BLIAS, Chicago, Ill. Filed Dec. 6, 1888. Serial No. 292,779. (No model.)

Claim.—1. A touch-regulator for pianos, comprising a bar fastened on pivoted arms and held in an uppermost position by springs, a lever for pressing the said bar, and springs secured to the action-levers and adapted to be engaged by the said bar, substantially as shown and described.



2. The combination, with a piano-action provided with springs, of a bar adapted to engage the said springs and mounted to swing, a spring for holding the said bar in an uppermost position, and a lever for pressing the said bar, substantially as shown and described.

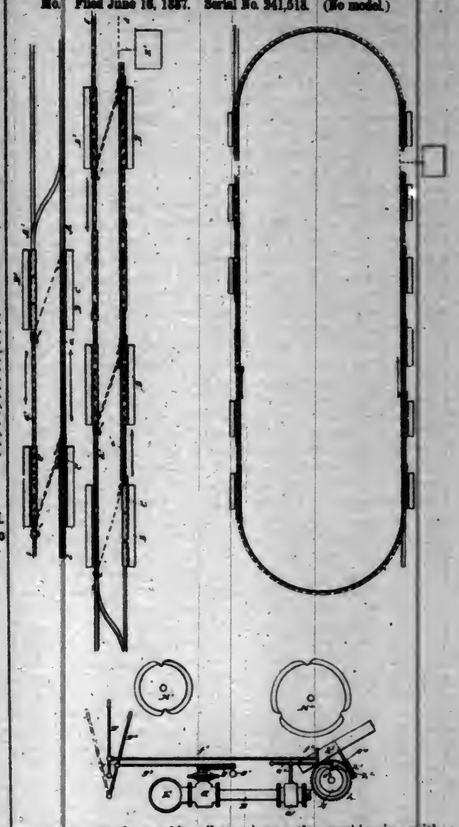
3. The combination, with a piano-action provided with springs, of a bar adapted to engage the said springs and mounted to swing, a spring for holding the said bar in an uppermost position, a lever for pressing the said bar, and a wedge formed on the top of the said bar and engaged by the said lever, substantially as shown and described.



4. The combination, with a piano-action provided with springs, of a bar adapted to engage the said springs and mounted to swing, a spring for holding the said bar in an uppermost position, a lever for pressing the said bar, a wedge formed on the top of the said bar and engaged by the said lever, and stop-pins for limiting the movement of the said lever, substantially as shown and described.

405,465.

405,466. LABELING AND PASTING APPARATUS. ELIAS H. FAGLNER, Deposit, N. Y. Filed Apr. 17, 1888. Serial No. 270,895. (No model.)



Claim.—1. The combination, with an apertured table provided with a flange upon its upper face surrounding said aperture, and a tubular support for said table, of a cylinder connected with said tubular support, and a spring-actuated pad resting upon the table above the apertures therein, substantially as and for the purpose herein set forth.

2. The combination, with an inclosing flange or casing open at its top, of a spring-seated paste-pad within said casing, a paste-receptacle being formed below the pad to supply paste thereto, substantially as set forth.

3. A label paster, holder, and affixer comprising a pasting-table, a cylinder supplying paste to said table, a spring-actuated pad resting upon said table, a box or casing adjacent to the pasting-table, provided with an upwardly-projecting pad secured centrally to its bottom, a spring-actuated vertically-reciprocating guide-plate provided with an opening adapted to receive the pad, and a flange projecting upward from said guide-plate and surrounding the pad-opening, substantially as and for the purpose specified.

4. A label paster, holder, and affixer consisting in a pasting-table, a cylinder adapted to supply paste to said table, a spring-actuated pad of absorbent material resting upon said table, a box or casing arranged adjacent to the pasting-table, provided with a pad secured centrally to its bottom and projecting upward essentially flush with the upper edges of the box or casing, and springs attached to the bottom of the said box or casing, one at each side of said pad, a the guide-plate resting upon said springs adapted for vertical reciprocation in the box or casing and provided with an opening adapted to receive the pad, and a vertical flange projecting from the upper surface of the guide-plate around the pad-opening a short distance therefrom, substantially as and for the purpose specified.

405,467. SYSTEM OF RAPID TRANSIT. HENRY FLAD, St. Louis, Mo. Filed June 16, 1887. Serial No. 241,513. (No model.)

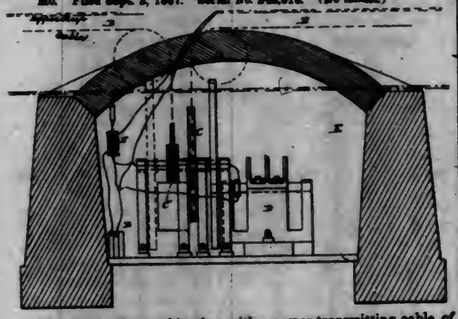
Claim.—1. In a cable-railway system, the combination, with a series of endless cables arranged in succession, the two strands of each endless cable being located between the stations, of independent motors for actuating each cable, a source of supply common to all the motors and constructed and arranged to supply power to all of said motors, and mechanism combined with each motor, whereby the cable is caused to travel a distance sufficient to propel the cable from one station to another and then to automatically stop both the cable and car, substantially as set forth.

2. In a cable-railway system, the combination, with a double track and a series of endless cables arranged successively along the line of both tracks, one strand of each cable extending from one station to another on one track, and the other strand of the same cable extending from one station to another on the other track, of independent motors for actuating each cable, a source of supply common to all the motors and constructed and arranged to supply power to all of said motors, and mechanism combined with each motor for causing the cable to propel the car from one station to another on each track, and then to automatically stop both the cable and car, substantially as set forth.

3. In a cable-railway system, the combination, with several cables located one after another along the track, independent motors for actuating the cables, and a common power-supply to the several motors, of a power-regulator between the power-supply and the motor, whereby the force of the motor is proportioned to the load, substantially as set forth.

4. In a cable-railway system, the combination, with an endless cable, a motor for driving the cable, and a power-supply to the motor, of a power-regulator located between the supply and the motor, and a regulator-operating device under the control of the train-manager, whereby the force of the motor may be regulated to suit the load, substantially as set forth.

5. In a cable-railway system, the combination, with several endless cables located one after another along the track, independent motors for actuating the cables, and a common supply of compressed air to the several motors, of a pressure-regulating valve located between the supply and the motor, and a valve-operating lever under the control of the train-manager, substantially as set forth.



6. In a cable-railway system, the combination, with several endless cables located one after another along a track, motors for actuating the cables, and a common power-supply, of starting mechanism under the control of the train-manager, and mechanism actuated by the motors and adapted to automatically shut off the power from the motor as the train nears the end of the cable-section, substantially as set forth.

7. In a cable-railway system, the combination, with several endless cables located one after another along a track, motors for actuating the cables, and a common supply of compressed air to the several motors, of a valve to admit the compressed air to the motors, a valve-operating lever under the control of the train-manager, and a cam-wheel driven by the motor and adapted to hold the valve open and allow the valve to close at the desired intervals, substantially as set forth.

8. In a cable-railway system, the combination, with the series of endless cables, the independent motors, and the common supply of compressed air to actuate the motors, of the valve to regulate the pressure and the valve to start and stop the motor, the said valves being located between the common supply and the motor, and mechanism for operating the valves, substantially as set forth.

9. In a cable-railway system, the combination, with the series of endless cables, the independent motors, and the common power-supply, of the valve to admit the power to the motor, a cam-wheel, a toothed wheel on the cam-wheel shaft, a worm driven by the motor and adapted to mesh with the toothed wheel, and a valve-operating lever in engagement with the face of the cam-wheel, substantially as set forth.

405,468. STREET CABLE RAILWAY. HENRY FLAD, St. Louis, Mo. Filed Sept. 2, 1887. Serial No. 248,618. (No model.)

Claim.—1. The combination, with a power-transmitting cable, of a motor for driving the same, a permanently-charged electric conductor to supply power to the motor, and an independent electric circuit to control the admission of power to the motor.

2. The combination, with a track and a car carrying a grip, of a power-transmitting cable, a motor for actuating the same, means for admitting power to and cutting it off from the motor, a local electric circuit, and means for opening and closing the same to control the admission of power to the motor, substantially as set forth.

3. The combination, with a track and a car carrying a grip, of a power-transmitting cable, a motor for actuating the same, a local electrical circuit, means for opening and closing the same, an electro-magnet in said circuit, and a device for admitting power to and shutting it off from the motor, said device being connected with the armature of the magnet, substantially as set forth.

4. The combination, with a track and a car carrying a grip, of a power-transmitting cable, a motor, a permanently-charged conductor to supply power to the motor, a pair of insulated conductors located along the track, a local battery having its poles connected with the last-named conductor, a connector carried by the car for electrically uniting said insulated conductors, and devices located in said local circuit for controlling the admission of power to the motor, substantially as set forth.

5. In combination, a car carrying a grip, a track, a power-transmitting cable, a motor, a permanently-charged electric conductor to supply power to the motor, a pair of insulated conductors located along the opposite sides of the path in which the grip travels and having a connection with the poles of a local battery, an electro-magnet in circuit with said local battery to control the admission of power to the motor, and a circuit maker and breaker adapted to be operated by the grip mechanism, substantially as set forth.

6. In combination, a power-transmitting cable, a motor, a permanently-charged electric conductor to supply power to the motor, normally-open connections between the conductor and the poles of the motor, a local circuit, an electro-magnet in the local circuit, and devices for closing the normally-open connections between the main conductor and the motor, said devices being connected with the armature of the electro-magnet, so that when the magnet is energized the said connections will be closed and when the magnet is de-energized the connections will be open, substantially as set forth.

7. In combination, a power-transmitting cable, a motor to drive the cable, a companion motor to drive the cable, a permanently-charged electric conductor to furnish power to the motors, branch connections between the conductor and the motors, switches interposed in the branch connections to throw either motor into electric connection with the conductor at pleasure, and an independent electric circuit to control the admission of power to the motors, substantially as set forth.

8. In combination, a power-transmitting cable, a motor to drive the cable, a main electric conductor permanently charged to supply power to the motor, normally-open connections between the main conductor and the motor, a local electric circuit, an electro-magnet in the local circuit, a pair of short conductors constructed to slide into and out of contact with the ends of the branch connections to make or break the connection between the main conductor and the motor, and mechanism connecting the said sliding conductors with the armature of the magnet, for the purpose substantially as set forth.

9. In combination, a power-transmitting cable, a motor to drive the cable, a power-supply, a grip adapted to engage the cable, a local electric circuit extending for a greater or less distance along the path in which the grip travels, and an electric conductor attached to the grip and adapted to make and break the said local circuit as the grip is manipulated, substantially as set forth.

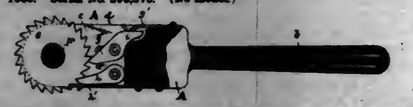
10. The combination, with several endless power-transmitting cables arranged one after another along a railway-track, independent motors to drive the cables, and a power-supply common to the several motors, of independent electric circuits—one for each cable-section—adapted to control the admission of power to the motors, substantially as set forth.

11. The combination, with several endless power-transmitting cables arranged one after another along a railway-track, independent motors to drive the cables, and a permanently-charged electric conductor extending along the track to supply power to the several motors, of independent electric circuits—one for each cable-section—adapted to control the admission of power to the motors, substantially as set forth.

12. The combination, with the local electric circuit and its conductors located along the path of the grip, of the grip carrying the circuit-closing bar and the clutch mechanism, means for adjusting the clutch and the circuit-closing bar up and down independent of each other, and means for adjusting the grip as a whole, substantially as set forth.

13. The combination, with the main plate of the grip secured to a suitable support on the car, provided with a vertical slot, of a vertically-sliding plate located in said slot and carrying a circuit-closer, a bar seated in vertically-sliding adjustment in a recess or slot formed in the said sliding plate, the said bar having clutch-operating mechanism attached thereto, means for operating the said bar independently of the sliding plate, and means for operating the plate and bar as a whole, substantially as set forth.

14. In a cable railway, the combination, with a power-transmitting cable, a motor to actuate the same, and insulated conductors located along the line of railroad, of the main plate of a grip and its support, a vertically-sliding plate seated in a slot formed in the sliding plate, a cable-guide depending from the sliding plate, a clutch attached to the depending guide, and means for operating the bar and sliding the plate, substantially as set forth.



15. The combination, with a power-transmitting cable and a motor of the main plate of the grip and its support, of a vertically-sliding plate seated in the main plate, a vertically-sliding bar seated in the sliding plate, a circuit-closer carried thereby, a cable-guide depending from the sliding plate, a clutch consisting, essentially, of a pair of levers pivoted to the depending cable-guide, a rod or bolt connected with the upper ends of the clutch-levers by links and connected with the said vertically-sliding bar to operate the clutch, and means for operating the bar and the sliding plate, substantially as set forth.

16. The combination, with the grip consisting, essentially, of a vertically-sliding plate carrying a clutch and a vertically-sliding bar, the said vertically-sliding plate being provided with a circuit-closing bar having metallic brushes at its ends, of a pair of copper strips

located along the opposite sides of the path of the grip, the said strips being insulated from the surrounding surfaces and connected with the poles of a local battery, means for actuating the sliding bar to close the clutch, and means for actuating the sliding plate to elevate the clutch and bring the said metallic brushes into contact with the copper strips, whereby the local circuit is closed when the clutch is in position to travel, for the purpose substantially as set forth.

17. In a cable railway, the combination, with the grip and an electric circuit to control the movements of the cable, of circuit-closing bar attached to the grip and provided with brushes to form points of contact to close the circuit and means for throwing the said circuit into and out of contact, substantially as set forth.

405,469. RATCHET-STOCK. GEORGE W. GLENN, Baltimore, Md., assignor of one-half to Wesley C. Thorpe, Jr., same place. Filed Feb. 1 1889. Serial No. 298,373. (No model.)

Claim.—1. In a ratchet-stock tool-holder, the combination, with the bifurcated head A and the shaft with ratchet-wheel *e* mounted in said head, of the pawls *g h*, with springs *g' h'*, the pawl *g* being centrally pivoted to form an arm *i*, substantially as and for the purpose set forth.

2. A ratchet-stock tool-holder consisting of the bifurcated head A, the shaft with ratchet-wheel *e* mounted in said head, and the pawls *g h*, with springs *g' h'*, the pawl *g* being pivoted at its center to form an arm *i*, so as to have a movement at both ends of said pawl, substantially as specified.

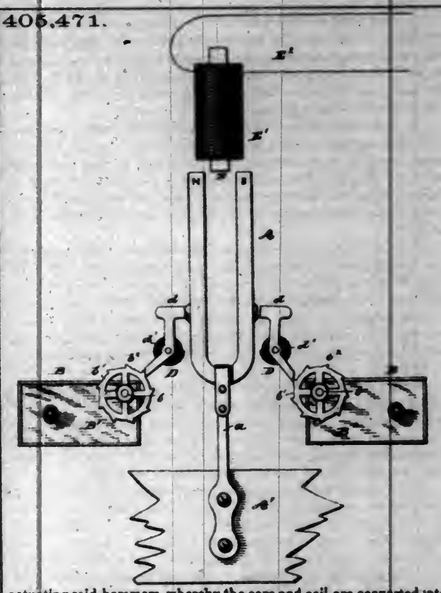
405,470. HORSESHOE. MICHAEL GATES, Decatur, Mich. Filed Oct. 23, 1888. Serial No. 288,974. (No model.)

Claim.—A soft-ground shoe consisting of a plate, adjustable hoof-clamps attached to the plate, adjustable heel-clamps C C, also attached to the plate, and beveled eccentric buttons D D, pivoted upon opposite sides of the said plate and adapted to bear upon opposite sides of the hoof and assist in clamping the shoe thereto, substantially as described.

405,471. APPARATUS FOR GENERATING ELECTRICITY. TIMOTHY GLEESON, Brooklyn, N. Y. Filed July 25, 1888. Serial No. 280,964. (No model.)

Claim.—1. An apparatus for generating electricity, consisting of a vibratory magnet and a soft-iron core supported above the magnet and surrounded by an insulated coil, substantially as described.

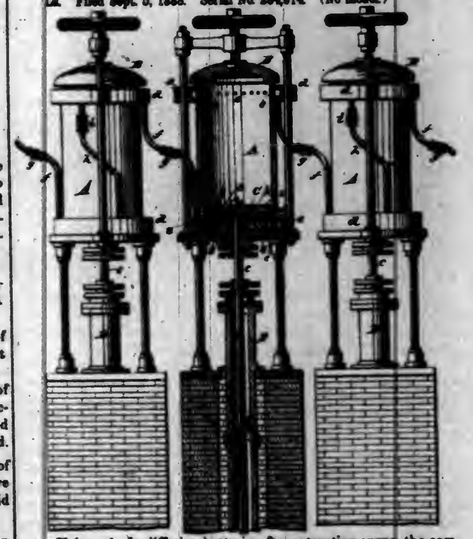
2. In an apparatus for generating electricity, the combination of a magnet, means for alternately moving the magnet in opposite directions, a soft-iron core supported above the magnet, and an insulated coil surrounding said core, substantially as herein shown and described.



3. In an apparatus for generating electricity, the combination of a vibratory magnet, motors for vibrating said magnet, a soft-iron core supported above the magnet, and an insulated coil surrounding said core, substantially as described.

4. In an apparatus for generating electricity, the combination, with a forked vibrating contact-maker, of spring-actuated hammers engaging opposite sides of the fork, and means, substantially as shown and described, for alternately actuating said hammers, as and for the purpose specified.

5. In a machine for generating electricity, the combination, with a forked vibratory stationary magnet, of spring-actuated hammers engaging opposite faces of the said magnet, and clock mechanism alternately actuating said hammers, substantially as shown and described.

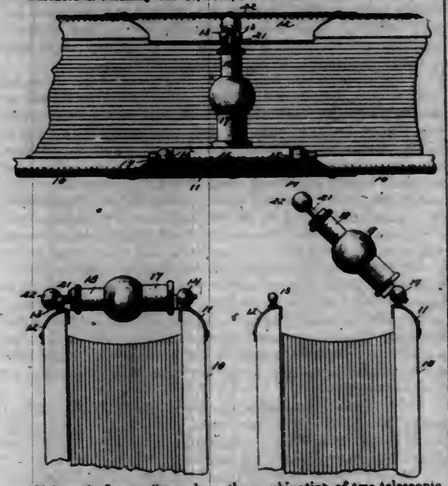


6. In a machine for generating electricity, the combination, with a forked vibratory stationary magnet, a soft-iron core suspended above the poles of the magnet, and an insulated coil surrounding said core, of spring-actuated hammers engaging opposite sides of said magnet, and mechanism, substantially as shown and described, for alternately

405,471.

actuating said hammers, whereby the core and coil are converted into an electric magnet, as and for the purposes specified.

405,472. DIFFUSION-BATTERY. WILLIAM GOLDING, New Orleans, La. Filed Sept. 5, 1888. Serial No. 284,814. (No model.)



Claim.—1. In diffusion-batteries for extracting sugar, the combination of a series of cells or diffusion-chambers composed of upright cylinders connected the lower end of one cylinder with the upper end of an adjacent cylinder, opening and closing covers applied to the upper ends of the cylinders, perforated pistons fitting said cylinders, provided with one or more valves operating to allow of the passage of fluid through the pistons in their downstroke, and means for operating said pistons, substantially as specified.

2. In a diffusion-battery for extracting sugar, the cylinders A, constructed with hollow belts *d* at their upper and lower ends in circumferential communication with the cylinder by a series of apertures *c*, in combination with the connecting-pipes *f* between the cylinders and a perforated reciprocating piston C in each cylinder having valves *k*, and a perforated shield or distributer *l* over said valves, essentially as described.

3. The passover-pipes *h* and valves *i*, in combination with the cylinders A, having opening and closing covers B at their upper ends, the pipes *f*, connecting said cylinders, and a perforated reciprocating piston C in each cylinder fitted with valves *k*, substantially as specified.

4. In a diffusion-battery for extracting sugar, the combination of the cylinders A A, having opening and closing covers applied to their upper ends, and hollow belts *d* at their opposite ends in communication with each cylinder circumferentially by apertures *c*, the pipes *f*, connecting said cylinders, the perforated piston C in each cylinder having valves *k* and a perforated shield or distributer *l*, and a hydraulic device connected with said piston and operating to raise it, essentially as herein set forth.

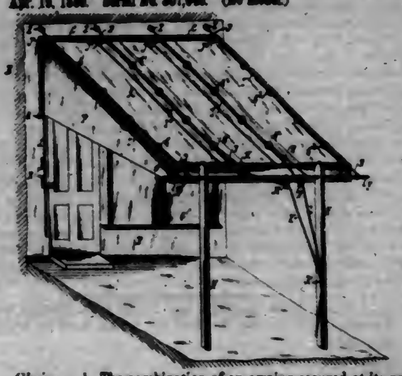
405,473. ALBUM-CLASP. HENRY P. HINKEL, Offenbach-on-the-Main, Germany. Filed Feb. 12, 1888. Serial No. 263,616. (No model.) Patented in Germany Oct. 11, 1886, No. 45,772.

Claim.—1. In an album-clasp, the combination of two telescopic sections and a spring secured in one section and adjustably connected to the other section, substantially as described.

2. In an album-clasp, the combination of two telescopic sections, one of the sections being provided with a nose or lug, and a spiral spring secured in one section and receiving the nose or lug of the other section between its spirals, substantially as herein shown and described.

3. In an album-clasp, the combination, with a hinge and keeper plate, of a hinged cylindrical section, a smaller cylindrical section fitting in the hinged section and provided with a nose or lug and adapted to engage the keeper-plate, and a spring secured in the hinged section and having its spirals engaged by the nose of the smaller section, substantially as specified.

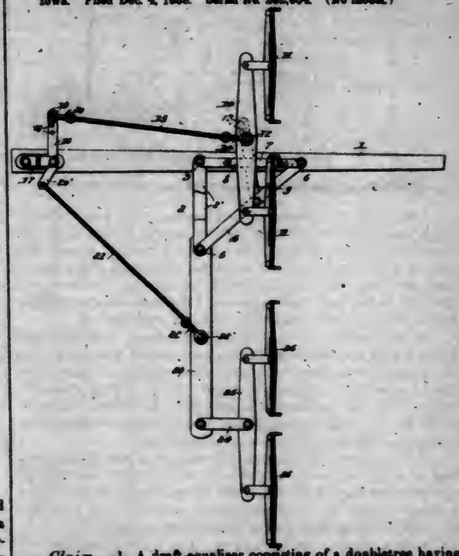
4. The combination, with a hinge-plate and a hinge-bar journaled thereon, of a clasp consisting of two tubular telescopic sections, the outer section provided with a longitudinally-disposed spiral or coil spring rigidly secured at one end, and an inner section having a lug or nose projected downward from the inner end, capable of contact with the said spring between the said coils, a locking device integral with the outer end, and a clasp-plate provided with spaced buttons adapted to receive the locking device, all combined for operation, substantially as shown and described.



405,474. RUNG-SOCKET PLATE FOR TRUCKS. GEORGE HOEFFNER and HENRY WURST, New York, N. Y. Filed Nov. 15, 1888. Serial No. 290,916. (No model.)

Claim.—1. As an improved article of manufacture, a combined rung plate and socket consisting of a horizontal flat plate having a longitudinal aperture produced therein, and a box-like casing surrounding the said aperture and projecting downward from the under face of the plate, substantially as shown and described.

2. As an improved article of manufacture, a combined rung plate and socket consisting of a metallic horizontal plate having one straight end surface and provided with a longitudinal opening at or near the said straight surface, and a box-like casing constituting a socket integral with the under surface of the plate and surrounding the longitudinal opening therein, substantially as and for the purpose specified.

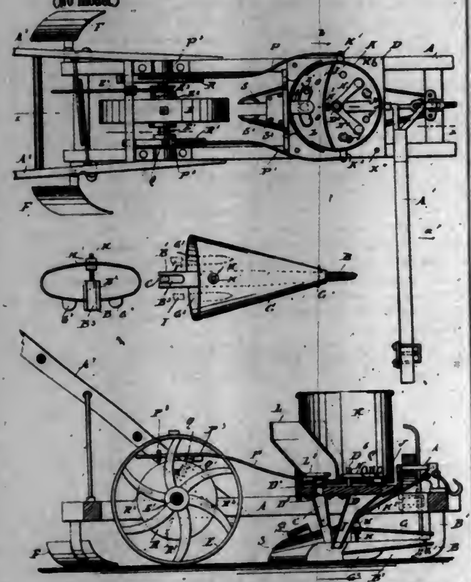


405,475. AWNING. FREDERICK HASSMER, Brooklyn, N. Y. Filed Apr. 19, 1888. Serial No. 307,648. (No model.)

Claim.—1. The combination of an awning secured at its upper edge and provided adjacent thereto with a transverse row of eyebolts, a series of rows of rings secured at intervals along the length of the awning, a series of longitudinal stationary ropes secured at their upper ends, a support for the lower ends of the stationary ropes, and the awning-raising ropes passing through the eyebolts and rings and respectively secured at the lower edge of the awning, substantially as described.

2. The combination of an awning secured at its upper edge and provided adjacent thereto with a transverse row of eyebolts, a series of rows of rings secured at intervals along the length of the awning, a transverse rod supported at the lowest portion of the awning, a series of longitudinal ropes secured at their upper ends and fastened at their lower ends to the transverse rod, the awning-raising ropes passing through the eyebolts and rings and secured at the lower edge of the awning, substantially as set forth, and ropes supported from the transverse rod and secured to the lower end of the awning for extending the latter.

405,476. DRAFT-EQUALIZER. CHARLES F. HOLCK, Laporte City, Iowa. Filed Dec. 4, 1888. Serial No. 292,604. (No model.)



Claim.—1. A draft-equalizer consisting of a doubletree having singletrees, a bar pivoted at one end to a lateral frame on the pole and pivotally connected at its outer end to the doubletree, a cross-bar

pivoted to the rear end of the pole and loosely connected at one end by a rod loosely connected at its other end to the bar pivoted to the lateral frame on the pole, and a doubletree with singletrees on the opposite side of the pole pivoted to the end of a bar extending across the pole and pivoted at its other end to the lateral frame, with a rod loosely connected at one end to the doubletree and at the other to one end of the cross-bar pivoted to the rear of the pole, substantially as shown and described.

2. A draft-equalizer consisting of doubletrees 10 and 25, with singletrees 11 and 26, respectively, on opposite sides of the pole, a triangular frame on one side of the pole consisting of double bars 2' and diagonal brace-bar 4, fastened to the pole, a strap 7, with upwardly-bent portion 8, secured to the pole between the ends of bars 2 and brace-bar 4, a swinging bar 9, pivoted at one end to brace-bar 4, extending beneath strap 7, and having adjustably secured to its other end by holes 13 and bolt 12 the doubletree 10, a bar 23, pivoted at one end to the outer end of bars 2', and pivotally connected by double straps 24 with doubletree 25, and cross-bar 16, adjustably connected at one end by means of holes 18, bolt 19, and clevis 20 with one end of a rod 15, the other end of which connects by a clevis 14 and bolt 12 with doubletree 10, and the other rearwardly-inclined end 20' of bar 16 connected to one end of a rod 21, the other end of which connects by clevis 22 and bolt 23' with doubletree 25, substantially as shown and described.

405,477. SEED-PLANTER AND FERTILIZER-DISTRIBUTER.

WHITSON A. HOLT, Harrison, Mo. Filed Nov. 6, 1888. Serial No. 290,105. (No model.)

Claim.—1. In a planter, the combination, with a frame, of a central plow held on the said frame, side plows held parallel on the said central plow, chutes opening on the rear ends of the said plows, a plate secured to the main frame and supporting said chutes, a disk held to oscillate on the said fixed plate and having openings registering with openings in the said fixed plate, and a fertilizer and a seed-hopper held on the said disk, substantially as shown and described.

2. In a planter, the combination, with a frame, three plows, and a main wheel, of a disk supporting the seed and the fertilizer hoppers and mounted to oscillate, being operated from the said main wheel, a fixed plate held on the said frame and having openings adapted to register with the openings in the said disk, and chutes held on the under side of the said fixed plate and leading to furrows made by the said plows, substantially as shown and described.

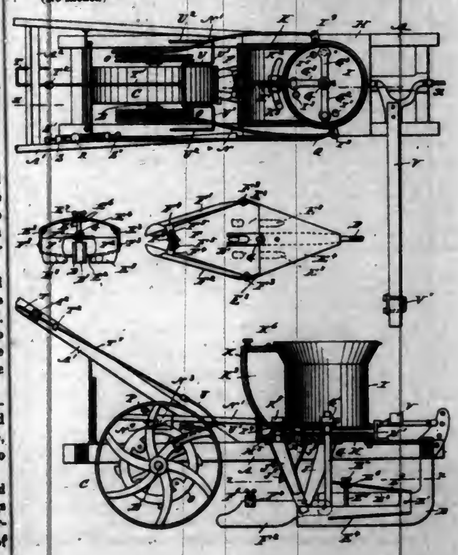
3. In a planter, the combination, with a fixed plate having openings, of a disk mounted to oscillate on the said plate and provided with openings adapted to register with the openings in the fixed plate, a hopper carried by the oscillating disk, and fixed arms secured to the pivot of the oscillating plate, substantially as described.

4. In a planter, the combination, with a fixed and apertured plate, of oscillating disk above the plate and provided with openings adapted to register with the openings of the fixed plate, a hopper carried by the oscillating disk, and fixed arms secured to the pivot of the said oscillating disk and provided with rods projecting therefrom, substantially as and for the purpose set forth.

5. In a planter, the combination, with a fixed plate having openings, of a disk held to oscillate on the said plate and having openings adapted to register with the openings in the said plate, a fertilizer-hopper secured on the said disk, and fixed arms held on the said hopper in line with the openings in the said fixed plate, rods secured to the said arms to agitate the fertilizer in the said fertilizer-hopper, and buttons adapted to close one or more of the said openings in the said disk, substantially as shown and described.

6. In a planter, the combination, with a frame and a plate secured to the said frame and having openings, of a disk mounted to oscillate on the said fixed plate and having openings adapted to register with the openings in the said fixed plate, a seed-hopper and a fertilizer-hopper secured on the said disk, rods connected with the said disk and provided with lugs, wheels provided with lugs adapted to engage the lugs on the said rods, a shaft carrying the said wheels and mounted on the said main frame, and a wheel held on the said shaft for rotating the latter on the forward movement of the machine, substantially as shown and described.

7. In a planter, the combination, with a frame and a plate secured to the said frame and having openings, of a disk mounted to oscillate on the said fixed plate and having openings adapted to register with the openings in the said fixed plate, a seed-hopper and a fertilizer-hopper secured on the said disk, rods connected with the said disk and provided with lugs, wheels provided with lugs adapted to engage the lugs on the said rods, a shaft carrying the said wheels and mounted on the said main frame, a wheel held on the said shaft for rotating the latter on the forward movement of the machine, and a clutch mechanism for connecting or disconnecting said main wheel with or from the said shaft, substantially as shown and described.



8. In a planter, the combination, with a fixed plate having an aperture, of a disk held to oscillate on the said plate and having a segmental slot, a plate fitting into the said segmental slot and having one or more apertures adapted to register with the openings in the said disk, a seed-hopper secured on the said disk around the said segmental slot, and a brush secured in the said seed-hopper and held directly above the opening in the said fixed plate, substantially as shown and described.

9. In a planter, the combination, with a frame, of a wheel supporting the rear end of the said frame, a plow supporting the front end of the said frame, and a casing mounted to swing on the said plow, substantially as shown and described.

10. In a planter, the combination, with a frame, of a wheel supporting the rear end of the said frame, a plow supporting the front end of the said frame, a casing mounted to swing on the said plow, two plows held on the under side of the said casing parallel with the said central plow, and means for raising and lowering said casing, substantially as shown and described.

405,478. SEED-PLANTER AND FERTILIZER-DISTRIBUTER.

WHITSON A. HOLT, Harrison, Mo. Filed Jan. 22, 1889. Serial No. 297,172. (No model.)

Claim.—1. In a planter, the combination, with a main frame, a plow held on the front end of the said frame, and a main driving-wheel held to turn on the rear end of the said main frame, of a fertilizer-hopper held to turn on the said main frame and actuated by rotation of the main wheel, a seed-box held stationary on the said main frame, and a drop-plate held on the said fertilizer-hopper and operating under the seed-box, substantially as shown and described.

2. In a planter, the combination, with a main frame, a plow held on the front end of the said frame, and a main driving-wheel held to turn on the rear end of the said main frame, of a fertilizer-hopper held to turn on the said main frame and actuated by rotation of the main wheel, a seed-box held stationary on the said main frame, a drop-plate held on the said fertilizer-hopper and operating under the seed-box, and a seat provided with apertures and secured on the main frame under the said drop-plate and fertilizer-hopper, substantially as shown and described.

3. In a planter, the combination, with a main frame, a plow held on the front end of the said frame, and a main driving-wheel held to turn on the rear end of the said main frame, of a fertilizer-hopper held to turn on the said main frame and actuated by rotation of the main wheel, a seed-box held stationary on the said frame, a drop-plate held on the said fertilizer-hopper and operating under the seed-box, a seat provided with apertures and secured on the main frame under the said drop-plate and fertilizer-hopper, and fixed arms held in the fertilizer-hopper to cover up alternately the discharge-openings in the bottom of the hopper, substantially as shown and described.

4. In a planter, the combination, with a main driving-wheel and cam-wheels rotating with the said main wheel, of rods actuated by the said cam-wheels, and a fertilizer-hopper mounted to turn and connected at its sides with the said rods, substantially as shown and described.

5. In a planter, the combination, with a main driving-wheel and cam-wheels rotating with the said main wheel, of rods actuated by the said cam-wheels, and a fertilizer-hopper mounted to turn and connected at its sides with the said rods, the said fertilizer-hopper being provided in its bottom with sets of apertures, and a fixed seat having apertures with which are adapted to register alternately the apertures of the sets of apertures, substantially as shown and described.

6. In a planter, the combination, with a main driving-wheel and cam-wheels rotating with the said main wheels, of rods actuated by the said cam-wheels, and a fertilizer-hopper mounted to turn and connected at its sides with the said rods, the said fertilizer-hopper being provided in its bottom with sets of apertures, a fixed seat having apertures with which are adapted to register alternately the apertures of the sets of apertures, and fixed arms held in the said hopper to cover up alternately the apertures in the sets of apertures, substantially as shown and described.

7. In a planter, the combination, with a fertilizer-hopper mounted to turn and provided with sets of apertures in its bottom, a fixed apertured seat held under the said hopper, and fixed arms held in the said hopper over the sets of apertures, of rods connected with the said hopper on its sides, and sets of cam-wheels, substantially as described, for imparting a forward and backward motion to the said rods, as set forth.

8. In a planter, the combination, with a fertilizer-hopper mounted to turn and provided with sets of apertures in its bottom, a fixed apertured seat held under the said hopper, and fixed arms held in the said hopper over the sets of apertures, of rods connected with the said hopper on its sides, sets of cam-wheels, substantially as described, for imparting a forward and backward motion to the said rods, and a main driving-wheel for imparting a rotary motion to the said cam-wheels, substantially as shown and described.

9. In a planter, the combination, with the sets of cam-wheels O, O', and O^3, each having projections, of rods each having a shoulder adapted to be engaged by the said projections, and a fertilizer-hopper mounted to turn and connected with the said rods, substantially as shown and described.

10. In a planter, the combination, with the sets of cam-wheels O, O', and O^3, each wheel having one or more projections, of rods connected with the fertilizer-hopper at its sides, shoulders formed on the said rods and operated on by the said projections when the cam-wheels are turned, and flanges held on the said rods on the sides of the shoulders to hold the rods on the cam-wheels, substantially as shown and described.

11. In a planter, the combination, with the sets of cam-wheels O, O', and O^3, each wheel having one or more projections, of rods connected with the fertilizer-hopper at its sides, shoulders formed on the said rods and operated on by the said projections when the cam-wheels are turned, flanges held on the said rods on the sides of the shoulders to hold the rods on the cam-wheels, and screws in the said rods to engage the periphery of the cam-wheels, substantially as shown and described.

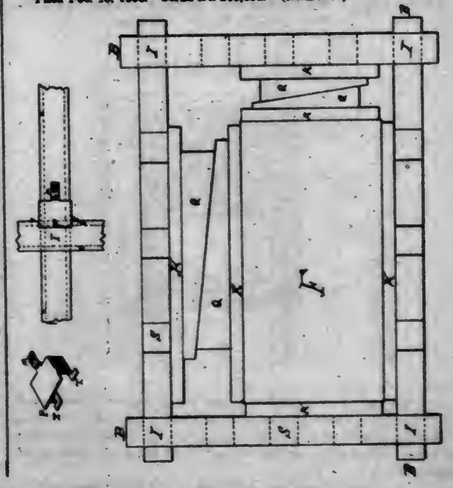
12. In a planter, the combination, with the sets of cam-wheels O, O', and O^3, each having projections, of rods each having a shoulder adapted to be engaged by the said projections, a fertilizer-hopper mounted to turn and connected with the said rods, and means, substantially as described, for throwing the said rods out of contact with the said cam-wheels, as set forth.

13. In a planter, the combination, with a fertilizer-hopper having apertures in its bottom and mounted to turn, of a fixed apertured seat held under the said hopper, a seed-box secured on the said fixed seat, and a drop-plate held on the said hopper and projecting under the slotted bottom of the said seed-box, substantially as shown and described.

14. In a planter, the combination, with a fertilizer-hopper having apertures in its bottom and mounted to turn, of a fixed apertured seat held under the said hopper, a seed-box secured on the said fixed seat, a drop-plate held on the said hopper and projecting under the slotted bottom of the said seed-box, and a partition held in the said seed-box to divide the latter into two compartments, substantially as shown and described.

15. In a planter, the combination, with a fertilizer-hopper having apertures in its bottom and mounted to turn, of a fixed apertured seat held under the said hopper, a seed-box secured on the said fixed seat, a drop-plate held on the said hopper and projecting under the slotted bottom of the said seed-box, a partition held in the said seed-box dividing the latter into two compartments, rods connected with the said hopper, cam-wheels for operating the said rods, and a main driving-wheel actuating the said cam-wheels, substantially as shown and described.

16. In a planter, the combination, with a fertilizer-hopper having apertures in its bottom and mounted to turn, of a fixed apertured seat held under the said hopper, a seed-box secured on the said fixed seat, a drop-plate held on the said hopper and projecting under the slotted bottom of the said seed-box, a partition held in the said seed-box to divide the latter into two compartments, a rod connected with one side of the said hopper, and a lever pivotally connected with the said rod for turning the said hopper by hand, substantially as shown and described.



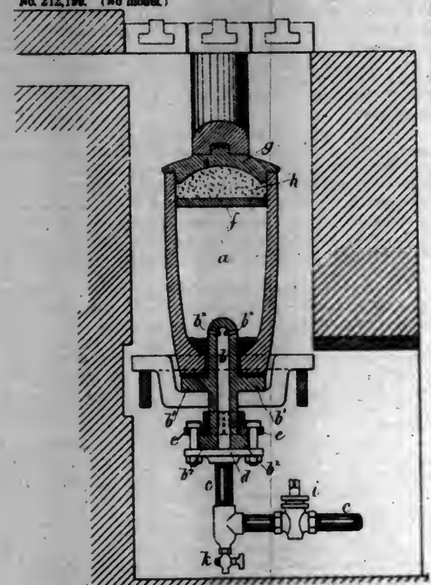
17. In a planter, the combination, with a fertilizer-hopper having apertures in its bottom and mounted to turn, of a fixed apertured seat held under the said hopper, a seed-box secured on the said fixed seat, a drop-plate held on the said hopper and projecting under the slotted bottom of the said seed-box, a partition held in the said seed-box to divide the latter into two compartments, a rod connected with one side of the said hopper, a lever pivotally connected with the said rod for turning the said hopper by hand, and means, substantially as described, for limiting the movement of the said lever, as set forth.

18. In a planter, the combination, with a main plow, of a mold-board pivoted on the said plow, and covering-shovels pivotally connected with the said mold-board at its end, substantially as shown and described.

19. In a planter, the combination, with a main plow, of a mold-board pivoted on the said plow, covering-shovels pivotally connected with the said mold-board at its end, and means for connecting with each other the rear ends of the said shovels, as set forth.

405,479. PRINTER'S CHASE.

PAUL HUSTHER, Allegheny, Pa. Filed Feb. 13, 1888. Serial No. 263,852. (No model.)



Claim.—1. A printer's chase composed of four similar interlocking bars, each provided with two or more superficial notches, substantially as described.

2. The combination, with a printer's chase composed of four interlocking bars, each provided with two or more superficial notches of sliding clamps which embrace the bars at their intersection, substantially as described.

405,480. MANUFACTURE OF CARBON FILAMENTS.
